### Technology Licenses

The hardware and/or software described in this document are furnished under a license and may be used or copied only in accordance with the terms of such license.

## U.S. Government Rights

The Software is "commercial computer software," as defined by Federal Acquisition Regulation ("FAR") 2.101. Pursuant to FAR 12.212 and 27.405-3 and Department of Defense FAR Supplement ("DFARS") 227.7202, the US government acquires commercial computer software under the same terms by which the software is customarily provided to the public. Accordingly, Keysight provides the Software to US government customers under its standard commercial license, which is embodied in its End User License Agreement (EULA), a copy of which can be found at

<http://www.keysight.com/find/sweula>. The license set forth in the EULA represents the exclusive authority by which the US government may use, modify, distribute, or disclose the Software. The EULA and the license set forth therein, does not require or permit, among other things, that Keysight: (1) Furnish technical information related to commercial computer software or commercial computer software documentation that is not customarily provided to the public; or (2) Relinquish to, or otherwise provide, the government rights in excess of these rights customarily provided to the public to use, modify, reproduce, release, perform, display, or disclose commercial computer software or commercial computer software documentation. No additional government requirements beyond those set forth in the EULA shall apply, except to the extent that those terms, rights, or licenses are explicitly required from all providers of commercial computer software pursuant to the FAR and the DFARS and are set forth specifically in writing elsewhere in the EULA. Keysight shall be under no obligation to update, revise or otherwise modify the Software. With respect to any technical data as defined by FAR 2.101, pursuant to FAR 12.211 and 27.404.2 and DFARS 227.7102, the US government acquires no greater than Limited Rights as defined in FAR 27.401 or DFAR 227.7103-5 (c), as applicable in any technical data.

## Warranty

THE MATERIAL CONTAINED IN THIS DOCUMENT IS PROVIDED "AS IS," AND IS SUBJECT TO BEING CHANGED, WITHOUT NOTICE, IN FUTURE EDITIONS. FURTHER, TO THE MAXIMUM EXTENT PERMITTED BY APPLICABLE LAW, KEYSIGHT DISCLAIMS ALL WARRANTIES, EITHER EXPRESS OR IMPLIED, WITH REGARD TO THIS MANUAL AND ANY INFORMATION CONTAINED HEREIN, INCLUDING BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. KEYSIGHT SHALL NOT BE LIABLE FOR ERRORS OR FOR INCIDENTAL OR CONSEQUENTIAL DAMAGES IN CONNECTION WITH THE FURNISHING, USE, OR PERFORMANCE OF THIS DOCUMENT OR OF ANY INFORMATION CONTAINED HEREIN. SHOULD KEYSIGHT AND THE USER HAVE A SEPARATE WRITTEN AGREEMENT WITH WARRANTY TERMS COVERING THE MATERIAL IN THIS DOCUMENT THAT CONFLICT WITH THESE TERMS, THE WARRANTY TERMS IN THE SEPARATE AGREEMENT SHALL CONTROL.

## Safety Information

### CAUTION

A CAUTION notice denotes a hazard. It calls attention to an operating procedure, practice, or the like that, if not correctly performed or adhered to, could result in damage to the product or loss of important data. Do not proceed beyond a CAUTION notice until the indicated conditions are fully understood and met.

### WARNING

A WARNING notice denotes a hazard. It calls attention to an operating procedure, practice, or the like that, if not correctly performed or adhered to, could result in personal injury or death. Do not proceed beyond a WARNING notice until the indicated conditions are fully understood and met.

# 1 Product Support & Documentation Roadmap

This section describes the Keysight products covered by this document, and provides links to available support resources and related documentation.

- ["Products Covered by this Document" on page 46](#)
- ["Where to Find the Latest Information" on page 47](#)
- ["Product and Solution Cybersecurity" on page 48](#)
- ["Additional Documentation" on page 49](#)

## 1.1 Products Covered by this Document

For the full list of instrument models covered by this documentation, see the title page: ["Noise Figure Mode User's & Programmer's Reference" on page 1](#).

## Where to Find the Latest Information

Periodically, Keysight releases software updates to fix known defects and incorporate product enhancements. To search for software updates for your product, go to the Keysight Technical Support website at:

<http://www.keysight.com/find/techsupport>

Documentation is updated periodically. For the latest information about these products, including instrument software upgrades, application information, and product information, navigate to the URL above, then in the Support by Product Model Number box, enter the Product Number of your instrument (for example, N9040B) and click **Find**:

To receive the latest updates by email, subscribe to Keysight Email Updates:

<http://www.keysight.com/find/emailupdates>

Information on preventing instrument damage can be found at:

<http://www.keysight.com/find/PreventingInstrumentRepair>

## Is your product software up-to-date?

Periodically, Keysight releases software updates to fix known defects and incorporate product enhancements. To search for software updates for your product, go to the Keysight Technical Support website at:

<http://www.keysight.com/find/techsupport>

## 1.2 Product and Solution Cybersecurity

Keysight complies with multinational regulations for the cybersecurity of its own products and is committed to providing information to assist you in protecting your products and solutions from external cyberthreats. For more information, see:

<https://www.keysight.com/us/en/about/quality-and-security/security/product-and-solution-cyber-security.html>

Keysight also recommends that you secure your IT environments using appropriate third-party tools. For instruments that run the Microsoft Windows operating system, Keysight concurs with Microsoft's recommendations for ensuring that the instrument is protected:

- Get the latest critical Windows updates
- For network-connected instruments, use an internet firewall (in Keysight instruments, Windows Firewall is enabled by default)
- For network-connected instruments, use up-to-date antivirus and anti-spyware software

### 1.2.1 Responsible Disclosure Program

Keysight recommends that security researchers share the details of any suspected vulnerabilities across any asset owned, controlled, or operated by Keysight (or that would reasonably impact the security of Keysight and our users) using this form:

<https://www.keysight.com/us/en/contact/responsible-disclosure-program.html>

### 1.2.2 Report a Product Cybersecurity Issue

If you discover a cybersecurity issue that you suspect may involve Keysight's proprietary software, or third-party software supplied by Keysight as part of a product, or that may affect the operation of Keysight products, we encourage you to report it to us using this form:

<https://www.keysight.com/us/en/about/quality-and-security/security/product-and-solution-cyber-security/report-a-product-cybersecurity-issue.html>

## 1.3 Additional Documentation

If your instrument or computer has an internet connection, then you can access the latest editions of all relevant X-Series documentation via the links below.

*This document is available in 3 formats:*

- **Embedded Help**, in the instrument
- **Online Help**, at Keysight's web site

For information on this Mode, browse to:

<http://rfmw.em.keysight.com/wireless/helpfiles/NFIGUREMode/FlexUI.htm>

- **Users & Programmers Reference**, in downloadable PDF format

For information on this Mode, download from:

<http://literature.cdn.keysight.com/litweb/pdf/N9069-90002.pdf>

The following documents are available online at keysight.com:

[X-Series Messages Guide](#)

The following documents are in downloadable PDF format:

## 2 User Interface

Here are the basic elements of the Multitouch User Interface. For more information, tap a topic.

Included in this section are also topics for several front panel keys not described in other topics. Tap one of these topics for more information.

"Cancel key" on  
page 99

"Onscreen Keyboard key" on  
page 100

"Touch On/Off Key" on  
page 101

"Tab key" on  
page 102

## 2.1 Screen Tabs

In the X-Series Multitouch User Interface (or Multitouch UI), you can run many different Measurement Applications, or “Modes”. Examples are Spectrum Analyzer Mode, LTE-A FDD Mode, IQ Analyzer Mode, and Real Time Spectrum Analyzer Mode. Each Mode has its own set of controls, windows and SCPI commands.

Each Mode runs within a “Screen”. The Multitouch UI supports multiple “Screens” (see ["Multiscreen" on page 143](#) for more information). Each screen displays one Measurement in one Mode. The set of configured screens is shown across the top of the display as a set of Screen Tabs, with a + tab at the right for adding new Screens:

You can see up to six tabs at a time on the UXA, and 4 at a time on the CXA, EXA, MXA and PXA. If there are more Screens configured than this, arrows appear to the left and right of the Screen Tabs; pressing the arrows scrolls the Screen Tabs to the left or right. A scroll bar also appears at the bottom of the Screen Tabs, indicating that you can scroll the tabs by dragging them with your finger; you can also scroll them by dragging the scroll bar.

Pressing a Screen Tab selects that screen for operation. Pressing the blue (selected) Screen Tab is the same as pressing the Mode/Meas front panel key.

Both actions open the ["Mode/Meas/View Dialog" on page 55](#). In addition, if you have a PC keyboard plugged in, the sequence CTL-SHIFT-M will open up this dialog.

The + tab at the right of the Screen Tabs bar adds a new Screen by cloning the current screen. The new Screen has the identical setup and settings as the current Screen. You can then change the Mode, Measurement and/or settings of the new Screen.

You can define up to 16 screens at once.

### Example Multiscreen View

The example below shows a four-screen display in Multiscreen view.

The Screen called “Real-Time SA 2” is selected, as indicated by its blue tab. Touching any other screen or tab selects the screen for that tab and brings it to the foreground.

The following topics provide more information:

- "Mode/Meas/View Dialog" on page 55
- "Add Screen" on page 72
- "Multiscreen" on page 143

### 2.1.1 Mode/Meas/View Dialog

The Mode/Meas/View dialog opens when you press the selected (blue) Screen tab (see "Screen Tabs" on page 54) or the **Mode/Meas** front panel key.

This dialog displays lists of available Modes, Measurements and Views, as well as the "Sequencer" on page 66 control for configuring Screens.

2.1.1.1 Mode

The first column in the Mode/Meas/View dialog allows you to select the desired Mode from those currently licensed in your instrument.

Modes, also known as “measurement applications”, are collections of measurement capabilities packaged together to provide you with an instrument personality specific to your measurement needs. Each Mode is ordered separately by Model Number and must be licensed in order for it to be available in the instrument.

You select the Mode you want to run using the Mode/Meas/View dialog. Once a Mode is selected, only the commands that are valid for that mode can be executed

For more information on Modes, preloading Modes, and memory requirements for Modes, see ["More Information" on page 59](#)

The `:INSTRument[:SElect]` command is used to remotely select a Mode by sending the instrument a parameter which represents the name of the desired Mode. The Mode Names may be found in the table under ["Index to Modes" on page 58](#).

The `:INSTRument:NSElect` command is used to remotely select a Mode by sending the Mode Number of the desired Mode. See ["Instrument Number Select" on page 57](#). The Mode Numbers may be found in the table under ["Index to Modes" on page 58](#).

The `:INSTRument:CONFigure` command causes a Mode and Measurement switch at the same time. This generally results in faster overall switching than sending the

**:INSTrument:SElect** and **CONFiGure** commands separately. See "Mode and Measurement Select" on page 57.

|                |                                                                                                                                                                 |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <b>:INSTrument[:SElect] &lt;mode_id&gt;</b><br>where <mode_id> is one of the values listed in "Index to Modes" on page 58 below<br><b>:INSTrument[:SElect]?</b> |

| Notes          | A list of the valid mode choices is returned by the <b>:INST:CAT?</b> query                                                                                     |
| Preset         | The default Mode is set to <b>SA</b> on <b>Restore System Defaults-&gt;All</b> , unless noted below:<br>For N8973B, N8974B, N8975B, or N8976B: <b>NFIG</b>      |
| State Saved    | Saved in instrument state                                                                                                                                       |
| Annunciation   | Application Title is in the Screen Tab                                                                                                                          |

## Instrument Number Select

|                |                                                                                                                                                                                                                                                                            |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <b>:INSTrument:NSElect &lt;integer&gt;</b><br><b>:INSTrument:NSElect?</b>                                                                                                                                                                                                  |
| Example        | <b>:INST:NSEL 1</b>                                                                                                                                                                                                                                                        |
| Notes          | The Mode Numbers may be found in the table under "Index to Modes" on page 58<br>SA mode is number 1<br>The command is sequential: that is, continued parsing of commands cannot proceed until the instrument select is complete and the resultant SCPI trees are available |
| Preset         | The default Mode is set to <b>1</b> by <b>Restore System Defaults-&gt;All</b> , unless noted in the table above                                                                                                                                                            |
| State Saved    | Saved in instrument state                                                                                                                                                                                                                                                  |

## Mode and Measurement Select

|                |                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <b>:INSTrument:CONFiGure:&lt;mode_id&gt;:&lt;meas&gt;</b><br>where <mode_id> is a valid parameter for the <b>:INST:SEL</b> command and <meas> is a valid parameter for the <b>:CONF</b> command in the Mode specified by <mode>                                                                                                                                                                                               |
| Example        | <b>:INST:CONF:SA:SAN</b><br>selects the Spectrum Analyzer mode and the Swept SA measurement<br><b>:INST:CONF:WCDMA:RHO</b><br>selects the WCDMA mode and the Mod Accuracy measurement                                                                                                                                                                                                                                         |
| Notes          | The available parameters for <mode_id> are dependent upon installed and licensed applications resident in the instrument. The available parameters for <meas> are dependent on the <mode_id> parameter and the valid measurements available for that mode, which can depend on model numbers and installed options<br>In general this command will execute more quickly than sending the equivalent separate <b>:INST:SEL</b> |

---

and **:CONF** commands

## Index to Modes

The Mode Number in the table below is the parameter for use with the **:INSTRument:NSElect** command. The Mode Parameter is the parameter for use with the **:INSTRument[:SElect]** command. Your actual choices will depend upon which applications are installed in your instrument.

| Mode                          | Mode Number | Mode Parameter<br><mode_id> |
|-------------------------------|-------------|-----------------------------|
| 5G NR                         | 109         | NR5G                        |
| 89601 VSA                     | 101         | VSA89601                    |

More Information

The Mode name appears on the Screen Tab, followed by a number identifying which instance of the Mode appears on that screen. Each Screen contains one Mode. For example, in the image below, there is one Real-Time Spectrum Analyzer screen, and two Spectrum Analyzer screens. The current Screen contains **Real-Time SA 1**.

It is possible to specify the order in which the Modes appear in the Mode menu, using the **Configure Applications** utility on the Desktop. Using the same utility, it is also possible to specify a subset of the available applications to load into memory at startup time, which can decrease the startup time of the instrument and the amount of memory consumed.

Each application (Mode) that runs in an X-Series instrument consumes virtual memory. The various applications consume varying amounts of virtual memory, and as more applications run, the memory consumption increases. Keysight characterizes each Mode and assigns a memory usage quantity based on a conservative estimate. The **Configure Applications** utility shows an estimate for how much memory each Mode will consume.

You can still run a Mode even if it is not preloaded into memory – during runtime, the first time an application that is not loaded into memory is selected (either by pressing that application's **Mode** key or by sending that application's **:INST:SEL** command), the Application will be loaded, but this takes a few seconds. The instrument will pause while loading the application while displaying a message box that says “Loading application, please wait...” Preloading the application eliminates this wait time *but* consumes additional memory.

2.1.1.2 Application Mode Remote Commands

This section contains a number of remote commands that are provided for programming convenience and remote compatibility.

Application Mode Catalog Query (Remote Command Only)

Returns a string containing a comma-separated list of names of all the installed and licensed measurement modes (applications). These names can only be used with **:INSTrument[:SElect]**.

---

|                |                             |
|----------------|-----------------------------|
| Remote Command | <b>:INSTrument:CATalog?</b> |
|----------------|-----------------------------|

|                               |                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Example                       | <code>:INST:CAT?</code>                                                                                                                                                                                                                                                                                                                                                       |
| Notes                         | Query returns a quoted string of the installed and licensed modes separated with a comma. Example:<br><code>"SA,PNOISE,WCDMA"</code>                                                                                                                                                                                                                                          |
| Backwards Compatibility Notes | VSA (E4406A): <code>:INSTrument:CATalog?</code> returned a list of installed <code>INSTrument:SELECT</code> items as a comma separated list of string values, for example:<br><code>"BASIC", "GSM", "EDGE GSM", "CDMA", "SERVICE"</code><br><br>X-Series uses the ESA/PSA compatible query of a string contain comma separated values:<br><code>"SA,PNOISE,NFIG,BASIC"</code> |

### Current Application Model (Remote Command Only)

Returns a string that is the Model Number of the currently selected application (mode). This information is also displayed in the **Show System** screen.

|                |                                                                                                                                                                                        |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:SYSTem:APPLication[:CURRent][:NAME]?</code>                                                                                                                                     |
| Example        | <code>:SYST:APPL?</code>                                                                                                                                                               |
| Notes          | Query returns a quoted string that is the Model Number of the currently selected application (Mode). Example:<br><code>"N9060A"</code><br><br>String length between 6 to 9 characters. |
| Preset         | Not affected by Preset                                                                                                                                                                 |
| State Saved    | Not saved in state, the value will be the selected application when a Save is done.                                                                                                    |

### Current Application Revision (Remote Command Only)

Returns a string that is the Revision of the currently selected application (mode). This information is also displayed in the Show System screen

|                |                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:SYSTem:APPLication[:CURRent]:REVisIon?</code>                                                                                                                                                                                                                                                                                                                                               |
| Example        | <code>:SYST:APPL:REV?</code>                                                                                                                                                                                                                                                                                                                                                                       |
| Notes          | Query returns a quoted string that is the Revision of the currently selected application (Mode). Example:<br><code>"1.0.0.0"</code><br><br>String length is a maximum of 23 characters. (each numeral can be an integer + 3 decimal points)<br>The format is Major.Minor.Build.Compile, where Major must correspond to the Integer portion of the Version in the license file for the application. |
| Preset         | Not affected by a Preset                                                                                                                                                                                                                                                                                                                                                                           |
| State Saved    | Not saved in state, the value will be the selected application when a Save is done.                                                                                                                                                                                                                                                                                                                |

## Current Application Options (Remote Command Only)

Returns a string that is the Options list of the currently selected application (Mode). This information is also displayed in the Show System screen

|                |                                                                                                                                                                                                                                                                                            |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:SYSTem:APPLication[:CURRent]:OPTion?</code>                                                                                                                                                                                                                                         |
| Example        | <code>:SYST:APPL:OPT?</code>                                                                                                                                                                                                                                                               |
| Notes          | Query returns a quoted string that is the Option list of the currently selected application (Mode). The format is the name as the *OPT? or SYSTem:OPTion command: a comma separated list of option identifiers. Example:<br>"1FP,2FP"<br><br>String length is a maximum of 255 characters. |
| Preset         | Not affected by a Preset                                                                                                                                                                                                                                                                   |
| State Saved    | Not saved in state per se, the value will be the selected application when a Save is invoked.                                                                                                                                                                                              |

## Application Catalog Number of Entries (Remote Command Only)

Returns the number of installed and licensed applications (Modes).

|                |                                                        |
|----------------|--------------------------------------------------------|
| Remote Command | <code>:SYSTem:APPLication:CATalog[:NAME]:COUNT?</code> |
| Example        | <code>:SYST:APPL:CAT:COUN?</code>                      |
| Preset         | Not affected by Preset                                 |
| State Saved    | Not saved in instrument state.                         |

## Application Catalog Model Numbers (Remote Command Only)

Returns a list of Model Numbers for the installed and licensed applications (Modes).

|                |                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:SYSTem:APPLication:CATalog[:NAME]?</code>                                                                                                                                                                                                                                                                                                                                                            |
| Example        | <code>:SYST:APPL:CAT?</code>                                                                                                                                                                                                                                                                                                                                                                                |
| Notes          | Returned value is a quoted string of a comma separated list of Model Numbers. Example, if SAMS and Phase Noise are installed and licensed:<br>"N9060A,N9068A"<br><br>String length varies based on licenses. Licenses are between 6 and 9 characters. So the string length will be between COUNT * 7 - 1 and COUNT * 10 - 1. (7 & 10 = Model Number length + 1 for comma. -1 = no comma for the 1st entry.) |
| Preset         | Not affected by a Preset                                                                                                                                                                                                                                                                                                                                                                                    |
| State Saved    | Not saved in instrument state.                                                                                                                                                                                                                                                                                                                                                                              |

## Application Catalog Revision (Remote Command Only)

Returns the Revision of the provided Model Number.

|                |                                                                                                                                                                                                                                                                                                                                                                        |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:SYSTem:APPLication:CATalog:REVision? &lt;model&gt;</code>                                                                                                                                                                                                                                                                                                       |
| Example        | <code>:SYST:APPL:CAT:REV? 'N9060A'</code>                                                                                                                                                                                                                                                                                                                              |
| Notes          | <p>Returned value is a quoted string of revision for the provided Model Number. The revision will be a null-string ("" ) if the provided Model Number is not installed, licensed, and loaded. Example, if SAMS is installed and licensed:</p> <p>"1.0.0.0"</p> <p>String length is a maximum of 23 characters. (each numeral can be an integer + 3 decimal points)</p> |
| Preset         | Not affected by a Preset.                                                                                                                                                                                                                                                                                                                                              |
| State Saved    | Not saved in instrument state.                                                                                                                                                                                                                                                                                                                                         |

## Application Catalog Options (Remote Command Only)

Returns a list of Options for the provided Model Number

|                |                                                                                                                                                                                                                                                                                                                                               |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:SYSTem:APPLication:CATalog:OPTion? &lt;model&gt;</code>                                                                                                                                                                                                                                                                                |
| Example        | <code>:SYST:APPL:CAT:OPT? 'N9060A'</code>                                                                                                                                                                                                                                                                                                     |
| Notes          | <p>Returned value is a quoted string of a comma separated list of Options, in the same format as *OPT? or :SYSTem:OPTion?. If the provided Model Number is not installed and licensed a null-string ("" ) will be returned. Example, if SAMS is installed and licensed:</p> <p>"2FP"</p> <p>String length is a maximum of 255 characters.</p> |
| Preset         | Not affected by a Preset                                                                                                                                                                                                                                                                                                                      |
| State Saved    | Not saved in instrument state.                                                                                                                                                                                                                                                                                                                |

## ESA SA compatibility command (Remote Command only)

Provided for backwards compatibility with ESA. When this command is received, the analyzer aliases it to the appropriate Mode.

|                |                                                                                                          |
|----------------|----------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:INSTrument[:SElect] 'SA'   'PNOISE'   'EDGE'   'GSM'   'BASIC'</code>                             |
| Example        | <code>:INST 'SA'</code>                                                                                  |
| Notes          | The query is not a quoted string. It is an enumeration as indicated in the Instrument Select table above |

### GSM Mode compatibility command (Remote Command only)

Provided for backwards compatibility. When this command is received, the analyzer aliases it to the following:

```
:INST:SEL EDGE GSM
```

---

|                |                          |
|----------------|--------------------------|
| Remote Command | :INSTrument[:SElect] GSM |
|----------------|--------------------------|

---

|         |           |
|---------|-----------|
| Example | :INST GSM |
|---------|-----------|

### SA compatibility command for EMC (Remote Command only)

Provided for ESU compatibility. When this command is received, the analyzer aliases it to the following:

```
:INST:SEL SCPI LC
```

This results in the analyzer being placed in SCPI Language Compatibility Mode, in order to emulate the ESU Spectrum Analyzer Mode.

---

|                |                                |
|----------------|--------------------------------|
| Remote Command | :INSTrument[:SElect] SANalyzer |
|----------------|--------------------------------|

---

|         |           |
|---------|-----------|
| Example | :INST SAN |
|---------|-----------|

### Receiver compatibility command for EMC (Remote Command only)

Provided for ESU compatibility. When this command is received, the instrument aliases it to the following:

```
:INST:SEL EMI
```

```
:CONF FSC
```

This results in the instrument being placed in the EMI Receiver Mode, running the Frequency Scan measurement, in order to emulate the ESU Receiver Mode.

---

|                |                               |
|----------------|-------------------------------|
| Remote Command | :INSTrument[:SElect] REceiver |
|----------------|-------------------------------|

---

|         |           |
|---------|-----------|
| Example | :INST REC |
|---------|-----------|

### APD compatibility command for EMC(Remote Command only)

Provided for ESU compatibility. When this command is received, the analyzer aliases it to the following:

```
:INST:SEL EMI
```

```
:CONF APD
```

This results in the analyzer being placed in the EMI Receiver Mode, running the APD measurement, in order to emulate the ESU APD Mode.

|                |                                     |
|----------------|-------------------------------------|
| Remote Command | :INSTrument[:SElect] APDistribution |
| Example        | :INST APD                           |

**IF Mode compatibility command for EMC (Remote Command only)**

Provided for ESU compatibility. When this command is received, the analyzer aliases it to the following:

```
:INST:SEL EMI  
:CONF MON
```

This results in the analyzer being placed in the EMI Receiver Mode, running the Monitor Spectrum measurement, in order to emulate the ESU IF Mode.

|                |                                 |
|----------------|---------------------------------|
| Remote Command | :INSTrument[:SElect] IFANalyzer |
| Example        | :INST IFAN                      |

**2.1.1.3 Measurement**

The Measurement column of the Mode/Meas/View dialog shows all the Measurements available for the Mode which is selected in the first column. Select a Measurement in the second column and the View column will show all the Views available for that measurement. Once you have the Mode, Measurement and View selected, press OK to change the current Screen to that Mode, Measurement and View.

**2.1.1.4 View**

A View is a collection of Result Windows. The View column of the "Mode/Meas/View Dialog" on page 55 shows all the Views available for the Measurement which is selected in the second column. Once you have the Mode, Measurement and View selected, press OK to change the current Screen to that Mode, Measurement and View.

The View may also be set by using the View tab on the Display menu. The View tab is the last tab on the Display menu for every measurement. The Views are the same as those listed in the "Mode/Meas/View Dialog" on page 55.

2.1.1.5 Sequencer

Allows multiple Screens to update sequentially while in "Multiscreen" on page 143 display mode. Each Screen updates in sequence, and when all have updated, the sequence will start again.

To start the Sequencer, you must have more than one Screen defined, and you must have Multiscreen selected (see "Screen Tabs" on page 54).

If you want each Screen to use a different input, you must turn off All Screens Use Same Input under Input/Output, Input.

CAUTION

Differences in hardware settings between the Screens may cause switches and/or attenuators to cycle as you go from one Screen to another. This could potentially reduce the life of these components. To avoid this, make sure **Attenuation**, **µW Path Control** and other switch settings are the same in each Screen.

NOTE

When the Sequencer is running, the destination of remote commands is unpredictable, so you should stop the Sequencer before sending any measurement-related commands. Once the Sequencer has stopped, select a specific Screen using `:INSTrument:SCReen:SElect`, before sending any further commands. See "Select Screen" on page 145

NOTE

When the Sequencer is running, Auto alignment is temporarily disabled. A pending auto alignment might be executed when the sequencer is stopped.

See "More Information" on page 66

|                |                                                                                                                                                                                  |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:SYSTem:SEQuencer ON   OFF   1   0</code><br><code>:SYSTem:SEQuencer?</code>                                                                                               |
| Example        | <code>:SYST:SEQ ON</code>                                                                                                                                                        |
| Notes          | If the display is disabled (via <code>:DISP:ENAB OFF</code> ) then the error message “-221, Settings conflict; Screen SCPI cannot be used when Display is disabled” is generated |
| Dependencies   | To start the Sequencer, you must have more than one Screen defined and you must have Multiscreen selected                                                                        |
| Preset         | <code>OFF</code>                                                                                                                                                                 |

More Information

To start the Sequencer, tap the current (blue) Screen tab to go into the Mode/Meas/View Dialog:

In the Sequencer block in the upper left hand corner, tap the Sequencing switch to turn it On:

2 User Interface  
2.1 Screen Tabs

The instrument will immediately exit the Mode/Meas/View Dialog and begin making measurements in each of the screens, one after the other. When a measurement is being made in a particular Screen, that Screen's tab will be blue.

Measurement being made in Screen 1:

Measurement being made in Screen 2:

Touching any key or control on the display will cause the Sequencer to stop, so that you can make desired changes. When this happens, the message “Sequencer stopped” is displayed.

When the Sequencer is running, the screens update in the order in which they were created.

Each Screen takes one measurement then passes control to the next Screen. Each Screen updates as though it were in Single Sweep or Single Measurement mode. Thus, if Averaging is on, a Screen may take multiple sweeps before moving on to the next Screen.

### 2.1.1.6 Screen Name

By default, the screen name is the Mode (Application) name followed by a number indicating the instance of the application.

You may change the name displayed on the Screen Tab of any screen. The control to do this appears in the ["Mode/Meas/View Dialog" on page 55](#):

When you touch this control an onscreen keyboard appears, allowing you to change the name. Whatever you change it to appears on the Tab, even if you subsequently change the screen to a different Mode.

To reset the name, delete the screen name entirely.

Each Screen Name must be unique; you cannot give the same name to more than one screen.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:INSTrument:SCReen:REName &lt;alphanumeric&gt;</code>                                                                                                                                                                                                                                                                                                                                                                                              |
| Example        | <code>:INST:SCR:REN "Baseband"</code>                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Notes          | <p>The currently active screen is renamed.</p> <p>If the <code>&lt;alphanumeric&gt;</code> specifying the new name is already present in the list of screen names, the error message “-224, Illegal parameter value; New name &lt;name&gt; already exists” appears</p> <p>If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message “-221, Settings conflict; Screen SCPI cannot be used when Display is disabled” appears</p> |

2.1.1.7 Delete This Screen

Pressing this button deletes the current Screen (the one with the blue tab). Deleting a screen removes it from view and selects the next lower screen in the list of screens. If only one screen is configured, it cannot be deleted.

If you press the **Delete This Screen** button, a prompt appears:

“This function will delete the current screen and its settings. This action cannot be undone. Do you want to proceed?”

Pressing **OK** or Enter deletes the screen, pressing **Cancel** or **ESC** does not.

|                |                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:INSTrument:SCReen:DELeTe</code>                                                                                                                                                                                                                                                                                                                                                                        |
| Example        | <code>:INST:SCR:DEL</code>                                                                                                                                                                                                                                                                                                                                                                                    |
| Notes          | <p>The currently active screen is deleted</p> <p>If the screen you are attempting to delete is the only configured screen, the error message “-221, Settings conflict; Last screen cannot be deleted” is displayed</p> <p>If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message “-221, Settings conflict; Screen SCPI cannot be used when Display is disabled” is generated</p> |

2.1.1.8 Delete All But This Screen

Pressing this control deletes all the Screens except the current Screen (the one with the blue tab).

If you press the **Delete All But This Screen** button, a prompt appears:

“This function will delete all defined screens and their settings, except for the current screen. This action cannot be undone. Do you want to proceed?”

Pressing **OK** or Enter deletes the screen, pressing **Cancel** or ESC does not.

|                |                                                                                                                                                                                                                                                                                                                                             |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:INSTrument:SCReen:DELeTe:ALL</code>                                                                                                                                                                                                                                                                                                  |
| Example        | <code>:INST:SCR:DEL:ALL</code>                                                                                                                                                                                                                                                                                                              |
| Notes          | <p>You can reset the instrument to the power-on configuration by invoking <code>:INST:SCR:DEL:ALL</code> followed by <code>:SYSTem:DEFault ALL</code></p> <p>If the display is disabled (via <code>:DISP:ENAB OFF</code>) then the error message “-221, Settings conflict; Screen SCPI cannot be used when Display is disabled” appears</p> |

### 2.1.1.9 89600 VSA

Pressing this button launches the 89600 VSA software. The 89600 VSA software is powerful, PC-based software, offering the industry's most sophisticated general purpose and standards specific signal evaluation and troubleshooting tools for R&D engineers. Even for proprietary and non-standard signals in SATCOM or MILCOM applications, you can make signal quality measurements with customized IQ constellation.

The 89600 VSA software offers the following features:

- Over 35 general-purpose analog and digital demodulators ranging from 2FSK to 4096QAM
- Flexible and custom IQ and OFDM signal analysis for single carrier
- Standards specific modulation analysis including:
  - Cellular: GSM/EDGE, cdma2000, W-CDMA, TD-SCDMA, LTE(FDD/TDD),
  - LTE-Advanced and more
  - Wireless networking: 802.11a/b/g, 802.11n, 802.ac, 802.16 WiMAX (fixed/mobile), WiSUN (MR-FSK PHY)
  - RFID
  - Digital satellite video and other satellite signals, radar, LMDS
- Up to 400K bin FFT, for the highest resolution spectrum analysis
- A full suite of time domain analysis tools, including signal capture and playback, time gating, and CCDF measurements
- 20 simultaneous trace displays and the industry's most complete set of marker

functions

- Easy-to-use Microsoft Windows graphical user interface

For more information see the Keysight 89600 Series VSA web site at [www.keysight.com/find/89600vsa](http://www.keysight.com/find/89600vsa)

To learn more about how to use the 89600 VSA in the instrument, start the 89600 VSA software, then open the 89600 VSA Help and navigate to the topic "About Keysight X-Series Signal Analyzer with 89600 VSA Software".

---

|         |                                                                |
|---------|----------------------------------------------------------------|
| Example | <code>:INST:SEL VSA89601</code><br><code>:INST:NSEL 101</code> |
|---------|----------------------------------------------------------------|

### 2.1.2 Add Screen

On X-Series analyzers you can configure up to 16 different Screens at one time. Each Screen contains one Mode, each Mode contains one Measurement, and each Measurement contains a number of Windows.

You can add screens by pressing the “+” icon in the "Screen Tabs" on page 54 panel. The icon is shown below:

Every time you add a Screen, the instrument “clones” or “copies” the current Screen into the new Screen. If desired, you can then use the "Mode/Meas/View Dialog" on page 55 to change the Mode, Measurement and/or View of the new Screen, or simply operate a second copy of your previous Screen, thus preserving the settings of your previous Screen.

When you have defined the maximum number of Screens (16), the “+” icon disappears.

For more information about operating the instrument with multiple screens configured, see "Multiscreen" on page 143.

---

|                |                                        |
|----------------|----------------------------------------|
| Remote Command | <code>:INSTrument:SCReen:CREate</code> |
|----------------|----------------------------------------|

---

|         |                            |
|---------|----------------------------|
| Example | <code>:INST:SCR:CRE</code> |
|---------|----------------------------|

---

|       |                                                                                                                                                                                                                                                                                                                                       |
|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Notes | <p>The maximum number of screens is 16. If an attempt to add a screen occurs when the maximum have been defined, the error message “-221, Settings conflict; Screen limit reached” appears</p> <p>When you create a new screen the Screen Name is the current Mode name followed by a number indicating the instance of the Mode.</p> |
|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

---

If the display is disabled (via **:DISP:ENAB OFF**) then the error message “-221, Settings conflict; Screen SCPI cannot be used when Display is disabled” appears

## 2.2 Meas Bar

The Meas Bar is used to display annotation for the current measurement. There are three primary uses for the Meas Bar:

1. To show annotation for the most important parameters in the measurement so you can see them at a glance
2. To show the annotation that you will most want to have recorded in a screen dump
3. To give you quick access to settings.

The Meas Bar is made up of a number of annotation panels, each of which, when pressed, opens up a dialog below it which contains controls for those settings.

For example, here is what the display looks like when you touch one of the regions of the Meas Bar:

Touching anywhere off the hotspot panel or pressing any hardkey except **Save** or **Quick Save** closes the hotspot panel.

In a hotspot panel, the control in black with the blue border is the active function. Each panel may have its own default active function.

Settings that are colored amber are those that you need to be particularly aware of; for example, if Alignments are off, this is shown in amber, so you will know that you may not be meeting spec. Similarly, if DC coupling is on, this is shown amber, to alert you to be careful what voltage you put on the input.

You can turn the Meas Bar on and off with a switch on the Annotation tab of the Display menu.

### System Control Panel

The leftmost panel holds the GPIB/Remote annunciators, the Single/Continuous symbol/control, the LXI indicator and the PASS/FAIL indicator. Tapping this panel drops down controls for Single/Continuous, Pause/Resume and restart.

### GPIB/Remote annunciators

The GPIB/Remote annunciators are shown as the letters **KRLTS**. Each letter is shown if the state is true and is not shown if the state is false, as follows:

|          |                         |                                                                                                                              |
|----------|-------------------------|------------------------------------------------------------------------------------------------------------------------------|
| <b>K</b> | Keylock indicator       | This is shown when the instrument is in the Keylock state (turned on and off by the <b>SYST:KLOCK</b> command)               |
| <b>R</b> | Remote annunciator      | Shown when the instrument is in the remote state, as when being controlled via the IEEE-488 bus (GPIB) or TCP/IP connections |
| <b>L</b> | GPIB Listen annunciator | Shown when addressed to listen via GPIB or TCP/IP                                                                            |
| <b>T</b> | GPIB Talk annunciator   | Shown when addressed to talk via GPIB or TCP/IP                                                                              |
| <b>S</b> | GPIB SRQ annunciator    | Shown when the instrument is asserting SRQ on GPIB. This annunciator is an amber color                                       |

### Single/Continuous symbol/control

This annunciator shows as an arrow on an oval line when in Continuous, or an arrow on a straight line when in Single.

LXI indicator

This indicator displays in green when LAN is connected, in white when LAN is not connected, and in red when LAN is connected but has a connection problem.

PASS/FAIL indicator

This annunciator displays when Limits are turned on. It is green if all Limits are passing, and a red FAIL if any limit is not passing.

The following command queries the status of the current measurement limit testing. It returns a 0 if the measured results pass when compared with the current limits. It returns a 1 if the measured results fail any limit tests.

|                |                                                                                                                                            |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | :CALCulate:CLIMits:FAIL?                                                                                                                   |
| Example        | :CALC:CLIM:FAIL?<br><br>queries the current measurement to see if it fails the defined limits<br>Returns a 0 or 1: 0 it passes, 1 it fails |

Trace Detector Settings Panel

In the Swept SA and some other measurements, there is a special panel summarizing the settings for the traces in the measurement:

There is one column for each trace. The rows are as follows:

- The top row shows the Trace Number, in the trace color.
- The second row shows the Trace Type for each trace (W=Clear/Write, A=Trace Average, M=Max Hold, m=Min Hold); this letter is in white if the trace is Active, in gray if the trace is inactive; there is a bar through the letter if the trace is not being displayed
- The third row shows the detector for each trace (N=Normal, S=Sample, A=Average, P=peak, p=negative peak, Q=Quasi Peak, E=EMI Average, R=RMS Average, f=math function)

In the example above, trace 1 is active, visible, and in Average using the Sample detector, the other traces are inactive, blanked and in Clear/Write using the Normal detector.

Tapping this panel drops down controls for the Traces.

## 2.3 Measurement Display

The Measurement Display contains one or more data windows displaying the result of the current measurement. These may be graphical or textual windows.

Each window in the Measurement display contains a "Window Title" on page 78, "Measurement Data" on page 82, and graphical windows also may contain "Annotation Hotspot" on page 85.

The selected window in the Measurement Display is indicated by a blue border. Window-dependent controls in the menu panel always refer to the selected window.

### 2.3.1 Window Title

The Window Title appears in the upper left hand corner of the window, and includes a title describing the measurement data currently being displayed in the window. The title may also contain additional information about the data in the window, for example in the LTE measurement supplication, the component carrier being displayed in the window will be indicated (e.g., "CC0").

Measurements that support User Views (see ["View Editor" on page 122](#)) also display the Window Number in the Window Title, to enable window addressing from SCPI. The number is the number that will be used in the SCPI command to address that window, for example, in the WCDMA Mod Accuracy measurement, Code Domain Power is assigned window number 6, so you address it with the following SCPI command:

```
:DISP:RHO:WIND6:TRAC:Y:RLEV 0.0
```

Note the arrow pointing down on the right side of the Window Title. This indicates that touching the Window Title will display a dropdown, which enables you to select the Measurement Data to be displayed in the window.

For example, if we wish to assign the results of the upper window in the display below to the Marker Table, we would touch the window title and then the “Data” control that is revealed, as shown:

And then select Marker Table, yielding the result below:

2 User Interface

2.3 Measurement Display

Note also that the Window Data dropdown can be a cascaded list, if the number of available results requires categorization to hold them all:

Note also that the Window Data dropdown sometimes includes controls for further configuring the window, for example, in LTE choosing the desired Component Carrier and Data format.

Touching a window's title dropdown also selects the window.

2.3.2 Measurement Data

The Measurement Data region shows graphical or textual data for the Data selected in the Window Title Data control. Below you can see examples of both graphical and textual windows in a four-window display.

There are many gestures which you can use to interact with a measurement display window. They are detailed below.

## Swipe

There are several swipe actions, as listed below. One of the most important actions is swiping a spectrum window to the left or right, or up or down, to adjust the frequency and level of the spectrum, as shown below.

Swipe actions are summarized in the table below. Not all of these may be available, depending on the measurement.

| Object                          | Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Spectrum Trace Left/Right       | Drag trace (change Center Frequency)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Spectrum Trace up/down          | Drag trace (change Ref Level)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Marker Left/Right               | Drag marker along trace                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Fixed Marker Left/Right/Up/Down | Drag marker in space                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Scrollable area                 | <p>Scroll vertically or horizontally. Scrollable areas include the Menu Panel (if overfull), tables and lists. A scrollable area is indicated by a vertical or horizontal translucent white bar which can also be dragged by a mouse</p> <p>When scrolling a table:</p> <ul style="list-style-type: none"> <li>Row headers remain in place when the table is scrolled horizontally, and scroll with the table when the table is scrolled vertically</li> <li>Column headers remain in place when the table is scrolled vertically, and scroll with the table when the table is scrolled horizontally</li> </ul> |

| Object         | Action                   |
|----------------|--------------------------|
| Toggle control | Toggle in that direction |

Pinch

You can also pinch in or out either horizontally or vertically to zoom in the x-axis or y-axis dimension. For example, a pinch horizontally lets you adjust the Span of the Spectrum window. Also, pinching on the wings of a Band Power or other Band Function allows you to widen or narrow that Band Function.

Pinching may sometimes be easier if you use the index finger of each hand, rather than pinching with one hand.

Touch-and-Hold

You can also touch-and-hold the display, that is, touch it and hold your finger on the display. A circle is drawn, and when the drawing completes, a right-click gesture is performed that depends on the screen feature touched, as listed in the table below.

|                         |                                                                                                                                                                                               |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Right Click on a Trace  | Peak Search, Trace Type (Clear/Write, Trace Average, Max Hold, Min Hold), Trace View/Blank (Active, View, Blank, Background). Not all of these may be available, depending on the measurement |
| Right Click on a Marker | Marker Mode (Normal, Delta, Fixed, Off), Peak Search, Next Peak, Next Pk Right, Next Pk Left). Not all of these may be available, depending on the measurement                                |

|                                     |                                                                                    |
|-------------------------------------|------------------------------------------------------------------------------------|
| Right Click on the Background       | Lets you select Help                                                               |
| Right Click on a Menu Panel control | Lets you add or remove that control from the User Menu or get Help on that control |

## Tap

Tapping an object causes the actions defined in the table below:

| Object                            | Action                                                                                                       |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------|
| Marker                            | Select                                                                                                       |
| Marker (repeated taps on stacked) | Cycle through stacked markers                                                                                |
| Trace                             | Select. In addition if Marker is the active function, move the selected marker to the point where you tapped |
| Trace (repeated taps on stacked)  | Cycle through stacked traces                                                                                 |
| Window                            | Select if unselected                                                                                         |
| Screen                            | Select if unselected                                                                                         |

## Double Tap

Double-tapping an object causes the actions defined in the table below:

| Object | Action      |
|--------|-------------|
| Window | Zoom/Unzoom |

### 2.3.3 Annotation Hotspot

You can tap on a graticule annotation to modify one of the fields in that annotation. For example if you tap on the region with Center Freq and Res BW in it, a menu panel pops up with just those settings on it.

2 User Interface  
2.3 Measurement Display

Touching anywhere off the hotspot panel or pressing any hardkey except **Save** or **Quick Save** closes the hotspot panel.

Annotation which is not currently able to be adjusted is not grayed out on the display, but the control in the hotspot that drops down or pops up is grayed out.

In a hotspot panel, the control in black with the blue border is the active function. Each panel may have its own default active function

## 2.4 Menu Panel

The menu panel is the main focus of the X-Series Multitouch user interface. The controls include active functions, dropdowns, action buttons, radio buttons and toggles.

2 User Interface  
2.4 Menu Panel

The menu panel normally appears on the right side of the display and consists of a rectangular panel with multiple “sub-panels” lying on top of each other, each sub-panel being accessed by a tab on the right.

You press a front panel key (or “hardkey”) to access a particular menu. On the front panel there are twelve “measurement hardkeys” (the ones in the shaded region in the figures below) – these are the hardkeys that open up menus in the menu panel.

With a menu open, tap a tab to access the controls on its sub-panel. Whenever you press the front panel key associated with a menu, the default (top) tab is selected.

If the number of controls on a panel exceeds the height of the panel, scrolling is enabled, which is indicated by a white bar on the left that fades away after a few seconds. You swipe up or down with your finger to scroll the panel, or you can grab the white bar with a mouse.

If you move to a different menu panel or sub-panel and then come back to a previous panel, the previous panel is always reset to be scrolled all the way back to the top.

### Accessing Menus Without Using Front-Panel Keys

You can access the menu panels without using the front panel keys, as you would need to do if you were operating the instrument using Remote Desktop. Touch or click on the menu title, as shown below. A dropdown containing the twelve measurement hardkeys appears. Selecting a hardkey from the dropdown displays the corresponding menu, and the dropdown disappears.

### Entering Numeric Values

Many controls on the menu panel allow you to enter numeric values. These are called “active functions.” An active function control displays a number and a suffix,

## 2 User Interface

### 2.4 Menu Panel

for example 13.255 GHz, as in the example below:

An active function is “active” if the numeric value is surrounded by a black background with a blue border, as below. In this state, it is ready to receive numeric input from the number pad on the front panel, the knob, or the step keys.

When an active function is in the active state, you can start typing or pressing the number keys on the front panel, which causes the Numeric Entry Panel to appear, as shown below. The Numeric Entry Panel displays the typed value, and the terminators to complete the entry.

Here we see a UXA with an active function control in the active state. Although no Numeric Entry Panel is displayed, you can just touch the “2” key:

This causes the Numeric Entry Panel to pop up to receive the numbers you are typing:

Type in as many digits as required, then touch one of the unit terminator buttons in the Numeric Entry Panel to complete the entry. In this case, 2 GHz was the desired entry, so you just touch the “GHz” terminator:

## 2 User Interface

### 2.4 Menu Panel

The Numeric Entry Panel disappears and, in the example, the active function value becomes 2 GHz.

It is important to note that you can always pop up the Numeric Entry Panel by touching an active function control while it is active; for example, if you were to touch it in the figure above, the Numeric Entry Panel would pop up right next to the control:

2 User Interface  
2.4 Menu Panel

You can display the Numeric Entry Panel by touching any active function control while it is active, but you don't have to pop up the Numeric Entry Panel first, you can just start typing and it will pop up on its own, thus saving you a keystroke.

You can also adjust a value without displaying the Numeric Entry panel by turning the knob or using the step keys while an active function is active. If you turn the knob or use the step keys while the Numeric Entry Panel is displayed, it disappears, allowing you to see the entire screen while you are making the adjustment.

You can also drag the Numeric Entry Panel to another part of the display if it is covering something that you wish to see while it is on the screen.

## 2.4.1 Right-Click Menu

If you click with the right mouse button on any of the menus in measurements, a popup menu appears, which includes:

The items in this menu are:

- ["Add to User Menu" on page 97](#)
- ["Help on this setting" on page 97](#)
- ["Show SCPI Command" on page 97](#)
- ["Add to SCPI Recorder" on page 98](#)
- ["Start/Stop SCPI Recorder" on page 98](#)
- ["Show SCPI Recorder" on page 98](#)

### 2.4.1.1 Add to User Menu

For details, see ["User Menu" on page 98](#).

### 2.4.1.2 Help on this setting

For details, see ["Help" on page 111](#).

### 2.4.1.3 Show SCPI Command

Enabled/visible when the currently-active feature has an associated SCPI command or query. Displays a popup dialog that shows the active GUI selection's SCPI command.

To close the popup dialog, click **OK**

#### 2.4.1.4 Add to SCPI Recorder

Adds SCPI to the recorder from User Interface features that have equivalent SCPI.

This is the manual mode for adding SCPI to the recorder when you do not wish to add SCPI continuously. This control is enabled only when the current active feature has an associated SCPI command or query.

Irrespective of the continuous recording state, clicking this control adds the active entry into the recorder, including the active value if it is a setting.

#### 2.4.1.5 Start/Stop SCPI Recorder

Starts or stops continuous recording mode. After starting the recording, any changes to settings will be recorded.

After continuous recording is enabled, the button label changes to **Stop SCPI Recorder**, which is displayed while recording is in progress. Clicking **Stop SCPI Recorder** halts recording and switches the control label back to **Start SCPI Recorder**.

#### 2.4.1.6 Show SCPI Recorder

This shortcut opens the dialog **"SCPI Recorder"** on page 526.

### 2.4.2 User Menu

Lets you create your own menu, to include controls that you frequently use. You can have one **User Menu** for each measurement, and all User Menus survive a power cycle.

You add a control to the User Menu for the current measurement by right-clicking on the control, then selecting **"Add to User Menu"** on page 97. You can also remove the control from the User Menu using the same right-click menu item.

**User Menu** appears at the bottom of the menu drop-down panel.

## 2.5 Cancel key

This front-panel key has the same functions as the Windows **Esc** (Escape) key. It does the following:

- Cancels dialogs
- Cancels active functions (unless there is an entry in progress, in which case it cancels that, and reverts to the previous value)
- Resets input overloads
- Aborts print operations
- Cancels certain other operations (such as alignments)
- Returns you to Local Control (if in Remote)
- If the backlight is off, turns on the backlight, and does nothing else

Most of this functionality is the same as earlier X-Series models and similar to ESA and PSA operation.

When the instrument is in Remote, any hardkey that is pressed on the front panel displays this message:

**Analyzer is in Remote. Press ESC to return to Local**

The exception is the **Cancel (ESC)** key, which takes the instrument out of Remote.

When the instrument is also in the LLO (local lockout state), the **Local** key is locked out as well. When this is the case, and the **Local** key is pressed, this message is displayed:

**Local key is locked out by remote computer. Cancel Local Lockout on computer or release remote control**

When you see this message, you should disconnect the remote computer, or use it to take the instrument out of the Local Lockout state.

## 2.6 Onscreen Keyboard key

This key turns the onscreen alpha keyboard (OSK) on and off.

There are two onscreen keyboards:

- The Multitouch OSK, which pops up automatically if, while using the analyzer application, a text field becomes the active function
- The Windows OSK, which you must open manually when a text field must be entered while interacting with Windows or other apps

## 2.7 Touch On/Off Key

This front-panel key turns the display touch functionality on and off. If off, you can turn it back on using the front panel **Touch On/Off** key. When the touch functionality is off, you can still use a mouse as a pointer.

When toggled, a dialog box appears midscreen that confirms “Touchscreen On” or “Touchscreen Off”.

This function remains in effect until it is turned off or until the app shuts down. The app always starts up with Touch enabled.

## 2.8 Tab key

This key has the same function as the **Tab** key on a PC keyboard.  
You can use this key to display the Windows Taskbar, as follows.

- Alt-Tab to the Desktop
- Touch the desktop
- Touch **TAB**
- The Taskbar appears

## 2.9 Local Button

Appears in the Menu Panel when the instrument is in remote, and can be brought back to local via the **Local (ESC)** Key. See also "[Cancel key](#)" on page 99.

## 2.10 Control Bar

The Control Bar contains controls and readouts that let you control instrument functions independent of the current measurement.

## 2.11 Windows

Pressing the Windows icon on the "Control Bar" on page 104 has the same effect as pressing the Windows icon on the Windows taskbar. It displays the Windows taskbar and Start Menu, which allows you to launch Windows programs and access features such as the Control Panel.

## 2.12 Undo/Redo

The Undo button in the "Control Bar" on page 104,

and the Undo front panel key,

**Ctrl=Redo**

are used to undo the most recently executed function.

If you Undo a function, and then decide you should not have done so, you can use the **Redo** button in the "Control Bar" on page 104 to put it back the way it was. The Redo function may also be executed by pressing **Ctrl+Undo** (holding the **Ctrl** key down while pressing the **Undo** front panel key).

Undo allows you to restore a setting, which you had previously set, back to its value before you changed it. When you press the Undo button or front panel key, the last setting you changed is "undone", that is, its previous setting is restored. You are notified of this fact with an advisory pop up message; for example, if the Center Frequency had been 300 MHz, and you changed it to 1 GHz and then pressed **Undo**, the message would show:

UNDO: Center Freq 1 GHz -> 300 MHz

The instrument can store 5 levels of action for Undo.

To truly understand Undo and Redo, it helps to think of two "stacks", an Undo stack and a Redo stack,

**UNDO stack**

**REDO stack**

Whenever you perform an action, it is placed on the Undo stack. So for example, if you set the Center Frequency to 1 GHz, then set the RBW to 1 MHz, then set the Detector to Peak, each of these actions gets "pushed" onto the Undo stack:

| UNDO stack | REDO stack |
|------------|------------|
| Det = Peak |            |
| RBW = 1MHz |            |
| CF = 1 GHz |            |

When you press **Undo**, the top item on the Undo stack is removed, the action represented by that item is undone, and the item is placed on the Redo stack. So pressing **Undo** once in the above case would undo the setting of the peak detector, and the stacks would look like this:

| UNDO stack | REDO stack |
|------------|------------|
| RBW = 1MHz | Det = Peak |
| CF = 1 GHz |            |

Now pressing **Undo** again would undo the RBW = 1 MHz action, and the stacks would look like this:

| UNDO stack | REDO stack |
|------------|------------|
| CF = 1 GHz | RBW = 1MHz |
|            | Det = Peak |

Now pressing Redo would Redo the RBW = 1 MHz action, and the stacks would again look like this:

| UNDO stack | REDO stack |
|------------|------------|
| RBW = 1MHz | Det = Peak |
| CF = 1 GHz |            |

Also, whenever you set a value, the Redo stack is cleared; you can't redo an action once you have interrupted the original flow of actions. Think of the Undo stack as the past, and the Redo stack as the future; if you have items in both stacks it means you have gone back to a time in the past; if you then *do* something you have changed the future, so the old future (the Redo stack) gets cleared.

For example, in the example above, if you now were to change another setting, such as VBW = 1 kHz, the Redo stack gets cleared, and the stacks would look like this:

| UNDO stack  | REDO stack |
|-------------|------------|
| VBW = 1 kHz |            |
| RBW = 1MHz  |            |
| CF = 1 GHz  |            |

Undo can undo changes you make with the knob or step keys, however all contiguous events that affect the same parameter are aggregated into one event for the sake of Undo. For example, if CF is the active function and is 1 GHz, and you turn the knob back and forth, then enter a value, then use the step keys, when you press **Undo**, the instrument returns to CF = 1 GHz.

### Actions that Cannot be Undone

There are some actions that cannot be undone, because these clear the Undo/Redo stack:

- Restore Mode Defaults clears the stack for that Mode in that Screen
- Sending SCPI commands clears the stack for that Mode in that Screen
- Loading a state file (including User Preset) clears the stack for that Mode in that Screen
- Deleting a Screen clears all the stacks in that screen
- Changing Views

Undo/Redo works within the context of a Mode. Each Mode in each Screen keeps its own record. Settings in the Control Panel or System Settings menus are not undoable.

There are several actions that may change many parameters. Among these are Auto Tune, and Adjust Atten for Min Clipping. After executing such a function, Undo sets all parameters back to their value before the function was selected. Auto Tune appears to be a single action, even though the instrument executes it in several steps.

Redo reverses the effect of the last Undo action, assuming that no other settings have been changed since the last Undo. Changing a setting after an Undo clears memory of all settings after that Undo, that is, it clears the Redo stack, as explained above.

When you press the **Redo** icon or **Ctrl** and the **Undo** hardkey, you are notified with an advisory popup message; for example, if the Center Frequency had been 300 MHz, and you changed it to 1 GHz and then pressed **Undo**, the message would say:

UNDO: Center Freq 1 GHz -> 300 MHz

If you then press **Redo**, the message will say:

REDO: Center Freq 300 MHz -> 1 GHz

Neither **Undo** nor **Redo** perform any navigation, and have no effect on which menu panel is displayed nor which function is active.

## 2.13 File Functions

The File Functions popup contains controls for executing Save, Recall, File and Print operations. You display the File Functions popup by tapping the File Functions icon in the "Control Bar" on page 104.

For more information on a control, tap an icon in the image below.

Tapping this folder icon displays the File Functions popup

### 2.13.1 File Explorer

Pressing the File Explorer button in the "File Functions" on page 110 dialog opens the Windows File Explorer, which allows you to perform operating system file functions such as Move, Copy and Delete.

File Explorer also allows you to map network drives to drive letters on your PC or intranet, in order to more easily save screen images, states and other data, and load them back into the instrument.

## 2.14 Help

Pressing the **Help** button in the "Control Bar" on page 104, the **Help** front panel key, or the **F1** key if you have a PC keyboard connected, opens the context-sensitive help system. The **Help** button appears in the "Control Bar" on page 104 and in the banner of full-screen dialogs

You can also use the Help window's Contents pane to navigate to Help for any function in the instrument

You can also touch-and-hold a specific control to display a "right-click" menu, in which one of the choices is **Help on this setting**

## 2.15 Status Bar

The Status Panel (or Status Bar) appears at the bottom of the display and contains three fields:

The Message Balloon appears on the left side of the Status Panel and lets you know when there is an unread message in the queue.

No unread messages

Unread messages

The Message Balloon has a gray outline and no fill if there are no unread messages; it has a gray fill and a white outline and displays a white ellipsis in the middle if there are unread messages.

The Condition Indicator appears to the right of the Message Balloon and shows the current number of open conditions. Below are some examples of what the Condition Indicator can look like:

The triangle is unfilled if there are no open conditions, filled with yellow if all open conditions are warnings, and filled with red if at least one open condition is an error. The number displayed is the total number of open conditions.

Touching the Condition Indicator opens up the Show Status dialog (see below) with the Current Conditions tab selected. Touching anywhere else on the Status Bar opens up the Show Status dialog with the History tab selected.

The Condition Message appears to the right of the Condition Indicator. In the example below, the cCondition Message is “Align All, Now required”:

Warning condition messages display in yellow, error condition messages display in red.

If there is more than 1 open condition, the Condition Message cycles through the display of all of the open conditions, one at a time. Each message is displayed for 2 seconds, then the next for 2 seconds, and so on.

### Show Status Dialog

The Show Status dialog appears if you tap anywhere in the Status Bar. Touching the Condition Indicator (the triangle in the Status Bar) opens up the Show Status dialog with the Current Conditions tab selected. Touching anywhere else on the Status Bar opens up the Show Status dialog with the History tab selected.

If the display fills up, scrolling is enabled just as in other X-Series Multi-touch UI displays.

The Status dialog automatically refreshes as new messages and conditions occur.

At the bottom of the screen is a Clear Message Queue button. This button clears all errors in all error queues.

Note the following:

- Clear Message Queue does not affect the current status conditions
- Mode Preset does not clear the message queue
- Restore System Defaults (Super Preset) will clear all message queues
- \*CLS only clears the queue if it is sent remotely and \*RST does not affect any error queue
- Switching Modes does not affect any error queues

See "More Information" on page 115

|                |                                   |

| Backwards Compatibility Notes | <p>In some legacy analyzers, the Repeat field shows the number of times the message has repeated since the last time the error queue was cleared. In the X-Series, the Repeat field shows the number of times the error has repeated since the last intervening error. So the count may very well be different than in the past even for identical signal conditions</p> <p>Unlike previous analyzers, in the X-Series all errors are reported through the Message or Status lines and are logged to the event queue. They never appear as text in the graticule area (as they sometimes do in previous analyzers) and they are never displayed in the settings panel at the top of the screen (as they sometimes do, by changing color, in previous analyzers)</p> <p>As a consequence of the above, the user can only see one status condition (the most recently generated) without looking at the queue. In the past, at least in the Spectrum Analyzer, multiple status conditions might display on the right side of the graticule</p> <p>In general, there is no backwards compatibility specified or guaranteed between the error numbers in the X-Series and those of earlier products. Error, event, and status processing code in customers' software will probably need to be rewritten to work with X-Series</p> <p>In the legacy analyzers, some conditions report as errors and others simply turn on status bits. Conditions that report as errors often report over and over as long as the condition exists. In the X-series, all conditions report as start and stop events. Consequently, software that repeatedly queries for a condition error until it stops reporting will have to be rewritten for the X-series</p> |

## More Information

The Status Dialog has two screens, selectable by the tabs on the right: **History** and **Current Conditions**:

### History

**History** brings up a screen displaying the front panel message queue in chronological order, with the newest event at the top. Remember that the front panel queue contains all of the events generated by front panel actions as well as error events from all of the SCPI queues. A typical History display appears below:

2 User Interface  
2.15 Status Bar

| Status                                                                                                                                                                                                                                                                            | History                                                                           |      |                                          |         | ? | Type         | Displays the icon identifying the event or condition as an error or warning                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| ID           | Displays the error number                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Message      | Displays the message text                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Repeat (RPT) | <p>This field shows the number of consecutive instances of the event, uninterrupted by other events. In other words, if an event occurs 5 times with no other intervening event, the value of repeat will be 5</p> <p>If the value of Repeat is 1 the field does not display. If the value of Repeat is &gt;1, the time and date shown are those of the most recent occurrence. If the value of repeat reaches 999,999 it stops there. The Repeat field can run into some pretty large numbers when apps (like the GSM app) report things like “GSM sync burst not found” as events rather than conditions, which is actually fairly common</p> <p>Note that the repeat count is unavailable over SCPI</p> |
| Time         | Shows the most recent time (including the date) at which the event occurred. Time is displayed to the second                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

To understand the History dialog, and to properly program the instrument’s messaging system, remember that there are two types of occurrences, events and conditions:

- An event is an occurrence of zero duration. Events generate messages which are displayed in the center of the display for a period of time and then fade away. These may be of an advisory nature or may represent errors, for example “No

peak found”

- A condition is an occurrence of finite duration, that is, it has a start and an end. Conditions are states of the analyzer characterized by some combination of settings or some kind of failure that the user needs to be told about while it is happening, but then can stop being told once it goes away; for example “Input overload; ADC over range”

The error queue contains error events as well as the DETECTED and CLEARED events for condition errors, as seen in the figure above.

DETECTED events have numbers less than 1000 and CLEARED events have the same number plus 1000. For example,

301, Meas Uncal – DETECTED

and later

1301, Meas Uncal – CLEARED

To detect a condition error over SCPI, you should read the error queue and note any DETECTED error which is not followed eventually by an associated CLEARED error. This means the condition is still in effect. It is not sufficient to simply read the error queue until you get “No Errors” back. You may still have the condition error; the condition may still be in effect, and if that is the case, all you have done by clearing the error queue is to remove the first event (the DETECTED event) from the queue. For a condition error, you have to read the error queue until you see the CLEARED event for that condition. THEN you know that the condition is gone.

### Current Conditions

The **Current Conditions** display shows all of the open conditions in the instrument. An open condition is a condition error or warning for which a start (detected) event has occurred but for which no corresponding stop (cleared) event has occurred.

An example of the Current Conditions screen appears below:

2 User Interface  
2.15 Status Bar

| Status                                                                                                                                                                                                                                                                                                                                                 | Current Conditions                                                                |     |                        |                         |

| History                                                                                                                                                                                                                                                                                                                                                | Type                                                                              | ID  | Message                | Time                    |
| Current Conditions                                                                                                                                                                                                                                                                                                                                     |  | 64  | Align Now All required | 6:36:59 PM<br>2/24/2015 |
| Settings                                                                                                                                                                                                                                                                                                                                               |  | 301 | Meas Uncal             | 6:33:27 PM<br>2/24/2015 |
| <div> Informational  Warning  Error</div> <div>Press any row for more info about that Message</div> |                                                                                   |     |                        |                         |

The fields on the Current Conditions display are:

|         |                                                                                                              |
|---------|--------------------------------------------------------------------------------------------------------------|
| Type    | Displays the icon identifying the event or condition as an error or warning or informational                 |
| ID      | Displays the error number                                                                                    |
| Message | Displays the message text                                                                                    |
| Time    | Shows the most recent time (including the date) at which the event occurred. Time is displayed to the second |

Touching a condition message expands the display of that message. Touching again collapses it. The description is the same as the one that appears on the message dialog. An example of this is shown in the History section, below.

When there are no open conditions, the display is as shown below:

## 2.16 Block Diagram

When you press the Block Diagram button in the "Control Bar" on page 104, the display changes to a stylized pictorial representation of the current internal hardware setup and signal processing path. When you touch one of the blocks on the Block Diagram, the corresponding menu panel opens.

When you press the Block Diagram button, the display changes to a stylized pictorial representation of the current internal hardware setup and signal processing path. When you touch one of the blocks on the Block Diagram, the corresponding menu panel opens.

While in the Block Diagram display, the button is blue colored, as:

To exit the Block Diagram display, tap the button again.

The Block Diagram display is not meant to be a completely accurate representation, but one which can show differences as you change the hardware setup. For example, here is the basic RF Block Diagram:

And here is the Block Diagram when External Mixing is selected:

And here is the Block Diagram when the I/Q inputs are selected:

## 2.17 View Editor

This section describes the use of the View Editor, which allows you to:

- Add windows to and delete windows from the current measurement
- Resize and rearrange windows
- Create User Views

User Views are custom Views that you create by adding, deleting, rearranging, resizing, or changing the contents of the windows in an existing View, and then saving the edited View as a new View. The instrument lists the current User Views for a measurement after the Predefined Views, in the Mode/Meas dialog and on the View menu panel under Display:

| ent | View                   |
|-----|------------------------|
|     | Basic                  |
|     | Meas Summary           |
|     | RB Slot Meas           |
|     | Subcarrier Meas        |
|     | MIMO Summary           |
|     | Cross Carriers Summary |
|     | User View              |
|     | My New View            |

You can save an edited View using the **Save Layout as New View** control in the View menu (see ["To Save a User View" on page 135](#)).

On occasion, the instrument may automatically save an edited View for you. If you have edited a View, so that the \* is displaying next to the View name, you must save that View as a User View before you save State or switch measurements. If you forget that you have made changes to a View, then to keep from losing your edited View when you switch measurements, the instrument will save it for you. If you have an edited View that has not been saved and you try to do any of the following:

- Enter the "Save" menu
- Switch Measurements
- Switch Modes
- Switch Screens

the edited view will be saved for you with the name "Autosaved". When this happens, you will receive the following message:

If an Autosaved User View already exists, the User View called "Autosaved" will be overwritten with the currently edited view. If you have multiple edited views, the selected edited view will be Autosaved. If there is not an edited view selected the last selected edited view will be Autosaved.

### To Open the View Editor

Pressing the View Editor button (shown above) in the ["Control Bar" on page 104](#), at the bottom right of the screen, opens the View Editor.

While in the View Editor, the icon is blue colored, as:

Pressing the View Editor button again exits the View Editor.

## To Close the View Editor

Tap the View Editor button again.

The user chooses the desired View through the use of the Mode/Meas/View dialog (see ["Mode/Meas/View Dialog" on page 55](#)) or the View menu (a tab under the **Display** key). The View menu allows the user to browse the views in the current measurement. The View menu contains a list of Predefined Views for you to use. If you wish to modify a Predefined View or create your own, new View, you use the View Editor.

## User Views & Predefined Views

A User View is any View that is not in the list of predefined Views for the current measurement. For example, the Swept SA measurement has four predefined Views: Normal, Spectrogram, Zone Span, and Trace Zoom.

User Views allow you to add, delete, change and rearrange the windows of a predefined View, creating a new custom view.

### 2.17.1 To Create a User View

Whenever you add or delete a window to/from a predefined View, or change what is being displayed in a Predefined View's window, the Predefined View is marked with an asterisk (\*), to show that it has been modified.

For example, to edit the View shown below, you press the Edit View icon.

When you do this, you get the View Editor screen, which appears as below. The menu panel switches to the View menu. Here we see that we are in the Predefined View called “Basic”.

Each window has two arrows containing + signs. Pressing either of the “+” symbols adds a new window on that side. For example, let’s say you press the + symbol on the right of the lower left window:

You would then see this:

## 2 User Interface

### 2.17 View Editor

A fifth window has been added, and is automatically assigned the number 5. (The window number, which is displayed in the Window Title region, is used when sending SCPI commands to that window).

Note the \* that now appears next to Basic in the View menu, indicating that you are now in the **modified** Basic View. You see the \* if you add, delete or rearrange windows, but simply resizing windows does not display the \*. The \* means you are in a modified View, which must be saved as a User View before you leave the measurement (if you don't save it, the instrument will save it for you).

Note also that the Restore Layout to Default control is no longer grayed out. If you press this control it restores the Basic View to its default state. Restore Layout to Default becomes available when you add, delete or rearrange windows **and** when you resize them; otherwise it is grayed out.

You can add more windows with the "+" arrow symbols. Note that the "+" arrow symbols only appear if the current measurement has more windows available to display. If you are already displaying all the measurement's windows, the "+" symbols disappear.

You can exit the View Editor by again tapping the Edit View icon.

You can specify which result you want to see in the new window by tapping its title region.

A panel drops down, containing a Data control for specifying window results. Some measurements, such as LTE-A in this example, also provide controls on this dropdown for specifying other window parameters, such as the Component Carrier and Data Format, Tap the Data control and you will see a list of available results for the window. In some cases, as in LTE-A, this will be a cascading list, due to the number of results available:

## 2 User Interface

### 2.17 View Editor

Choose the result you want and tap OK. Here we have chosen IQ Meas Time from the Demod group:

Your new, edited User View is now ready to use.

## 2.17.2 To Resize or Rearrange Windows in a View

Sometimes you may wish to resize a window. To do this go back into the View Editor and note the large, translucent white circles along the edges of the draggable borders. These are the “resize handles”. You can resize the windows by dragging these handles. Note that in their quiescent state they are slightly translucent; when you touch one it turns solid white, indicating that it is draggable. If you touch and drag one of them it moves the axis to which it is attached.

Another feature that comes with the View Editor is the ability to move windows around. You do this by dragging the four-arrow objects in the center of the window; the whole window goes along. Actually you can touch and drag anywhere in the window (except on one of the arrows or the delete circle) and it will drag, but the four-arrow objects give you an indication and a convenient finger target.

2 User Interface  
2.17 View Editor

The outline of the window appears as it is being dragged. When you start to drag a window, target symbols appear in the other windows:

If you drop a window on one of the targets, it swaps positions with the target window. If you drag a window's center into another window, green stripes appear on the edges to show you where the window will go when you release it:

When you hover over one of the stripes it gets dimmer, to show the position the window being dragged will take on. If you release a window over an inner stripe, the window you are dragging and the window over which you were hovering resize to share the space the target window originally occupied. If you release a window over an outer stripe, as shown below, the window you are dragging takes on a new position outside the array of other windows:

## 2 User Interface

### 2.17 View Editor

In either case, one or more of the remaining windows resize to occupy the space formerly occupied by the window you were dragging.

#### 2.17.3 To Delete a Window from a View

The View Editor also lets you delete a window. To do this, tap one of the circled red X's, as shown below.

There has to be more than one window for you to see the circled red Xs.

Now press the View Editor button (the blue hand) to exit the View Editor. At this point, you have an edited Predefined View, as shown by the \* next to Basic:

When you are finished with it, you can restore the Layout to the default for Basic by pressing “Restore Layout to Default”. Or you can save your edited View as a “User View” (if you exit the measurement without saving the edited View, the instrument will save it for you as a User View called “Autosaved”).

If you clone the current Screen by pressing the “+” tab, the modified Predefined View will be saved as a User View called “Autosaved”, and it will be available in the new Screen.

## 2.17.4 To Save a User View

See also ["Transferring User Views Between Instruments" on page 137](#)

To save your new View as a User View, tap the “Save Layout as New View” control. You will get an alpha keyboard that lets you name your new View; the default is the old View name with a number. Below, we have typed in “My New View”:

## 2 User Interface

### 2.17 View Editor

When you tap “Done”, the View is saved:

Notice the User View region which has appeared on the menu panel above, with the new User View called “My New View. Notice also that “Basic” has returned to its original, unedited state and the \* is gone from its name. Note also that “Restore

Layout to Default” is grayed out. Note also that if you go to the Mode/Meas dialog, you will see the User View there as well:

When naming a new View, you must choose a name that is not already in use for any User View in any measurement; this is because User Views get written to permanent memory and are available to all instances of the Measurement in any screen. They survive a Mode Preset and also survive shutdown and restart of the application.

### Transferring User Views Between Instruments

To transfer a User View to another instrument, you must copy the desired file to a portable drive or to your network and then copy it to the target instrument.

When you save a User View, a file is created (or updated if it already exists) containing all the User Views for the current measurement. All of these files are saved on the D: drive in the instrument, in the folder:

D:\Users\Instrument\My Documents\UserViews

(assuming you are logged in as Instrument, which is the default).

Look for the file for your measurement. The file naming convention is:

ModeName.MeasName.layout

Where **ModeName** is the long-form SCPI parameter for the **:INST:SEL** command for your Mode, and **MeasName** is the long-form SCPI parameter for the **:CONF** command for your Measurement.

For a full list of all **ModeName** parameters, see **Index to Modes** in "Mode" on page 56.

The following is a full list of all [MeasName](#) parameters.

| Measurement Name                   | SCPI ID     |
|------------------------------------|-------------|
| ACP, Adjacent Channel Power        | ACPower     |
| AM                                 | AM          |
| AM Depth                           | AMD         |
| Amplitude Probability Distribution | APD         |
| Audio Distortion                   | AUDDist     |
| Audio Frequency                    | AUDFreq     |
| Audio Level                        | AUDLevel    |
| Audio SINAD                        | AUDSinad    |
| Automatic Direction Finder         | ADF         |
| Channel Power                      | CHPower     |
| Code Domain                        | CDPower     |
| Combined GSM                       | CGSM        |
| Combined WCDMA                     | CWCDma      |
| Complex Spectrum                   | SPECTrum    |
| Conformance EVM                    | CEVM        |
| Custom OFDM                        | OFDM        |
| Digital Demod                      | DDEMod      |
| Disturbance Analyzer               | DANalyzer   |
| EDR In-band Spurious Emissions     | IBSPurious  |
| EVM                                | EEVM        |
| Fast Capture                       | FCAPture    |
| Fast Spectrum                      | FSpectrum   |
| FM                                 | FM          |
| FM Deviation                       | FMDeviation |
| FM Stereo                          | FMStereo    |
| Frequency Counter                  | FCOuter     |
| Frequency Scan                     | FSCan       |
| GMSK Phase & Freq Error            | PFError     |
| Group Delay                        | GDElay      |
| Harmonics                          | HARMonics   |
| HRP UWB Demodulation               | HUWB        |
| Instrument Landing System          | ILS         |
| IQ Waveform                        | WAVEform    |
| LE In-band Emissions               | IBEMissions |
| List Power Step                    | LPSTep      |

| Measurement Name            | SCPI ID     |
|-----------------------------|-------------|
| List Sequencer              | LSEQuencer  |
| List Sweep                  | LIST        |
| Log Plot                    | LPLot       |
| LoRa (CSS) Demodulation     | LORA        |
| Marker Beacon               | MBE         |
| Mod Accuracy                | RHO         |
| Modulation Analysis         | EVM         |
| Modulation Distortion       | MODDist     |
| Modulation Rate             | MODRate     |
| Modulation SINAD            | MODSinad    |
| Monitor Spectrum            | MONitor     |
| Noise Figure                | NFIGure     |
| Occupied BW /               | OBWidth     |
| Output Spectrum BW          |             |
| Output RF Spectrum          | EORFspectr  |
| Phase and Amplitude vs Time | PAVTime     |
| PM                          | PM          |
| PM Deviation                | PMDeviation |
| Power Amplifier             | PAMplifier  |
| Power Control               | PCONtrol    |
| Power Stat CCDF             | PSTatistic  |
| Power vs Time               | EPVTime     |
| Pulse                       | PULSe       |
| QPSK EVM                    | EVMQpsk     |
| Real Time Scan              | RTSC        |
| RF Power                    | RFPower     |
| SEM                         | SEMask      |
| Spectral Flatness           | FLATness    |
| Spectrum & PVT              | RTSA        |
| Spot Frequency              | SFRequency  |
| Spurious Emissions          | SPURious    |
| Streaming                   | STReaming   |
| Strip Chart                 | SCHart      |
| Swept SA                    | SANalyzer   |
| TOI                         | TOI         |

| Measurement Name                | SCPI ID  |
|---------------------------------|----------|
| Transmit Analysis               | TX       |
| Transmit On/Off Power           | PVTime   |
| Transmit Power<br>(Burst Power) | TXPower  |
| Tuned RF Level                  | TRFLevel |
| Tuned RF Level with Tracking    | TTRF     |
| Tx Band Spur                    | ETSPur   |
| VHF Omni-Directional Range      | VOR      |

Examples:

- The User View file for the Swept SA measurement is [SA.SANalyzer.layout](#)
- The User View file for the ACP measurement in the WCDMA mode is [WCDMA.ACPower.layout](#)

Copy the desired file to a thumb drive or to your network. Then go to the target instrument and copy the file into the [D:\Users\Instrument\My Documents\UserViews](#) directory on that instrument (again, assuming you are logged in as Instrument).

Note that copying this file to another instrument will overwrite the file already in that instrument, if any, and will destroy any User Views that might have been created on that instrument.

Note that when you delete the last User View for a measurement, the file is removed.

### 2.17.5 To Rename a User View

You can rename a User View by selecting that View and tapping “Rename User View.” You can also re-edit a User View; if you do this, an asterisk will appear next to the User View’s name. You can then tap “Re-Save User View to save it back to its existing name, or “Save Layout as New View” to add another, new User View.

### 2.17.6 To Delete a User View

You can delete a User View by doing the following:

1. From the ["Mode/Meas/View Dialog"](#) on [page 55](#), or from the **View** menu, select the User View that you want to delete
2. Switch to the **Display** menu

3. Select the **View** tab
4. Tap **Delete User View**

### 2.17.7 To Delete All User Views

You can delete all User Views by tapping “Delete All User Views.” The default view becomes the current view for the Measurement if a User View was the current view when this control was pressed.

### 2.17.8 Use Case: Displaying Marker and Peak Tables

One common application for User Views is to create a View that allows the Spectrum Analyzer to display both a Marker Table and a Peak Table at the same time. To do this, simply add a Marker Table Window and a Peak Table window to the Spectrum window of the Swept SA measurement. The result is shown below; note that the new View has been named “Marker Table & Peak Table”:

NOTE: There are legacy displays like Marker Table, Peak Table, Measure at Marker and Gate View, which are not Views but special display modes. These are retained for backwards compatibility, however they are turned on and off with switches and do not use the View system. Turning on one of these switches does not create a modified View, it merely adds the specified window to the current View; turning the switch back off removes the window. While the switch is on, NO View shows as

selected in the View menu. These switches are grayed out if you are in a modified View or a User View. Since only one of these switches can be on at a time, and because these switches turn off on a Preset, User Views offer a superior way of adding windows than using the switches.

Some measurements do not support User Views; these do not allow adding, deleting or rearranging windows, however they do allow resizing windows. In these measurements you can get into the View Editor but the Add icons, Delete icons and Move icons will not appear. You can still resize the windows and in some cases (e.g. Noise Figure) you can still change window contents.

### **2.17.9 View Editor Remote Commands**

Remote Commands for User Views can be found in the documentation for the **Display, View** tab.

## 2.18 Multiscreen

You can configure up to 16 different Screens at a time. Normally, you only see one Screen, and the set of configured screens is shown across the top of the display in a series of "Screen Tabs" on page 54. Touching any screen's tab brings it to the foreground, makes it the current Screen and starts it updating.

Multiscreen view lets you display all of the configured Screens at once.

You can switch to Multiscreen View by pressing this button in the "Control Bar" on page 104 at the bottom right of the screen:

Multiscreen View looks like this:

## 2 User Interface

### 2.18 Multiscreen

While in Multiscreen View, the button changes from a black background to a blue background:

To exit Multiscreen view, tap the button again.

Multiscreen View cannot be activated if only one screen is configured.

Each Screen contains one Mode, each Mode contains one Measurement, and each Measurement contains a number of Windows arranged in Views. You can configure multiple instances of the same Mode along with any combination of other Modes.

In Multiscreen View, just as in Single Screen View, only one screen is active.

You switch Screens by tapping the Screen Tab you want, or when in Multiscreen View, you can tap the Screen itself. When you switch Screens, the current Screen's state and measurement results are preserved, the new Screen's previous state and data are loaded, and the new Screen starts running its Mode.

In Multiscreen View:

- The Meas Bar does not display
- The Screens are presented in an array of equal size boxes, except where the number of Screens means some have to be different sizes (as when you have 3 Screens, 5 Screens, etc.).

- Each Screen has a tab that contains the name of the Mode and Measurement in the box and a number associated with the instance of that Mode. You can enter a custom Screen name that replaces the Mode name, by going into the Mode/Meas dialog
- There is always one and only one selected Screen. It is indicated by a blue tab. Only the selected Screen is actually running a measurement and updating its display
- The selected window in the selected screen is the context for the current menus. It is the only window on the display with a blue border
- As you go from screen to screen, each screen remembers the last menu that was active in that screen and restores it as the active menu

In Multiscreen View, as in Single Screen View, tapping the blue tab or pressing the Mode/Meas front panel key opens the ["Mode/Meas/View Dialog" on page 55](#) which allows you to change the Mode (or Measurement or View) being displayed in that Screen.

|                |                                                                                                                                                    |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:INSTrument:SCReen:MULTiple[:STATe] OFF   ON   0   1</code><br><code>:INSTrument:SCReen:MULTiple?</code>                                     |
| Example        | <code>:INST:SCR:MULT ON</code>                                                                                                                     |
| Notes          | If only one screen is configured, attempting to set Multi-Screen ON generates the error “-221, Settings conflict; Multi-Screen requires >1 screen” |
| Preset         | OFF                                                                                                                                                |

For more information, see the following:

- ["Select Screen" on page 145](#)
- ["Screen List \(Remote only command\)" on page 146](#)

## 2.18.1 Select Screen

You can select a screen by touching its tab or, in ["Multiscreen" on page 143](#) mode, touching the screen itself. Selecting the Screen activates the screen and suspends the previously selected screen (if any).

|                |                                                                                                                                                                                                                                                                                                                                                   |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:INSTrument:SCReen:SElect &lt;screen name&gt;</code><br><code>:INSTrument:SCReen:SElect?</code>                                                                                                                                                                                                                                             |
| Example        | <code>:INST:SCR:SEL "Baseband"</code>                                                                                                                                                                                                                                                                                                             |
| Notes          | If the <screen name> is specified but not found in the list of Screens, the error message “-224, Illegal parameter value; Screen Name not found” is generated<br>If the display is disabled (via <code>:DISP:ENAB OFF</code> ) then the error message “-221, Settings conflict; Screen SCPI cannot be used when Display is disabled” is generated |

---

|        |                                       |
|--------|---------------------------------------|
| Preset | Returns the name of the active screen |
|--------|---------------------------------------|

**2.18.2 Screen List (Remote only command)**

You can obtain a list of currently configured Screens. This permits your remote program to manage screens for selection, renaming, or deletion.

---

|                |                                                                                                                                                                                                                                                       |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:INSTrument:SCReen:CATalog?</code>                                                                                                                                                                                                              |
| Example        | <code>:INST:SCR:CAT?</code>                                                                                                                                                                                                                           |
| Notes          | <p>The query response is a comma separated list of Screen Names. If only 1 Screen is configured, there is no trailing comma</p> <p>For R&amp;S compatibility, the following query is also available:</p> <p><code>:INSTrument:SCReen:LIST?</code></p> |
| Preset         | Returns list of currently configured Screens                                                                                                                                                                                                          |

## 2.19 Fullscreen

The Fullscreen button is in the "Control Bar" on page 104, at the lower right corner of the display.

When **Full Screen** is pressed the measurement window expands horizontally over the entire instrument display. The screen graticule area expands to fill the available display area.

It turns off the display of the menu panel, however the controls that drop down from the Meas Bar and on-screen annotation are still available, and you can still drag the trace and markers and perform a pinch zoom, so you can still operate the instrument.

Pressing **Full Screen** again while Full Screen is in effect cancels Full Screen.

You can get even more screen area for your data display by turning off the Meas Bar using the Annotation tab of the Display menu)

Full Screen is canceled by the **Preset** key.

| Backwards Compatibility SCPI  | <code>:DISPlay:MENU[:STATe] OFF   ON   0   1</code><br>This emulates ESA full screen functionality, which is the same as the FSCreen command in PSA except that the sense of on/off is reversed (that is, OFF means the menus are OFF, so Fullscreen is ON) and the default is ON (meaning Fullscreen is OFF) |
| Backwards Compatibility Notes | In ESA/PSA, Full Screen was turned on with a softkey, so pressing any other key turned Full Screen off. In the X-Series, because a hardkey is provided to turn this function on and off, pressing any other key no longer turns off Full Screen                                                               |

### 3 Noise Figure Mode

Noise Figure Mode is used for Noise Figure measurements using a Noise Source from the Keysight 346, 347 or N4000 (SNS) Noise Source families. It is the default application in the N8973B Noise Figure Analyzer.

Noise Figure Mode contains one measurement, the "Noise Figure Measurement" on [page 149](#).

NOTE

When Noise Figure Mode is exited, both SNS and Normal noise sources are switched **Off**. This prevents any hardware damage if you connect other instruments to the 28V noise source control. When you access Noise Figure Mode again, the noise sources will only turn on when a valid measurement is initiated.

|                                                                                                                                                                 |                                                                                                                                                                                        |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| To access the built-in help for this Mode, it must be the currently-active Mode. If it is not, exit help ( <b>Esc</b> key), select this Mode, then reopen help. |                                                                                                                                                                                        |
| Example                                                                                                                                                         | <code>:INST:SEL NFIGURE</code><br><code>:INST:NSEL 219</code>                                                                                                                          |
| Dependencies                                                                                                                                                    | The Mode must be installed and licensed in your instrument before it is available for use                                                                                              |
| Status Bits/OPC dependencies                                                                                                                                    | Changing Modes resets all SCPI status registers and mask registers to their power-on defaults. Therefore, event or condition register masks must be re-established after a Mode change |

## 3.1 Noise Figure Measurement

The Noise Figure measurement makes individual noise figure measurements over the range of frequencies specified by the frequency parameters. After each frequency point has been measured, the results are displayed on screen. See ["Layouts" on page 155](#) for a description of the various formats in which the data may be displayed, depending on the Format selected under ["Sweep" on page 356](#), or the Layout selected under ["Display" on page 175](#).

### NOTE

The ENR, Loss Compensation Lists, User Calibration data and Frequency List tables are all stored in the Instrument State file, which means that they may be stored for later use simply by using 'Power-On, Last State' or 'Power-On, User' (if you stored the files under Save User Preset) Preset features of the instrument. If these features are not saved in the State file, the measurement will appear to 'clear' these tables every time a Mode Preset is performed. Alternatively, the tables may be saved to internal or external storage and loaded at a later date.

---

### Pulsed Noise Figure Measurement

In the Y-factor method, each measurement consists of the pHot/pCold measurement that is made while the noise source is On/Off. In a Pulsed Noise Figure measurement, these two measurements need to be performed only in the active part of the pulse. To ensure this, a gated trigger signal must be used to synchronize the active part of the pulse to the data acquisition. Then, the gate settings, such as **Gate Delay** and **Gate Holdoff**, can be used to further synchronize the data acquisition to the on-period of the pulse. Use the controls in ["Gate Settings" on page 987](#), under **Trigger**, to adjust the gate parameters.

For more details, see ["Avg Time/Pt" on page 356](#).

## Noise Figure Measurement Commands

The general functionality of "CONFigure" on page 1040, "INITiate" on page 1041, "FETCh" on page 1041, "MEASure" on page 1043, and "READ" on page 1042 are described in the section **SCPI Operation and Results Query** in the topic **Programming the Instrument**.

The following commands and queries are used to configure the measurement:

|                                          |                                                                                                                                                           |
|------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>:INITiate:NFIGure</code>           | Initiates a trigger cycle for the measurement, but does not return any data. You must then use <code>:FETCh :READ :MEAS:NFIG:...?</code> to retrieve data |
| <code>:CONFigure?</code>                 | Does not change any measurement settings<br>Returns the long form name of current measurement, in this case, <code>NFIGure</code>                         |
| <code>:CONFigure:NFIGure</code>          | Selects <code>NFIG</code> measurement with Meas Setup settings in preset state – same as "Meas Preset" on page 320                                        |
| <code>:CONFigure:NFIGure:NDEFault</code> | Selects <code>NFIG</code> measurement <i>without</i> affecting settings                                                                                   |

### 3 Noise Figure Mode

#### 3.1 Noise Figure Measurement

#### Remote Command Results

Use **:FETCh**, **:READ** or **:MEASure** to retrieve measurement results.

The tables below describe the data returned by the queries:

|                               |                                                                                                            |
|-------------------------------|------------------------------------------------------------------------------------------------------------|
| Remote Command                | <b>:FETCh MEASure READ:NFIGure?</b>                                                                        |
| Notes                         | Returns comma-separated results of the last point from the last swept measurement, in the following order: |
|                               | 1 T cold Scalar Value                                                                                      |
|                               | 2 Corrected Noise Figure                                                                                   |
|                               | 3 Corrected Noise Factor                                                                                   |
|                               | 4 Corrected Gain                                                                                           |
|                               | 5 Corrected Effective Temperature                                                                          |
|                               | 6 Corrected Hot Power Density                                                                              |
|                               | 7 Corrected Cold Power Density                                                                             |
|                               | 8 Uncorrected Noise Figure                                                                                 |
|                               | 9 Uncorrected Noise Factor                                                                                 |

##### Meter

|                |                                                                              |
|----------------|------------------------------------------------------------------------------|
| Remote Command | <code>:FETCh READ[:NFIGure]:METer?</code>                                    |
| Notes          | Return the measured 61 noise figure results in fixed "Freq Mode" on page 191 |

##### Meter Minimum

|                |                                                                                                      |
|----------------|------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:FETCh READ[:NFIGure]:METer:MINimum?</code>                                                    |
| Notes          | Returns the current measured minimum noise figure within 61 results in fixed "Freq Mode" on page 191 |

### 3.1.1 Layouts

There are three predefined layouts: **Graph**, **Table**, and **Meter**.

These are multiple-window layouts. When in a multiple-window layout, you select a window by touching it. The menu controls may sometimes change depending on which window is selected.

When "Layout" on page 175 (under Display) is in AUTO, the layout changes when "Freq Mode" on page 191 (under Frequency) changes, as follows:

| Freq Mode | Layout              |
|-----------|---------------------|
| Swept     | "Graph" on page 156 |
| Fixed     | "Meter" on page 156 |
| List      | "Table" on page 157 |

NOTE

The Noise Figure measurement uses **Layout** to control the result display instead of **View**. This is the same as the N9069A Noise Figure Measurement.

|                                 |                                                                           |
|---------------------------------|---------------------------------------------------------------------------|
| Remote Command                  | :DISPlay:NFIGure:FORMat GRAPh   TABLe   METer<br>:DISPlay:NFIGure:FORMat? |
| Example                         | :DISP:NFIG:FORM GRAP                                                      |
| Preset                          | GRAPh                                                                     |
| State Saved                     | Saved in instrument state                                                 |
| Backwards Compatibility<br>SCPI | :DISPlay[:NFIGure]:FORMat                                                 |

Graph

Draws two selected results in two graph windows respectively. A caret (^) is displayed below each trace at the position of the current measurement when the total sweep time exceeds 300 ms (total sweep time = avg sweep time per point \* number of points).

If "Overlay / Combined" on page 183 (under Display) is ON, draws both results as two traces on the same graph with two sets of Y-axis notation. This layout can be useful for printing both results together on a larger graph. A caret (^) is displayed below each trace at the position of the current measurement.

|         |                      |
|---------|----------------------|
| Example | :DISP:NFIG:FORM GRAP |
|---------|----------------------|

Meter

Shows results for a single frequency point. The Stripchart window always shows the Noise Figure result. The meter window shows the results in a large font for one frequency point.

|         |                     |
|---------|---------------------|
| Example | :DISP:NFIG:FORM MET |
|---------|---------------------|

## Table

Shows discrete results for each frequency point in a tabular form. The headings show the data types selected and the data within the table shows the results for each data type at the given frequency point. All values are displayed according to their defined 'Display Format' (see "Results" on page 157).

Example :DISP:NFIG:FORM TABL

### 3.1.2 Results

This measurement supports seven result (window) types. The calculation of these results is described in detail in:

<https://www.keysight.com/us/en/assets/7018-06829/application-notes/5952-3706.pdf>

| Name                                    | Display Format |
|-----------------------------------------|----------------|
| "Noise Figure" on page 158              | 0.001 dB       |

For each of these result types, a window is available (in the **Graph** Layout), a column is available (in the **Table** Layout), and a window and column are available (in the **Meter** Layout).

## ENR Calibration & Results

The availability of the results of each type is shown in the following table:

| Result Type                | No ENR,<br>Uncalibrated | Valid ENR,<br>Uncalibrated | Valid ENR, Calibrated |
|----------------------------|-------------------------|----------------------------|-----------------------|
| Noise Figure/ Noise Factor |                         | Uncorrected                | Uncorrected/Corrected |
| Gain                       |                         |                            | Corrected             |
| Y Factor                   |                         | Uncorrected                | Uncorrected           |
| T-Effective                |                         | Uncorrected                | Uncorrected/Corrected |
| P hot                      |                         | Uncorrected                | Uncorrected/Corrected |
| P cold                     |                         | Uncorrected                | Uncorrected/Corrected |

NOTE

When calibrated, use **Noise Figure Corrections On/Off** under **Meas Setup** to toggle between corrected and uncorrected results.

---

### 3.1.2.1 Noise Figure

For an active device, **Noise Figure** is the contribution by the device itself to thermal noise at its output, over the bandwidth of interest. **Noise Figure** is usually expressed in decibels (dB) and is with respect to thermal noise power at the system impedance, at a standard noise temperature (usually 290 K) over the bandwidth of interest. It is determined by (a) measuring (determining) the ratio, usually expressed in dB, of the thermal noise power at the output, to that at the input, and (b) subtracting from that result the gain, in dB, of the system. Typical noise figures range from 0.5 dB for very low noise devices, to 4 to 8 dB.

In some systems, for example: heterodyne systems, total output noise power includes noise from other than thermal sources, such as spurious contributions from image-frequency transformation, but noise from these sources is not considered in determining the Noise Figure.

### 3.1.2.2 Noise Factor

This is the same as "**Noise Figure**" on page 158, but expressed using linear units rather than dB.

### 3.1.2.3 Gain

The amplification factor, also called **Gain**, is the extent to which an analog amplifier boosts the strength of a signal. Amplification factors are usually expressed in terms of power.

The most common way of quantifying the gain of an amplifier is in decibels (dB), a logarithmic unit. For power, doubling the signal strength (an output-to-input power ratio of 2:1) translates into a gain of 3 dB; a tenfold increase in power (output-to-input ratio of 10:1) equals a gain of 10 dB; a hundredfold increase in power (output-to-input ratio of 100:1) represents 20 dB gain. If the output power is less than the input power, the amplification factor in decibels is negative. If the output-to-input signal power ratio is 1:1, then the amplification factor is 0 dB.

Power amplifiers typically have gain figures from a few decibels up to about 20 dB. Sensitive amplifiers used in wireless communications equipment can show gain of up to about 30 dB. If higher gain is needed, amplifiers can be cascaded, that is, hooked up one after another. But there is a limit to the amplification that can be attained this way. When amplifiers are cascaded, the later circuits receive noise at

their inputs along with the signals. This noise can cause distortion. Also, if the amplification factor is too high, the slightest feedback can trigger oscillation, rendering an amplifier system inoperative.

### 3.1.2.4 Y-Factor

This is the ratio of two noise power levels, one measured with the noise source **ON**, and the other with the noise source **OFF**, that is,  $Y = N_{ON}/N_{OFF}$ . Because noise power is proportional to noise temperature, it can be stated that  $Y = T_{ON}/T_{OFF}$ . The **Y-Factor** measurement is the most common method of measuring the quantities required to calculate **Noise Figure** and **Gain**.

### 3.1.2.5 T effective

All types of random noise can be expressed as the equivalent amount of thermal noise that would be generated at a physical temperature  $T_e$ . Generally, the word *effective* (or equivalent) is taken as understood, and the normal term is simply 'noise temperature'.

### 3.1.2.6 P hot/P cold

The level of the noise floor observed by a spectrum analyzer depends, in part, on the selected bandwidth of the measurement. The wider the bandwidth, the more noise is measured for each data point. If the instrument can display noise density, it simply normalizes the power measurements to a 1 Hz bandwidth and references it to  $kTB - 173.88$  dBm/Hz; the displayed function is equivalent to power spectral density referenced to  $kTB$  that is 15 dB would mean the power spectral density =  $-158.88$  dBm/Hz. When the unit is set to dBm/Hz, the instrument will not reference it to  $kTB$ ; the absolute power density will be displayed.

Hot Power Density simply refers to the power density measured when the noise source is on, and Cold Power Density is the same, but with the noise source off.

### 3.1.2.7 Indicating an Invalid Result

Several invalid result conditions may exist simultaneously. These conditions are ranked in order of severity (1 being worst) and only the most severe condition present is displayed.

The ranking order is:

| Ranking Order | Invalid Result Condition               | Result Indicator | Color |
|---------------|----------------------------------------|------------------|-------|
| 1             | Hot power $\leq$ cold power            | ==               | Red   |
| 2             | Corrected calculation not possible     | xx               | Amber |
| 3             | Measurement result calculation invalid | ---              | White |

Rank order 2 only occurs if a corrected measurement is requested and *either*:

- The input range used at this measurement point is not calibrated, *or*,
- The input range is calibrated, but the calibration data is invalid at this point

All types of invalid result are returned as *Not A Number* (9.91e37).

## 3.2 Amplitude

Activates the **Amplitude** menu and selects **Reference Level** or **Reference Value** as the active function, depending on the measurement.

Some features in this menu apply to multiple measurements. Some other features apply only to specific measurements and their controls are blanked or grayed-out in measurements that do not support the feature.

### 3.2.1 Y Scale

Contains controls that pertain to the Y axis parameters of the measurement. These parameters control how data on the vertical (Y) axis is displayed and control instrument settings that affect the vertical axis.

#### 3.2.1.1 Ref Value

Sets the reference value (level) to be used in the graph window specified by `<result>`. If the **Graph** window is not currently visible (if you are using the SCPI command), the new reference value will take effect next time the window is displayed. Values entered via SCPI here are in the default units only. The front panel lets you enter log or linear units and converts these to the default unit for each result type. For "**T effective**" on page 159, you can only enter values of K (Kelvin).

##### Details

| Result          | Noise Figure / Noise Factor       | Gain      | Y-Factor  | T Effective                  | P hot     | P cold    |
|-----------------|-----------------------------------|-----------|-----------|------------------------------|-----------|-----------|

| Step Increment: | 0.1 dB / 1, 1.5, 2, 3, 5, 7.5, 10 | 0.1 dB    | 0.1 dB    | 1, 1.5, 2, 3, 5, 7.5, 10 ... | 0.1 dB    | 0.1 dB    |
| Knob Increment: | 0.1 dB / 1, 1.5, 2, 3, 5, 7.5, 10 | 0.1 dB    | 0.1 dB    | 1, 1.5, 2, 3, 5, 7.5, 10 ... | 0.1 dB    | 0.1 dB    |
| Resolution:     | 0.1 dB                            | 0.1 dB    | 0.1 dB    | 0.1 K                        | 0.1 dB    | 0.1 dB    |

The functionality depends on the selected result. To use the form for a particular result, that result needs to be selected as one of the displayed results. For example, to use the **Noise Figure** form, **Noise Figure** needs to be selected as one of the displayed results.

## Window (Result) Options

| Layout/Window Name | Option <window> |
|--------------------|-----------------|
| Noise Figure       | NFIGure         |
| Noise Factor       | NFACtor         |
| Gain               | GAIN            |
| Y-Factor           | YFACtor         |
| T effective        | TEFFective      |

### 3 Noise Figure Mode

#### 3.2 Amplitude

| Layout/Window Name | Option <window> |
|--------------------|-----------------|
| P hot              | PHOT            |
| P cold             | PCOLd           |
| Meter              | METer           |

#### 3.2.1.2 Scale/Div

Sets the scaling to be used in the **Graph** window specified by **<result>**. If the **Graph** window is not currently visible (you are using the SCPI command), the new scaling will take effect next time the window is displayed. Values entered via SCPI here are in the default units only. The front panel allows log or linear units, but converts to the default unit for each result type. In the case of **T effective**, you can only enter values of Kelvin.

##### Details

| Result   | Noise Figure/ Noise Factor | Gain     | Y-Factor | T effective | P hot    | P cold   |
|----------|----------------------------|----------|----------|-------------|----------|----------|
| Default: | 1.00 dB / 0.71489          | 5.00 dB  | 1.00 dB  | 200.0 K     | 1.00 dB  | 1.00 dB  |
| Min:     | 0.001 dB / 0.001           | 0.001 dB | 0.001 dB | 0.1 K       | 0.001 dB | 0.001 dB |
| Max:     | 20.0 dB / 100              | 20.0 dB  | 20.0 dB  | 20000000 K  | 20.0 dB  | 20.0 dB  |

The functionality depends on the selected result. To use the form for a particular result, that result needs to be selected as one of the displayed results. For example, to use the **Noise Figure** form, **Noise Figure** needs to be selected as one of the displayed results.

### 3.2.1.3 Ref Position

Sets the reference position to be used in the **Graph** window. The "Ref Value" on [page 161](#) is positioned relative to this point on the graph. If the **Graph** window is not currently visible (you are using the SCPI command), the new reference position will take effect next time the window is displayed.

The functionality depends on the selected result. To use the form for a particular result, that result needs to be selected as one of the displayed results. For example, to use the Noise Figure form, Noise Figure needs to be selected as one of the displayed results.

#### 3.2.1.4 Auto Scaling

Automatically sets "Ref Value" on page 161 and "Scale/Div" on page 163 based on the current trace data. These are set such that the trace fills 90% of the graticule.

There are different SCPI commands for **Auto Scaling**, depending on whether you are using "Graph Layout" on page 165 or "Meter Layout" on page 166.

| Example        | :DISP:NFIG:VIEW3:WIND:TRAC:Y:COUP ON<br>:DISP:NFIG:VIEW3:WIND:TRAC:Y:COUP?                                                                                                                                                                                                                                                                               |
| Couplings      | When <b>Auto Scaling</b> is <b>ON</b> , this function automatically determines the scale per division to be 1/8 of the highest value in the strip chart and sets the <b>Ref Level</b> to 0.0 dB<br>When you set the value of either "Scale/Div" on page 163 or "Ref Value" on page 161 manually, <b>Auto Scaling</b> automatically changes to <b>OFF</b> |
| Preset         | ON                                                                                                                                                                                                                                                                                                                                                       |
| State Saved    | Yes                                                                                                                                                                                                                                                                                                                                                      |
| Range          | ON   OFF                                                                                                                                                                                                                                                                                                                                                 |

## 3.2.2 Attenuation

Controls the attenuator functions and interactions between the attenuation system components.

Not available in VXT models M9410A, M9411A, M9415A, M9416A, M9410E, M9411E, M9415E, M9416E.

### 3.2.2.1 Attenuation

Only applies to the mechanical attenuator. The electronic attenuator (which is limited to below 3.6 GHz) is disabled in Noise Figure Mode.

In this application, the attenuators cannot autorange. There is therefore a risk of overdriving the instrument. In most cases, 0 dB attenuation is adequate. To check for overdriving of the instrument (that is, compression occurring at the preamp stage) set the attenuation to 0 dB and note the Noise Figure of your DUT. Now increase the attenuation by one step. If the Noise Figure changes by more than 0.5 dB, attenuation is required. Repeat this process until you have found the lowest

level of attenuation that gives you a stable noise figure result and use this attenuation level for your measurements.

NOTE

The Full Range Attenuator in N9041B, which is at the front end of RF Input 2, is disabled. When doing measurement above 50 GHz with RF Input 2, the total attenuation is 0 dB. You may need to add an external attenuator to avoid overdriving the instrument.

### 3.2.3 Range (Non-attenuator models)

Only available for Keysight's modular signal analyzers and certain other Keysight products, such as VXT and M941xE.

|             |    |
|-------------|----|
| State Saved | No |
|-------------|----|

#### 3.2.3.1 Range

Represents the amplitude of the largest sinusoidal signal that could be present within the IF without being clipped by the ADC. For signals with high peak-to-average ratios, the range may need to exceed the rms signal power by a significant amount to avoid clipping.

This is a measurement global setting.

|                |                                                                                                  |
|----------------|--------------------------------------------------------------------------------------------------|
| Remote Command | <code>[ :SENSe]:POWer[:RF]:RANGe &lt;real&gt;</code><br><code>[ :SENSe]:POWer[:RF]:RANGe?</code> |
| Example        | <code>:POW:RANG 10 dBm</code>                                                                    |

|             |                                                                                                                                                                                         |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|             | <b>:POW:RANG?</b>                                                                                                                                                                       |
| Notes       | The MIN and MAX values are affected by the External Gain parameters, and by the <b>Center Frequency</b> . The hardware compensates for frequency response and alters the Range setting. |
| Preset      | 0 dBm                                                                                                                                                                                   |
| State Saved | Yes                                                                                                                                                                                     |
| Min/Max     | -/+100                                                                                                                                                                                  |
| Annotation  | Meas Bar                                                                                                                                                                                |

### 3.2.3.2 Adjust Range for Min Clipping

Sets the combination of attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an "immediate action" function, that is, it executes once, when the key is pressed.

This key does not appear in measurements that do not support this functionality.

|                |                                                                    |
|----------------|--------------------------------------------------------------------|
| Remote Command | <b>[ :SENSe]:POWer[:RF]:RANGe:OPTimize IMMEDIATE</b>               |
| Notes          | Executing Adjust Range for Min Clipping initiates the measurement. |
| Dependencies   | Does not appear in the Swept SA and Monitor Spectrum measurements. |

### 3.2.3.3 Pre-Adjust for Min Clipping

If this function is **ON**, it applies the adjustment described under Adjust Range For Min Clipping each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <b>[ :SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF   ON   ELECTrical   COMBined</b><br><b>[ :SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?</b>                                                                                                                                                                                                                                                               |
| Notes          | Because there is no attenuator control available in these models, the control displays only <b>ON</b> and <b>OFF</b> choices. However, for SCPI compatibility with other platforms, all three parameters ( <b>ELECTrical</b> , <b>COMBined</b> , and <b>ON</b> ) are honored and all are mapped to <b>ELECTrical</b> , so if any of these three parameters is sent, a subsequent query will return <b>ELEC</b> . |
| Dependencies   | Does not appear in the Swept SA and Monitor Spectrum measurements.                                                                                                                                                                                                                                                                                                                                               |
| Preset         | <b>OFF</b> for Swept SA measurement; <b>ON</b> for all other measurements that support <b>Pre-Adjust for Min Clipping</b> .                                                                                                                                                                                                                                                                                      |
| State Saved    | Saved in instrument state.                                                                                                                                                                                                                                                                                                                                                                                       |

#### Adjustment Algorithm

The algorithm for the adjustment is documented below:

3.2.3.4 Peak-to-Average Ratio

Used with "[Range \(Non-attenuator models\)](#)" on page 167 to optimize the level control in the instrument. The value is the ratio, in dB, of the peak power to the average power of the signal to be measured. A ratio of 0 should be used for sinusoidal signals; for 802.11g OFDM signals use 9 dB.

All Modes show the current value of Peak-to-Average ratio on the control. However, some Modes do not permit changing the value. In these situations, the control is grayed-out.

|                |                                                                                                                                                                                                                                                                          |       |

### 3.2.3.5 Mixer Lvl Offset

This is an advanced setting to adjust target Range at the input mixer, which in turn affects the signal level in the instrument's IF. This setting can be used when additional optimization is needed after setting "[Peak-to-Average Ratio](#)" on page 169. Positive values of offset optimize noise performance over distortion, negative values optimize distortion performance over noise.

|                |                                                                                          |        |

## 3.2.4 Signal Path

Contains controls that pertain to the routing of the signal through the frontend of the instrument.

Not available in VXT models M9410A, M9411A, M9415A, M9416A, M9410E, M9411E, M9415E, M9416E.

### 3.2.4.1 Internal Preamp

Turning on **Internal Preamp** improves noise figure and thus better uncertainties. In some cases, with high gain DUTs, especially when tested with wide RBWs, noise compression may occur. In this case, increasing the input attenuation or turning off the preamp are recommended. This control lets you set the Internal Preamp to **AUTO**, on, or off.

### 3 Noise Figure Mode

#### 3.2 Amplitude

When **Internal Preamp** is set to **AUTO = ON**, and no USB Preamp is connected, the Internal Preamp is turned on. If a USB Preamp is connected, the Internal Preamp turns off to optimize the dynamic range over which the user calibration should be run.

If the current IF frequency range falls completely or partially outside the internal preamp range, a warning message “Hardware missing; Internal preamp not available at all frequency points” is displayed.

Note that the default input attenuation calibration range is:

|                    |                                         |
|--------------------|-----------------------------------------|
| With FSA option    | 0 dB to 8 dB, and a step size of 4 dB   |
| Without FSA option | 0 dB to 10 dB, and a step size of 10 dB |

|                              |                                                                                                                                                                                                                                                                             |

#### 3.2.4.2 LNA

Lets you turn the Low Noise Amplifier (**LNA**) on or off.

**LNA** is an additional preamplifier that provides superior DANL and frequency range compared to "**Internal Preamp**" on [page 170](#). **LNA** provides lower system noise figure, especially at frequencies above 100 MHz, and can be operated up to the full range of 50 GHz instruments.

For best possible sensitivity, **LNA** can be turned on *together* with **Internal Preamp**, although if you operate both preamps together, note that the TOI (distortion) specifications are impacted. The sensitivity improvement of this combination is substantial when operating in high band (frequencies above 3.6 GHz).

For more details about annotation, see ["More Information" on page 172](#)

More Information

When **LNA** is installed, the preamp annotation changes to show the state of both **LNA** and **Internal Preamp**. Below is an example:

Note that when operating entirely in the low band (below about 3.6 GHz), if **LNA** is on, **Internal Preamp** is switched off (even if you have its switch set to **ON**). This is because the noise performance is actually degraded in low band if both preamps are on. In this case, the annotation reflects the actual state of the two preamps, but the **Internal Preamp** annotation displays in amber, to warn you that the actual state of **Internal Preamp** does not match its switch control display:

### 3.3 BW

Contains controls for the Resolution Bandwidth and Video Bandwidth functions of the instrument.

#### 3.3.1 Settings

Contains the Resolution Bandwidth control.

##### 3.3.1.1 Res BW

Sets the resolution bandwidth (**RBW**) to be used in Noise Figure measurement.

When this function is set to **Auto** (default setting), the bandwidth is set automatically, and is dependent on the measurement frequency:

- At measurement frequencies of 9.9 MHz or above, the resolution bandwidth is set automatically to 4 MHz
- At measurement frequencies less than 9.9 MHz, the resolution bandwidth is set automatically to approximately one third of the measurement frequency

When the resolution bandwidth is set to manual (**Man**), you can manually specify the resolution bandwidth from a minimum of 1 Hz to a maximum of 8 MHz. The lower the resolution bandwidth setting, the longer the measurement will take. With a resolution bandwidth setting of 1 Hz, each measurement point may take up to 6000 seconds.

## 3.4 Display

Opens the **Display** menu, which lets you configure display items for the current Mode, Measurement, Layout, or Window.

### 3.4.1 Format

Contains controls for setting up the display for the current Measurement, Layout, or Window.

#### 3.4.1.1 Layout

Selects the format in which the measurement results should be displayed on screen. Results can be displayed in **Graph**, **Table** or **Meter** form. The **AUTO** option couples the layout to "Freq Mode" on page 191.

When **Layout** is in **AUTO**, the layout changes when "Freq Mode" on page 191 (under **Frequency**) changes, as follows:

| Freq Mode    | Layout                     |
|--------------|----------------------------|
| Swept        | "Graph Layout" on page 176 |
| <b>FIXed</b> | "Meter" on page 180        |
| List         | "Table" on page 182        |

No matter which layout you choose, you have the choice of one or more of the seven possible results:

| Result                             | Option            |
|------------------------------------|-------------------|
| Noise Figure                       | <b>NFIGure</b>    |
| Noise Factor (Linear Noise Figure) | <b>NFACTOR</b>    |
| Gain                               | <b>GAIN</b>       |
| Y Factor                           | <b>YFACTOR</b>    |
| Effective Temperature              | <b>TEFFective</b> |
| Hot Power Density                  | <b>PHOT</b>       |
| Cold Power Density                 | <b>PCOLD</b>      |

See "Results" on page 157 for more information.

NOTE

The Noise Figure measurement uses **Layout** to control the result display instead of **View**.

| State Saved    | Yes                                                                                                                                                                                                                                                                                                                                                                                                    |

## Graph Layout

Two results are displayed simultaneously. There are two types of **Graph** layout: "Graph (Split)" on page 177 and "Graph (Overlaid Traces)" on page 178.

The command below lets you set the result for either trace.

|                |                                                                                                                                                                |

Graph (Split)

Draws the 'Data1 and 'Data2 results on two graphs in window 1 (top) and window 2 (bottom) respectively. A caret (^) is displayed below each trace at the position of the current measurement when the total sweep time exceeds 300 ms (total sweep time = avg sweep time per point \* number of points). Both graphs use the same Y-Axis Scale settings.

In **Graph** layout mode, "Data 1" and "Data 2" show the current result type. To select a result for either window, tap the window name (**Noise Figure** in the example below), tap **Data**, and select the desired result:

#### Graph (Overlaid Traces)

Draws both results as two traces on the same graph with two sets of Y-axis notation. This layout can be useful for printing both results together on a bigger graph. A caret (^) is displayed below each trace at the position of the current measurement.

### 3 Noise Figure Mode

#### 3.4 Display

In this mode, "Data 1" and "Data 2" show the current result type. All annotation in yellow refers to Trace 1 (displaying Data1) and all annotation in blue refers to Trace 2 (displaying Data2).

To select a result for either trace, tap the window name (**Overlay**), tap **Data 1** or **Data 2**, and select the desired result:

**Meter**

Displays a strip chart graph and a meter (bar graph style), as well as results in a one-row table. The **Meter** window shows results for one frequency point.

By default, only “Data 1” and “Data 2” results in graph layout are displayed in the table. You can use the “Result Table” panel to turn on more results. Note that only the latest measured results are displayed on the screen.

### 3 Noise Figure Mode

#### 3.4 Display

The graphic window contains two graphs, strip chart and bar graph. The data displayed in the graph is set by tapping the window name (**Noise Figure (Meter)** in the example below), then **Data**, then selecting the desired result:

Note that there is no horizontal scale in Strip chart, the displayed points will always be 61. The graph and strip chart do not update when "Freq Mode" on page 191 is not **FIXed**.

There 4 readouts on the strip chart's top area: "Max NF", "Avg NF", "Max-to-Min" and "Min NF". No marker is provided in strip chart. All readouts are one line, with 0.001dB resolution, for example "Max NF: 12.300 dB"

The bar chart draws a black line at the minimum level, and with two yellow triangle indicators on both sides.

The Strip Chart and Bar Graph are not affected by the setting of "View/Blank" on page 368 in the **Trace** menu.

The command below lets you set the result for the **Meter** trace:

|                |                                                                                                                                                        |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:DISPlay:NFIGure:DATA:TRACe3 NFIGure   NFACTOR   GAIN   YFACTOR   TEFFective   PHOT   PCOLd</code><br><code>:DISPlay:NFIGure:DATA:TRACe3?</code> |
| Example        | <code>:DISP:NFIG:DATA:TRAC3 NFIG</code>                                                                                                                |
| Preset         | <code>NFIGure</code>                                                                                                                                   |
| State Saved    | Yes                                                                                                                                                    |
| Range          | <code>NFIGure   NFACTOR   GAIN   YFACTOR   TEFFective   PHOT   PCOLd</code>                                                                            |

**Table**

Displays discrete results for each frequency point in a tabular form. The results are updated for each frequency in turn as they are measured. By default, only "Data 1" and "Data 2" results in graph layout are displayed in the table. You can use the "Result Table" panel to turn on more results.

All values are displayed according to their defined 'Display Format' (see appropriate SCPI table).

3 Noise Figure Mode

3.4 Display

Table ▼

| Frequency      | Noise Figure (TRC1) | Gain (TRC2) |
|----------------|---------------------|-------------|
| 10.000000 MHz  | -4.8652 dB          | 5.0016 dB   |
| 309.000000 MHz | -4.5841 dB          | 4.9858 dB   |
| 608.000000 MHz | -4.3937 dB          | 4.9673 dB   |
| 907.000000 MHz | -4.9982 dB          | 5.0459 dB   |
| 1.20600000 GHz | -5.1073 dB          | 5.0166 dB   |
| 1.50500000 GHz | -4.8447 dB          | 5.0021 dB   |
| 1.80400000 GHz | -6.1325 dB          | 4.9812 dB   |
| 2.10300000 GHz | -4.8928 dB          | 5.0174 dB   |
| 2.40200000 GHz | -4.7276 dB          | 5.0197 dB   |
| 2.70100000 GHz | -3.8586 dB          | 4.9984 dB   |
| 3.00000000 GHz | -3.5805 dB          | 4.9429 dB   |

3.4.1.2 Table Position

Sets the view position in the current measurement. Only displayed when "Layout" on page 175 is TABLE, and controls the selected row in the table. If the selected row is not currently displayed on-screen, the table scrolls automatically so that the selected row is centered.

|             |                                                            |
|-------------|------------------------------------------------------------|
| Couplings   | Max value coupled to "Points" on page 195(under Frequency) |
| Preset      | 1                                                          |
| State Saved | No                                                         |
| Min         | 1                                                          |
| Max         | Dependent on Frequency > "Points" on page 195              |

3.4.1.3 Overlay / Combined

If this parameter is ON, the current two traces appear on the screen, trace 1 in yellow and trace 2 in blue. Each trace displays its own data type name on the right side of the trace, and two sets of graph annotations use the same color as the corresponding trace. This is only displayed when "Layout" on page 175 is set to GRAPH.

|                |                                                                                                      |
|----------------|------------------------------------------------------------------------------------------------------|
| Remote Command | :DISPlay:NFIGure:TRACe:COMBined[:STATe] OFF   ON   0   1<br>:DISPlay:NFIGure:TRACe:COMBined[:STATe]? |

|                                 |                                                                                                                                                             |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Example                         | <code>:DISP:NFIG:TRAC:COMB:STAT ON</code>                                                                                                                   |
| Couplings                       | Only enabled when <b>Layout</b> is set to <b>GRAPH</b> , or <b>Layout</b> is set to <b>AUTO</b> and " <b>Freq Mode</b> " on page 191 is set to <b>SWEPT</b> |
| Preset                          | <b>OFF</b>                                                                                                                                                  |
| State Saved                     | Yes                                                                                                                                                         |
| Range                           | On   Off                                                                                                                                                    |
| Backwards Compatibility<br>SCPI | <code>:DISPlay[:NFIGure]:TRACe:COMBined[:STATE]</code>                                                                                                      |

### 3.4.1.4 Data Display

Lets you select which trace to be displayed. Available selections are:

|                             |                                                                                                                                                                          |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Current Trace</b>        | Displays the current measurement trace<br>This is the default setting                                                                                                    |
| <b>Memory</b>               | Displays the measurement trace you saved to memory by pressing " <b>Current Trace -&gt; Memory</b> " on page 185                                                         |
| <b>Current Trace+Memory</b> | Displays both the measurement trace you saved to memory by pressing <b>Current Trace-&gt; Memory</b> and the current measurement trace. This lets you compare two traces |

If the measurement frequencies are changed after the reference trace was saved, and there is an overlapped area of the current frequency range and the frequency range when the reference trace was saved, the reference trace in the overlapped frequency range will be displayed. If there is on overlap, only a **Reference** label will be displayed to indicate that the reference trace is enabled, but out of the current frequency range.

When the current measurement frequency range is wider than the reference trace, the start and stop frequencies of the reference trace will be displayed.

|              |                                                                                                                                                                                                                                            |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Dependencies | Only available when 2FP license is installed                                                                                                                                                                                               |
| Couplings    | <b>Memory</b> and <b>Current Trace+Memory</b> keys only become available after you press the <b>Current Trace-&gt;Memory</b> control<br>When sweep points changes, <b>Memory</b> and <b>Current Trace+Memory</b> options will be displayed |
| Preset       | Data                                                                                                                                                                                                                                       |
| State Saved  | Yes                                                                                                                                                                                                                                        |
| Range        | Current Trace   Memory   Current Trace+Memory                                                                                                                                                                                              |

### 3.4.1.5 Current Trace -> Memory

Stores the current trace in memory, where it remains until you do any of the following:

- Change **Sweep** "Points" on page 363
- Change "Freq Context" on page 218
- Preset the measurement
- Press **Current Trace->Memory** again to save another trace

After you have pressed **Current Trace->Memory**, "Data Display" on page 184 becomes available. **Current Trace->Memory** is only available after a complete sweep of data is made.

|              |                                                               |
|--------------|---------------------------------------------------------------|
| Dependencies | Only available when 2FP license is installed                  |
| Couplings    | Only becomes available after a complete sweep of data is made |
| State Saved  | No                                                            |

## 3.4.2 Result Table (Front Panel Only)

Contains controls that enable you to select which result will be displayed in the result table on the **Table** and **Meter** layout. The "Data 1" and "Data 2" results on the **Graph** layout are always displayed.

### 3.4.2.1 Noise Figure

Turns on or off Noise Figure result in the result table for **Table** and **Meter** Layouts.

|             |                                                                                         |
|-------------|-----------------------------------------------------------------------------------------|
| Couplings   | Disabled when "Data 1" or "Data 2" result on <b>Graph</b> layout is <b>Noise Figure</b> |
| Preset      | On                                                                                      |
| State Saved | Saved in instrument state                                                               |

### 3.4.2.2 Gain (Front Panel Only)

Turns on or off the Gain result in the result table for **Table** and **Meter** Layouts.

|             |                                                                                         |
|-------------|-----------------------------------------------------------------------------------------|
| Couplings   | Disabled when the "Data 1" or "Data 2" result on the <b>Graph</b> layout is <b>Gain</b> |
| Preset      | On                                                                                      |
| State Saved | Saved in instrument state                                                               |

### 3.4.2.3 Noise Factor (Front Panel Only)

Turns on or off the Noise Factor result in the result table for **Table** and **Meter** Layouts.

|             |                                                                                                 |
|-------------|-------------------------------------------------------------------------------------------------|
| Couplings   | Disabled when the “Data 1” or “Data 2” result on the <b>Graph</b> layout is <b>Noise Factor</b> |
| Preset      | On                                                                                              |
| State Saved | Saved in instrument state                                                                       |

### 3.4.2.4 Y-Factor (Front Panel Only)

Turns on or off the Y-Factor result in the result table for **Table** and **Meter** Layouts.

|             |                                                                                             |
|-------------|---------------------------------------------------------------------------------------------|
| Couplings   | Disabled when the “Data 1” or “Data 2” result on the <b>Graph</b> layout is <b>Y-Factor</b> |
| Preset      | On                                                                                          |
| State Saved | Saved in instrument state                                                                   |

### 3.4.2.5 T effective (Front Panel Only)

Turns on or off the T effective result in the result table of the **Table** and **Meter** layout.

|             |                                                                                                |
|-------------|------------------------------------------------------------------------------------------------|
| Couplings   | Disabled when the “Data 1” or “Data 2” result on the <b>Graph</b> layout is <b>T effective</b> |
| Preset      | On                                                                                             |
| State Saved | Saved in instrument state                                                                      |

### 3.4.2.6 P hot (Front Panel Only)

Turns on or off the P hot result in the result table of the **Table** and **Meter** layout.

|             |                                                                                          |
|-------------|------------------------------------------------------------------------------------------|
| Couplings   | Disabled when the “Data 1” or “Data 2” result on the <b>Graph</b> layout is <b>P hot</b> |
| Preset      | On                                                                                       |
| State Saved | Saved in instrument state                                                                |

### 3.4.2.7 P cold (Front Panel Only)

Turns on or off the P cold result in the result table of the **Table** and **Meter** layout.

|             |                                                                                           |
|-------------|-------------------------------------------------------------------------------------------|
| Couplings   | Disabled when the “Data 1” or “Data 2” result on the <b>Graph</b> layout is <b>P cold</b> |
| Preset      | On                                                                                        |
| State Saved | Saved in instrument state                                                                 |

### 3.4.3 Annotation

Contains controls for setting up the annotation for the current Mode or Measurement.

#### 3.4.3.1 Graticule

Turns the display graticule On or Off for all windows with graticules in all measurements in the current Mode. Also turns the graticule Y-Axis annotation on and off.

|                              |                                                                                                                                                                                                                                                                                                            |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command               | <code>:DISPlay:GRATicule[:STATe] OFF   ON   0   1</code><br><code>:DISPlay:GRATicule[:STATe]?</code>                                                                                                                                                                                                       |
| Example                      | <code>:DISP:GRAT OFF</code>                                                                                                                                                                                                                                                                                |
| Notes                        | The graticule is the set of horizontal and vertical lines that make up the grid/divisions for the X-Axis and Y-Axis                                                                                                                                                                                        |
| Preset                       | <b>ON</b>                                                                                                                                                                                                                                                                                                  |
| State Saved                  | Saved in instrument state                                                                                                                                                                                                                                                                                  |
| Backwards Compatibility SCPI | <code>:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe] OFF   ON   0   1</code><br><code>:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe]?</code><br>This command is accepted for backwards compatibility with older instruments, but the <b>WINDow</b> , <b>TRACe</b> and <b>GRID</b> parameters are ignored |

#### 3.4.3.2 Screen Annotation

Controls the display of the annunciation and annotation around the graticule, including any annotation on lines (such as the display line, the threshold line, etc.) and the Y-Axis annotation, for all windows with screen annotation in all measurements in the current Mode.

This does *not* include marker annotation (or the N dB result). When **OFF**, the graticule expands to fill the entire graticule area, leaving only the 1.5% gap above the graticule, as described in the **Trace** section.

|                |                                                                                                                            |
|----------------|----------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:DISPlay:ANNotation:SCReen[:STATe] OFF   ON   0   1</code><br><code>:DISPlay:ANNotation:SCReen[:STATe]?</code>       |
| Example        | <code>:DISP:ANN:SCR OFF</code>                                                                                             |
| Dependencies   | Grayed-out and forced to <b>OFF</b> when <b>System Display Settings, Annotation</b> is <b>OFF</b>                          |
| Preset         | <b>ON</b><br>This remains <b>OFF</b> through a Preset when <b>System Display Settings, Annotation</b> is set to <b>OFF</b> |
| State Saved    | Saved in instrument state                                                                                                  |

### 3.4.3.3 Trace Annotation

Turns on and off the labels on the traces, showing their detector (or their Math Mode) as described in the **Trace** section, for all windows in all measurements in the current Mode for which Trace Annotation on/off is supported.

If Trace Math is being performed on a trace, then the Trace Math annotation replaces the detector annotation.

For measurements that support limit lines, this key also turns on and off the labels on the Limit Lines. The label is the Limit number annotation and Limit Comment displayed on the graph. If the length of the comment is greater than 20 characters, the first 8 characters and the last 8 characters are displayed, joined with ....

|                |                                                                                                                    |
|----------------|--------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:DISPlay:ANNotation:TRACe[:STATe] ON   OFF   1   0</code><br><code>:DISPlay:ANNotation:TRACe[:STATe]?</code> |
| Example        | <code>:DISP:ANN:TRAC OFF</code>                                                                                    |
| Preset         | <b>OFF</b>                                                                                                         |
| State Saved    | Saved in instrument state                                                                                          |

### 3.4.3.4 Control Annotation

Turns on and off the display of values on the Active Function controls for all measurements in the current Mode. This is a security feature.

|                |                                                                                                                            |
|----------------|----------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:DISPlay:ACTivefunc[:STATe] ON   OFF   1   0</code><br><code>:DISPlay:ACTivefunc[:STATe]?</code>                     |
| Example        | <code>:DISP:ACT OFF</code>                                                                                                 |
| Dependencies   | Grayed out and forced to <b>OFF</b> when <b>System Display Settings, Annotation</b> is <b>OFF</b>                          |
| Preset         | <b>ON</b><br>This remains <b>OFF</b> through a Preset when <b>System Display Settings, Annotation</b> is set to <b>OFF</b> |
| State Saved    | Saved in instrument state                                                                                                  |

### 3.4.3.5 Meas Bar

Turns the Measurement Bar at the top of the screen on and off for all measurements in the current Mode. When **OFF**, the graticule area expands to fill the area formerly occupied by the Measurement Bar.

|                |                                                                                                                  |
|----------------|------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:DISPlay:ANNotation:MBAR[:STATe] OFF   ON   0   1</code><br><code>:DISPlay:ANNotation:MBAR[:STATe]?</code> |
|----------------|------------------------------------------------------------------------------------------------------------------|

### 3 Noise Figure Mode

#### 3.4 Display

|              |                                                                                                                                |
|--------------|--------------------------------------------------------------------------------------------------------------------------------|
| Example      | <code>:DISP:ANN:MBAR OFF</code>                                                                                                |
| Dependencies | Grayed out and forced to <b>OFF</b> when <b>System Display Settings, Annotation</b> is <b>OFF</b>                              |
| Preset       | <b>ON</b><br><br>This remains <b>OFF</b> through a Preset when <b>System Display Settings, Annotation</b> is set to <b>OFF</b> |
| State Saved  | Saved in instrument state                                                                                                      |

##### 3.4.3.6 Display Enable (Remote Command Only)

Turns the display on/off, including the display drive circuitry. The backlight stays lit to confirm that the instrument is on. The display enable setting is mode global. There are three reasons for turning the display off:

1. To increase speed as much as possible by freeing the instrument from having to update the display
2. To reduce emissions from the display, drive circuitry
3. For security purposes

If you have turned off the display:

- and you are in local operation, the display can be turned back on by pressing any key or by sending `:SYSTem:DEFaults MISC` or `:DISPlay:ENABle ON` (neither `*RST` nor `:SYSTem:PRESet` enable the display)
- and you are in remote operation, the display can be turned back on by pressing the **Local** or **Esc** keys, or by sending `:SYSTem:DEFaults MISC` or `:DISPlay:ENABle ON` (neither `*RST` nor `:SYSTem:PRESet` enable the display)
- and you are using either the `:SYSTem:KLOCK` command or GPIB local lockout, then *no* front-panel key press will turn the display back on. You must turn it back on remotely.

If the display is **OFF**, many SCPI commands related to User Views and Multiscreen functionality do not work, and return the error messages “-221, Settings conflict; Screen SCPI cannot be used when Display is disabled” or “221, Settings conflict; View SCPI cannot be used while Display is disabled”. These commands include:

| Name             | Command                                    |
|------------------|--------------------------------------------|
| Select User View | <code>:DISPlay:VIEW:ADVanced:SElect</code> |
| Rename User View | <code>:DISPlay:VIEW:ADVanced:REName</code> |
| Delete User View | <code>:DISPlay:VIEW:ADVanced:DELeTe</code> |
| Create User View | <code>:DISPlay:VIEW:ADVanced:NAME</code>   |
| Select Screen    | <code>:INSTrument:SCReen:SElect</code>     |
| Delete Screen    | <code>:INSTrument:SCReen:DELeTe</code>     |

| Name                       | Command                                    |
|----------------------------|--------------------------------------------|
| Delete All But This Screen | <code>:INSTrument:SCReen:DELeTe:ALL</code> |
| Add Screen                 | <code>:INSTrument:SCReen:CREate</code>     |
| Rename Screen              | <code>:INSTrument:SCReen:REName</code>     |
| Sequencer On/Off           | <code>:SYSTem:SEQuencer</code>             |

|                               |                                                                                                                                                                                                               |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command                | <code>:DISPlay:ENABle OFF   ON   0   1</code><br><code>:DISPlay:ENABle?</code>                                                                                                                                |
| Example                       | <code>:DISP:ENAB OFF</code>                                                                                                                                                                                   |
| Couplings                     | <code>:DISP:ENAB OFF</code> turns Backlight <b>OFF</b> and <code>:DISP:ENAB ON</code> turns Backlight <b>ON</b> , but changing Backlight settings does <i>not</i> change the state of <code>:DISP:ENAB</code> |
| Preset                        | <b>ON</b><br>Set by <code>:SYST:DEF MISC</code> , but not affected by <code>*RST</code> or <code>:SYSTem:PRESet</code>                                                                                        |
| State Saved                   | Not saved in instrument state                                                                                                                                                                                 |
| Backwards Compatibility Notes | <code>:SYST:PRES</code> no longer turns on <code>:DISPlay:ENABle</code> as it did in legacy analyzers                                                                                                         |

## 3.5 Frequency

Accesses a menu of controls that let you control the frequency parameters of the instrument.

### 3.5.1 Settings

Contains controls for frequently used functions.

#### 3.5.1.1 Freq Mode

Determines how the list of frequencies to be measured is calculated. The options are:

- SWEpt** Points are linearly distributed between start and stop frequencies, where the number of points is determined by the **Points** parameter. **Start Freq**, **Stop Freq**, **Center Frequency**, and **Span** parameters are coupled  
In this mode, **Fixed Freq** and **Edit Freq List** are invisible
- FIXed** A single frequency (supplied by "**Fixed Freq**" on page 195) is measured. **Meter** View is ideal for this mode  
In this mode, **Start/Stop/Center Frequency**, **Span**, **Points** and **Edit Freq List** are invisible
- LIST** A user-specified list of frequencies is measured. The list of frequencies can be supplied using the respective SCPI commands, loading the frequency list from file, or by entering the data manually into the frequency list. Duplicate frequencies are not acceptable. In this mode, **Start/Stop/Center/Fixed Freq**, **Span**, and **Points** are invisible

When "**Layout**" on page 175 (in the **Display** menu) is **AUTO**, the layout changes when **Freq Mode** changes, as follows:

| Freq Mode | Layout                     |
|-----------|----------------------------|
| Swept     | "Graph Layout" on page 176 |
| Fixed     | "Meter" on page 180        |
| List      | "Table" on page 182        |

NOTE

When **DUT** is **MCONverter**, you need to specify the DUTs Input(RF), DUTs Output(IF) and LO (if the DUTs LO is Swept) frequency list respectively. Switching the DUT type does not change the frequency lists for **MCONverter**, that is, when you switch to **MCONverter** from other DUT types, the DUT Input(RF), DUT Output(IF) and LO frequency lists are restored to the latest values.

## NOTE

Frequency Mode is global to all frequency contexts (see ["Freq Context" on page 218](#)). When it is changed in one frequency context, the change is mirrored in all other frequency contexts. When **Freq Mode** changes, the frequency parameters in all other contexts are recalculated to reflect the frequency parameters in the current context.

When **Freq Mode** is **LIST** and the context changes, the list values are recalculated, to satisfy the new context.

|                              |                                                                                                                      |
|------------------------------|----------------------------------------------------------------------------------------------------------------------|
| Remote Command               | <code>[ :SENSe]:NFIGure:FREQuency:MODE SWEpt   FIXed   LIST</code><br><code>[ :SENSe]:NFIGure:FREQuency:MODE?</code> |
| Example                      | <code>:NFIG:FREQ:MODE FIX</code>                                                                                     |
| Couplings                    | See above                                                                                                            |
| Preset                       | <b>SWEpt</b>                                                                                                         |
| State Saved                  | Yes                                                                                                                  |
| Range                        | <b>SWEpt   FIXed   LIST</b>                                                                                          |
| Backwards Compatibility SCPI | <code>[ :SENSe][ :NFIGure]:FREQuency:MODE</code>                                                                     |

### 3.5.1.2 Center Frequency

Sets the **Center Frequency** to be used when ["Freq Mode" on page 191](#) is **SWEpt**.

This control is blanked when ["Freq Mode" on page 191](#) is **FIXed** or **LIST**.

The Start, Stop, Center, and Span frequencies are all coupled. Changing one causes the others to be recalculated, to satisfy the equations:

- $\text{Span} = \text{Stop} - \text{Start}$
- $\text{Center} = \text{Start} + (\text{Span} / 2)$

## NOTE

Unless the number of Points is odd, **Center Frequency** is not actually measured, because the measured points are evenly distributed between the start and stop frequencies.

|                |                                                                                                                         |
|----------------|-------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>[ :SENSe]:NFIGure:FREQuency:CENTer &lt;freq&gt;</code><br><code>[ :SENSe]:NFIGure:FREQuency:CENTer?</code>        |
| Example        | <code>:NFIG:FREQ:CEN 1.5 GHz</code>                                                                                     |
| Notes          | Preset value differs from legacy apps, in which it was 1.505 GHz                                                        |
| Couplings      | Lets you set <b>Center Frequency</b> for a swept measurement. Appears only when <a href="#">"Freq Mode" on page 191</a> |

### 3 Noise Figure Mode

#### 3.5 Frequency

|                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                              | is set to <b>SWEPT</b> . Coupled to <b>Start Freq</b> , <b>Stop Freq</b> , and <b>Span</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Preset                       | 1.505 GHz                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| State Saved                  | Yes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Min                          | 10.005 kHz                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Max                          | There are a few conditions related to the frequency context (see " <b>Freq Context</b> " on page 218) where the max will be 3.30 THz less half of the min span of 10 Hz: <ul style="list-style-type: none"> <li>– When "<b>DUT</b>" on page 219 is <b>AMPLifier</b>, and the system downconverter is <i>not</i> in use with DSB, the frequency context is set to <b>RF</b> (DUT Input)</li> <li>– When <b>DUT</b> is <b>AMPLifier</b>, and the system downconverter is in use with DSB, the frequency context will be enabled. The <b>RF</b> and <b>SysDownConvLO</b> contexts are available</li> <li>– When <b>DUT</b> is <b>DOWNconv</b>, and the frequency context is set to <b>RF</b> (DUT Input)</li> </ul> |
| Backwards Compatibility SCPI | <b>[ :SENSe ] [ :NFIGure ] :FREQuency :CENTer</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

##### 3.5.1.3 Span

Sets the displayed frequency range symmetrically about the "**Center Frequency**" on page 192.

This control is blanked when "**Freq Mode**" on page 191 is **FIXed** or **LIST**.

The Start, Stop, and Center parameters are **Span** frequencies and are all coupled. Changing one causes the others to be recalculated to satisfy the equations:

- $\text{Span} = \text{Stop} - \text{Start}$
- $\text{Center} = \text{Start} + (\text{Span} / 2)$

### 3.5.1.4 Start Freq

Sets the start frequency that will be used when "Freq Mode" on page 191 is **SWEpt**. A separate start frequency is maintained for each frequency context (DUT Input(RF), LO, DUT Output(IF), SysDownConvLO – see "Freq Context" on page 218). The control displays and controls the start frequency for the current context.

The Start, Stop, Center, and Span frequencies are all coupled. Altering one causes the others to be recalculated, to satisfy the equations:

- $\text{Span} = \text{Stop} - \text{Start}$
- $\text{Center} = \text{Start} + (\text{Span} / 2)$

|                                 |                                                                                                                                                                                                                                                                                                            |

### 3.5.1.8 Edit Freq List

Lets you edit the frequency lists for Noise Figure measurement.

- When "**DUT**" on page 219 is not **MCONverter**, only the frequency list for the current frequency context (see "**Freq Context**" on page 218) is editable. Entered frequencies can be arbitrary values within the frequency range of the current frequency context. Values will be displayed in sorted order. Duplicates are not allowed in the frequency list
- When **DUT** is **MCONverter**, three frequency lists are all editable. You can use "**Selected Freq List**" on page 197 to specify which frequency list to be edited. Entered frequencies can be arbitrary values within the frequency range of the selected frequency context. Values for the current frequency context are displayed in sorted order. Duplicates are not allowed in the frequency list for the current frequency context

Once a new list is entered, the application stores this table in non-volatile memory, to allow for restoration after a power cycle.

If the frequency context changes while "**Freq Mode**" on page 191 is **LIST**, the frequency list values must be recalculated, to satisfy the new context.

## Selected Freq List

Specifies the frequency list when "DUT" on page 219 is **MCONverter**. Only enabled when DUT is **MCONverter**.

When "Freq Mode" on page 191 is **LIST** and DUT type is **MCONverter**, you must enter the frequency list for RF, LO and IF before calibration and measurement.

| Couplings      | Only enabled when DUT is <b>MCONverter</b><br>Coupled to "Freq Context" on page 218                                         |
| Preset         | <b>IF</b>                                                                                                                   |
| State Saved    | Yes                                                                                                                         |
| Range          | <b>RF LO IF</b>                                                                                                             |

## Go to Row (Front Panel Only)

Specify a row and make it the selected row.

## Insert Row Below (Front Panel Only)

Inserts a row below the current row. The new row is a copy of the current row, and becomes the current row. The new row is not yet entered into the underlying table, and the data in the row is displayed in light gray.

## Delete Row (Front Panel Only)

This is an immediate action control. It immediately deletes the currently-selected row, whether or not that point is being edited, and selects **Navigate**. The point following the currently-selected row (or the preceding row if there is none) is selected.

## Start Freq (Front Panel Only)

Used only by "Fill Using Start and Stop Freq (Front Panel Only)" on page 199 to generate a frequency list. Note that it is not the same parameter as "Start Freq" on page 194, which is used in the Noise Figure measurement when "Freq Mode" on page 191 is **SWEPT**.

Switching to List mode updates this parameter to the latest start frequency value of the Swept mode.

### Stop Freq (Front Panel Only)

Only used by "Fill Using Start and Stop Freq (Front Panel Only)" on page 199 to generate frequency list. Note that it is not the same parameter as "Stop Freq" on page 194, which is used in the Noise Figure measurement when "Freq Mode" on page 191 is **SWEPT**.

Switching to List mode updates this parameter to the latest stop frequency value of the Swept mode.

### Points (Front Panel Only)

Only used by "Fill Using Start and Stop Freq (Front Panel Only)" on page 199 to generate a frequency list. Note that this is *not* the same parameter as "Points" on

page 195, which is used in the Noise Figure measurement when "Freq Mode" on page 191 is **SWEPT**.

Switching to **LIST** mode updates this parameter to the latest **Points** value of **SWEPT Freq Mode**.

|             |                                                                              |

| State Saved | Yes                                                                          |
| Min         | 2                                                                            |
| Max         | 1301                                                                         |

**Fill Using Start and Stop Freq (Front Panel Only)**

Clears the existing frequency list table, and replaces it with an auto-generated table according to "Start Freq (Front Panel Only)" on page 197, "Stop Freq (Front Panel Only)" on page 198 and "Points (Front Panel Only)" on page 198.

The frequency points are linearly distributed between **Start Freq** and **Stop Freq**, and the number of points generated is determined by **Points**.

NOTE

This function can be used to set the template frequencies which can then be modified for the exact "sweet spots" in the DUT.

**Clear Table**

This function clears all data from the frequencies list.

|                |                                                                                                                                                                                                                                                                            |

| Remote Command | [ :SENSe]:NFIgure:FREQuency:LIST:DATA:DELeTe                                                                                                                                                                                                                               |
| Notes          | Clears all entries in the selected Frequency List table. If in <b>LIST</b> "Freq Mode" on page 191, clearing the freq list of the current "Freq Context" on page 218 will make the measurement hang, and "Insufficient Data; Frequency list empty" error will be displayed |

## 3.6 Marker

Accesses the **Marker** menu. A marker can be placed on a trace to allow the value of the trace at the marker point to be determined precisely.

### 3.6.1 Select Marker

Specifies the selected marker. The term “selected marker” is used throughout this document to specify which marker will be affected when you change marker settings, perform a peak search, etc.

This control appears above the menu panel, indicating that it applies to all controls in the **Marker** menu. **Select Marker** is blanked if you select a tab whose controls do *not* depend on the selected marker (for example, **Counter**).

In any menu that includes **Select Marker**, the first control is always **Marker Frequency** on page 200.

|              |                                                                                                                                                                                          |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Notes        | The selected marker is remembered even when not in the <b>Marker</b> menu and is used if a search is performed, or a Band Function is turned on, or for Signal Track, or Continuous Peak |
| Preset       | Marker 1                                                                                                                                                                                 |
| State Saved  | The number of the selected marker is saved in instrument state                                                                                                                           |
| Annunciation | Appears in the marker results block label for <b>Normal</b> , <b>Delta</b> and <b>Fixed</b> markers                                                                                      |

### 3.6.2 Settings

The controls on this tab include the **Marker** active function, and a radio button selection for **Marker Mode** on page 202 (**Normal**, **Delta**, **Fixed**, or **Off**) for the selected marker, as well as additional functions that help you use markers.

#### 3.6.2.1 Marker Frequency

Sets the marker X Axis value in the current marker X Axis Scale unit. It has no effect if the control mode is **Off**, but is the SCPI equivalent of entering an X value if the control mode is **Normal** or **Delta**.

|                |                                                                                                                            |
|----------------|----------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:CALCulate:NFIGure:MARKer[1] 2 ... 12:X &lt;freq&gt;</code><br><code>:CALCulate:NFIGure:MARKer[1] 2 ... 12:X?</code> |
| Example        | <code>:CALC:NFIG:MARK2:X 1GHz</code><br><code>:CALC:NFIG:MARK2:X?</code>                                                   |
| Notes          | If no suffix is sent, uses the fundamental units for the current marker X Axis Scale. If a suffix is sent that             |

### 3 Noise Figure Mode

#### 3.6 Marker

|             |                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|             | <p>does not match the current marker X Axis Scale unit, an error “Invalid suffix” is generated</p> <p>The query returns the marker’s absolute X Axis value if the control mode is <b>Normal</b>, or the offset from the marker’s reference marker if the control mode is <b>Delta</b>. The query is returned in the fundamental units for the current marker X Axis scale: Hz for Frequency; Inverse Time, seconds for Period and Time</p> |
| Preset      | Preset turns <b>Off</b> all markers, so the query returns Not A Number ( <b>NAN</b> )                                                                                                                                                                                                                                                                                                                                                      |
| State Saved | Saved in instrument state                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Annotation  | Mkr # <X value> and <Marker value> upper right on graph                                                                                                                                                                                                                                                                                                                                                                                    |

#### Marker X Axis Position (Remote Command Only)

Sets the marker X Axis Scale position in trace points. Has no effect if the control mode is **Off** but is the SCPI equivalent of entering a value if the control mode is **Normal** or **Delta**. The entered value is immediately translated into the current X Axis Scale units for setting the value of the marker.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Example        | <code>:CALC:NFIG:MARK4:X:POS 0</code><br><code>:CALC:NFIG:MARK4:X:POS?</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Notes          | The query returns the marker’s absolute X Axis value in trace points if the control mode is <b>Normal</b> , or the offset from the marker’s reference marker in trace points if the control mode is <b>Delta</b> . The value is returned as a real number, not an integer, corresponding to the translation from X Axis Scale units to trace points. When a Marker is turned on, it is placed center of the screen on the trace. Therefore, the default value depends on instrument condition. If the marker is <b>Off</b> , the response is Not A Number |
| Preset         | Preset turns <b>Off</b> all markers, so the query returns Not A Number ( <b>NAN</b> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| State Saved    | Saved in instrument state                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Min/Max        | –/+9.9E+37                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

#### Marker Y Axis Value (Remote Query only)

Returns the marker Y Axis value in the current marker Y Axis unit.

|                              |                                                                                                                                                     |

| Remote Command               | <code>:CALCulate:NFIGure:MARKer[1] 2 ... 12:Y?</code>                                                                                               |
| Example                      | <code>:CALC:NFIG:MARK2:Y?</code>                                                                                                                    |
| Notes                        | Returns the marker Y-axis result, if the control mode is <b>Normal</b> or <b>Delta</b> . If the marker is <b>Off</b> , the response is Not A Number |
| Preset                       | Depends on <b>Marker</b> setup and signal source                                                                                                    |
| State Saved                  | No                                                                                                                                                  |
| Backwards Compatibility SCPI | <code>:CALCulate:NFIGure:MARKer[1] 2 ... 12:FUNCTION:RESult?</code>                                                                                 |

### 3.6.2.2 Marker Mode

Sets the marker control mode to **POSition** (Normal), **DELta**, or **OFF**. All interactions and dependencies detailed under the control description are enforced when the remote command is sent. If the selected marker is **OFF**, pressing **Marker** sets it to **Normal** and places it at the center of the screen on the trace determined by the **Marker Trace** rules. At the same time, the Marker X Axis Value appears on the Active Function area.

The default active function is the active function for the currently selected marker control mode. If the current control mode is **OFF**, there is no active function, and the active function is turned off.

|                |                                                                                                                                                                                                             |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:CALCulate:NFIGure:MARKer[1] 2 ... 12:MODE POSition   DELta   OFF</code><br><code>:CALCulate:NFIGure:MARKer[1] 2 ... 12:MODE?</code>                                                                  |
| Example        | <code>:CALC:NFIG:MARK:MODE POS</code><br><code>:CALC:NFIG:MARK:MODE?</code>                                                                                                                                 |
| Preset         | <b>OFF</b>                                                                                                                                                                                                  |
| State Saved    | Saved in instrument state                                                                                                                                                                                   |
| Range          | <b>POSition DELta OFF</b>                                                                                                                                                                                   |
| Annotation     | Mkr # <X value> and <Marker value> upper right on graph<br>When Marker Trace is Polar in WCDMA mode:<br>Mkr # <Chip Value (RHO & QPSKEVM)/Symbol Value (CDP)>, <X value> and <Y value> upper right on graph |

### 3.6.2.3 Delta Marker (Reset Delta)

Pressing this control has the same effect as pressing **Delta** in "**Marker Mode**" on [page 202](#). The selected marker becomes a **Delta** marker. If the selected marker is already a **Delta** marker, the reference marker is moved to the current position of the selected marker, thus resetting the delta to zero.

### 3.6.2.4 Marker Table

When **ON**, the display is split into a measurement window and a marker data display window. For each marker that is on, information is displayed in the data display window, which includes the marker number, control mode, trace number, X axis scale, X axis value, and the Y-axis result. Additional information is shown for markers that have marker functions **ON**.

Turning **Marker Table** on turns **Peak Table** off and *vice versa*.

### 3 Noise Figure Mode

#### 3.6 Marker

|                |                                                                                                                                |
|----------------|--------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:CALCulate:NFIGure:MARKer:TABLE[:STATe] OFF   ON   0   1</code><br><code>:CALCulate:NFIGure:MARKer:TABLE[:STATe]?</code> |
| Example        | <code>:CALC:NFIG:MARK:TABL ON</code><br><code>:CALC:NFIG:MARK:TABL?</code>                                                     |
| Preset         | <code>OFF</code>                                                                                                               |
| State Saved    | The on/off state of <b>Marker Table</b> is saved in instrument state                                                           |

#### 3.6.2.5 Marker Settings Diagram

Lets you configure the **Marker** system using a visual utility, showing you all markers at once.

The top row (labeled **Marker**) shows each of the markers, with a label showing the Mode and a visual representation of the Mode (diamond for **Normal** or **Delta**, nothing for **Off**). The selected **Marker** has a blue outline with the figure in green.

The second row (labeled **Reference Marker**) shows the reference marker for each marker in the top row. If a marker in the top row is a **Delta** marker, an arrow points down to its reference marker. You can drag a top row marker down to any position in the bottom row to make it the reference marker for any other marker.

At the bottom is an image of the **Selected Marker** and dropdowns, allowing you to change the mode and the window of the selected Marker. The **Marker Window** number appears in the trace color of the trace in question.

#### 3.6.2.6 All Markers Off

Turns off all markers.

|                |                                             |
|----------------|---------------------------------------------|
| Remote Command | <code>:CALCulate:NFIGure:MARKer:AOff</code> |
| Example        | <code>:CALC:NFIG:MARK:AOff</code>           |

#### 3.6.2.7 Couple Markers

When **ON**, moving any marker causes an equal X Axis movement of every other marker that is not **Off**. By “equal X Axis movement” we mean that we preserve the difference between each marker’s X Axis value (in the fundamental x-axis units of the trace that marker is on) and the X Axis value of the marker being moved (in the same fundamental x-axis units).

|                |                                                                                                                                  |
|----------------|----------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:CALCulate:NFIGure:MARKer:COUPle[:STATe] ON   OFF   1   0</code><br><code>:CALCulate:NFIGure:MARKer:COUPle[:STATe]?</code> |
| Example        | <code>:CALC:NFIG:MARK:COUP ON</code>                                                                                             |

|             |                                                                       |
|-------------|-----------------------------------------------------------------------|
|             | <code>:CALC:NFIG:MARK:COUP?</code>                                    |
| Preset      | <b>OFF</b><br>Preset by <b>Mode Preset</b> and <b>All Markers Off</b> |
| State Saved | Saved in instrument state                                             |

### 3.6.2.8 Marker Compatibility

Controls whether the marker readout is compatible with earlier instruments. When **Marker Compatibility** is **ON**, it affects the SCPI query response, as well as the marker display.

If this parameter is **ON**, querying a marker returns two comma-separated values: the **Noise Figure** value first, followed by the **Gain** value. If this parameter is **OFF**, the response to a marker query is a single value, for whichever trace the marker is on (**Noise Figure** or **Gain**).

When "**Overlay / Combined**" on page 183 (under **Display**) is **ON**, the Marker value displays in the middle at the top of the screen, and displays only one value if **Marker Compatibility** is **OFF**, but displays both values (**Noise Figure** and **Gain**) if **Marker Compatibility** is **ON**.

This parameter affects the marker display in the **Graph** view. If **Marker Compatibility** is **ON**, the marker is placed on both upper and lower windows at the same frequency point, and the Marker value will be displayed on both windows.

Affects the marker table display in the **Graph** Layout (see "**Layouts**" on page 155). When **Marker Compatibility** is **ON**, the **Marker Table** has two columns for the Y value; one labeled **Noise Figure** and the other **Gain**. When **Marker Compatibility** is **OFF**, each column shows only one valid value, the one for the trace the Marker is on; the other column shows ---. When **Marker Compatibility** is **ON**, both columns show valid values.

In addition, this parameter allows the marker to be scrolled along the x-axis, which allows data to be viewed outside of measured points.

This setting is persistent and survives both **Mode Preset** and power cycle, but is reset to **OFF** by **Restore Mode Defaults**.

|                |                                                                                                                              |
|----------------|------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:CALCulate[:NFIGure]:MARKer:COMPAtible OFF   ON   0   1</code><br><code>:CALCulate[:NFIGure]:MARKer:COMPAtible?</code> |
| Example        | <code>:CALC:MARK:COMP ON</code><br><code>:CALC:MARK:COMP?</code>                                                             |
| Preset         | NFA-B: <b>ON</b><br>Others: <b>OFF</b>                                                                                       |
| State Saved    | Yes                                                                                                                          |
| Range          | <b>OFF</b>   <b>ON</b>                                                                                                       |

### 3.6.3 Peak Search

The controls on this tab let you move the marker to selected peaks of the signal, giving you powerful analysis capabilities, particularly when combined with the delta marker function.

NOTE

Pressing the **Peak Search** hardkey automatically moves you to the **Peak Search** page of the **Marker** menu *and* performs a peak search.  
Pressing the **Peak Search** tab once you are already *in* the **Marker** menu does *not* perform a peak search.

#### 3.6.3.1 Marker Frequency

This is the fundamental control that you use to move a marker around on the trace. It is the same as "[Marker Frequency](#)" on [page 200](#) under **Settings**.

#### 3.6.3.2 Peak Search

Moves the selected marker to the trace point which has the maximum y-axis value for that marker's trace.

NOTE

Pressing the **Peak Search** hardkey automatically moves you to the **Peak Search** page of the **Marker** menu *and* performs a peak search.

|                |                                                                                                                                                                                          |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | :CALCulate:NFIGure:MARKer[1] 2 ... 12:MAXimum                                                                                                                                            |
| Example        | :CALC:NFIG:MARK2:MAX<br><br>:SYST:ERR?<br><br>can be used to query the errors to determine if a peak is found. The message "No peak found" will be returned after an unsuccessful search |
| Notes          | Sending this command selects the subopcoded marker                                                                                                                                       |

#### 3.6.3.3 Next Peak

Moves the selected marker to the peak that is next lower in amplitude than the current marker value. Only peaks that meet all enabled peak criteria are considered.

If there is no valid peak lower than the current marker position, a "No peak found" message is generated, and the marker is not moved.

If the selected marker was **Off**, then it is turned on as a **Normal** marker and a peak search is performed.

|                |                                                                 |
|----------------|-----------------------------------------------------------------|
| Remote Command | <code>:CALCulate:NFIGure:MARKer[1] 2 ... 12:MAXimum:NEXT</code> |
| Example        | <code>:CALC:NFIG:MARK2:MAX:NEXT</code>                          |
| Notes          | Sending this command selects the subopcoded marker              |
| State Saved    | Not part of saved state                                         |

### 3.6.3.4 Next Pk Right

Moves the selected marker to the nearest peak right of the current marker that meets all enabled peak criteria.

If there is no valid peak to the right of the current marker position, a “No peak found” message is generated, and the marker is not moved. If the selected marker was off, then it is turned on as a **Normal** marker and a peak search is performed.

|                |                                                                  |
|----------------|------------------------------------------------------------------|
| Remote Command | <code>:CALCulate:NFIGure:MARKer[1] 2 ... 12:MAXimum:RIGHT</code> |
| Example        | <code>:CALC:NFIG:MARK2:MAX:RIGH</code>                           |
| Notes          | Sending this command selects the subopcoded marker               |
| State Saved    | Not part of saved state                                          |

### 3.6.3.5 Next Pk Left

Moves the selected marker to the nearest peak left of the current marker that meets all enabled peak criteria. If there is no valid peak to the left of the current marker position, a “No peak found” message is generated, and the marker is not moved.

If the selected marker was **Off**, then it is turned on as a **Normal** marker and a peak search is performed.

|                |                                                                 |
|----------------|-----------------------------------------------------------------|
| Remote Command | <code>:CALCulate:NFIGure:MARKer[1] 2 ... 12:MAXimum:LEFT</code> |
| Example        | <code>:CALC:NFIG:MARK2:MAX:LEFT</code>                          |
| State Saved    | Not part of saved state                                         |

### 3.6.3.6 Minimum Peak

Moves the selected marker to the minimum y-axis value on the current trace. Minimum (negative) Peak searches do not have to meet the peak search criteria. It just looks for the lowest y-axis value.

If the selected marker is **Off**, it is turned on before the minimum search is performed.

|                |                                                            |
|----------------|------------------------------------------------------------|
| Remote Command | <code>:CALCulate:NFIGure:MARKer[1] 2 ... 12:MINimum</code> |
| Example        | <code>:CALC:NFIG:MARK:MIN</code>                           |
| Notes          | Sending this command selects the subopcoded marker         |
| State Saved    | Not part of saved state                                    |

### 3.6.3.7 Pk-Pk Search

Finds and displays the amplitude and frequency (or time, if in zero span) differences between the highest and lowest y-axis value. Places the selected marker on the minimum value on its selected trace, and places that marker's reference marker on the peak of its selected trace.

This function turns on the reference marker and sets its mode to **Normal** if it is not already on. (These markers may be on two different traces.)

The rules for finding the maximum peak are the same as for **Peak Search**. However, the minimum trace value is not required to meet any criteria other than being the minimum y-axis value in the trace.

If the selected marker is **Off**, a **Delta** type marker is turned on and the peak-to-peak search is done. If the selected marker is on, but it is not a **Delta** marker, then it is changed to **Delta**, which turns on the reference marker if needed, then it performs the peak-to-peak function.

|                |                                                                                             |
|----------------|---------------------------------------------------------------------------------------------|
| Remote Command | <code>:CALCulate:NFIGure:MARKer[1] 2 ... 12:PTPeak</code>                                   |
| Example        | <code>:CALC:NFIG:MARK:PTP</code>                                                            |
| Notes          | Turns on the Marker D active function<br>Sending this command selects the subopcoded marker |
| Dependencies   | Not available when " <b>Couple Markers</b> " on page 203 is <b>ON</b>                       |
| Couplings      | The selected marker becomes a <b>Delta</b> marker if not already in delta mode              |
| State Saved    | Not part of saved state                                                                     |

### 3.6.3.8 Marker Delta

Pressing this control has the same effect as pressing **Delta** in "**Marker Mode**" on page 202 on the **Settings** tab. The selected marker becomes a **Delta** marker. If the selected marker is already a **Delta** marker, the reference marker is moved to the current position of the selected marker, thus resetting the Delta to zero.

The control is duplicated here to allow you to conveniently perform a peak search and change the marker's control mode to **Delta** without having to access two separate menus.

### 3.6.3.9 Continuous Peak Search

Sets **Continuous Peak Search** on or off. When **ON**, a peak search is automatically performed for the *selected* marker after each sweep. The rules for finding the peak are the same as for **Peak Search**, including the peak criteria rules. If no valid peak is found, a warning is generated after each sweep.

|                              |                                                                                                                            |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------|
| Remote Command               | :CALCulate:NFIGure:MARKer[1] 2 ... 4:CPEak[:STATe] ON   OFF   1   0<br>:CALCulate:NFIGure:MARKer[1] 2 ... 4:CPEak[:STATe]? |
| Example                      | :CALC:NFIG:MARK:CPE ON                                                                                                     |
| Preset                       | OFF                                                                                                                        |
| State Saved                  | Yes                                                                                                                        |
| Range                        | ON OFF                                                                                                                     |
| Backwards Compatibility SCPI | :CALCulate[:NFIGure]:MARKer[1]   2   ...   4:SEARch:CONTInuous[:STATe]                                                     |

## 3.6.4 Pk Search Config

Contains controls that allow you to set up **Peak Search** functions.

Since the **Pk Search Config** functions are independent of the selected Marker, **Select Marker** does not display while in **Pk Search Config**.

### 3.6.4.1 Peak Search Mode

Selects the type of peak search to be performed when the **Peak Search** front-panel key is pressed:

|       |     |                                |
|-------|-----|--------------------------------|
| Min   | MAX | Performs a minimum peak search |
| Max   | MIN | Performs a maximum peak search |
| Pk Pk | PPK | Performs a peak-to-peak search |

|                |                                                                                                 |
|----------------|-------------------------------------------------------------------------------------------------|
| Remote Command | :CALCulate:NFIGure:MARKer:SEARch:TYPE MAX   MIN   PPK<br>:CALCulate:NFIGure:MARKer:SEARch:TYPE? |
| Example        | :CALC:NFIG:MARK:SEAR:TYPE MIN                                                                   |
| Couplings      | Performing a <b>PPK</b> search turns a marker's relative marker on if it is currently off       |
| Preset         | MAXimum                                                                                         |
| State Saved    | Yes                                                                                             |
| Range          | MINimum MAXimum PTPeak                                                                          |

|               |                                         |
|---------------|-----------------------------------------|
| Backwards     | :CALCulate[:NFIGure]:MARKer:SEARch:TYPE |
| Compatibility |                                         |
| SCPI          |                                         |

## 3.6.5 Properties

The controls on this tab are used to set certain properties of the selected marker.

### 3.6.5.1 Marker Frequency

This is the fundamental control that you use to move a marker around on the trace. It is the same as ["Marker Frequency" on page 200](#) under **Settings**.

### 3.6.5.2 Relative To

Selects the marker to which the selected marker is relative (its reference marker).

Every marker has another marker to which it is relative. This marker is referred to as the “reference marker” for that marker. The marker must be a **Delta** marker to make this relevant. If it is a **Delta** marker, the reference marker determines how the marker is controlled and how its value is displayed. A marker cannot be relative to itself.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | :CALCulate:NFIGure:MARKer[1] 2 ... 12:REference <integer><br>:CALCulate:NFIGure:MARKer[1] 2 ... 12:REference?                                                                                                                                                                                                                                                                                                            |
| Example        | :CALC:NFIG:MARK3:REF 2<br>:CALC:NFIG:MARK3:REF?                                                                                                                                                                                                                                                                                                                                                                          |
| Notes          | Causes the marker specified with the subopcode to become selected<br>A marker cannot be relative to itself so that choice is not available, and if sent from SCPI generates error -221: “Settings conflict; marker cannot be relative to itself”<br>The query returns a single value (the specified marker numbers relative marker)                                                                                      |
| Couplings      | The act of specifying the selected marker’s reference marker makes the selected marker a <b>Delta</b> marker<br>If the reference marker is <b>Off</b> , it is turned on in <b>Fixed</b> or <b>Normal</b> mode at the delta marker location                                                                                                                                                                               |
| Preset         | The preset default “Relative To” marker (reference marker) is the next higher numbered marker (current marker +1). For example, if marker 2 is selected, then its default reference marker is marker 3. The exception is marker 12, which has a default reference of marker 1<br>Set to the defaults by <b>Restore Mode Defaults</b> . <i>Not</i> reset by <b>Marker Off</b> , <b>All Markers Off</b> , or <b>Preset</b> |
| State Saved    | Saved in instrument state. Not affected by <b>Marker Off</b> and hence not affected by Preset or power cycle                                                                                                                                                                                                                                                                                                             |
| Range          | (For SCPI command): 1 to 12<br>If the range is exceeded, the value is clipped                                                                                                                                                                                                                                                                                                                                            |
| Min            | 1                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Max            | 12                                                                                                                                                                                                                                                                                                                                                                                                                       |

|              |                                                      |
|--------------|------------------------------------------------------|
| Annunciation | Appears in the marker label of a <b>Delta</b> marker |
|--------------|------------------------------------------------------|

### 3.6.5.3 Marker Window

Assigns the specified marker to one of the traces. A marker can be assigned to any trace.

|                |                                                                                                                                     |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------|

| Example        | <code>:CALC:NFIG:MARK2:TRAC TRACe2</code><br><code>:CALC:NFIG:MARK2:TRAC?</code>                                                    |
| Preset         | 1                                                                                                                                   |
| State Saved    | Yes                                                                                                                                 |
| Range          | <code>TRACe1 TRACe2</code>                                                                                                          |

### 3.6.5.4 Marker Settings Diagram

Lets you configure the Marker system using a visual utility. It is the same as "**Marker Settings Diagram**" on [page 203](#) under **Settings**.

## 3.7 Meas Setup

Contains functions for setting up measurement parameters, and parameters global to all measurements in the Mode.

NOTE

In the **Meas Setup** menu, you may configure **"Averaging"** on page 211, and set the **"Average/Hold Num"** on page 211.

### 3.7.1 Settings

Contains frequently used **Meas Setup** functions to which you will want the fastest access.

#### 3.7.1.1 Average/Hold Num

Sets the number of data acquisitions that will be averaged. **"Averaging"** on page 211 can be turned on or off.

NOTE

During calibration, the value you select for Average Count is translated into a sweep time for each point. An Average Count of 10 results in a sweep time of 160ms (160ms at each measurement point if you are using the default sweep time). There are 2 measurement points per freq point; one measurement for noise source **Off** and one for **On**. If **Averaging** is **ON**, then for a Cal the app uses effectively point type averaging, and for Meas, it reverts to sweep type averaging.

|                                 |                                                                                                                       |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------|

### 3.7.1.3 DUT Profile

Specifies which DUT profile is being used for the current measurement.

A **DUT Profile** contains a group of DUT related measurement settings (see ["More Information" on page 212](#) below). You can save these parameters for multiple DUTs into different DUT profiles. By changing the DUT profile, you can switch measurement settings for different DUTs.

When you change a measurement setting in the group, it will be automatically saved into the selected profile. When you change the DUT profile, the settings saved in the profile will be automatically loaded.

#### NOTE

The settings saved in DUT profiles are preset by **Mode Preset** or **Meas Preset**.

|                |                                                                                                                 |
|----------------|-----------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>[ :SENSe]:NFIGure:MODE:PROFile &lt;integer&gt;</code><br><code>[ :SENSe]:NFIGure:MODE:PROFile?</code>     |
| Example        | <code>:NFIG:MODE:PROF 1</code>                                                                                  |
| Couplings      | When you change the <b>DUT Profile</b> , the measurement settings saved in the profile are automatically loaded |
| Preset         | 1                                                                                                               |
| State Saved    | Yes                                                                                                             |
| Min            | 1                                                                                                               |
| Max            | 12                                                                                                              |

### More Information

The following settings are included in a DUT profile:

#### Meas Setup

All settings under:

- DUT Setup & Calibration, Measurement
- Ext LO Setup
- Cal Setup

### 3 Noise Figure Mode

#### 3.7 Meas Setup

|           |                                     |
|-----------|-------------------------------------|
|           | - Noise Source                      |
|           | - Loss Comp                         |
| Frequency | All settings under <b>Frequency</b> |
| Amplitude | Internal Preamp, Attenuation        |
| BW        | Res BW                              |
| Sweep     | Avg Time/Pt                         |

The DUT profile also contains Cal Data and Calibration Status. Cal Data is saved to the DUT profile when you perform a calibration on that profile using ["Profile Calibration" on page 256](#) under the **DUT Setup & Calibration, Calibration** tab.

#### 3.7.1.4 DUT Setup & Calibration

Lets you prepare the application for measuring specific devices and setups. It also provides information about how to set up the instrumentation for calibration and measurement.

**Noise Figure** can measure a wide range of different device types. Figuring out how to connect each of these devices for calibration and measurement is not immediately obvious, so to simplify things, diagrams are provided.

The IF/RF frequencies are displayed below the diagram (and the LO frequency or Factor if appropriate). A small 'eye' icon is displayed next to the frequencies that are used. This can be toggled between **RF/IF/LO** using ["Freq Context" on page 218](#).

To allow you to change the DUT profile easily, there is a shortcut to the **DUT Profile** parameter in each tab..

In the **Measurement** tab, there is a **DUT Setup** diagram that tells you how to set up the connection. There are four groups of parameters at the top of the **DUT Setup** diagram. Parameters in the left group are **Frequency** parameters; parameters in the middle two groups are **DUT** parameters and System down converter parameters; parameters in the right group are **Analyzer** parameters. The **Analyzer** parameter group displays several important measurement settings, which can also be found under **Amplitude**, **BW** and **Sweep** panels.

The measurement related frequencies are displayed below the **DUT Setup** diagram. The blue eyeball icon goes with "**Freq Context**" on page 218), when **Freq Context** = **RF**, the eyeball is displayed next to the DUT Input (RF) frequencies. Similarly, for IF and LO, the eyeball is near the LO and the DUT Output (IF) frequencies.

In the **Calibration** tab, there is a **Calibration Setup** diagram that tells you how to set up the connection for calibration. There is a group of check boxes at the bottom, which lets you do a calibration using the settings saved in selected DUT profiles. The Cal Data is saved into each selected profile when the calibration is finished. When you change the profile, the Cal Data is loaded automatically, and Apply Cal is set to **ON**.

The diagrams update in real-time as the settings on the form are changed, and the respective Calibration or Measurement diagram is displayed depending on the selection made in the form.

### 3 Noise Figure Mode

#### 3.7 Meas Setup

Frequency Converter Measurement Diagram

System Downconverter Calibration Diagram

For DSB measurements in System Downconverter mode, the filter at the RF port is removed from the diagram. This can be misleading, because this filter is normally used to remove one of the sidebands. In some cases, the LPF at the output of the mixer is not needed if the 3.6 GHz LPF in the RF front end of signal analyzer will suffice.

## Freq Block

Contains controls that let you set "Freq Mode" on page 191 and Context.

## Frequency Mode

Provides a shortcut to "Freq Mode" on page 191 in Frequency.

When the frequency mode is set to LIST via the DUT Setup form, the form and the menus do not change. The Frequency List Editor can be opened from the "Frequency" on page 191 menu.

Editing the frequency list updates the start/stop frequencies in the DUT form to match, depending on which one is in the frequency context (see "Freq Context" on page 218). Changing the frequencies in the frequency list does not update the start, stop, center and span frequencies under Frequency. They are only altered when in SWEpt frequency mode. This is how the instrument operates.

If the DUT setup requires a frequency conversion (down, up, system down converter), then the frequency context is important to the frequency list. When the Freq LIST mode is selected and the Freq Context is changed, an advisory message is displayed warning that frequencies in the Frequency menu will change. The frequencies in the list are recalculated in keeping with the new context. The previous frequencies can be recovered if the original context is restored. There are conditions where you may change context, then the sideband and then restoring the original context will not obtain the original frequency list. This original frequency list can however be restored by retracing your steps.

NOTE

When DUT is MCONverter, you must specify the RF, IF and LO (if DUT LO is Swept) frequency list respectively. Switching DUT types does not change the frequency lists for the MCONverter, that is, when you switch to MCONverter from other DUT types, RF, IF and LO frequency lists will be restored to the latest values.

See "DUT Block" on page 219 for more details on how to specify the frequency for an MCONverter.

## Freq Context

Defines the way frequencies are shown in the results window when using a frequency converting device:

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>RF</b>            | Frequencies are displayed as they are before they enter the DUT and before any frequency conversion takes place. In the case of Sideband = DSB measurements, the RF frequencies represented are only that of the LSB Start and Stop range. If a frequency conversion is taking place, then the RF frequencies are not the ones being measured at the signal analyzer RF input port                                                                                                                              |
| <b>IF</b>            | Frequencies are displayed as they are when they leave the DUT after the conversion takes place. If a system downconverter is not used, these are the frequencies that the instrument is physically measuring. If a system downconverter is used, these are the frequencies that enter the system downconverter                                                                                                                                                                                                  |
| <b>LO</b>            | Frequencies at the DUT's external LO are displayed. These are NOT the frequencies that the instrument is physically measuring. This context lets you review the LO frequencies required to program the external LO or those set by the instrument. The LO context is only selectable when the DUT's external LO frequency mode is swept                                                                                                                                                                         |
| <b>SysDownConvLO</b> | Frequencies at the system downconverter's external LO are displayed. DSB system downconverter measurements have implicit linear averaging of DUT characteristics and ENR values between the USB and LSB frequencies. Results are made against the average frequency of the two bands – the system downconverter LO frequency. The <b>SysDownConvLO</b> context is only selectable when the DUT is set to <b>Amplifier</b> , system downconverter is in use, and the system downconverter sideband is set to DSB |

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

DUT Block

Contains controls pertinent to the DUT.

DUT

Lets you select the type of DUT to be measured:

|                         |                   |
|-------------------------|-------------------|
| Amplifier               | <b>AMPLifier</b>  |
| Down Converter          | <b>DOWNconv</b>   |
| Up Converter            | <b>UPConv</b>     |
| Converter (Multi-stage) | <b>MCONverter</b> |

The DUT type **MCONverter** represents a combination of multi-stage converters, which perform internal frequency conversion. For this type of DUT, the frequency range is *not* calculated or checked, so you must set both the input, output, and LO frequency ranges respectively and correctly.

NOTE

1. DSB frequency converting device should not be used in the combination of converters

2. Only one Swept LO is allowed to connect to a converting device in the combination

|                |                                                                                                                                                                                                                                                                                                                                                                                                                  |

#### More Information

In most cases, for downconverters, the IF is always lower than the LO, however since mixers perform a sum and difference term, that is, LO-RF and RF-LO, there are corner cases that are still valid where the IF is not less than the LO. See the following diagram, which illustrates such a case.

## DSB

Making accurate measurements using DSB essentially requires that the IF is small, and that the DUT is a broadband device. The main advantage of using DSB is that the filtering requirement is substantially reduced. In the X-Series Signal Analyzer application we will return the values for the LSB only when the RF context (see "[Freq Context](#)" on page 218) is set. When the frequency context is set to SysDownConvLO, the results are returned with RF values equal to the LO. Using DSB is a trade-off between filtering needs and result accuracy.

For DSB measurements, noise from two separated RF bands is mixed into the IF band, where a power addition takes place. Measurements are made with the noise from a pair of separate bands, symmetrically arranged about the LO frequency. The selection of the IF frequency value should be a low frequency. Hence this technique maintains the two bands close together. The reason is to justify making the assumption that the variations in noise source ENR, gain and noise figure are linear between the two bands. This means that the averaging of results for the two bands, due to the power summation, gives a result which can be assigned to the center frequency – the LO frequency.

For the downconverter DUT, the noise from two bands is combined during the measurement, while during calibration, when the DUT was not connected, only one band (at the IF frequency) was used. If the assumptions about the parameters being flat over frequency between the two sidebands are valid, this causes a doubling in power (3.01 dB increase) in noise level during the measurement. This does not happen during calibration. This can be corrected for, using the Loss Compensation facility, and entering Before DUT Value of -3.01 dB and selecting Fixed in the Before DUT field. The DSB power addition occurs for both the Hot and Cold noise from the noise source, and the noise created in the input of the DUT. A temperature value can be assigned to this loss using the Before Temperature. Using the Cold temperature of the noise source (often assumed to be 290 Kelvin) corrects for this, and the X-

### 3 Noise Figure Mode

#### 3.7 Meas Setup

Series Signal Analyzer will give corrected results comparable to those that would have been given by an SSB measurement.

If you must use a high IF frequency, or if it has variations in performance over frequency, then the assumption is invalid. DSB measurements are not appropriate for making measurements where DUT performance, or noise source ENR, have significant variation over the frequency range  $LO \pm IF$ . DSB measurements need care to determine their filtering needs.

In all cases where DSB is selected, advisory message 0.2191 will be displayed and "(LSB only)" will also be appended to the 'RF' label on the DUT setup form to remind users that only the LSB frequencies are displayed.

There are two conditions where DSB could be used.

### DUT = DOWNconv, LO = Fixed

### DSB - Downconv, Fixed LO

The fixed LO mode produces no sweep at the DUT input, as the two sideband input pairs diverge their average remains fixed. This mode could be useful for measuring a complex DUT where the effect of variation of performance of the post-mixer stage over IF frequency is of interest. Because the LO frequency is held constant it is the IF frequency at the X-Series Signal Analyzer input that is swept. The figure illustrates this mode. Note again that the ENR values for the measurement are taken at the LO frequency that is, effectively the average of both sidebands.

### DUT = DOWNconv, LO = Swept

In the fixed IF (swept LO) mode, the IF frequency at the input of the signal analyzer is constant, and the LO frequency is swept to perform the measurement.

### 3 Noise Figure Mode

#### 3.7 Meas Setup

DSB – Downconv, Swept LO. Note Y axis is Sweep Pts.

The figure shows how the different frequencies in a DSB, downconverter, fixed IF, measurement vary as the measurement sweep proceeds. This mode measures the DUT's noise figure across a range of DUT input frequencies. This is the main use of the DSB mode. A similar diagram could be drawn, if needed, showing the LO harmonic mixing modes at higher frequencies, with flatter slopes due to frequency multiplication. Note again that the ENR values for the measurement are taken at the LO frequency, that is, effectively the average of both sidebands.

#### Sideband Interaction

Let's look at some examples as to how Sideband interacts with other DUT setup parameters.

Sidebands

Case 1:

DUT = **DOWNconv**, Sideband = LSB, LO Mode = Fixed, RF is Fixed, Freq Context = RF (default Freq Context is IF). Picture above is valid accept the USB has been filtered out (removed). So, LO and LSB RF mix to give the IF = LO-RF. Let's now say the user now selects USB, what happens? Since the freq context = RF, then the frequency that is auto calculated is the IF frequency leaving the LO and RF untouched. In this

condition the IF cannot change to a frequency that will satisfy these conditions and an error like "System input freq out of range" will be flagged. If, however the Freq Context was IF and the user changed from LSB to USB, then under these conditions the RF is auto calculated and could then change to the USB freq above the LO as shown in the diagram. A similar scenario can be deduced if the RF and IF are both swept. Note the default Freq Context for a downconverter DUT is IF.

Case 2:

DUT = **UPConv**, Sideband = LSB, LO Mode = Fixed, RF is Fixed, Freq Context = RF (default Freq Context is IF). Picture below shows the setup accept the USB has been filtered out (removed). Note the IF and RF terms have been swapped from the above diagram. So, LO and RF mix to give the IF = LO-RF. Let's now say the user now selects USB, what happens? Since the Freq Context = RF, then the frequency that is auto calculated is the IF frequency leaving the LO and RF untouched. Under these conditions the IF is auto calculated and can change to the USB freq above the LO as shown in the diagram below. However, if the Freq Context was IF and the user changed from LSB to USB, then under these conditions the RF cannot change to a frequency that will satisfy these conditions and an error like "System input freq out of range" will be flagged. A similar scenario can be deduced if the RF and IF are both swept. Note the default Freq Context for a downconverter DUT is IF.

Upconverter Sidebands

LO Mode (For DUT)

Set the mode of the external LO frequency for DUT. This can be **FIXed**, where a constant LO frequency is being used, or **SWEPt**, where the LO frequency changes between sweep points.

| Example        | <code>:NFIG:MODE:DUT:LOSC FIX</code><br><code>:NFIG:MODE:DUT:LOSC?</code>                                                                                                                     |
| Couplings      | Valid only when "DUT" on page 219 is <b>DOWNconv</b> , <b>UPConv</b> , or <b>MCONverter</b><br>When set to <b>SWEPt</b> (IF is <b>FIXed</b> ), "Freq Context" on page 218 is set to <b>RF</b> |

Changing from **SWEPT** to **FIXed** sets **Freq Context** to **IF**

When **DUT** is **DOWNconv** or **UPConv**, LO Freq Mode in DUT group is set to **SWEPT**, if **Freq Context** is **RF**, LO Frequency start stop are auto-calculated from the RF and IF frequencies. If **Freq Context** is **LO**, then the RF frequencies are auto calculated from the LO and IF frequencies

Changing **LO Freq Mode** in DUT group from **FIXed** to **SWEPT** sets the **LO Freq Mode** in System Downconverter group to **FIXed** automatically if its current setting is **SWEPT**

When "**Freq Mode**" on page 191 is set to **FIXed**, LO Freq Mode in DUT group is set to **FIXed** automatically and grayed-out

When **LO Freq Mode** in DUT group is **FIXed**, **Freq Context** cannot be set to **LO**

## Ext LO Control (For DUT)

Toggles external LO control on/off for DUT. This is the same as "**DUT LO Control (on/off)**" on page 261.

## LO Power (For DUT)

Lets you set the LO Power. This is the same as "**LO Power**" on page 262.

## Sys Downconv Block

Contains controls pertinent to the System Downconverter.

## Sys Downconv

Selects whether the system downconverter is active. A system downconverter effectively increases the range of the measurement by downconverting high frequencies to those that the instrument can measure. The system downconverter is similar to the standard downconverting DUT, although because it is not actually a part of the DUT, it can be calibrated out of the measurement. This is used normally for testing DUTs outside the range of the signal analyzer or possibly to move the frequencies into the range of the specified (not nominal specs) signal analyzer frequencies.

|                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## DSB

For an Amplifier with a system downconverter, the  $-3.01$  dB adjustment is not needed since the doubling of the power is made in both the calibration stage and the measurement stage.

There are two conditions where DSB could be used.

### DUT = Amplifier, Sys Downconv = ON, LO = Fixed

With the fixed LO, there may be a gap in the coverage of the DUT test (see figure below), and hence will limit the usefulness of the measurement. With the swept LO, fixed IF (assuming the conditions mentioned are met) causes no gaps in the coverage. Another issue here (also the same for downconverter DUT's) is that the values being averaged are getting further apart as the sweep takes place, increasing the possibility of accuracy errors.

X-Series Analyzers do not restrict this mode of operation; however, a warning message is displayed when DSB is selected. You enter the LSB range and the diagram on the DUT setup form shows "(LSB range only)" alerting you to consider the USB, also.

Note that in the amp "test coverage" area the results will effectively be the average of both upper and lower sidebands.

### DUT = Amplifier, Sys Downconv = ON, LO = Swept

This condition is similar to the downconverter DUT above (see figure below), however in this case the DUT is an amplifier and the setting of the sweep span and IF, are important to the results obtained. If the span of the sweep is not large enough compared to the IF, then the results are split into two bands that do not overlap leaving an area in the middle untested. The sweep span needs to be approximately 10 times the IF to allow a sensible overlap. In NFA, the results are returned with the

RF values equal to the LO, so the overlap condition may not be obvious. In the X-Series Signal Analyzer application we return the values for the LSB only when the RF context (see "Freq Context" on page 218) is set. When the frequency context is set to **SysDownConvLO**, the results are returned with RF values equal to the LO.

Note that in the amp "test coverage" area the results will effectively be the average of both upper and lower sidebands.

LO Freq Mode (For Sys Downconv)

Lets you set the mode of the external LO frequency for the system downconverter. This can be **FIXed**, where a constant LO frequency is being used, or **SWEPT**, where the LO frequency changes between sweep points.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

### Ext LO Control (on/off) (For Sys Downconv)

Toggles the external LO control on/off for the System Downconverter. This is the same as ["DUT LO Control \(on/off\)" on page 261](#).

### LO Power (For Sys Downconv)

Lets you set the LO Power. This is the same as ["LO Power" on page 273](#).

### Misc Block

Contains copies of various controls for your convenience.

### Int Preamp

This is the same as ["Internal Preamp" on page 170](#) under **Amplitude, Signal Path**.

### Mech Atten

This is the same as **Mech Atten** under **Amplitude, Attenuation**.

### Res BW

This is the same as ["Res BW" on page 173](#) under **BW, Settings**.

### Avg Time/Pt

This is the same as ["Avg Time/Pt" on page 356](#) under **Sweep, Sweep/Control**.

### Points

This is the same as ["Points" on page 363](#) under **Sweep, Sweep/Control**.

### RF, LO and IF Frequencies (For DownConv and Upconv)

This section describes the RF, LO and IF frequencies when the DUT is a Downconv or Upconv.

## DUT Input

The DUT Input Start, Stop and Fixed frequencies can be changed via the DUT setup dialog. These parameters mirror those in the **Frequency** menu (see ["Settings" on page 191](#)) when ["Freq Context" on page 218](#) is **RF**. The **Fixed** frequency menu appears only when the LO is **FIXed**, and ["Freq Mode" on page 191](#) is set to **FIXed**.

### DUT Input Start Frequency

Sets the start frequency for a swept RF.

DUT LO

The LO Start, Stop and Fixed frequencies can be changed via the DUT setup form. These parameters mirror those in the **Frequency** menu (see "Settings" on page 191) when "Freq Context" on page 218 is **LO**. If any of the LO frequencies lie outside of the range defined by the LO "Min Freq" on page 266 and "Max Freq" on page 267, message 525 is displayed.

When the LO is fixed, the Start and Stop LO frequencies are disabled and hidden, and the **Fixed** frequency parameter are enabled and displayed for changing the LO frequency.

When the LO is swept, the Start and Stop frequencies are enabled and displayed and the **Fixed** frequency parameter is disabled and hidden.

## LO Start Frequency

Sets the start frequency for a swept LO.

|                |                                                                                                                         |

| State Saved    | Yes                                                                                                                     |
| Min            | 2 Hz                                                                                                                    |
| Max            | 3.30 THz                                                                                                                |

## LO Fixed Frequency

Sets the External LO frequency when **LO Freq Mode** is set to **FIXed**, when measuring frequency converting devices.

### 3 Noise Figure Mode

#### 3.7 Meas Setup

When using a fixed LO, this parameter becomes active along with the frequency in context (RF or IF; see ["Freq Context" on page 218](#)). The frequencies used in the measurement can then be set between this parameter and the RF/IF. When a Swept LO is selected, this parameter is disabled and hidden, and the LO Start and Stop frequency boxes are enabled and displayed to allow swept frequency adjustments.

| Backwards Compatibility<br>SCPI | <code>[ :SENSe]:CONFigure:MODE:DOWNconv   UPConv:LOSCillator:FREQuency</code><br>(PSA/NFA/FSP)                                                                       |

## DUT Output

The IF Start, Stop and Fixed frequencies can be configured via the DUT Setup form. These parameters mirror those in the **Frequency** menu (see ["Settings" on page 191](#)) when ["Freq Context" on page 218](#) is **IF**. The Start and Stop frequencies are only available when the context is IF.

When the DUT setup requires a frequency conversion (downconverter, upconverter), and the External LO Frequency Mode is **FIXed**, and ["Freq Mode" on page 191](#) is **SWEpt**, the IF Start and Stop frequencies are enabled and displayed. The IF Fixed frequency is disabled and hidden.

When the DUT setup requires a frequency conversion (downconverter, upconverter), and the External LO Frequency Mode is **SWEpt** or ["Freq Mode" on page 191](#) is **FIXed**, the Start and Stop frequency parameters are disabled and hidden and the Fixed frequency is enabled and displayed.

**DUT Output (IF)**  
Fixed: 30.000000 MHz

## DUT Output Start Frequency

Sets the start frequency for a swept IF. This parameter is only available when External LO Frequency Mode is **FIXed** and "**Freq Mode**" on page 191 is **SWEpt**.

#### DUT Output Fixed Frequency

Sets the tuned frequency at the input of the instrument. This parameter is only available when External LO Frequency Mode is **SWEPT**, or "**Freq Mode**" on page 191 is set to **FIXed**.

#### RF, LO and IF Frequencies (For Converter)

When measuring Converter (multi-stage), RF, LO and IF frequencies should be set by editing Start, Stop and Fixed frequencies (when "**Freq Mode**" on page 191 is **SWEPT** or **FIXed**), or by editing RF, LO and IF frequency list (when **Freq Mode** is **LIST**). The application does not calculate and check these frequencies for this type of DUT.

There is no requirement that Stop frequency must be greater than Start frequency. For example, when External LO Frequency Mode is **FIXed** and Frequency Mode is **SWEpt**, IF Start and Stop frequencies could be equal if there was a swept LO in the combination of multi-stage converter. However, it is not controlled by the application.

## DUT Input

The RF Start, Stop and Fixed frequencies can be changed via the DUT setup form. These parameters mirror those in the **Frequency** menu (see "**Settings**" on page 191) when "**Freq Context**" on page 218 is **RF**.

The commands in this section are used to set the RF Start, Stop and Fixed frequencies when "**DUT**" on page 219 is **MCONverter**.

## RF Start Frequency

Used to set the RF start frequency when "**DUT**" on page 219 type is **MCONverter**. When "**Freq Context**" on page 218 is **RF**, you can use **[ :SENSe ] :NFIGure:FREQuency:STARt** or this command to set RF start frequency; When **Freq Context** is **LO/IF**, you can use *only* this command to set RF start frequency.

|                |                                                                                                                                              |

| Couplings      | Only available when "Freq Mode" on page 191 is <b>FIXed</b>                                                                                  |
| Preset         | 30 MHz                                                                                                                                       |
| State Saved    | Yes                                                                                                                                          |
| Min            | 1 Hz                                                                                                                                         |
| Max            | Depends on instrument frequency range                                                                                                        |

#### DUT LO

The LO Start, Stop and Fixed frequencies can be changed via the DUT setup form. These parameters mirror those in the **Frequency** menu (see "Settings" on page 191) when "Freq Context" on page 218 is **LO**.

The following commands are used to set the LO Start, Stop and Fixed frequencies when "DUT" on page 219 is **MCONverter**.

#### LO Start Frequency

Used to set the LO start frequency when "DUT" on page 219 type is **MCONverter**. When "Freq Context" on page 218 is **LO**, you can use `[ :SENSe ] :NFIGure:FREQuency:START` or this command to set LO start frequency; When **Freq Context** is **IF/RF**, you can use *only* this command to set LO start frequency.

|                |                                                                                                                                                                        |

## LO Fixed Frequency

Sets the External LO frequency when the LO Frequency Mode is set to **FIXed**. When a Swept LO is selected, this parameter is disabled and hidden, and the LO Start and Stop frequency boxes are enabled and displayed to allow swept frequency adjustments.

When measuring Converter (multi-stage) using a fixed LO, RF, LO and IF frequency parameters are always active, no matter which "Freq Context" on page 218 is selected.

## DUT Output

The IF Start and Stop frequencies can be changed via the DUT setup form. These parameters mirror those in the **Frequency** menu (see "**Settings**" on page 191) when "**Freq Context**" on page 218 is **IF**.

The commands in this section are used to set the IF Start, Stop and Fixed frequencies when "**DUT**" on page 219 is **MCONverter**.

## IF Start Frequency

Used to set the IF start frequency when "**DUT**" on page 219 type is **MCONverter**. When "**Freq Context**" on page 218 is **IF**, you can use `[ :SENSe ] :NFIGure:FREQuency:STARt` or this command to set IF start frequency; When **Freq Context** is **RF/LO**, you can use *only* this command to set IF start frequency.

## System Downconverter LO Block

Lets you set LO fixed frequency parameters.

## LO Fixed Frequency

Sets the External LO frequency for system downconverter when the LO Freq Mode of system downconverter is set to **FIXed**.

When **Frequency Mode** is **SWEpt** or **LIST**, and System Downconverter is **FIXed**, IF start and stop frequency are displayed. System Downconverter LO start and stop frequency are hidden.

3 Noise Figure Mode  
3.7 Meas Setup

When **Frequency Mode** is **FIXed**, only IF Fixed and LO Fixed frequencies are displayed. LO Fixed frequency is enabled for changing the frequency. IF Fixed frequency is disabled.

### LO Start Frequency

Displays the LO Start frequency of the system downconverter when the LO Freq Mode of system downconverter is [SWEPT](#). This value is not editable.

### LO Stop Frequency

Displays the LO Stop frequency of the system downconverter when the LO Freq Mode of system downconverter is [SWEPT](#). This value is not editable.

### System Downconverter IF Block

Lets you set IF fixed frequency parameters.

### IF Fixed Frequency

Sets the tuned frequency at the input of the Instrument when system downconverter is turned on. This parameter is only available when External LO Frequency Mode of system downconverter is [SWEPT](#).

When **Frequency Mode** is [SWEPT](#) or [LIST](#), and system downconverter is [SWEPT](#), IF start and stop frequency will be hidden. System downconverter LO start and stop frequency will be displayed.

3 Noise Figure Mode  
3.7 Meas Setup

When "Freq Mode" on page 191 is **FIXed**, only IF Fixed and LO Fixed frequencies are displayed. LO Fixed frequency is enabled for changing the frequency. IF Fixed frequency is disabled.

Select All

Deselect All

Calibrate Profiles

Clear Cal Data

Pressing **Calibrate Profiles** performs user calibration on the selected profiles in sequence. The measurement loads the settings from each profile and performs

calibration. Once the calibration is performed successfully on the selected profile, the Cal Data is automatically saved in that profile. When you change the DUT profile, the Cal Data saved in that profile is automatically loaded.

You can skip calibration on a selected profile by pressing **Cancel**.

## Signal Path Configuration

This tab is only available in N897xB models. This path can help you improve the uncertainty of your measurement. It lets you input DUT, Noise Source and USB Preamp information and configure the signal path according to the uncertainty estimation.

Input the required DUT information, the Noise Source type and USB Preamp type then press **Optimize**. The **Signal Path Configuration** table will show the optimized attenuation value and estimated uncertainty for four different preamp combinations, and automatically selects the one with the minimum uncertainty. You can also choose other preamp combinations with optimized attenuation in the table, or choose the **User Defined** row to configure both preamp combination and attenuation yourself. The Internal Preamp and Attenuation settings are updated according to the selected configuration. During the calibration and measurement, you will be prompted to plug or unplug the USB Preamp according to the selected configuration in this table.

You can bypass this feature by leaving the Information table blank (or pressing **Clear** if the Information table is not blank), and then exiting this tab. If the Information table is blank, no signal path configuration will be selected in the Signal Path Configuration table, and you will not be prompted to plug or unplug the USB Preamp during the calibration and measurement.

You are recommended to fill the ENR table first to get a more accurate uncertainty estimation.

## DUT Information

Used to input necessary DUT, Noise Source and USB Preamp information for uncertainty estimation, including DUT Noise Figure, DUT Gain, DUT bandwidth, DUT input/output match, Noise Source type and USB Preamp type. The DUT information can be measured or estimated values.

### NF (Front Panel Only)

Lets you enter the noise figure of DUT.

|             |        |
|-------------|--------|
| State Saved | Yes    |
| Min         | 0 dB   |
| Max         | 100 dB |

### Gain (Front Panel Only)

Lets you enter the gain of DUT.

|             |           |
|-------------|-----------|
| State Saved | Yes       |
| Min/Max     | -/+100 dB |

### BW (Front Panel Only)

Lets you enter the bandwidth of DUT.

|             |          |
|-------------|----------|
| State Saved | Yes      |
| Min         | 1 Hz     |
| Max         | 3.30 THz |

### Input Match (Front Panel Only)

Lets you enter the input match of DUT.

|             |        |
|-------------|--------|
| State Saved | Yes    |
| Min/Max     | -/+100 |

### Output Match (Front Panel Only)

Lets you enter the input match of DUT.

### 3 Noise Figure Mode

#### 3.7 Meas Setup

|             |        |
|-------------|--------|
| State Saved | Yes    |
| Min/Max     | -/+100 |

#### Noise Source (Front Panel Only)

Lets you select the Noise Source model.

|             |                                                                                                                                 |
|-------------|---------------------------------------------------------------------------------------------------------------------------------|
| State Saved | Yes                                                                                                                             |
| Range       | 346A   346B   346C   346CK40   N4000A   N4001A   N4002A   U1832A   U1832C   U1832C   U1833A   U1833B   U1833C   U1833D   U1833G |

#### USB Preamp (Front Panel Only)

Lets you select the USB Preamp model.

|             |                          |
|-------------|--------------------------|
| State Saved | Yes                      |
| Range       | U7227A   U7227C   U7227F |

#### Optimize (Front Panel Only)

Used to calculate optimized attenuation value and estimated uncertainty for four different preamp combinations, according to Information table, and select the one with minimum estimated uncertainty to update Internal Preamp and Attenuation.

|           |                                                                                          |
|-----------|------------------------------------------------------------------------------------------|
| Couplings | Enabled only when "DUT" on page 219, Noise Source and USB Preamp information are entered |
|-----------|------------------------------------------------------------------------------------------|

#### Clear (Front Panel Only)

Used to clear the Information table. As a result, the Signal Path Configuration table will also be cleared, and you will not be prompted to plug or unplug USB-Preamp during calibration/measurement process.

|           |                                                                                                  |
|-----------|--------------------------------------------------------------------------------------------------|
| Couplings | Enabled when one of the configurations in the <b>Signal Path Configuration</b> table is selected |
|-----------|--------------------------------------------------------------------------------------------------|

#### Signal Path Configuration

Shows the optimized attenuation value and estimated uncertainty for four different preamp combinations, and automatically selects the one with the minimum uncertainty.

For the first four rows (**Both | USB PA Only | Int PA Only | None**), Int PA and Atten cannot be modified in the table, if they are modified outside through the front panel

or SCPI, the selected signal path configuration changes to **User Defined** automatically.

The **User Defined** row lets you control preamp combinations and fine tune the attenuation settings by observing the estimated uncertainty.

## Signal Path Selection (Front Panel Only)

Lets you select one signal path for current DUT profile. The Internal Preamp and Attenuation settings will be updated according to the selected signal path.

When the **Both** row is selected, the USB-Preamplifier should be plugged in, the Internal Preamp turns on automatically, and the attenuation is adjusted automatically. You will be prompted to plug in the USB-Preamplifier during calibration and measurement, if it was not plugged in.

When the **USB PA Only** row is selected, the USB-Preamplifier should be plugged in, the Internal Preamp is turned off automatically, and the attenuation is adjusted automatically. You will be prompted to plug in the USB-Preamplifier during calibration/measurement process, if it was not plugged in.

When the **Int PA Only** row is selected, the USB-Preamplifier should be unplugged, the Internal Preamp turns on automatically, and the attenuation is adjusted automatically. You will be prompted to unplug the USB-Preamplifier during the calibration/measurement process, if it is plugged in.

When the **None** row is selected, the USB-Preamplifier should be unplugged, the Internal Preamp turns off automatically, and the attenuation is adjusted automatically. You will be prompted to unplug USB-Preamplifier during the calibration/measurement process, if it is plugged in.

The **User Defined** row is the only row in this table where you can modify the USB PA, Int PA and Atten. When you modify these parameters, the uncertainty estimation is updated. You will be prompted to plug or unplug the USB-Preamplifier according to your input here.

---

|           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## DUT LO Setup

Used to set up miscellaneous source functions, including Ext LO power level, settling time, minimum frequency, maximum frequency, etc.

## LO Power

Sets the fixed signal generator LO drive level into the frequency converter device.

## Multiplier Numerator

Sets the External Local Oscillator frequency multiplier. If an external frequency divider is used in conjunction with the External Local Oscillator, then the values of the multiplier denominator should be set to the external frequency divider's dividing factor.

|                |                                                                                                                                                                                       |

## Multiplier Denominator

Sets the External Local Oscillator frequency divider value. If an external frequency multiplier is used in conjunction with the External Local Oscillator, then the values of the multiplier should be set to the external frequency multiplier's multiplying factor. Alternatively, this value can be used when custom commands are used to drive the External Local Oscillator and the frequency suffix is not 'Hz'. In this case, enter the power of ten equivalent to the frequency scaling implied by the suffix.

For example: if the suffix is "GHz" then enter 1000000000. The maximum is high in the case where you are using a non-SCPI source whose input is given in GHz. In such a case, enter 1E9 here to convert between Hz (the units of the measurement) and GHz (the units of the source). However, if the source is followed by a doubler for high-frequency measurement, the proper conversion factor is 2E9, which is the value that should be entered.

## Min Freq

Used to specify the minimum frequency that the external source is capable of. Attempting to set the external source to a value less than this will result in an error message and clipping to this value.

This value is automatically set when the minimum frequency of the external source is capable of being queried.

#### Max Freq

Used to specify the maximum frequency that the external source is capable of. Attempting to set the external source to a value greater than this will result in an error message and clipping to this value.

This value is automatically set when the maximum frequency of the external source is capable of being queried.

## LO Commands

Selects the command set used to control the external LO. Standard SCPI commands are used by default and will work with all Keysight Signal Sources and other SCPI-compliant sources. Non SCPI-compliant sources may be controlled using custom commands defined by the LO Commands parameter. The custom commands are stored with the State, but if you do not store the state prior to **Restore Mode Defaults**, then the custom settings will be lost. If you change from using SCPI commands to using custom commands without saving the state of the instrument, the custom commands will be preserved and will be recalled when you move back to custom commands.

## Auxiliary

Specifies a custom command to be used between setting the power and setting the frequency. By default, it is used to ensure the RF signal is switched **ON**. Several commands can be chained together using the standard semicolon. NFA allows this.

|                |                                                                                                                              |
|----------------|------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | [:SENSe]:NFIGure:MODE:LOSCillator:DUT:COMManD:AUXiliary <string><br>[:SENSe]:NFIGure:MODE:LOSCillator:DUT:COMManD:AUXiliary? |
| Example        | :NFIG:MODE:LOSC:DUT:COMM:AUX "RF ON"<br>:NFIG:MODE:LOSC:DUT:COMM:AUX?                                                        |
| Couplings      | Disabled when "LO Commands" on page 268 is set to <b>SCPI</b>                                                                |
| Preset         | "OUTP:STAT ON"                                                                                                               |
| State Saved    | Yes                                                                                                                          |
| Range          | Alphanumeric                                                                                                                 |

## Backwards Compatibility Command

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Sys Downconv LO Setup

Used to set up miscellaneous source functions, including Ext LO power level, settling time, minimum frequency, maximum frequency, etc.

### LO Power

Sets the fixed signal generator LO drive level into the frequency converter device.

|                |                                                                                                                                                                                 |

### Multiplier Numerator

Sets the External Local Oscillator frequency multiplier. If an external frequency divider is used in conjunction with the External Local Oscillator, then the values of the multiplier denominator should be set to the external frequency divider's dividing factor.

## Multiplier Denominator

Sets the External Local Oscillator frequency divider value. If an external frequency multiplier is used in conjunction with the External Local Oscillator, then the values of the multiplier should be set to the external frequency multiplier's multiplying factor. Alternatively, this value can be used when custom commands are used to drive the External Local Oscillator, and the frequency suffix is not 'Hz'. In this case enter the power of ten equivalent to the frequency scaling implied by the suffix.

For example: if the suffix is "GHz" then enter 1000000000. The maximum is high in the case where you are using a non-SCPI source whose input is given in GHz. In such a case enter 1E9 here to convert between Hz (the units of the measurement) and GHz (the units of the source). However, if the source is followed by a doubler for high-frequency measurement, the proper conversion factor is 2E9, which is the value that should be entered.

|                |                                                                                                                                                                                                |

### Min Freq

Used to specify the minimum frequency that the external source is capable of. Attempting to set the external source to a value less than this will result in an error message and clipping to this value.

This value is automatically set when the minimum frequency of the external source is capable of being queried.

|                |                                                                                                                                                                                                                  |

## Max Freq

Used to specify the maximum frequency that the external source is capable of. Attempting to set the external source to a value greater than this will result in an error message and clipping to this value.

This value is automatically set when the maximum frequency of the external source is capable of being queried.

|                |                                                                                                                                                                                                                   |

## LO Commands

Selects the command set used to control the external LO. Standard SCPI commands are used by default and will work with all Keysight Signal Sources and other SCPI-compliant sources. Non SCPI-compliant sources may be controlled using custom commands defined by the LO Commands parameter. The custom commands are stored with the State, but if you do not store the state prior to **Restore Mode Defaults**, then the custom settings will be lost. If you change from using SCPI commands to using custom commands without saving the state of the instrument, the custom commands will be preserved and will be recalled when you move back to custom commands.

## Auxiliary

Specifies a custom command to be used between setting the power and setting the frequency. By default, it is used to ensure the RF signal is switched ON. Several commands can be chained together using the standard semicolon. NFA allows this.

|                |                                                                                                                                                       |

## LO Select

Displays the Add Source dialog, which lets you add a new source to list.

## LAN

The LAN cannot be scanned directly from the instrument software, but you can import the list of currently configured devices from Keysight Connection Expert, by pressing **Add From Connection Expert List**. The Connection Expert List depends on which instruments have already been discovered by the Keysight Connection Expert application. Any connected, supported sources in that list will be added.

You can also enter the IP address then press **Add**. If a supported source is found at that address, it will be added.

If you want to discover sources on the LAN, open Connection Expert by pressing “**Run Connection Expert...**”.

## IP Address

Lets you enter the IP address of the desired source. After you enter the address, press **Add** to add the source at that address to the Available Source List.

|             |                                                                                             |
|-------------|---------------------------------------------------------------------------------------------|
| Preset      | Unaffected by <b>Mode Preset</b> but set to 0.0.0.0 by <b>Restore Input/Output Defaults</b> |
| State Saved | No                                                                                          |

## Add Specified IP Address

Adds the source at the entered IP address to the Available Source List. If a supported source is found at that address it will be added to the list.

|       |                                                                                              |
|-------|----------------------------------------------------------------------------------------------|
| Notes | If no supported source is found at the specified address, an error message is generated –310 |
|-------|----------------------------------------------------------------------------------------------|

## Run Connection Expert

Runs the **Keysight Connection Expert** so that you can scan the LAN for sources.

## Add From Connection Expert

You can import the list of currently configured devices from **Keysight Connection Expert** by pressing **Add From Connection Expert**. The Connection Expert list depends on which instruments have already been discovered by **Keysight Connection Expert**. Any connected, supported sources in that list will be added.

---

|       |                                                                                                   |
|-------|---------------------------------------------------------------------------------------------------|
| Notes | If no supported source is found in the Connection Expert list, an error message is generated –310 |
|-------|---------------------------------------------------------------------------------------------------|

## GPIB

Lets you add GPIB sources to the Available Source List. Both GPIB-GPIB and USB-GPIB interfaces are supported.

For the GPIB-GPIB interface to work properly, it must be configured as a Controller. You can find this setting under **System, I/O Config, GPIB**. Set the GPIB Controller function to **Enabled**.

You must also ensure that the GPIB interface is *not* set to **Ignore** in **Keysight Connection Expert**. If it is set to **Ignore**, then even if the GPIB Controller is set to **Enabled**, it is not possible for the instrument to find a GPIB-connected source. See ["Checking Ignore Status" on page 284](#) below.

For the USB-GPIB interface, you do *not* need to set the GPIB Controller to **Enabled**.

### Checking Ignore Status

If you suspect that the GPIB interface is set to **Ignore**, run **Keysight Connection Expert**, by pressing **Meas Setup, Ext LO Config, Add Source to List, LAN, "Run Connection Expert" on page 283**. Look for the GPIB branch on the interface tree:

3 Noise Figure Mode  
3.7 Meas Setup

Right click on the GPIB branch. You should see a dialog like the one below. If this dialog shows **Stop Ignoring**, select **Stop Ignoring** and close the Connection Expert.

GPIB Address

Lets you enter the GPIB address. After entering the address, press **Add** to add the source at that address to the Available Source List.

|             |                                                                                        |
|-------------|----------------------------------------------------------------------------------------|
| Preset      | Unaffected by <b>Mode Preset</b> but set to 19 by <b>Restore Input/Output Defaults</b> |
| State Saved | No                                                                                     |
| Min         | 0                                                                                      |
| Max         | 30                                                                                     |

NOTE

For this to work properly, the GPIB interface must be configured as **GPIB1**. This is the default state and should normally be the case. For the process to verify this, see "[Checking Ignore Status](#)" on page 286 below.

Both GPIB-GPIB and USB-GPIB connection are supported. If GPIB Controller is disabled, the following pop-up message will be displayed to inform you that only USB-GPIB sources will be added.

## Checking Ignore Status

If you suspect that the GPIB interface is set to **Ignore**, run **Keysight Connection Expert**, by pressing **Meas Setup**, **Ext LO Config**, **Add Source to List**, **LAN**, "[Run Connection Expert](#)" on page 283. Look for the GPIB branch on the interface tree:

### 3 Noise Figure Mode

#### 3.7 Meas Setup

If this branch is not labeled GPIB1, right click on the GPIB branch, and select **Change Properties**.

You should see a dialog like the one below. Click on the drop-down arrow to the right of **VISA Interface ID**, select **GPIB1** and click **OK**

## Add Specified GPIB Address

Add the source at the entered GPIB address to the Available Source List. If a supported source is found at that address it will be added to the list.

---

|       |                                                                                              |
|-------|----------------------------------------------------------------------------------------------|
| Notes | If no supported source is found at the specified address, an error message is generated –310 |
|-------|----------------------------------------------------------------------------------------------|

---

## Scan and Add GPIB Sources

Press to add sources on GPIB. Any supported source found will be added to the Available Source List.

### NOTE

Both GPIB-GPIB and USB-GPIB connection are supported. If GPIB Controller is disabled, the following pop-up message will be displayed to inform you that only USB-GPIB sources will be added.

---

|       |                                                                                            |
|-------|--------------------------------------------------------------------------------------------|
| Notes | If no GPIB device is found which is a supported source, an error message is generated –310 |
|-------|--------------------------------------------------------------------------------------------|

---

## USB

Sources on USB (once installed) can be added to the list by pressing **Add Installed USB Sources**. Any supported source found will be added to the list.

## Add Installed USB Sources

Press to add USB sources to the Available Source List. Note that this function will *only* find sources that have previously been installed onto the USB. For information on how to install a USB source, see ["Installing a USB source" on page 289](#).

---

|       |                                                                                                    |
|-------|----------------------------------------------------------------------------------------------------|
| Notes | If no installed USB device is found that is a supported source, an error message is generated –310 |
|-------|----------------------------------------------------------------------------------------------------|

---

Installing a USB source

USB is the only interface that requires no user runtime action in the **Select Source** menu, but does require “installation” when a source is plugged in.

Start by connecting the USB source to the instrument. You will see a series of messages indicating that the instrument is installing required device software.

When the installation is complete, you will see a message to that effect. You can then use **Add Installed USB Sources** to add the source to the list of sources in the Available Source List.

Once a given source is installed, you should not have to repeat this procedure for that source (unless you disconnect the USB source then re-connect it to a *different* port).

Select Highlighted Source As DUT LO

You can navigate up and down in the list with the up and down arrow keys and select any entry by pressing **"Select Highlighted Source As DUT LO"** on page 289.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

Delete Highlighted Source

Deletes the highlighted source from the list of available sources. You are first prompted with a dialog box, to confirm that you *really* want to do this: “The highlighted source will be permanently deleted from the list. Are you sure you want to do this? Press Enter to proceed or Cancel (ESC) to cancel.”

3.7.1.6 Uncertainty Calculator

Based largely upon the Java uncertainty calculator, which can be found at:

<http://www.keysight.com/find/nfu>

Automate Settings

Setting this control to **On** in the "Uncertainty Calculator" on page 291 fills in the parameters automatically, unless you set the corresponding field to **MANual** or **NONE**. The parameters are updated once at center frequency (CF) immediately when the control is changed from **Off** to **On**. You can press **Update at CF** or **Update at Selected Freq** to update the parameters at the frequency of interest at any time.

When this control is switched **ON**, the DUT type becomes non-editable and is updated from the DUT setup, that is, if **Amplifier** is selected in DUT setup, the DUT type will be **Amplifier**, otherwise it will be **Converter**. The DUT parameters, including “DUT NF” and “DUT Gain” become non-editable and are filled in using the latest measurement results. Pressing **Update** in the form or from the softpanel updates these two parameters immediately.

When this control is switched **ON**:

- "Noise Source" on page 299 type is set to **AUTO** if an SNS is connected, and “Noise Source Preference” is set to **SNS**
- "Instrument" on page 303 type is set to **AUTO**
- "Ext Preamp" on page 310 type is set to **AUTO** if an U7227x series USB preamplifier is connected

You have the flexibility to change **Noise Source** type, **Instrument** type or **Ext Preamp** type to **MANual** or **NONE** even when **Automate Settings** is **ON**. The related parameters are not updated automatically. See the descriptions of each parameter for details.

## Update Parameters

When "Automate Settings" on page 291 is enabled, you can press "Update at CF" on page 292 or "Update at Selected Freq" on page 293 to update the calculator parameters at the frequency of interest.

## Update at CF

Enabled only when "Automate Settings" on page 291 is enabled. Note that CF is based on the current "Freq Context" on page 218:

Forces the DUT parameters, including DUT NF and DUT Gain to be updated using the latest measurement results at CF. If CF is not measured, the values are interpolated between the two closest results

When the DUT type on DUT Setup view is **Converter**, and the start and stop frequencies of the current frequency context are equal, the calculator cannot determine the NS Freq and Inst Freq, and the error message "Settings conflict; Unable to interpolate NS and Inst Freq" is displayed

Forces the NS Freq to be updated according to current DUT setup and CF if Noise Source type is **Auto(SNS)/A346A/A346B/A346C**. Related NS parameters are updated automatically

Forces the Inst Freq to be updated if "Instrument" on page 303 type is **AUTO**. Related Inst parameters are updated automatically

Forces the Ext PA parameters to be updated automatically if "Ext Preamp" on page 310 type is **AUTO**

When the latest measurement results are invalid (a dirty marker is displayed), "---" is displayed for DUT NF and DUT Gain

|                |                                                          |
|----------------|----------------------------------------------------------|
| Remote Command | :CALCulate:UNCertainty:PARameter:FREQuency:CENTer:UPDate |
| Example        | :CALC:UNC:PAR:FREQ:CENT:UPD                              |
| Couplings      | See above for detailed information                       |

## Update at Selected Freq

Enabled only when ["Automate Settings" on page 291](#) is enabled. Note that Selected Freq is based on the current ["Freq Context" on page 218](#). When the Selected Freq is outside the measurement frequency range, error message "Settings conflict; Selected frequency is invalid" is displayed.

Forces the DUT parameters, including DUT NF and DUT Gain to be updated using the latest measurement results at Selected Freq. If Selected Freq point is not measured, the values are interpolated between the two closest results

When the DUT type on DUT Setup view is **Converter**, and the start and stop frequencies of the current frequency context are equal, the calculator cannot determine the NS Freq and Inst Freq if the Selected Freq is equal to start (or stop) frequency. Error message "Settings conflict; Unable to interpolate NS and Inst Freq" are displayed

Forces the NS Freq to be updated according to current DUT setup and Selected Freq if ["Noise Source" on page 299](#) type is [Auto\(SNS\)/A346A/A346B/A346C](#). Related NS parameters are updated automatically

Forces the Inst Freq to be updated if ["Instrument" on page 303](#) type is [AUTO](#). Related Inst parameters are updated automatically

Forces the Ext PA parameters to be updated automatically if ["Ext Preamp" on page 310](#) type is [AUTO](#)

When the latest measurement results are invalid (a dirty marker is displayed), "---" is displayed for DUT NF and DUT Gain

|                |                                                                                      |

| Remote Command | <code>:CALCulate:UNCertainty:PARAmeter:FREQuency:SElected:UPDate &lt;freq&gt;</code> |
| Example        | <code>:CALC:UNC:PAR:FREQ:SEL:UPD</code>                                              |
| Couplings      | See above for detailed information                                                   |

## Selected Freq

Sets the selected frequency to be used when ["Update at Selected Freq" on page 293](#) is pressed. This parameter is based on the current ["Freq Context" on page 218](#). If the context is [RF](#), this frequency is an RF frequency. Also applies to [LO](#) and [IF](#) context.

|                |                                                                                                                                                    |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:CALCulate:UNCertainty:PARAmeter:FREQuency:SElected &lt;freq&gt;</code><br><code>:CALCulate:UNCertainty:PARAmeter:FREQuency:SElected?</code> |
| Example        | <code>:CALC:UNC:PAR:FREQ:SEL 3GHz</code>                                                                                                           |
| Couplings      | Enabled only when <a href="#">"Automate Settings" on page 291</a> is enabled                                                                       |

|             |           |
|-------------|-----------|
| Preset      | 1.505 GHz |
| State Saved | Yes       |
| Min         | 0 Hz      |
| Max         | 3.30 THz  |

## DUT

Sets DUT type:

- Select **AMPLifier** if the DUT (device under test) has the same input and output frequencies, such as amplifier, attenuator, and filter
- Select **CONVerter** for frequency-converting devices, such as mixers

|                |                                                                                                                               |
|----------------|-------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | :CALCulate:UNCertainty:DUT AMPLifier   CONVerter<br>:CALCulate:UNCertainty:DUT?                                               |
| Example        | :CALC:UNC:DUT AMPL                                                                                                            |
| Couplings      | When "Automate Settings" on page 291 is ON, the DUT type becomes non-editable and is updated automatically from the DUT setup |
| Preset         | AMPL                                                                                                                          |
| State Saved    | No                                                                                                                            |
| Range          | AMPLifier CONVerter                                                                                                           |

## DUT NF, NF1

Includes the DUT noise figure settings.

### DUT NF, NF1

Selects the DUT noise figure to be used in the calculator.

It is best to set this to the best estimate of the NF, such as from the measurement itself, but changes in DUT NF only weakly effect the uncertainty.

When "Automate Settings" on page 291 is enabled, this parameter becomes non-editable and is filled in automatically from the measurement results at the frequency of interest. Pressing **Update** updates this parameter immediately.

| Min/Max        | -/+100 dB                                                                                                                                                                                                                                                                                                                                                                |

### DUT Gain Specification Style

The specification style of DUT gain is “Fixed”. It cannot be changed.

### DUT Input Match

Includes the DUT input match settings.

### DUT Input Match

Selects the DUT input match to be used in the calculator.

The input match especially can have a significant, though rarely dominant, effect of the uncertainty of the measurement. Therefore, a measured value of the match gives the best estimate of the uncertainty by the calculator.

As noted in the on-calculator footnote, the match can be entered as a return loss (any number that is zero or negative is treated as return loss in decibels), as a reflection coefficient (any number between 0 and 1 is treated as the magnitude of the reflection coefficient), or as a voltage standing-wave ratio, VSWR (any number 1 or larger is treated as a VSWR).

|                                 |                                                                                                                               |

### DUT Input Match Specification Style

Selects the DUT input match specification style to be used in the calculator.

The values used for the DUT match, whether read from a DUT data sheet or measured, is usually best treated as a value that is not statistically varying., so it is best to set to **FIXed**.

## DUT Input Match Distribution

Selects the DUT input match distribution to be used in the calculator.

The value used for the DUT match, whether read from a DUT data sheet or measured, is usually best treated as a value that is not statistically varying, so, it is best to set to `FIXed`.

## DUT Output Match

Includes the DUT output match settings.

### DUT Output Match

Selects the DUT output match to be used in the calculator.

As noted in the on-calculator footnote, the match can be entered as a return loss (any number that is zero or negative is treated as return loss in decibels), as a reflection coefficient (any number between 0 and 1 is treated as the magnitude of the reflection coefficient), or as a voltage standing-wave ratio, VSWR (any number 1 or larger is treated as a VSWR).

## Noise Source

Set the Noise Source type. The calculator maintains an ENR uncertainty and a VSWR table for each Keysight noise source model. Choosing one of the listed noise sources from the drop-down menu conveniently sets values for NS parameters automatically from the table, based on current NS Freq setting.

For Keysight N4000 Smart Noise Source series, select **AUTO**. When there is no SNS connected, this option is grayed-out. For Keysight 346 series, select the actual model number (**A346A**, **A346B**, **A346C**, **A346CK01**, **A346CK40**).

For other noise sources, especially for the most accurate estimation of uncertainty, select **MANual**. This option can be selected whenever the actual value of the noise source calibration data is available. You must enter values for NS ENR Uncert and NS Match values. There are two ways to estimate the ENR uncertainty: the Calibration Data Report (also known as the Calibration Certificate) for the noise source in use, at the frequency of interest; or from the noise source Operating and Service Manual. The Calibration Data Report provides the more accurate estimation of uncertainty.

## NS Freq

Represents the frequency used in the measurement stage. The calculator uses this frequency to fill in NS ENR Uncertainty and Match parameters for standard Keysight Technologies noise sources.

When the "Noise Source" on page 299 type is **MANual**, it will be disabled and displayed as ---.

When the **Noise Source** type is any of **Auto(SNS)/A346A/A346B/A346C**:

- It can be set manually if **"Automate Settings"** on page 291 is **Off**
- It becomes non-editable if **Automate Settings** is switched **On**, and is filled in automatically according to current DUT type, **"Freq Context"** on page 218, and the CF or selected Freq. Pressing **Update** updates **NS Freq** immediately

If **NS Freq** is set manually or updated automatically, the NS ENR Uncertainty and Match parameters update immediately.

## ENR Uncert

Includes the noise source ENR uncertainty settings.

## ENR Uncert

Selects the ENR Uncertainty used in the uncertainty calculator.

For the most accurate estimation of uncertainty, set the NS ENR Uncertainty manually. This option can be selected whenever the actual value of the noise source calibration data is available. The values are available at each frequency on the Calibration Data Report, also known as the Calibration Certificate. This allows the entry of the actual uncertainty of the ENR and the 50  $\Omega$  match (in dB, VSWR or reflection coefficient).

The calibration data report gives the 95th percentile (two sigma) uncertainty of the ENR, which has a Gaussian probability density function.

### NOTE

**In frequency-converting DUT applications and other two-noise-source applications, the ENR uncertainty and the Noise Source Match can be different for the two locations of usage of the noise source or noise sources. This calculator is not designed to handle that case ideally; we recommend you use the worse of the parameters of the two applications to get a conservative, instead of accurate, estimate of noise figure uncertainty.**

#### ENR Uncert Specification Style

The specification style of ENR Uncertainty is "95th percentile". It cannot be changed.

#### ENR Uncert Distribution

The distribution of ENR Uncertainty is Gaussian. It cannot be changed.

#### NS Match

Includes the noise source match settings.

#### NS Match

Selects the **NS Match** value used in the calculator.

The match may come from the calibration report, in which case the specification style and distribution are both "fixed." If the match comes from the data sheet of the noise source, statistical study of the data has shown that for some models and frequency ranges, using "maximum" for the specifications style and "Rayleigh" for the distribution gives a very accurate estimation of the uncertainty. For all other

models and bands, the use of maximum and Rayleigh gives a modestly conservative estimate of uncertainty. (Using the Rayleigh distribution and "Maximum" always results in a more accurate model than previous practice or the other distributions. Therefore, the recommended and default setting of the "Specification Style" column is Maximum and of "Distribution" is Rayleigh for Keysight Noise Sources.)

As noted in the on-calculator footnote, the match can be entered as a return loss (any number that is zero or negative is treated as return loss in decibels), as a reflection coefficient (any number between 0 and 1 is treated as the magnitude of the reflection coefficient), or as a voltage standing-wave ratio, VSWR (any number 1 or larger is treated as a VSWR).

**NOTE**

In frequency-converting DUT applications and other two-noise-source applications, the ENR uncertainty and the Noise Source Match can be different for the two locations of usage of the noise source or noise sources. This calculator is not designed to handle that case ideally; we recommend you use the worse of the parameters of the two applications to get a conservative, instead of accurate, estimate of noise figure uncertainty.

## Instrument

Lets you specify whether the instrument parameters will be filled manually or automatically by the calculator.

The calculator maintains a specification table for each Keysight instrument model. By default, this parameter is set to **AUTO**. The calculator conveniently sets values for instrument parameters automatically from the specification table based on "Inst Freq" on page 304.

For most critical applications, the uncertainty is dominated by the ENR uncertainty of the noise source and only weakly dependent on instrument performance. Therefore, the convenience of using **AUTO** is sufficient for most needs.

For the most accurate estimation of uncertainty, select the **MANual** option and enter actual parameters to the extent known, at the frequency of interest. For example, the NF of the instrument at the exact operating frequency can be found by actual measurement or by reading graphs from the instrument data sheet or Specifications Guide. The instrument match may be measured with a network analyzer, or for X-

Series analyzers it can be estimated from graphs provided in the Specifications Guide, or for convenience in the PXA analyzer, the 95th percentile of the Rayleigh distribution of reflection coefficient can be taken from the Specifications Guide in the Preamplifier chapter. Instrument Uncertainty for NF and Instrument Uncertainty for Gain are both listed in the data sheets and Specifications Guides of Keysight instruments. "NFE Improvement" is listed in the Specifications Guide for X-Series instruments that have NFE available and thus are capable of Internal Cal.

With low gain or lossy devices, the instrument parameters can be significant or dominant contributors to uncertainty. You can change these values by setting this parameter to **MANual** and modifying values for instrument.

| Range          | <b>MANual</b>   <b>AUTO</b>                                                                                                                                                                                                                                                                                                                                            |

## Inst Freq

Represents the frequency used in the measurement stage. The calculator uses this frequency to fill in Inst parameters.

When "Instrument" on page 303 type is **MANual**, it is disabled and displayed as ---.

When **Instrument** type is **AUTO**:

- It can be set manually if "Automate Settings" on page 291 is **Off**
- It becomes non-editable if **Automate Settings** is **On**, and is filled in automatically according to current DUT type, "Freq Context" on page 218, and the CF or selected Freq. Pressing **Update** updates **Inst Freq** immediately

Once **Inst Freq** is set manually or updated automatically, the Inst parameters will be updated immediately, and the Ext PA parameters will be updated immediately when "Ext Preamp" on page 310 is **AUTO**.

|----------------|----------------------------------------------------------------------------------------------------|
| Remote Command | :CALCulate:UNCertainty:INSTrument:FREquency <freq><br>:CALCulate:UNCertainty:INSTrument:FREquency? |
| Example        | :CALC:UNC:INST:FREQ <b>3GHz</b>                                                                    |

### 3 Noise Figure Mode

#### 3.7 Meas Setup

|             |           |
|-------------|-----------|
| Couplings   | See above |
| Preset      | 1.505 GHz |
| State Saved | Yes       |
| Min         | 0 Hz      |
| Max         | 3.30 THz  |

#### Inst NF, NF2

Includes the instrument noise figure settings.

#### Inst NF, NF2

Selects the instrument noise figure to be used in the calculator.

For the most accurate estimation of uncertainty, enter the actual parameter to the extent known. For example, the NF of the instrument at the exact operating frequency can be found by actual measurement or by reading graphs from the instrument data sheet or Specifications Guide.

#### Inst NF Specification Style

The specification style of instrument noise figure is "Fixed". It cannot be changed.

#### Inst NF Uncert

Includes the instrument input uncertainty settings.

## Inst NF Uncert

Selects the instrument noise figure uncertainty to be used in the calculator.

When "**Instrument**" on page 303 is **AUTO**, the worse value of the Instrument NF Uncertainty at the calibration stage and measurement stage will be used.

For the most accurate estimation of uncertainty, enter the actual parameter to the extent known. Instrument Uncertainty for NF is listed in the data sheets and Specifications Guides of Keysight instruments.

| Max            | 100 dB                                                                                                                                                                                                                                                                                                                                                     |

## Inst NF Uncert Specification Style

The specification style of instrument noise figure uncertainty is "Maximum". It cannot be changed.

The specifications style for Instrument Uncertainty for NF, for Keysight Instruments is always "worst case." Statistical study shows that treating these as 3 sigma specifications with Gaussian distribution is on the conservative side of an accurate estimation of uncertainty.

## Inst NF Uncert Distribution

The distribution of instrument noise figure uncertainty is "Gaussian". It cannot be changed.

## Inst Gain Uncert

This section includes the instrument gain uncertainty settings.

## Inst Gain Uncert

Selects the instrument gain uncertainty to be used in the calculator.

For the most accurate estimation of uncertainty, enter the actual parameters to the extent known. Instrument Uncertainty for Gain is listed in the data sheets and Specifications Guides of Keysight instruments.

## Inst Gain Uncert Specification Style

The specification style of instrument gain uncertainty is "Maximum". It cannot be changed.

The specifications style for Instrument Uncertainty for Gain, for Keysight Instruments is always "worst case." Statistical study shows that treating these as 3 sigma specifications with Gaussian distribution is on the conservative side of an accurate estimation of uncertainty.

## Inst Gain Uncert Distribution

The distribution of instrument gain uncertainty is "Gaussian". It cannot be changed.

## Inst Match

Includes the instrument match settings.

## Inst Match

Selects the instrument input match to be used in the calculator.

For the most accurate estimation of uncertainty, enter the actual parameters to the extent known. The instrument match may be measured with a network analyzer, or with X-Series analyzers it can be estimated from graphs provided in the Specifications Guide, or for convenience in the PXA analyzer, the 95th percentile of the Rayleigh distribution of reflection coefficient can be taken from the Specifications Guide in the Preamplifier chapter.

As noted in the on-calculator footnote, the match can be entered as a return loss (any number that is zero or negative is treated as return loss in decibels), as a reflection coefficient (any number between 0 and 1 is treated as the magnitude of the reflection coefficient), or as a voltage standing-wave ratio, VSWR (any number 1 or larger is treated as a VSWR).

## Inst Match Distribution

Selects the instrument match specification style to be used in the calculator. For Keysight PXA, MXA and EXA analyzers, the distribution of the reflection coefficient is known to be a Rayleigh probability density function (pdf) with a different value in each band. The Keysight CXA does not have a Rayleigh distribution. Further information on the distribution of mismatch uncertainties is available in “Revisiting Mismatch Uncertainty with the Rayleigh Distribution,” available from the Keysight website at:

<https://www.keysight.com/us/en/assets/7018-03163/white-papers/5990-9185.pdf>

## Inst NFE Impr

Includes the instrument NFE improvement settings.

## Inst NFE Impr

Selects the instrument NFE improvement to be used in the calculator.

For the most accurate estimation of uncertainty, enter the actual parameter to the extent known. “NFE Improvement” is listed in the Specifications Guide for X-Series instruments that have NFE available and thus are capable of Internal Cal.

### NOTE

**This parameter does not appear on instruments that do not have an NFE or NF2 license.**

### Inst NFE Impr Specification Style

The specification style of instrument NFE improvement is "95th percentile". It cannot be changed.

**NOTE**

This parameter does not appear on instruments that do not have an NFE or NF2 license.

### Inst NFE Impr Distribution

The distribution of instrument NFE improvement is "Gaussian". It cannot be changed.

**NOTE**

This parameter does not appear on instruments that do not have an NFE or NF2 license.

### Ext Preamp

Lets you specify how to fill in the Ext PA parameters. If no external preamp is in use, select **NONE**.

For other external preamplifiers and the most accurate estimation of uncertainty, choose **MANual** and enter actual parameters to the extent known, at the frequency of interest.

## Ext Preamp Gain Specification Style

The specification style of external preamp gain is "Fixed". It cannot be changed.

## Ext Preamp Match

Includes the external preamp match settings.

## Ext Preamp Match

Selects the external preamp match to be used in the calculator.

As noted in the on-calculator footnote, the match can be entered as a return loss (any number that is zero or negative is treated as return loss in decibels), as a reflection coefficient (any number between 0 and 1 is treated as the magnitude of the reflection coefficient), or as a voltage standing-wave ratio, VSWR (any number 1 or larger is treated as a VSWR).

Specification Style

In combining sources of uncertainty, international standards usually call for using the method named GUM (Guide to the expression of Uncertainty in Measurement). GUM calls for computing the “standard uncertainty” (standard deviation) of each contributor, then combining these using a root-sum-square computation to compute the “combined standard uncertainty,” then multiplying by 2 (the coverage factor, k) to give the “expanded uncertainty.” The expanded uncertainty is also often called the 95th percentile measurement uncertainty.

The documentation of each contributor may be given in different forms, such as median, mean, or 95th percentile, as shown in the drop-down list for those parameters where the user of the calculator might need to vary the style of the specification.

Distribution

The statistical distribution of contributors to the uncertainty depends on the contributor and our knowledge of that parameter. In many cases, the value is known, thus a “Fixed” distribution is appropriate. In other cases, such as Noise Source ENR Uncertainty, the distribution is known to be Gaussian.

Sweep

Allows an input parameter to be selected then swept between lower and upper values so that the variation in uncertainty can be seen on the “Swept Uncertainty” area.

Parameter

Select the parameter to be swept. This calculator only supports DUT parameter sweeping. Use the Java calculator (at <https://www.keysight.com/us/en/lib/resources/training-materials/noise-figure-uncertainty-calculator-96887.html>) to sweep other parameters.

|                |                                                                                                                       |

| Preset         | NFIGure                                                                                                               |
| State Saved    | Yes                                                                                                                   |
| Range          | NFIGure GAIN INMatch OUTMatch                                                                                         |

## Lower Value

Set the lower value for the swept parameter.

|                |                                                                                                                   |
|----------------|-------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:CALCulate:UNCertainty:SWEep:STARt &lt;value&gt;</code><br><code>:CALCulate:UNCertainty:SWEep:STARt?</code> |
| Example        | <code>:CALC:UNC:SWE:STAR 1.0</code><br><code>:CALC:UNC:SWE:STAR?</code>                                           |
| Preset         | 1.5                                                                                                               |
| State Saved    | No                                                                                                                |
| Min/Max        | -/+9.9e37                                                                                                         |

## Upper Value

Set the upper value for the swept parameter.

|                |                                                                                                                 |
|----------------|-----------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:CALCulate:UNCertainty:SWEep:STOP &lt;value&gt;</code><br><code>:CALCulate:UNCertainty:SWEep:STOP?</code> |
| Example        | <code>:CALC:UNC:SWE:STOP 10.0</code><br><code>:CALC:UNC:SWE:STOP?</code>                                        |
| Preset         | 4.5                                                                                                             |
| State Saved    | No                                                                                                              |
| Min/Max        | -/+100                                                                                                          |

## Rules for lower and upper default values

To provide a reasonable sweeping range, the lower and upper values may change when the swept parameter or the value of the swept parameter changes. The lower and upper values follow the following rules. For DUT NF and Gain parameters, the following rules are applied:

- The lower value is set to one-half of the current value of the swept parameter
- The upper value is set to 1.5 times the current value of the swept parameter
- For the Match parameters, the following rules are applied:
  - When the current value is negative, use 0.5 times the value for lower value and 1.5 times for upper value
  - When the current value is between 0 and 0.6, set the upper value to 1.5 times the value, and the lower value to 0.5 times

- When the current value is between 0.6 and 1.0, set the upper value to 0.75 plus 0.25 times the value. Set the lower value to twice the value minus the upper value
- When the current value is 1.0 exactly, set the upper and lower value to 1.0
- When the current value is above 1.0, set the lower value to 0.5 plus half of the value, and the upper value to twice the value minus the lower value

NOTE

When you change the lower or upper value manually for a swept parameter, these rules are turned off for that parameter. They are turned back on by **Mode Preset**.

Points

Sets the number of sweep points. The points are distributed evenly between the lower and upper values.

Measurement Uncertainty

This section contains information on measurement uncertainty.

Measurement Uncertainty

When Sweep "Parameter" on page 314 is **NONE**, three 95th percentile measurement uncertainties are displayed on the result area, and can be used to determine the overall uncertainty of the noise figure measurement in different calibration types (User Cal, Internal Cal or Uncal). These values update whenever any of the other parameters under the :CALCulate:UNCertainty SCPI node change.

This parameter is never editable from the front panel or via SCPI but is auto calculated from the other parameters in the DUT setup form.

|               |           |
|---------------|-----------|
| User Cal:     | ±0.574 dB |
| Internal Cal: | ±0.576 dB |
| Uncal:        | ±0.726 dB |

User Cal Uncertainty

Returns 95th percentile measurement uncertainty result when calibration type is User Cal.

|                              |                                                                                |
|------------------------------|--------------------------------------------------------------------------------|
| Remote Command               | :CALCulate:UNCertainty:USER?                                                   |
| Example                      | :CALC:UNC:USER?                                                                |
| Notes                        | Automatically calculated from other uncertainty calculator values<br>Read-only |
| Couplings                    | Always read only – calculated from other uncertainty calculator values         |
| Preset                       | 0.2 dB                                                                         |
| State Saved                  | No                                                                             |
| Min                          | 0 dB                                                                           |
| Max                          | 100 dB                                                                         |
| Backwards Compatibility SCPI | :CALCulate:UNCertainty:RSS?                                                    |

Internal Cal Uncertainty

Returns 95th percentile measurement uncertainty result when calibration type is Internal Cal.

|                |                                                                                                                                                                                      |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | :CALCulate:UNCertainty:INTERNAL?                                                                                                                                                     |
| Example        | :CALC:UNC:INT?                                                                                                                                                                       |
| Notes          | Automatically calculated from other uncertainty calculator values<br>Read only                                                                                                       |
| Couplings      | Always read-only – calculated from other uncertainty calculator values<br>Returns NaN if the instrument does not support Internal Cal, in which case, '---' is displayed on the form |
| Preset         | 0.2 dB                                                                                                                                                                               |
| State Saved    | No                                                                                                                                                                                   |

|     |        |
|-----|--------|
| Min | 0 dB   |
| Max | 100 dB |

Uncalibrated Uncertainty

Returns 95th percentile measurement uncertainty result when the measurement is calibrated.

|                |                                                                        |
|----------------|------------------------------------------------------------------------|
| Remote Command | :CALCulate:UNCertainty:UNCal?                                          |
| Example        | :CALC:UNC:UNC?                                                         |
| Notes          | Read only                                                              |
| Couplings      | Always read-only – calculated from other uncertainty calculator values |
| Preset         | 0.2 dB                                                                 |
| State Saved    | No                                                                     |
| Min            | 0 dB                                                                   |
| Max            | 100 dB                                                                 |

Sweep Uncertainty

Three traces are displayed on the result area by default for different calibration types (User Cal, Internal Cal and Uncal). The trace may be hidden if the checkbox for a calibration type is unchecked.

If you move a mouse over the trace, the value of the point will be shown on the upper left corner.

Sweep Result Array (Remote Query only)

Returns an array of the swept uncertainty for each calibration type. One value is returned for each point.

|                |                                                         |
|----------------|---------------------------------------------------------|
| Remote Command | :CALCulate:UNCertainty:SWEep:ARRay:USER INTernal UNCal? |
|----------------|---------------------------------------------------------|

Sweep Trace Display

Selects which trace is displayed. By default, three traces are displayed for three different calibration types. You can uncheck the checkbox to hide the trace.

User Cal Trace

Selects whether displaying sweep results for User Cal.

|             |                  |
|-------------|------------------|
| Notes       | Front Panel Only |
| Preset      | On               |
| State Saved | Yes              |
| Range       | On   Off         |

Internal Cal Trace

Selects whether to display sweep results for Intercal Cal.

|             |                                                                                                             |
|-------------|-------------------------------------------------------------------------------------------------------------|
| Notes       | Front Panel Only                                                                                            |
| Couplings   | Disabled when NFE (and NF2) license is not installed and "Ext Preamp" on page 310 is not set to <b>AUTO</b> |
| Preset      | On                                                                                                          |

### 3.7.1.7 Optimize Preselector

This control runs through the current setup's frequency points optimizing the preselector. This may be required if the calibration step was performed some time ago and the preselector drift is impacting the measurement (for example: higher errors than expected).

When selected, the following pop-up box appears, with an estimate of the time expected to complete.

|                |                                                                                    |
|----------------|------------------------------------------------------------------------------------|
| Remote Command | <code>[ :SENSe ]:NFIGure:PRESelector:OPTimize</code>                               |
| Example        | <code>:NFIG:PRES:OPT</code>                                                        |
| Dependencies   | Does not appear in CXA and CXA-m platforms                                         |
| Couplings      | Disabled when instrument tuned frequencies are below 3.6 GHz, that is, in low band |

### 3.7.1.8 Meas Preset

Restores all measurement local parameters to their default values, except for ENR Tables, Limit Line Data, and Loss Comp Table Data. They remain unchanged, but the limit lines and loss comp are turned off.

|                |                                        |
|----------------|----------------------------------------|

| Example        | <code>:CONF:NFIG</code>                |
| Couplings      | Loads default values of all parameters |

### 3.7.1.9 Calibrate

Performs a User Calibration on the current DUT setup using the ENR data in the Meas Table (if "Use Meas Table Data for Cal" on page 322 is **ON**) or the ENR data in the Cal Table (if Use Meas Table Data for Cal is **OFF**). Cal data is collected for each attenuation setting set in the User Setup parameters. For example, in X-Series Instruments, if Max Atten is set to 8 dB and Min set to 0 dB, then a set of calibration data will be taken for 0 dB, 4 dB and 8 dB. You can then choose any of these attenuation settings when the measurement is performed, and corrected results will be made. If you want attenuation settings outside this range, they need to be set in Max/Min prior to performing a Calibration.

During calibration, the value you select for **Average Count** is translated into a sweep time for each point. So, an **Average Count** of 10 results in a sweep time of 160 ms (160 ms at each measured frequency point if using the default sweep time). There are 2 measurement points per freq point: one for noise source Off and one for On.

Once the calibration step has been performed successfully, the calibration data (including ENR cal data and USB Preamp serial number if in use) is stored in a

'power-on persistent' state. A mode preset or power cycle will not erase the cal data. An advisory message alerts you that cal is valid, and you need to toggle **Apply Calibration** to **On** to restore corrected data. If, after a mode preset, the DUT/measurement setup has changed such that the saved calibration data is invalid, **Apply Calibration** is grayed-out, but can be restored if setup during cal is set again, or the original setup with cal is stored in a state and recalled again.

NOTE

If any input frequencies are in high band, for example: above 3.6 GHz, then the “Calibrate Now” process optimizes the preselector at these frequencies *and stores the preselector offset values*. It uses these *offsets* both in the cal acquisition results and also when acquiring the measurement results. This reduces the error *for* corrected results since the preselector is set at the same place for acquiring the cal and meas results. The ‘Optimize Preselector’ function allows the *offset* values to be collected again without the cal acquisition results.

To abort a Cal while it is running, press **ESC** or **Cancel**. This stops the action and discards any data collected. The previous data is erased, and the **Apply Calibration** parameter is set to **OFF**. If a valid User Cal is still stored, you can then turn **Apply Calibration** back on by setting it to **ON**. Note that aborting the calibration operates in both **Single** and **Continuous** modes of use.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## Edit Meas Table

Opens the ENR Table editor for the measurement ENR table, which should contain the ENR data for the noise source that is currently being used.

### NOTE

When each parameter in the table is entered, the table is saved. Once a new ENR Table is entered, the application stores this table in non-volatile memory, to allow for restoration after a power cycle.

Keysight Noise Sources are delivered complete with ENR Data particular to that source. It is possible to read this data directly into the measurement, and even save the data in the same format if changes are required, or if the disk has been lost. The ENR Data can be copied onto a USB flash drive for loading onto the instrument using a PC.

See the section, "Entering Excess Noise Ratio (ENR) Data" in the Measurement Guide.

|           |                                            |
|-----------|--------------------------------------------|
| Couplings | Error 171 is displayed if no data in table |
|-----------|--------------------------------------------|

## Serial #

To obtain the best accuracy, ENR Data is uniquely derived for each noise source. For Keysight Sources, this data can be found printed on the side of the source body. It is a good idea to enter the serial number and model ID of the source into the table – this way you can tell at-a-glance whether the data is valid for a specific source or not.

The Meas and Cal tables both have an independent serial number and model ID parameter.

Go to Row

Specify a row and make it the selected row.

Insert Row Below

Inserts a row below the current row. The new row is a copy of the current row, and becomes the current row. The new row is not yet entered into the underlying table, and the data in the row is displayed in light gray.

Delete Row

This is an immediate action control. It immediately deletes the currently-selected row, whether or not that point is being edited, and selects **Navigate**. The point following the currently-selected row (or the row preceding if there is none) will be selected.

Fill From SNS

Invokes population of the Meas Table or Cal Table from an SNS. Only available when an SNS is connected to the instrument.

|                              |                                                                                 |
|------------------------------|---------------------------------------------------------------------------------|
| Remote Command               | <code>[ :SENSe]:NFIGure:CORRection:ENR:MEASurement:TABLE:SNS</code>             |
| Example                      | <code>:NFIG:CORR:ENR:MEAS:TABL:SNS</code>                                       |
|                              | Backwards Compatibility Command                                                 |
| Notes                        | Same as:<br><code>[ :SENSe]:NFIGure:CORRection:ENR:MEASurement:TABLE:SNS</code> |
| Backwards Compatibility SCPI | <code>[ :SENSe][ :NFIGure]:CORRection:ENR[ :MEASurement]:TABLE:SNS</code>       |

Clear Table

Clears all data from the Meas ENR table and removes the table's backup from persistent storage.

|                |                                                                                          |
|----------------|------------------------------------------------------------------------------------------|
| Remote Command | <code>[ :SENSe]:NFIGure:CORRection:ENR[ :MEASurement]:TABLE:DATA:DELeTe</code>           |
| Notes          | Clears all entries in the Meas ENR table. Interrupts the current measurement immediately |

## Frequency Column

Lets you enter the frequency component of a frequency/amplitude pair.

|             |          |
|-------------|----------|
| Preset      | 10 Hz    |
| State Saved | Yes      |
| Min         | 10 kHz   |
| Max         | 3.30 THz |

## ENR Column

Lets you enter the amplitude component of a frequency/amplitude pair.

|             |           |
|-------------|-----------|
| Preset      | 0 dB      |
| State Saved | Yes       |
| Min/Max     | -/+200 dB |

## Setting ENR Table Remotely (Remote Command only)

Data can be entered into the current measurement or calibration ENR table using SCPI. Parameters are provided in frequency/amplitude pairs, the units being Hz and dB respectively. Up to 1301 point-pairs are accepted. See the "[Frequency Column](#)" on page 326 and "[ENR Column](#)" on page 326 definitions for the acceptable parameter ranges.

|                |                                                                                                                                                                                                                               |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>[ :SENSe]:NFIGure:CORRection:ENR:MEASurement:TABLE:DATA &lt;frequency&gt;, &lt;amplitude&gt; ([, &lt;frequency&gt;, &lt;amplitude&gt;])</code><br><code>[ :SENSe]:NFIGure:CORRection:ENR:MEASurement:TABLE:DATA?</code> |
| Example        | <code>:NFIG:CORR:ENR:MEAS:TABL:DATA 1000, -10, 2000,-8, 3000, -6, 10000, 5</code>                                                                                                                                             |

Notes Between 1 and 1301 points must be entered

Backwards Compatibility Command

|                              |                                                                                                                                                                                                                                          |

## Edit Cal Table

Opens the ENR Table editor for the calibration ENR table, which should contain the ENR data for the noise source that is currently being used. If **"Use Meas Table Data for Cal"** on page 322 is **ON**, the ENR data for calibration is taken from the measurement ENR Table.

When an SNS is attached, if **"Noise Source Preference"** on page 343 is **SNS** and **Auto Load ENR** is **ON**, **Use Meas Table Data for Cal** is set to **ON** and the SNS ENR data populates the measurement ENR Table (no alteration to the Cal table). If you want the SNS to be used for the calibration ENR table, then you must **"Fill From SNS"** on page 325 under the ENR Table editor for calibration ENR table.

The **Edit Cal Table** is only available when **Use Meas Table Data for Cal** is **OFF**. Once a new Cal Table is entered, the application stores this table in non-volatile memory, to allow for restoration after a power cycle.

Duplicates are *not* allowed in the frequency field of the Cal Table, but duplicate ENR values at different frequencies are accepted.

**NOTE**

When each parameter in the table is entered, the table is saved. Once a new ENR Table is entered, the application stores this table in non-volatile memory, to allow for restoration after a power cycle.

Keysight Noise Sources are delivered complete with ENR Data particular to that source. It is possible to read this data directly into the measurement, and even save the data in the same format if changes are required, or if the disk has been lost. The ENR Data can be copied onto a USB flash drive for loading onto the instrument using a PC.

See the section, "Entering Excess Noise Ratio (ENR) Data" in the Measurement Guide.

|           |                                            |
|-----------|--------------------------------------------|
| Couplings | Error 171 is displayed if no data in table |
|-----------|--------------------------------------------|

## Serial #

To obtain the best accuracy, ENR Data is uniquely derived for each noise source. For Keysight Sources, this data can be found printed on the side of the source body. It is a good idea to enter the serial number and model ID of the source into the table – this way you can tell ‘at-a-glance’ whether the data is valid for a specific source or not.

The Meas and Cal tables both have an independent serial number and model ID parameter.

|                              |                                                                                                                                                                                  |

## Model ID

To obtain the best accuracy, ENR Data is uniquely derived for each noise source. For Keysight Sources, this data can be found printed on the side of the source body. It is a good idea to enter the serial number and model ID of the source into the table – this way you can tell ‘at-a-glance’ whether the data is valid for a specific source or not.

The Meas and Cal tables both have an independent serial number and model ID parameter.

| Example                         | <code>:CORR:ENR:CAL:TABL:ID:DATA "346A"</code>                                                                                                                           |
| State Saved                     | Yes                                                                                                                                                                      |
| Range                           | <code>a-zA-Z0-9</code>                                                                                                                                                   |
| Backwards Compatibility Command |                                                                                                                                                                          |
| Notes                           | Same as:<br><code>[ :SENSe]:NFIGure:CORRection:ENR:CALibration:TABLE:ID:DATA</code>                                                                                      |
| Range                           | <code>a-zA-Z0-9</code>                                                                                                                                                   |
| Backwards Compatibility SCPI    | <code>[ :SENSe][ :NFIGure]:CORRection:ENR:CALibration:TABLE:ID:DATA &lt;string&gt;</code><br><code>[ :SENSe][ :NFIGure]:CORRection:ENR:CALibration:TABLE:ID:DATA?</code> |

## Go to Row

Specifies a row and makes it the selected row.

## Insert Row Below

Inserts a row below the current row. The new row is a copy of the current row, and becomes the current row. The new row is not yet entered into the underlying table, and the data in the row is displayed in light gray.

## Delete Row

This is an immediate action control. It immediately deletes the currently-selected row, whether or not that point is being edited, and selects **Navigate**. The point following the currently-selected row (or the row preceding if there is none) will be selected.

### Fill From SNS

Invokes population of the Meas Table or Cal Table from an SNS. Only available when an SNS is connected to the instrument.

|                              |                                                                                 |
|------------------------------|---------------------------------------------------------------------------------|
| Remote Command               | <code>[ :SENSe]:NFIGure:CORRection:ENR:CALibration:TABLE:SNS</code>             |
| Example                      | <code>:NFIG:CORR:ENR:CAL:TABL:SNS</code><br><br>Backwards Compatibility Command |
| Notes                        | Same as:<br><code>[ :SENSe]:NFIGure:CORRection:ENR:CALibration:TABLE:SNS</code> |
| Backwards Compatibility SCPI | <code>[ :SENSe][ :NFIGure]:CORRection:ENR:CALibration:TABLE:SNS</code>          |

### Clear Table

Clears all data from the Cal ENR table and removes the table's backup from persistent storage.

|                |                                                                                                                                                 |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>[ :SENSe]:NFIGure:CORRection:ENR:CALibration:TABLE:DATA:DELeTe</code>                                                                     |
| Notes          | Clears all entries in the Cal ENR table. If the Cal ENR table data is being used in measurement, interrupts the current measurement immediately |

### Frequency Column

Lets you enter the frequency component of a frequency/amplitude pair.

|             |                    |
|-------------|--------------------|
| Preset      | 10 Hz              |
| State Saved | Yes                |
| Range       | 10 kHz to 3.30 THz |
| Min         | 10 kHz             |
| Max         | 3.30 THz           |

### ENR Column

Lets you enter the amplitude component of a frequency/amplitude pair.

### 3 Noise Figure Mode

#### 3.7 Meas Setup

|             |           |
|-------------|-----------|
| Preset      | 0 dB      |
| State Saved | Yes       |
| Min/Max     | -/+200 dB |

#### Setting ENR Table Remotely (Remote Command only)

Data can be entered into the current measurement or calibration ENR table using SCPI. Parameters are provided in frequency/amplitude pairs, the units being Hz and dB respectively. Up to 1301 point-pairs are accepted. See the "[Frequency Column](#)" on page 330 and "[ENR Column](#)" on page 330 definitions for the acceptable parameter ranges.

|                              |                                                                                                                                                                                                                                     |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command               | <code>[ :SENSe]:NFIGure:CORRection:ENR:CALibration:TABLE:DATA &lt;frequency&gt;, &lt;amplitude&gt; ([, &lt;frequency&gt;, &lt;amplitude&gt;])</code><br><code>[ :SENSe]:NFIGure:CORRection:ENR:CALibration:TABLE:DATA?</code>       |
| Example                      | <code>:NFIG:CORR:ENR:CAL:TABL:DATA 1000, -10, 2000, -8, 3000, -6, 10000, 5</code>                                                                                                                                                   |
| Notes                        | Between 1 and 1301 points must be entered<br><br>Backwards Compatibility Command                                                                                                                                                    |
| Notes                        | Between 1 and 1301 points must be entered<br>Same as:<br><code>[ :SENSe]:NFIGure:CORRection:ENR:CALibration:TABLE:DATA</code>                                                                                                       |
| Backwards Compatibility SCPI | <code>[ :SENSe][ :NFIGure]:CORRection:ENR:CALibration:TABLE:DATA &lt;frequency&gt;, &lt;amplitude&gt; ([, &lt;frequency&gt;, &lt;amplitude&gt;])</code><br><code>[ :SENSe][ :NFIGure]:CORRection:ENR:CALibration:TABLE:DATA?</code> |

#### ENR Table Entry Count (Remote Query only)

Returns the number of frequency/amplitude point-pairs in the current measurement or calibration table. If the table is empty, returns 0.

|                |                                                                        |
|----------------|------------------------------------------------------------------------|
| Remote Command | <code>[ :SENSe]:NFIGure:CORRection:ENR:CALibration:TABLE:COUNT?</code> |

## Spot ENR

Set the ENR value used when "[ENR Mode](#)" on [page 322](#) is [SPOT](#), and "[Spot Mode](#)" on [page 332](#) is ENR. Spot ENR values have units of decibels (dB).

ENR values are the best way to enter the noise of the most common noise sources, solid state noise sources. Solid state noise sources have an output noise that is the sum of the attenuated noise of a noise diode and the noise of the output attenuator. When the ambient temperature experienced by that output attenuator changes, it changes the output noise in both the cold (off) and hot states of the noise source by the same amount of power. ENR is defined in terms of the difference between Thot and Tcold, and thus remains constant as Tcold changes.

|                |                                                                                                                         |

| Backwards Compatibility<br>SCPI | <code>[ :SENSe ] [ :NFIgure ] :CORRection:ENR:SPOT</code> |

#### Spot T hot

Set the ENR value used when "Spot Mode" on page 332 is **THOT**.

Setting  $T_{hot}$  is the best way to enter the noise temperature of a noise source that has separate hot and cold loads. Such noise sources are commonly used in national standards laboratories but not by general users.

Unlike the case with solid state noise sources, with hot and cold loads,  $T_{hot}$  does not change due to changes in  $T_{cold}$ . Therefore, when you set  $T_{hot}$ , the instrument does not adjust  $T_{hot}$  according to changes in  $T_{cold}$ .

|                                 |                                                                                                                                   |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|

| Example                         | <code>:NFIg:CORR:ENR:THOT 200.5 K</code>                                                                                          |
| Preset                          | 9892.80 K                                                                                                                         |
| State Saved                     | Yes                                                                                                                               |
| Min                             | 0 K                                                                                                                               |
| Max                             | 29650000 K                                                                                                                        |
| Backwards Compatibility<br>SCPI | <code>[ :SENSe ] [ :NFIgure ] :CORRection:ENR:THOT</code>                                                                         |

#### T Cold Mode

Determines which Tcold value is used in the measurement:

|                |                                           |
|----------------|-------------------------------------------|
| <b>USER</b>    | Use a user-input custom Tcold value input |
| <b>DEFAult</b> | Use the default Tcold of 301.0 K          |

If an SNS is connected and "SNS T Cold State" on page 335 is **ON**, the Tcold value used for the NF measurement is read from the SNS at the beginning of every sweep and the **T Cold Mode** parameter is disabled. The User Tcold value can also be read once from an SNS (if connected) using "User T cold From SNS" on page 335.

|                |                                                                                                                        |

## User T cold Value

Sets the ambient temperature, Tcold, of the noise source. This is the temperature of the termination resistance inside the noise source. If this is set incorrectly, the error in temperature leads to a proportional error in the estimated noise power of that resistor. This error appears as an error in the apparent noise power at the input of the DUT. This can be very significant for very low NF devices and negligible for high NF devices.

|                |                                                                                                                                                                                                               |

## SNS T Cold State

When set to **ON** and an SNS is connected, the Tcold values used in the NF measurement are read from the SNS at the beginning of every sweep. User and Default Tcold mode selections are disabled when this is **ON** and SNS is connected.

## 3.7.2 Cal Setup

Lets you configure calibration setup.

### 3.7.2.1 Cal Type

Selects the type of calibration to be used. **USER** cal or **INTernal** cal types are available.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>[ :SENSe]:NFIgure:CALibration:TYPE USER   INTernal</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Example        | <code>:NFIg:CAL:TYPE INT</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Couplings      | <p>If changed from <b>INTernal</b> to <b>USER</b> and no user cal exists, <b>Apply Calibrations</b> is grayed-out and a message is displayed</p> <p>When set to <b>INTernal</b>, Cal State annunciator in meas bar changes to INT CAL</p> <p>When set to <b>USER</b>, Cal State annunciator in meas bar shows CAL when valid cal exists, UNCAL when cal is invalid (error 309) and ~CAL when cal is interpolated (error 311) or adjusted for RBW changes (error 313)</p> <p>Disabled when System Downconverter is used</p> <p>Apply Calibration is grayed-out when selected</p> |
| Preset         | <b>USER</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| State Saved    | Yes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Range          | <b>USER</b>   <b>INTernal</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

### User Cal

User cal is the "normal" calibration technique, which requires you to connect the noise source directly to the instrument input that is, remove the DUT from the input circuit and perform a calibration.

Once the calibration is complete, the DUT can be inserted back into the input circuit and the measurement can proceed using the acquired calibration data.

When a calibration completes and is valid, **Apply Calibration** is set to "YES", if previously NO

When **User Cal** is selected and valid, the Cal State field in the Meas bar shows "CAL". When cal data is invalid "UNCAL" is shown in the Cal State field. When **User Cal** has been interpolated or adjusted, the Cal State field shows "~CAL"

If cal data changed from valid to invalid (for example, frequency param has changed since last user cal), **Apply Calibration** is grayed-out

### Invalidating User Cal

Should certain measurement parameters change when **User Cal** is selected and valid, the current calibration data will become invalid, and a new user calibration is

required before calibrated measurements can be performed. If **User Cal** is selected and invalid, the results will show uncalibrated data.

In this case, Cal State in Meas bar changes from green "Cal" to red "UnCal".

Changes To Parameters that will Invalidate User Cal

**Frequency:** Setting the frequency outside the current valid user cal set (for example, if the current sweep range is 2 to 3 GHz, then setting the start frequency to 1.9 GHz will invalidate the current user cal. Other frequency changes that will invalidate the user cal are:

- If the cal was performed at a fixed frequency and you change this frequency
- If you are in "Freq List" mode and you change it to extend beyond the current user cal range. In this case you will see an error message

**DUT Type:** If the DUT Type parameter changes, causing the measurement frequencies to be pushed outside the current cal

**Attenuation:** If a setting of attenuator has been selected but not been calibrated

**Preamplifier:** If set to condition different from current cal settings for example: if calibrated with preamp on, turning off will invalidate cal

**Points:** Changing the number of measured frequency points can make the stored preselector offsets become inaccurate and hence invalidate the calibration: This occurs when all the following conditions exist:

- A successful calibration has been performed
- Some measured freq points are > 3.6 GHz

The new points > 3.6 GHz are located more than 50 MHz away from the current calibration points

For freq pts. Measured above 3.6 GHz

**USB Preamplifier:** Changing the USB Preamplifier can invalidate the calibration. This occurs when any one of the following conditions exists:

- The current USB Preamplifier in use is not the one which was used when the current calibration was performed
- Disconnecting an USB Preamplifier after a successful calibration with USB Preamplifier has been performed
- Connecting an USB Preamplifier after a successful calibration without USB Preamplifier has been performed

## Interpolating User Cal

The measurement can interpolate calibration. For example: if the frequency range changes it can 'guess' the correct values; however, this will only work provided the new frequency range is a subset of the calibrated range.

In this case, Cal State in Meas bar will show in yellow as "~Cal" and a warning message will be displayed.

Changes To Parameters that will Interpolate User Cal

**Frequency:** If the frequency changes such that it is inside the current user cal settings. For example, if frequency sweep was from 1 to 2 GHz, and you change the start frequency to 1.1 GHz

**Points:** Changing the number of measured frequency points will interpolate the calibration under the following two conditions:

- All the frequencies are below 3.6 GHz
- Some measured freq points are above 3.6 GHz, the new points above 3.6 GHz are within 50 MHz of the current cal points

## Adjusting User Cal for RBW changes

When you change RBW away from the user cal setting, the cal data is adjusted. Each cal point is normalized to a 1 Hz BW and then multiplied by the new RBW to determine the *new* (interpolated) cal data.

In this case, the Cal State in Meas bar again shows in yellow as "~Cal" and a warning message is displayed.

## Internal Cal

This cal type lets you skip the calibration phase of a noise figure measurement, hence removing the need to mechanically change connection settings. This is only useful if you would normally connect the noise source directly to the instrument RF port. Any test bed fixtures that would normally require calibrating out in the calibrate step cannot use this calibration type. In some cases, you could put the test bed fixture data into the Loss Comp tables, but that would require precise measurement data from the test fixture. Also, for the case when "System Downconverter" is used, the **Internal Cal** option is disabled.

### 3.7.2.2 User Cal Min Atten

To ensure best accuracy in all situations, the calibration process can be performed at multiple attenuation settings. Ideally it should be performed at all available attenuation settings, but in practice this would take far too long and is unnecessary for most applications. For this reason, it is possible to limit the range of calibrated attenuation settings to a sensible range. This command operates in conjunction with **Max RF Atten** to set the range of attenuation used during the calibration process.

This tab is only available when the hardware set includes an input attenuator. For example, this tab does *not* appear in VXT models M9410A, M9411A, M9415A, M9416A, M9410E, M9411E, M9415E, M9416E. For this hardware, **Min Range** is available.

See "[Attenuation](#)" on page 166 under **Amplitude** for more information. The default input attenuation calibration range is:

- With FSA Option: 0 dB to 8 dB, and a step size of 4 dB
- Without FSA Option: 0 dB to 10 dB, and a step size of 10 dB

|                              |                                                                                                                                                             |

### 3.7.2.4 Min Range(Non-attenuator models)

To ensure best accuracy in all situations, the calibration process will be performed at multiple range settings. Ideally it should be performed at all available range settings, but in practice this would take far too long and is unnecessary for most applications. For this reason, it is possible to make a sensible limitation to the range of calibration. This command operates in conjunction with **Max Range** to set the range during the calibration process.

This tab is only available when the hardware does *not* include an input attenuator, such as in VXT models M9410A, M9411A, M9415A, M9416A, M9410E, M9411E, M9415E, M9416E.

|        |                                                                               |
|--------|-------------------------------------------------------------------------------|

| Preset         | -20 dBm                                                                                                                                         |
| State Saved    | Yes                                                                                                                                             |
| Min/Max        | -/+100                                                                                                                                          |

##### 3.7.2.6 Apply Cal

Enables or disables the application of calibration data to the measurement to derive corrected results. If User Cal is selected and no valid calibration data exists (for example: when a calibration has not been performed or when a frequency parameter is changed), this parameter is grayed-out and status message alerts you that **Calibrate Now** is required. This parameter is also grayed-out if you cancel a User Calibration before it is completed.

|                |                                                                                                                        |
|----------------|------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>[ :SENSe]:NFIgure:CALibration:STATe ON   OFF   1   0</code><br><code>[ :SENSe]:NFIgure:CALibration:STATe?</code> |
| Example        | <code>:NFIG:CAL:STAT ON</code>                                                                                         |
| Couplings      | Only enabled when valid calibration data exists                                                                        |

|                                 |                                                                                                                                                                                            |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                 | <p>Grayed-out if a calibration is canceled before it is completed</p> <p>Set to <b>ON</b> when a calibration is successfully completed</p> <p>Grayed-out when internal cal is selected</p> |
| Preset                          | <b>OFF</b>                                                                                                                                                                                 |
| State Saved                     | Yes                                                                                                                                                                                        |
| Range                           | <b>ON OFF 1 0</b>                                                                                                                                                                          |
| Backwards Compatibility<br>SCPI | <p><b>:DISPlay[:NFIGure]:DATA:CORRections[:STATe]</b></p> <p><b>:DISPlay:DATA:CORRections[:STATe]</b></p> <p><b>[:SENSe]:CORRection[:STATe]</b></p>                                        |

### 3.7.2.7 Clear User Cal Data

Clears any user cal data currently stored both in working memory and on the hard drive of the instrument. The path for the Cal Data file is:

**D:\User\_My\_Documents\Instrument\My Documents\NFIGure\state\Corr.STA**

A confirmation dialog is displayed, as a safety mechanism when this control is pressed.

|                |                                                                                                 |
|----------------|-------------------------------------------------------------------------------------------------|
| Remote Command | <b>[:SENSe]:NFIGure:CALibration:DELeTe</b>                                                      |
| Example        | <b>:NFIG:CAL:DEL</b>                                                                            |
| Couplings      | Grayed-out if no user calibration data exists: status message "No User Calibration data exists" |

### 3.7.2.8 Calibration Status (Remote Query only)

Queries a bit to determine the current status, which will be one of: Cal, Uncal, ~Cal and Internal Cal (if NFE license is available).

|                |                                                                                                               |
|----------------|---------------------------------------------------------------------------------------------------------------|
| Remote Command | <b>[:SENSe]:NFIGure:CALibration:CONDition?</b>                                                                |
| Example        | <b>:NFIG:CAL:COND?</b>                                                                                        |
| Notes          | If the instrument is calibrated but <b>Apply Calibration</b> is set to <b>No</b> , returns "UnCal", not "Cal" |
| Preset         | 0                                                                                                             |
| State Saved    | Yes                                                                                                           |
| Range          | <b>CAL   UNCAL   INTERPCAL   INTCAL</b>                                                                       |

## 3.7.3 Noise Source

Lets you configure how to load ENR data from Noise Source.

3.7.3.1 Noise Source Preference

Selects the noise source preference. This feature lets you select which noise source you would prefer to use (if present). If two noise sources are connected (**SNS** and **NORMa1**), this parameter determines which one is used for measurement and calibration.

If set to **SNS** (Auto), an SNS noise source will be used if one is present. If an SNS is not present or preference is set to **NORMa1**, then a normal noise source will be used.

If set to **NORMa1**, "SNS T Cold State" on page 335 and "User T cold From SNS" on page 335 are disabled.

On connection of an SNS when **Preference** is set to **SNS**, if "Auto Load ENR" on page 343 is **ON**, "Use Meas Table Data for Cal" on page 322 is switched **ON** and the Meas Table will be automatically populated from the Noise Source. If "SNS T Cold State" on page 335 is **ON**, the Tcold parameter is also populated automatically from the SNS before every sweep.

NOTE

This parameter is a preference and is *not* altered automatically when an SNS is connected/disconnected.

|                              |                                                                                                                                                                                                                                                                                                               |

3.7.3.2 Auto Load ENR

If "Noise Source Preference" on page 343 is set to **SNS** and **Auto Load ENR** is **ON**, upon connection of an SNS, "Use Meas Table Data for Cal" on page 322 is switched **ON** and ENR data is automatically loaded into the Meas Table from the SNS, overwriting any existing data.

If set to **OFF**, **Use Meas Table Data for Cal** is not modified and no data is loaded into any ENR table automatically. ENR tables can still be populated from the SNS data using **Fill from SNS** under the appropriate table softpanel.

|                                 |                                                                                                                                            |

### 3.7.3.3 Noise Source State

Forces the noise source On or Off. When this function is set to **ON** or **OFF**, the application turns on/off the noise source and no valid results are provided. When noise source is set to **NORMa1** (default setting), the application controls the noise source on/off automatically during measurement.

"**Noise Source Preference**" on page 343 determines which noise source is controlled by this function. If **Noise Source Preference** is set to **SNS**, an SNS noise source will be controlled if one is present. If an SNS is not present, or **Noise Source Preference** is set to **NORMa1**, only a normal noise source will be controlled.

|                |                                                                                                         |

| Couplings      | When set to <b>ON</b> or <b>OFF</b> , <b>Calibration Now</b> is disabled and grayed-out                 |
| Preset         | <b>NORMa1</b>                                                                                           |
| State Saved    | Yes                                                                                                     |
| Range          | <b>NORM ON OFF</b>                                                                                      |

### 3.7.3.4 Noise Source Settling Time

Lets you enter a time for the DUT to settle to the transition time of the noise source when measuring each point. The required time for settling of the 346-series or SNS-series noise source is already allocated in the Noise Figure application. Therefore, with these noise sources, the **Noise Source Settling Time** is actually the excess

### 3 Noise Figure Mode

#### 3.7 Meas Setup

settling time required of the DUT. With other, unknown noise sources, this settling time should be set to allow adequate settling time for the noise source as well as the DUT.

The above times are set in the application, so for normal noise sources or DUTs that require longer settling times, the time would be entered via this parameter.

|                                 |                                                                                                |

| Max                             | 5 sec                                                                                          |
| Backwards Compatibility<br>SCPI | <code>:SYST:CONF:DUT:STIM</code>                                                               |

#### 3.7.4 Loss Comp

Controls the amount of loss compensation to be applied both before and after the Device Under Test. The loss compensation can be supplied as a fixed value for all frequencies, or a table of frequency/amplitude pairs that will be interpolated to find the most accurate compensation value for the measurement that is underway.

##### 3.7.4.1 Loss

Specify which loss (Before DUT Loss or After DUT Loss) will be affected by the functions.

##### 3.7.4.2 Loss Comp Mode

Controls the type of Loss Compensation to be applied before or after the Device Under Test.

|                |                                                                                                                                                           |

### 3.7.4.3 Loss Table

The loss compensation tables are used as a means of entering correction data that will be used to improve the accuracy of measurements. Where a specific measured frequency does not have an exact match in the table, the loss compensation value will be interpolated linearly on the dB scale between the two closest data points.

The table is displayed on the left side of the current measurement as a series of Frequency and Loss Value pairs. When number of entries in the table cannot all be displayed at once, the table can be scrolled. The table is sorted in ascending order using the frequency as a key. The table disappears from view upon exit from the **Loss Table** menu.

Duplicates are *not* allowed in the frequency fields of the **Loss Table** but duplicate Loss Values at different frequencies are acceptable.

|      |                                                                                                                             |
|------|-----------------------------------------------------------------------------------------------------------------------------|
| NOTE | Data entered into this table will have no effect unless <b>"Loss Comp Mode"</b> on <b>page 345</b> is set to <b>TABLE</b> . |
|------|-----------------------------------------------------------------------------------------------------------------------------|

### Loss

This is the same as **"Loss"** on **page 345** on the **Loss Comp** menu panel.

### Go to Row

Specify a row and make it become selected row.

Insert Row Below

Inserts a row below the current row. The new row is a copy of the current row, and becomes the current row. The new row is not yet entered into the underlying table, and the data in the row is displayed in light gray.

Delete Row

This is an immediate action control. It immediately deletes the currently-selected row, whether or not that point is being edited, and selects **Navigate**. The point following the currently-selected row (or the row preceding if there is none) will be selected.

Clear Table

Clears all data from the Loss table and removes the table’s backup from persistent storage.

|                |                                                                                  |
|----------------|----------------------------------------------------------------------------------|
| Remote Command | <code>[ :SENSe][ :NFIGure]:CORRection:LOSS:BEFore AFTer:TABLE:DATA:DELeTe</code> |
|----------------|----------------------------------------------------------------------------------|

Freq Column

Lets you enter the frequency component of a frequency/amplitude pair.

|             |                                                            |
|-------------|------------------------------------------------------------|
| Couplings   | Parameter coupled to currently selected frequency in table |
| Preset      | <blank>                                                    |
| State Saved | Yes                                                        |
| Min         | 10 kHz                                                     |
| Max         | 3.30 THz                                                   |

Loss Value Column

Lets you enter the amplitude component of a frequency/amplitude pair.

|             |                                                             |
|-------------|-------------------------------------------------------------|
| Couplings   | Parameter coupled to currently selected Loss Value in table |
| Preset      | 0                                                           |
| State Saved | Yes                                                         |
| Min/Max     | -/+200 dB                                                   |

### Setting Loss Compensation Table Remotely (Remote Command only)

Lets you remotely enter data into the current loss compensation table, by sending a variable number of frequency/amplitude point-pairs, with units Hz and dB respectively. Up to 1301 point-pairs are accepted. For the acceptable parameter ranges, see "[Freq Column](#)" on page 347 and "[Loss Value Column](#)" on page 347.

|                                 |                                                                                                                                                                                                                                    |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command                  | <code>[ :SENSe]:NFIGure:CORRection:LOSS:BEFore AFter:TABLE:DATA &lt;frequency&gt;, &lt;amplitude&gt; ([, &lt;frequency&gt;, &lt;amplitude&gt;])*</code><br><code>[ :SENSe]:NFIGure:CORRection:LOSS:BEFore AFter:TABLE:DATA?</code> |
| Example                         | <code>:NFIG:CORR:LOSS:BEF:TABL:DATA 1000, -10, 2000, -8, 3000, -6, 10000, 5</code>                                                                                                                                                 |

### Table Entry Count (Remote Query Only)

Returns the number of frequency/amplitude point-pairs in the current measurement or loss compensation table. If the table is empty, returns 0.

|                                 |                                                                              |
|---------------------------------|------------------------------------------------------------------------------|
| Remote Command                  | <code>[ :SENSe]:NFIGure:CORRection:LOSS:BEFore AFter:TABLE:COUNT?</code>     |
| Example                         | <code>:NFIG:CORR:ENR:MEAS:TABL:COUN?</code>                                  |
| Preset                          | 0                                                                            |
| Min                             | 0                                                                            |
| Max                             | 1301                                                                         |
| Backwards Compatibility<br>SCPI | <code>[ :SENSe]:[ :NFIGure]:CORRection:LOSS:BEFore AFter:TABLE:COUNT?</code> |

#### 3.7.4.4 Fixed Loss

Allows entry of a single loss compensation value that will be applied before the device under test at all measured frequencies. Takes effect only if "[Loss Comp Mode](#)" on page 345 before or after DUT is set to **FIXed**.

|                |                                                                                                                                                       |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>[ :SENSe]:NFIGure:CORRection:LOSS:BEFore AFter:VALue &lt;value&gt;</code><br><code>[ :SENSe]:NFIGure:CORRection:LOSS:BEFore AFter:VALue?</code> |
| Example        | <code>:NFIG:CORR:LOSS:BEF:VAL 20 dB</code>                                                                                                            |
| Notes          | Error -221 is displayed if you try to set <b>FIXed</b> value when <b>Before DUT</b> mode is <b>LIST</b> or <b>OFF</b>                                 |
| Couplings      | Only active when <b>Loss Comp Mode</b> is <b>FIXed</b>                                                                                                |

|                              |                                                                                                                                     |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| Preset                       | 0 dB                                                                                                                                |
| State Saved                  | Yes                                                                                                                                 |
| Min/Max                      | -/+100                                                                                                                              |
| Backwards Compatibility SCPI | <code>[ :SENSe] [ :NFIGure] :CORRection:LOSS:BEFore AFTer:VALue</code><br><code>[ :SENSe] :CORRection:LOSS:INPut OUTPut:SPOT</code> |

### 3.7.4.5 Temperature

Sets the before or after DUT correction temperature in units of Kelvin.

In loss compensation, if you set the gain loss (fixed value in dB), while setting the noise temperature of the attenuator to 0 K, then the noise figure of that loss is not taken into account. It is seen as a "purely reflective (non-dissipative)" loss. In most cases, the loss is a dissipative loss, hence the temperature at that loss is required and normally is set to 290 K.

For example, if a 3 dB attenuator is present before or after the DUT and **Temperature** is set to 0.0 K then only the expected transmission gain to the noise source declines by 3 dB in the results. Any noise added by the attenuator is attributed to the DUT instead of the attenuator. If **Temperature** is set to 290 K, then the NF results are computed assuming a noise contribution from the attenuator. This is then equivalent to adding in a 3 dB loss pad.

|                              |                                                                                                                                                                 |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command               | <code>[ :SENSe] :NFIGure:CORRection:TEMPerature:BEFore AFTer &lt;temperature&gt;</code><br><code>[ :SENSe] :NFIGure:CORRection:TEMPerature:BEFore AFTer?</code> |
| Example                      | <code>:NFIG:CORR:TEMP:BEF 0.15 K</code>                                                                                                                         |
| Notes                        | Only K unit is supported                                                                                                                                        |
| Preset                       | 290.00                                                                                                                                                          |
| State Saved                  | Yes                                                                                                                                                             |
| Min                          | 0 K                                                                                                                                                             |
| Max                          | 29650000 K                                                                                                                                                      |
| Backwards Compatibility SCPI | <code>[ :SENSe] [ :NFIGure] :CORRection:TEMPerature:BEFore AFTer</code>                                                                                         |

### 3.7.5 Limits

Contains controls for the Limit Lines of the Noise Figure measurement. **Limits** arrays can be entered via the front panel, sent over SCPI, or loaded from a file.

|        |                                                                                                                       |
|--------|-----------------------------------------------------------------------------------------------------------------------|
| Preset | Turned off by <b>Preset</b> , but the Limits arrays (data) are only reset (deleted) by <b>Restore Mode Defaults</b> . |
|--------|-----------------------------------------------------------------------------------------------------------------------|

---

They survive shutdown and restarting of the instrument application, which means they will survive a power cycle

### 3.7.5.1 Select Limit

Specifies the selected limit. The term "selected limit" is used throughout this section to specify which limit is affected by the functions. Four limits are available for selection.

### 3.7.5.2 Limit (On/Off)

Selects whether the limit and margin are displayed. If **Test All Limits** is **ON**, also determines whether the test trace will be tested against the limit. If **Limit On/Off** is **ON**, the following occurs:

- The limit trace is displayed
- The trace is tested if "**Test Limits**" on page 353 is **ON**

|                              |                                                                                                                                        |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command               | <code>:CALCulate:NFIGure:LLINe[1] 2 ... 4:DISPlay OFF   ON   0   1</code><br><code>:CALCulate:NFIGure:LLINe[1] 2 ... 4:DISPlay?</code> |
| Example                      | <code>:CALC:NFIG:LLIN2:DISP ON</code>                                                                                                  |
| Couplings                    | Limit display <b>ON</b> selects the limit<br>Testing is done on all displayed limits if <b>Test All Limits</b> is <b>ON</b>            |
| Preset                       | Off (all limits)                                                                                                                       |
| State Saved                  | Saved in State                                                                                                                         |
| Backwards Compatibility SCPI | <code>:CALCulate[:NFIGure]:LLINe[1] 2 ... 4[:STATe]</code><br><code>:CALCulate[:NFIGure]:LLINe[1] 2 ... 4:DISPlay[:STATe]</code>       |

### 3.7.5.3 Type

Selects whether the limit you are editing is an **UPPer** or **LOWer** limit. An **UPPer** limit fails if the trace exceeds the limit. A **LOWer** limit fails if the trace falls below the limit.

|                |                                                                                                                                              |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:CALCulate:LLINe[1] 2 ... 4:TYPE UPPer   LOWer</code><br><code>:CALCulate:LLINe[1] 2 ... 4:TYPE?</code>                                |
| Example        | <code>:CALC:NFIG:LLIN2:TYPE LOW</code><br>sets limit line 2 to act as a <b>LOWer</b> limit                                                   |
| Couplings      | If a margin has already been set for this limit line, and this control is used to change the limit type, then the margin value reverses sign |

### 3 Noise Figure Mode

#### 3.7 Meas Setup

|                                 |                                                                                                                                       |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| Preset                          | <b>UPPer</b> for Line 1, 3; <b>LOWer</b> for Line 2, 4<br>Not affected by <b>Mode Preset</b> . Preset by <b>Restore Mode Defaults</b> |
| State Saved                     | Saved in State                                                                                                                        |
| Backwards Compatibility<br>SCPI | <b>:CALCulate[:NFIGure]:LLINe[1] 2 ... 4:TYPE</b>                                                                                     |

#### 3.7.5.4 Test Trace

Selects the trace you want the limit to test. A limit is applied to one and only one trace. Each trace can have both an upper and a lower limit. When executing Limit Test, the limit is applied only to the specified trace.

|                |                                                                                                                                         |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <b>:CALCulate:NFIGure:LLINe[1] 2 ... 4:TRACe 1   2</b><br><b>:CALCulate:NFIGure:LLINe[1] 2 ... 4:TRACe?</b>                             |
| Example        | <b>:CALC:NFIG:LLIN3:TRAC 2</b><br>applies limit 3 to trace 2                                                                            |
| Couplings      | Relevant when testing a trace or limit line for failure, via <b>:CALC:NFIG:LLIN3:FAIL?</b> or <b>:CALC:NFIG:TRAC2:FAIL?</b>             |
| Preset         | Limits 1 and 2 default to 1, Limits 3 and 4 default to 2<br>Not affected by <b>Mode Preset</b> . Preset by <b>Restore Mode Defaults</b> |
| State Saved    | Saved in State                                                                                                                          |

#### 3.7.5.5 Edit Limit

Lets you modify limit lines.

#### Select Limit

Specifies the *selected limit*. The term "selected limit" is used throughout this section to specify which limit is affected by the functions. Four limits are available for selection.

#### Go to Row

Specify a row and make it become selected row.

Insert Row Below

Inserts a row below the current row. The new row is a copy of the current row, and becomes the current row. The new row is not yet entered into the underlying table, and the data in the row is displayed in light gray.

Delete Row

This is an immediate action control. It immediately deletes the currently-selected row, whether or not that point is being edited, and selects **Navigate**. The point following the currently-selected row (or the row preceding if there is none) is selected.

Delete Limit

Clears all data from the selected limit.

|                |                                              |
|----------------|----------------------------------------------|
| Remote Command | :CALCulate[:NFIGure]:LLINE[1] 2 ... 4:DElete |
|----------------|----------------------------------------------|

Freq Column

Lets you enter the frequency component of a frequency/amplitude pair.

|             |                                                          |
|-------------|----------------------------------------------------------|
| Couplings   | Parameter coupled to currently selected X value in table |
| Preset      | <blank>                                                  |
| State Saved | Yes                                                      |
| Min         | 10 Hz                                                    |
| Max         | 3.30 THz                                                 |

Amptd Column

Lets you enter the amplitude component of a frequency/amplitude pair.

|             |                                                          |
|-------------|----------------------------------------------------------|
| Couplings   | Parameter coupled to currently selected Y value in table |
| Preset      | 0                                                        |
| State Saved | Yes                                                      |
| Min/Max     | -/+100 dB                                                |

### 3.7.5.6 Test Limits

Selects whether displayed traces are tested against displayed limits (that is, those for which "Limit (On/Off)" on page 350 is ON).

If two amplitude values are entered for the same frequency, a single vertical line is the result. In this case, if an Upper line is chosen, the lesser amplitude is tested. If a Lower line is chosen, the greater amplitude is tested.

|                                 |                                                                                                                |
|---------------------------------|----------------------------------------------------------------------------------------------------------------|
| Remote Command                  | <code>:CALCulate:NFIGure:LLINe:TEST OFF   ON   0   1</code><br><code>:CALCulate:NFIGure:LLINe:TEST?</code>     |
| Example                         | <code>:CALC:NFIG:LLIN:TEST ON</code>                                                                           |
| Notes                           | When the command is used to turn an individual limit line test ON, the test for <i>all</i> limits is turned ON |
| Preset                          | ON<br>Not affected by <b>Mode Preset</b> . Preset by <b>Restore Mode Defaults</b>                              |
| State Saved                     | Saved in State                                                                                                 |
| Annotation                      | If ON, the active limit window displays the information above regarding pass/fail for each displayed limit     |
| Backwards Compatibility<br>SCPI | <code>:CALCulate[:NFIGure]:LLINe[1] 2 ... 4:TEST[:STATE]</code>                                                |

### 3.7.5.7 Delete All Limits

Deletes all limit lines and purges the data from all limit line tables.

All limit data is cleared and returned to factory preset values.

|                |                                                  |
|----------------|--------------------------------------------------|
| Remote Command | <code>:CALCulate:NFIGure:LLINe:ALL:DElete</code> |
| Example        | <code>:CALC:NFIG:LLIN:ALL:DEL</code>             |

### 3.7.5.8 All Limits Fail? (Remote Query Only, Backwards Compatibility)

Tests all limits on all traces for failure. Returns 0 if no limits fail or 1 if any limits fail.

|                                 |                                                                                                                                               |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| Notes                           | Performs the same action as sending <code>:CALC:TRACe[1] 2:FAIL?</code> for both traces then performing a logical OR operation on the results |
| Backwards Compatibility<br>SCPI | <code>:CALCulate:CLIMits:FAIL?</code>                                                                                                         |

### 3.7.5.9 Limit Line Data (Remote Command Only, Backwards Compatibility)

Defines the limit line values and destroys all existing data. Up to 200 points may be defined for each limit using the following parameters.

|                        |                                                                                                                                                                                                                                                                                           |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>&lt;x&gt;</b>       | Frequency or time values as specified by<br><b>:CALCulate:LLINE:CONTRol:DOMain</b> . Units default to Hz (for frequency) and seconds (for time)<br>Range: –30 Gs to +30 Gs for time limits, –3 kHz to +350 GHz for frequency limits                                                       |
| <b>&lt;ampl&gt;</b>    | Amplitude values units default to dBm. Up to two amplitude values can be provided for each x-axis value, by repeating <x-axis> in the data list<br>Range: –140 dBm to +100 dBm                                                                                                            |
| <b>&lt;connect&gt;</b> | Connect values are either "0" or "1." "1" means this point will be connected to the previously defined point to define the limit line. "0" means that it is a point of discontinuity and is not connected to the preceding point. The <b>connect</b> value is ignored for the first point |

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Preset                          | Limit line data is cleared by <b>Restore Mode Defaults</b>                                                                                                                                                                                                                                                                                                                                                     |
| State Saved                     | Yes                                                                                                                                                                                                                                                                                                                                                                                                            |
| Backwards Compatibility<br>SCPI | <b>:CALCulate[:NFIGure]:LLINE[1] 2 ... 4:DATA</b><br><b>:CALCulate:NFIGure:LLINE[1] 2 ... 4:DATA &lt;freq&gt;,&lt;ampl&gt;,&lt;connect&gt;,...</b><br><b>:CALCulate:NFIGure:LLINE[1] 2 ... 4:DATA?</b><br><br>The following query returns an integer representing the number of frequency/amplitude/connected sets that are currently loaded into the table. Min 0, Max 200. If the table is empty, returns 0. |
| Remote Command                  | <b>:CALCulate[:NFIGure]:LLINE[1] 2 ... 4:COUNT?</b>                                                                                                                                                                                                                                                                                                                                                            |
| Example                         | <b>:CALC:LLIN2:COUN?</b>                                                                                                                                                                                                                                                                                                                                                                                       |
| Preset                          | 0                                                                                                                                                                                                                                                                                                                                                                                                              |

## 3.7.6 Advanced

Allows control of functions that most users will not need to change.

### 3.7.6.1 Pcold/hot Unit

Specifies the Pcold/hot result unit.

| Unit   | SCPI          | Result                                            |
|--------|---------------|---------------------------------------------------|
| dBm/Hz | <b>DBM_HZ</b> | The absolute power density                        |
| dB     | <b>DB</b>     | The power density reference to kTB –173.88 dBm/Hz |

3 Noise Figure Mode  
3.7 Meas Setup

|                |                                                                                                   |
|----------------|---------------------------------------------------------------------------------------------------|
| Remote Command | <code>[ :SENSe]:NFIGure:PCHot:UNIT DB   DBM_HZ</code><br><code>[ :SENSe]:NFIGure:PCH:UNIT?</code> |
| Example        | <code>:NFIG:PCH:UNIT DB</code>                                                                    |
| Preset         | <code>DB</code>                                                                                   |
| State Saved    | Yes                                                                                               |
| Range          | <code>DB   DBMHZ</code>                                                                           |

## 3.8 Sweep

Accesses controls to configure and control the acquisition of data, and the X-axis parameters of the instrument.

Depending on the selected mode and measurement, these controls might include: **Sweep Time**, **Continuous/Single**, **Pause/Resume**, **X Scale** and **Number of Points**.

### 3.8.1 Sweep/Control

Accesses controls that let you operate the sweep and control functions of the instrument, such as **Sweep Time** and **Continuous/Single**.

#### 3.8.1.1 Avg Time/Pt

**Avg Time/Pt** is the measurement duration for each of the two states (noise source on and noise source off) that occur at each frequency point. Therefore, for one result trace, the time required will change by 2 times the number of frequency points times the change in **Avg Time/Pt**.

Longer settings of **Avg Time/Pt** reduce the variance of the results but slow the throughput. The **AUTO** setting sets **Avg Time/Pt** according to this formula:

$$\text{Avg Time/Pt} = 64 \text{ ks} / \text{RBW}$$

The default RBW is 4 MHz, so **Avg Time/Pt** default is 16 ms. At this sweep time, the variance of the trace point results under best-case circumstances (high DUT output noise levels) is such that 95% of all results will have an error due to this variance that is similar to the Instrument Uncertainty for Noise Figure. Therefore, the overall uncertainties do not improve much for longer averaging times. Averaging times much shorter than 16 ms will cause the throughput to be dominated by overheads of computation and settling. Thus, the default is often a good tradeoff between speed and variance.

One use of shorter settings of **Avg Time/Pt** is for testing DUTs that operate in a pulsed mode.

**Avg Time/Pt** is one way to reduce variance. Another is setting "**Average/Hold Num**" on page 211 in the **Meas Setup** menu. When averaging traces with **Average/Hold Num** set higher than one, the time to achieve a given variance is longer because the overhead time at each point is experienced during each sweep, thus increasing **Avg Time/Pt** is more efficient. A shorter **Avg Time/Pt** with a higher **Average/Hold Num** gives more interactive results, with an earlier first view of the results.

This trade-off between **AvgTime/Pt** and **Average/Hold Num** is analogous to the trade-off between "point" and "sweep" averaging modes in the Keysight NFA.

## Pulsed Noise Figure Measurement

In a Pulsed Noise Figure measurement, the pHot/pCold measurements must be performed only in the active part of the pulse. To accomplish this, in a gated and triggered measurement, **Avg Time/Pt** is further adjusted, according to the following formula, to guarantee that the data acquisition occurs during the active part of the pulse.

$$\text{Avg Time/Pt} \leq \text{Gate Length}$$

Use the controls in **"Gate Settings" on page 987**, under **Trigger**, to adjust the gate parameters. You can then select the appropriate trigger source and gate parameters, such as **Gate Delay** and **Gate Length**, to ensure that the noise figure is measured during the active part of the pulse.

---

Remote Command      [:SENSe]:NFIgure:SWEEP:TIME <time>  
                             [:SENSe]:NFIgure:SWEEP:TIME?

|                                 |                                     |

| Example        | <code>:NFIG:SWE:TIME:AUTO OFF</code>                                                                                                                             |
| Couplings      | When set to <b>AUTO</b> , the <b>Avg Time/Pt</b> value is coupled to <b>RBW</b> by this formula:<br>Avg Time/Pt = 64k/RBW<br>This optimizes the results variance |
| Preset         | <b>ON</b>                                                                                                                                                        |
| State Saved    | Yes                                                                                                                                                              |
| Range          | <b>ON OFF 1 0</b>                                                                                                                                                |

### 3.8.1.2 Sweep/Measure

Lets you toggle between **Continuous** and **Single** sweep or measurement operation. The single/continuous state is Meas Global, so the setting affects all measurements.

The front-panel key **Single/Cont** performs exactly the same function

See ["More Information" on page 359](#)

|                |                                                                                                                                                                                                                                                     |

|                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Continuous Mode | <p>The instrument takes repetitive sweeps, averages, measurements, etc., when in continuous mode. If in average or Max/Min Hold, and the average/hold count reaches the <b>Average/Hold Num</b>, the count stops incrementing, but the instrument keeps sweeping</p> <p>See the <b>Trace</b> key description under <b>Trace Average</b> for the averaging formula used both before and after the <b>Average/Hold Num</b> is reached. The trigger condition must be met prior to each sweep</p> <p>The type of trace processing for multiple sweeps is set under the <b>Trace</b> key, with choices of <b>Trace Average</b>, <b>Max Hold</b>, or <b>Min Hold</b></p> |
| Single Mode     | <p>The instrument takes a single sweep when in <b>Single</b> mode, or if in average or Max/Min Hold, or if there is a <b>Waterfall</b> window displayed, it takes multiple sweeps until the average/hold count reaches the <b>Average/Hold Num</b>, then the count stops incrementing, and the instrument stops sweeping</p> <p>See the <b>Trace</b> key description under <b>Trace Average</b> for the averaging formula used. The trigger condition must be met prior to the sweep</p> <p>The type of trace processing for multiple sweeps is set under the <b>Trace</b> key, with choices of <b>Trace Average</b>, <b>Max Hold</b>, or <b>Min Hold</b></p>       |

If the instrument is in **Single** measurement mode, pressing the **Cont/Single** toggle control does not zero the count and does not cause the sweep to be reset; the only action is to put the instrument into Continuous measurement operation.

If the instrument is already in **Continuous** sweep:

- **:INIT:CONT 1** has no effect
- **:INIT:CONT 0** places the instrument in Single Sweep but has no effect on the current sequence until  $k = N$ , at which point the current sequence will stop and the instrument will go to the idle state

See "**Restart**" on page 360 for details of **:INIT:IMMediate**.

If the instrument is already in **Single** sweep, **:INIT:CONT OFF** has no effect.

If the instrument is already in **Single** sweep, then pressing **Cont/Single** in the middle of a sweep does not restart the sweep or sequence. Similarly, pressing **Cont/Single** does not restart the sweep or sequence if the sweep is not in the idle state (for example, if you are taking a very slow sweep, or the instrument is waiting for a trigger). Even though pressing **Cont/Single** in the middle of a sweep does not restart the sweep, sending **:INIT:IMM** does reset it.

If the instrument is in **Single** sweep, and *not* Averaging/Holding, and you want to take one more sweep, press **Restart**.

If the instrument is in **Single** sweep, *and* Averaging/Holding, and you want to take one more sweep without resetting the Average trace or count, go to **Meas Setup** and increment the average count by 1 by pressing the **Step-Up** key while **Average/Hold Num** is the active function. You can also do this by sending **:CALC:AVER:TCON UP**.

3.8.1.3 Restart

Restarts the current sweep, or measurement, or set of averaged/held sweeps or measurements. If you are Paused, pressing **Restart** performs a Resume.

The front-panel key **Restart** performs exactly the same function.

The **Restart** function is accessed in several ways:

- Pressing the **Restart** key
- Sending **:INIT:IMM**
- Sending **:INIT:REST**

See "More Information" on page 361

|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                               | The <b>MEASURING</b> bit is set                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Backwards Compatibility Notes | <p>For Spectrum Analysis Mode in ESA and PSA, the <b>Restart</b> hardkey and the <b>:INIT:REST</b> command restarted trace averages (displayed average count reset to 1) for a trace in <b>Clear Write</b>, but did not restart <b>Max Hold</b> and <b>Min Hold</b></p> <p>In X-Series, the <b>Restart</b> hardkey and the <b>:INIT:REST</b> command restart not only <b>Trace Average</b>, but <b>MaxHold</b> and <b>MinHold</b> traces as well</p> |

More Information

The **Restart** function first aborts the current sweep or measurement as quickly as possible. It then resets the sweep and trigger systems, sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is in the process of aligning when a **Restart** is executed, the alignment finishes before the restart function is performed.

Even when set for **Single** operation, multiple sweeps may be taken when **Restart** is pressed (for example, when averaging/holding is on). Thus, when we say that **Restart** "restarts a measurement", depending on the current settings, we may mean that it:

- Restarts the current sweep
- Restarts the current measurement
- Restarts the current set of sweeps if any trace is in Trace Average, Max Hold or Min Hold
- Restarts the current set of measurements if Averaging, or Max Hold, or Min Hold is on for the measurement

If there is no Average or Max/Min Hold function (no trace in Trace Average or Hold, or **Average/Hold Num** set to 1), and no **Waterfall** window is being displayed, a single sweep is equivalent to a single measurement. A single sweep is taken after the trigger condition is met; and the instrument stops sweeping once that sweep has completed. However, with **Average/Hold Num** >1, and at least one trace set to Trace Average, Max Hold, or Min Hold, or a **Waterfall** window being displayed, multiple sweeps/data acquisitions are taken for a single measurement. The trigger condition must be met prior to each sweep. The sweep is stopped when the average count k equals the number N set for **Average/Hold Num**.

Once the full set of sweeps has been taken, the instrument goes to the idle state. To take one more sweep without resetting the average count, increment the average count by 1, by pressing the **Step-Up** key while **Average/Hold Number** is the active function, or by sending the remote command **:CALC:AVER:TCN UP**.

## Trace Update

The numeric results are not blanked at any time during the restart cycle.

For slow sweeps (see **Trace Update** section in **Trace/Detector**), the traces are updated real-time during the sweep. There may be a special circumstance in application mode measurements where an exception is made and the traces and/or results need to be blanked before displaying the new results.

To summarize, the following list shows what happens to the trace data on various events:

| Event                                                           | Trace Effect                                       |
|-----------------------------------------------------------------|----------------------------------------------------|
| <b>Clear/Write</b> pressed (even if already in Clear/Write)     | Set to mintracevalue                               |
| <b>Max Hold</b> pressed (even if already in Max Hold)           | Set to mintracevalue                               |
| <b>Min Hold</b> pressed (even if already in Min Hold)           | Set to maxtracevalue                               |
| <b>Trace Average</b> pressed (even if already in Trace Average) | Trace data unaffected but start new sweep/avg/hold |
| <b>Restart</b> pressed                                          | Trace data unaffected but start new sweep/avg/hold |
| Parameter requiring restart changed (e.g., RBW)                 | Trace data unaffected but start new sweep/avg/hold |

## Sweep and Trigger Reset

Resetting the sweep system resets the average/hold count  $k$  to 0. It also resets the set point counter to 0. Resetting the trigger system resets the internal auto trig timer to the value set by the **Auto Trig** control.

## Averaging

The weighting factor used for averaging is  $k$ . This  $k$  is also the average/hold count for how many valid sweeps (data acquisitions) have been done. This  $k$  is used for comparisons with  $N$ , as those comparisons always needs to be based on valid completed sweeps.

The displayed average/hold,  $K$ , shows the count for the sweep (data acquisition) in progress.  $K = k + 1$ , with a limit of  $N$ . The displayed value  $K$  changes from its previous value to 1 as soon as the trigger condition for the first data acquisition (sweep) is met.

3.8.1.4 Points

Sets the number of frequency points that are used when "Freq Mode" on page 191 is **SWEpt**. The frequency points are distributed evenly between the start and stop frequencies.

|                                 |                                                                             |

3.8.1.5 Start Manual Cal

Can be used to perform a manual calibration with a hot/cold noise source. Primarily for situations where a SNS or 346 Series noise source is *not* being used.

This function adds an interrupt state between HOT and COLD power measurement, during which you can switch the noise source.

When this control is pressed, the following dialog is displayed:

If **Internal Cal** is selected, the dialog is different, as shown below:

When **OK** is pressed, manual calibration begins. The instrument is forced to **Single** mode, and the following dialog is displayed:

This dialog informs you to connect a “Hot” noise source. After connecting a “Hot” noise source, you can start calibration by pressing **OK** or **Enter**.

The instrument measures “Hot” power for each frequency points, while displaying the following dialog:

When completed, the measured powers are collected, then the following dialog is displayed.

3 Noise Figure Mode  
3.8 Sweep

Connect a “Cold” noise source, the press **OK** or **Enter** to continue. The instrument measures “Cold” powers while displaying the following dialog:

When “Cold” power measurement is complete, the dialog closes. A further message appears: Apply Calibration is set to On.

To abort, press **Cancel** or **ESC**.

To start Manual Measurement, press **Start Manual Meas**. If you press **Restart**, **Single** or **Cont**, an Automatic Measurement will start.

NOTE

When manual calibration is in progress, "**Start Manual Meas**" on page 366 is disabled.

|                |                                                                |
|----------------|----------------------------------------------------------------|
| Remote Command | <code>[ :SENSe]:NFIGure:MANual:CALibration:INITiate</code>     |
| Example        | <code>:NFIG:MAN:CAL:INIT</code>                                |
| Notes          | Immediate action                                               |
| Couplings      | Instrument forced to <b>SINGLE</b> mode when manual cal starts |

### 3.8.1.6 Start Manual Meas

Performs a manual measurement with a hot/cold noise source. Primarily for situations where a SNS or 346 Series noise source is *not* being used.

This procedure is the same as ["Start Manual Cal" on page 363](#), except that the dialogs differ. The following dialogs are displayed during “Cold” and “Hot” power measurement.

When “Cold” power measurement is complete, the dialog closes. A further message “Manual Meas is complete” appears, and the results are displayed.

**NOTE** When manual calibration is in progress, **Start Manual Meas** is disabled.

|                |                                                                |
|----------------|----------------------------------------------------------------|
| Remote Command | <code>[ :SENSe]:NFIGure:MANual:MEASurement:INITiate</code>     |
| Example        | <code>:NFIG:MAN:MEAS:INIT</code>                               |
| Notes          | Immediate action                                               |
| Couplings      | Instrument forced to <b>SINGLe</b> mode when manual cal starts |

**3.8.1.7 Manual Continue (Remote Command only)**

Used to trigger manual calibration or manual measurement after you connect a Cold or Hot noise source.

|                |                                                |

| Remote Command | <code>[ :SENSe]:NFIGure:MANual:CONTinue</code> |
| Example        | <code>:NFIG:MAN:CONT</code>                    |

**3.8.1.8 Manual Abort (Remote Command only)**

Used to abort current manual calibration or manual measurement.

|                |                                             |
|----------------|---------------------------------------------|
| Remote Command | <code>[ :SENSe]:NFIGure:MANual:ABORt</code> |
| Example        | <code>:NFIG:MAN:ABORt</code>                |

## 3.9 Trace

Lets you control the display mode of each of the traces in the Noise Figure measurement.

### 3.9.1 Trace Control

Lets you set the **View/Blank** state of each trace, select a trace, and switch on all traces.

#### 3.9.1.1 Select Trace

Specifies the *selected trace*, which is the trace that will be affected when you change trace settings.

**Select Trace** appears above the menu panel, indicating that it applies to *all* controls in the menu panel. **Select Trace** is blanked if you select a tab whose controls do *not* depend on the selected trace (for example, **Trace Function**).

|              |                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Notes        | The selected trace is remembered even when not in the <b>Trace</b> menu                                                                                                                                                                                                                                                                                                                                                                              |
| Dependencies | <div>For the Swept SA measurement:</div> <div><div><div>– In Image Suppress mode, when you select a trace it becomes the active trace, and the formerly active trace goes into View</div><div>– When you turn on Image Suppress, Update turns off for all traces except the selected trace</div></div><div>For the ACP measurement, when <b>Meas Method</b> is <b>RBW</b>, <b>FAST</b> or <b>FPOwer</b>, <b>Select Trace</b> is disabled</div></div> |
| Preset       | Trace 1                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| State Saved  | Yes                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

#### 3.9.1.2 View/Blank

Lets you set the state of the two trace variables: **Update** and **Display**. The choices available in this dropdown menu are:

|            |                                                                                                                                                                               |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Active     | Update and Display both <b>ON</b>                                                                                                                                             |
| View       | Update <b>OFF</b> ; Display <b>ON</b>                                                                                                                                         |
| Blank      | Update <b>OFF</b> ; Display <b>OFF</b>                                                                                                                                        |
| Background | <div>Update <b>ON</b>, Display <b>OFF</b></div> <div>Allows a trace to be blanked <i>and</i> continue to update “in the background”, which was not possible in the past</div> |

In the Swept SA measurement, a trace with **DisplayOFF** is indicated by a strikethrough of the type letter in the trace annotation panel in the Measurement Bar. A trace with **UpdateOFF** is indicated by dimming the type letter in the trace annotation panel in the Measurement Bar. In the example below, Traces 3, 4, 5 and 6 have **UpdateOFF**, and Traces 4 and 6 have **DisplayOFF**.

See: ["More Information" on page 370](#)

|              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Couplings   | Whenever you set <b>Update</b> to <b>ON</b> for any trace, the <b>Display</b> is set to <b>ON</b> for that trace |
| Preset      | 1 0 0<br><br><b>ON</b> for Trace 1; <b>OFF</b> for 2 & 3                                                         |
| State Saved | Saved in instrument state                                                                                        |

**More Information**

When a trace becomes inactive, any update from the :SENSe system (detectors) immediately stops, without waiting for the end of the sweep. The trace data remains unchanged, but stops updating. If the trace is blanked, this still does not affect the data in the trace. Traces that are blanked (**Display=OFF**) do not display nor appear on printouts, but their data stays intact, they may be queried, and markers may be placed on them

In most cases, inactive traces are static and unchanging; however, there are cases when an inactive trace will update, specifically:

- if data is written to that trace from remote
- if trace data is loaded from mass storage
- if the trace is the target of a **Copy** or participant in an **Exchange**
- if the trace is cleared using **Clear Trace**

Inactive traces that are also being displayed (traces in **View**) are displayed at half intensity. Traces in **View** display across the entire X-Axis of the instrument. Their horizontal placement does not change, even if X-Axis settings subsequently are changed, although Y-Axis settings do affect the vertical placement of data.

When a trace becomes active (**Update=ON**), the trace is cleared, the average count is reset, and a new sweep is initiated.

Note that putting a trace into **Display=OFF** and/or **Update=OFF** does *not* restart the sweep and does *not* restart Averaging or Hold functions for any traces.

## 4 System

The **System** hardkey and the “gear” icon both open the **System Settings** dialog, which allows you to access various configuration menus and dialogs. The line of tabs down the left side let you choose various pages for configuring your instrument.

|       |                                             |
|-------|---------------------------------------------|
| Notes | No remote command for this key specifically |
|-------|---------------------------------------------|

## 4.1 System

Allows access to several general system functions, including three **Show** screens for viewing system parameters. Several such **Show** screens are available on this and other **System** menu pages. They can also be accessed with the SCPI command described here.

---

|         |                              |
|---------|------------------------------|
| Example | <code>:SYST:SHOW SYST</code> |
|---------|------------------------------|

#### 4.1.1.1 Show System contents (Remote Query Only)

Returns the contents of the **Show System** screen (the entire contents, not just the currently displayed page).

---

|                |                                          |
|----------------|------------------------------------------|
| Remote Command | <code>:SYSTem:CONFigure[:SYSTem]?</code> |
|----------------|------------------------------------------|

---

|         |                          |
|---------|--------------------------|
| Example | <code>:SYST:CONF?</code> |
|---------|--------------------------|

---

|       |                                                                                                                       |
|-------|-----------------------------------------------------------------------------------------------------------------------|
| Notes | The output is an IEEE Block format of the <b>Show System</b> contents. Each line is separated by a new-line character |
|-------|-----------------------------------------------------------------------------------------------------------------------|

#### 4.1.1.2 Computer System description (Remote Query Only)

Returns the **Computer System** description, which consists of the operating system and patch level, as reported by operating system.

---

|                |                               |
|----------------|-------------------------------|
| Remote Command | <code>:SYSTem:CSYStem?</code> |
|----------------|-------------------------------|

---

|         |                          |
|---------|--------------------------|
| Example | <code>:SYST:CSYS?</code> |
|---------|--------------------------|

---

|       |                                                         |
|-------|---------------------------------------------------------|
| Notes | Returns the Computer System name and service pack level |
|-------|---------------------------------------------------------|

### 4.1.2 Show Hardware

Displays details of the installed hardware. This information can be used to determine versions of hardware assemblies and field-programmable devices, in the advent of future upgrades or potential repair needs.

The screen is divided into two groups: product descriptive information and hardware information. The hardware information is listed in a table format.

---

|         |                              |
|---------|------------------------------|
| Example | <code>:SYST:SHOW HARD</code> |
|---------|------------------------------|

### 4.1.3 Show LXI

Displays the product number, serial number, firmware revision, computer name, IP address, Host ID, LXI Class, LXI Version, MAC Address, and the Auto-MDIX Capability.

---

|         |                             |
|---------|-----------------------------|
| Example | <code>:SYST:SHOW LXI</code> |
|---------|-----------------------------|

4.1.4 Show Support Subscriptions

Displays the software support subscription information for the licenses available on the instrument.

Shows the software license, description, software support expiration date (format is **YYYY.MMDD**), and the software support status. The **Software Version Date** (format is **YYYY.MMDD**) shown in the header indicates the date required to access the latest software enhancements included in this version of the software. If any license has a **Software Support Expiration Date** earlier than the **Software Version Date**, then enhancements may be available that the license does *not* enable.

|                  |                                |                                                        |                                                                                                                      |                                                                                                                                                                                                                                                                                                                                                 |

Example        `:SYST:SHOW SSInformation`

4.1.5 Show Support ID

Displays the Support ID for each license available in the instrument. Shows the **Software License**, **Description**, software support expiration date, and **Support ID** for that license.

Each license has a copy icon, which copies just the **Support ID** for that license to the Windows clipboard. This is useful to avoid typing mistakes when entering this value into another program or web site.

The **Copy all to clipboard ...** control copies all the data to the Windows clipboard, in comma-separated value (CSV) format.

| System Settings  | System                  |                                             |           |                   | Support ID |

Example :SYST:SHOW SID

## 4.1.6 Control Panel...

Opens the Windows Control Panel. **Control Panel** is used to configure certain elements of Windows that are not configured via the Multitouch UI System menus.

**NOTE** This feature is *not* available if Option SF1 is installed.

**Control Panel** is a separate Windows application, so to return to the Instrument Application, either:

- Exit by tapping on the red **X** in the upper right-hand corner
- Use **Alt+Tab**. Press and hold the **Alt** key and press and release the **Tab** key until the Instrument logo is showing in the window in the center of the screen, then release the **Alt** key

Notes No remote command for this key

### 4.1.7 Web Browser

Launches the instrument's default **Web Browser**. Usually, the default is Microsoft Edge. A mouse and external keyboard are highly desirable for using the browser. To return focus to the Instrument Application, close the browser (or use **Alt-Tab**).

NOTE

This feature is *not* available if Option SF1 is installed.

---

### 4.1.8 Application Controls

Lets you Minimize or Exit the application.

Pressing **Exit Program** displays a prompt asking if you are sure you want to close the program. If you select **OK**, the entire analyzer application will shut down, and you will lose any unsaved trace or measurement data.

---

Notes

No equivalent remote command for this key

### 4.1.9 Sounds

Lets you adjust the speaker volume using the slider, or mute/unmute the speaker, by tapping the **Speaker** icon.

Moving the slider up and down changes the speaker volume, and *also* unmutes the speaker if muted.

**Icon when muted**

## 4.2 I/O Config

Lets you specify and change the I/O configuration for remote control. Controls in this menu allow configuration of the I/O ports used for SCPI remote control over GPIB and LAN.

The SCPI LAN parameters are set using controls in this menu, but configuration of LAN settings themselves is performed using the Windows Control Panel (DHCP, Gateway, Subnet Mask, etc.).

The USB port is also available for remote control, but requires no configuration.

### 4.2.1 GPIB

Lets you configure the GPIB I/O port.

|              |                      |
|--------------|----------------------|
| Dependencies | Not available in UXM |
|--------------|----------------------|

#### 4.2.1.1 GPIB Address

Select the GPIB remote address.

|                |                                                                                                                                     |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:SYSTem:COMMunicate:GPIB[1][:SELF]:ADDRess &lt;integer&gt;</code><br><code>:SYSTem:COMMunicate:GPIB[1][:SELF]:ADDRess?</code> |
| Example        | <code>:SYST:COMM:GPIB:ADDR 17</code>                                                                                                |
| Notes          | If the GPIB port address is changed, all further communication must use the <i>new</i> address                                      |
| Preset         | Unaffected by <b>Preset</b> , but set to 18 by <b>Restore Defaults</b> > "Misc" on page 426                                         |
| State Saved    | No                                                                                                                                  |
| Min            | 0                                                                                                                                   |
| Max            | 30                                                                                                                                  |

#### 4.2.1.2 GPIB Controller

Sets the GPIB port into Controller (**ON**) or Device (**OFF**) mode. In the normal state, **GPIB Controller** is disabled (**OFF**), which allows the instrument to be controlled by a remote computer. When **GPIB Controller** is enabled (**ON**), the instrument can run software applications that use the instrument's computer as a GPIB controller for devices connected to the GPIB port.

## NOTE

When **GPIO Controller** is enabled, the analyzer application itself cannot be controlled over GPIB. In this case, it can be controlled via LAN or USB. The GPIB port cannot be a Controller and Device at the same time. Only one Controller can be active on the GPIB bus at any given time. If the instrument is the Controller, an external PC cannot also be a Controller.

To control the instrument from the software that is performing GPIB Controller operation, you can use an internal TCP/IP connection to the analyzer application. Use the following IP Address to send commands to the analyzer application:

`TCPIP0:localhost:inst0:INSTR`

|                |                                                                                                                                                                          |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:SYSTem:COMMunicate:GPIB[1][:SELF]:CONTroller[:ENABLE] ON   OFF   0   1</code><br><code>:SYSTem:COMMunicate:GPIB[1][:SELF]:CONTroller[:ENABLE]?</code>             |
| Example        | Set GPIB port to Controller:<br><code>:SYST:COMM:GPIB:CONT ON</code><br><br>Set GPIB port to Device:<br><code>:SYST:COMM:GPIB:CONT OFF</code>                            |
| Notes          | When the instrument becomes the Controller, Bit 0 in the Standard Event Status Register is set. When the instrument relinquishes Controller capability, bit 0 is cleared |
| Preset         | Unaffected by Preset, but set to <b>OFF</b> (Disabled) by <b>Restore Defaults &gt; "Misc"</b> on page 426                                                                |
| State Saved    | No                                                                                                                                                                       |
| Range          | Disabled   Enabled                                                                                                                                                       |

## 4.2.2 SCPI LAN

Displays a menu for identifying and changing SCPI over a LAN configuration. There are several ways to send SCPI remote commands to the instrument over LAN.

Having multiple users simultaneously accessing the instrument over the LAN may lead to communication problems. These controls can help to prevent that, by disabling the telnet, socket, and/or SICL capability.

## NOTE

When multiple instances of the application are running, Telnet port 5023, socket port 5025, SICL server inst0 and HiSLIP server Device 0 will be assigned to the first instance; Telnet port 5123, socket port 5125, SICL server inst1 and HiSLIP server Device 1 will be assigned to the second instance; Telnet port 5223, socket port 5225, SICL server inst2 and HiSLIP server Device 2 will be assigned to the third instance; Telnet port 5323, socket port 5325, SICL server inst3 and HiSLIP server Device 3 will be assigned to the fourth instance.

- "SCPI Telnet" on page 380
- "SCPI Socket" on page 380
- "SICL Server" on page 381
- "HiSLIP Server" on page 382
- "Verbose SCPI On/Off" on page 382
- "SCPI Socket Control Port (Remote Query Only)" on page 384

4.2.2.1 SCPI Telnet

Turns SCPI LAN telnet capability On or Off, allowing you to limit SCPI access over LAN through telnet.

|                |                                                                                                                                                                                                            |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

4.2.2.2 SCPI Socket

Turns the capability to establish Socket LAN sessions **ON** or **OFF**, to limit SCPI access over LAN through socket sessions.

Connection String & Copy Button

In "SCPI LAN" on page 379, the full SCPI connection string is displayed to the right of the **SCPI Socket**ON/OFF control. Pressing **Copy**, to the right of the string, copies the connection string to the Windows clipboard.

|                |                                                                                                                                                                                                                                |

| Range       | <b>OFF   ON</b>                                                                                                                                                                                            |

#### 4.2.2.3 SICL Server

Turns the **SICL Server** capability **ON** or **OFF**, to limit SCPI access over LAN through the SICL server. (SICL IEEE 488.2 protocol.)

| Parameter                  | Description                                                                                                            | Setting |
|----------------------------|------------------------------------------------------------------------------------------------------------------------|---------|
| Maximum Connections        | The maximum number of connections that can be accessed simultaneously                                                  | 5       |
| Instrument Name            | The name (same as the remote SICL address) of your instrument                                                          | inst0   |
| Instrument Logical Unit    | The unique integer assigned to your instrument when using SICL LAN                                                     | 8       |
| Emulated GPIB Name         | The name (same as the remote SICL address) of the device used when communicating with your instrument                  | gpib7   |
| Emulated GPIB Logical Unit | The unique integer assigned to your device when it is being controlled using SICL LAN                                  | 8       |
| Emulated GPIB Address      | The emulated GPIB address assigned to your transmitter tester when it is a SICL server (the same as your GPIB address) | 18      |

#### Connection String & Copy Button

In "SCPI LAN" on page 379, the full connection string is displayed to the right of the **SICL Server** **ON/OFF** control. Pressing **Copy**, to the right of the string copies the connection string to the Windows clipboard.

|                |                                                                                                                                                                                                                                                        |

| Example        | <b>:SYST:COMM:LAN:SCPI:SICL:ENAB</b> OFF                                                                                                                                                                                                               |
| Dependencies   | Not available in UXM<br>If the Secure Instrument Communications configuration has disabled this connection, local changes are not allowed, and an attempt to do so results in error -221, "Disabled by Secure Instrument Communications configuration" |
| Preset         | Unaffected by <b>Preset</b> , but set to <b>ON</b> by <b>Restore Defaults</b> > "Misc" on page 426<br>If not set up or specified, the Secure Instrument Communications configuration setting: is <b>ON</b>                                             |
| State Saved    | No                                                                                                                                                                                                                                                     |
| Range          | <b>OFF   ON</b>                                                                                                                                                                                                                                        |

4.2.2.4 HiSLIP Server

Turns the **HiSLIP Server** capability **ON** or **OFF**, to limit SCPI access over LAN through the HiSLIP server.

HiSLIP stands for High-Speed LAN Instrument Protocol, and is part of the IVI-6.1 specification.

Example of a VISA connection string used to connect to the HiSLIP Server on an X-Series Spectrum Analyzer:

```
TCPIP0::a-n9030a-93016::hislip0::INSTR
```

In the example above, **hislip0** is the HiSLIP device name that VISA users must include in HiSLIP VISA Address strings. Your HiSLIP device name may differ, depending on your VISA settings.

Connection String & Copy Button

In "**SCPI LAN**" on page 379, the full connection string is displayed to the right of the **HiSLIP ServerON/OFF** control. Pressing **Copy**, to the right of the string copies the connection string to the Windows clipboard.

|                |                                                                                                                                                                                                                     |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| Example        | :SYST:COMM:LAN:SCPI:HISL:ENAB OFF                                                                                                                                                                                   |
| Preset         | Unaffected by <b>Preset</b> , but set to <b>ON</b> by <b>Restore Defaults</b> > " <b>Misc</b> " on page 426<br>If not set up or specified, the Secure Instrument Communications configuration setting: is <b>ON</b> |
| State Saved    | No                                                                                                                                                                                                                  |
| Range          | OFF   ON                                                                                                                                                                                                            |

4.2.2.5 Verbose SCPI On/Off

When you turn **Verbose SCPION**, additional information is returned by **:SYSTem:ERRor?**. The additional information consists of the characters that stimulated the error. This can aid you in debugging your test programs, by indicating where in the parsing of a SCPI command the instrument encountered an invalid command or query.

Specifically, with **Verbose SCPION**, **:SYSTem:ERRor?** is expanded to show the SCPI data received, with the indicator **<Err>** at the point in the stream that the error occurred.

**Verbose SCPI** has no effect on the **Show Errors** screen or front-panel Message Line; and only changes the response to **:SYST:ERR?**.

See the example below, where the invalid command **:SENS:BOGUS** is sent:

Normal response to **:SYST:ERR?** (using the Telnet window):

```
SCPI> SENS:BOGUS
SCPI> SYST:ERR?
-113,"Undefined header"
```

After turning on **Verbose SCPI**:

```
SCPI> SYST:BOGUS
SCPI> SYST:ERR?
-113,"Undefined header;SYST:BOGUS<Err>"
```

|                |                                                                                                     |
|----------------|-----------------------------------------------------------------------------------------------------|
| Remote Command | <b>:SYSTem:ERRor:VERBoSe OFF   ON   0   1</b><br><b>:SYSTem:ERRor:VERBoSe?</b>                      |
| Example        | <b>:SYST:ERR:VERB ON</b>                                                                            |
| Preset         | Unaffected by <b>Preset</b> , but set to <b>OFF</b> by <b>Restore Defaults</b> > "Misc" on page 426 |
| State Saved    | No                                                                                                  |
| Range          | <b>OFF   ON</b>                                                                                     |

#### 4.2.2.6 Device Clear on Disconnect

When using HiSLIP (High Speed LAN Instrument Protocol), Telnet, or Sockets, a communication session with the instrument is opened when you connect, and closed when you disconnect. This differs from other connections such as GPIB, USB and VXI-11 connections, which are never actually closed but stay open as long as the instrument is running.

When a session is closed, a Device Clear function is generated, which affects the entire instrument, not just the current connection. Thus, when using HiSLIP, Telnet, or Sockets, unexpected Device Clears may occur, which can disrupt measurements in ways that GPIB and VXI-11 "sessions" do not.

**Device Clear on Disconnect** enables these auto-generated Device Clears for Telnet, Socket, and HiSLIP sessions. For backwards compatibility, they are *not* generated unless you explicitly enable them.

There is no change in VXI-11, USB, or GPIB session behavior. These sessions do not close when you disconnect, have never generated Device Clear events, and still do not generate Device Clear events, regardless of the setting of this switch.

|                |                                                                                                                                              |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <b>:SYSTem:COMMunicate:LAN:SCPI:EOSession:DCLEar:ENABle 0   1   ON   OFF</b><br><b>:SYSTem:COMMunicate:LAN:SCPI:EOSession:DCLEar:ENABle?</b> |
| Example        | <b>:SYST:COMM:LAN:SCPI:EOS:DCLE:ENAB ON</b>                                                                                                  |
| Preset         | Unaffected by <b>Preset</b> , but set to <b>OFF</b> by <b>Restore Defaults</b> > "Misc" on page 426                                          |

|             |                                          |
|-------------|------------------------------------------|
| State Saved | No                                       |
| Range       | <a href="#">OFF</a>   <a href="#">ON</a> |

#### 4.2.2.7 SCPI Socket Control Port (Remote Query Only)

Returns the TCP/IP port number of the control socket associated with the SCPI socket session. This query lets you obtain the unique port number to open when a device clear is to be sent to the instrument. Every time a connection is made to the SCPI socket, the instrument creates a peer control socket. The port number for this socket is random. You must use this command to obtain the port number of the control socket. To force a device clear on this socket, open the port and send the string [DCL\n](#) to the instrument.

If this query is sent to a non-SCPI Socket interface, then 0 is returned.

|                                 |                                                                                             |

#### 4.2.2.8 SCPI Instrument Port (Remote Query Only)

Some MIMO applications need to be able to determine the port to use to communicate with the instrument. This query returns the port number to use for communications.

|                   |                                                          |
|-------------------|----------------------------------------------------------|
| Remote<br>Command | <a href="#">:SYSTem:COMMunicate:LAN:INSTrument:PORT?</a> |
|-------------------|----------------------------------------------------------|

### 4.2.3 Web Password Reset

The embedded web server contains certain capabilities that are password-protected; modifying the LAN configuration of the instrument, and access to web pages that can change the settings of the instrument. The default password from the factory is:

[measure4u](#)

This control lets you set the web password as desired, or to reset the password to the factory default.

Selecting **Web Password Reset** displays a control for resetting the password as desired, or to the factory default. The built-in alpha keyboard appears. You may change the password from the factory default of “**measure4u**”.

You can cancel this entry by pressing the **Cancel (ESC)** front-panel key.

## 4.2.4 System IDN Response

Allows you to specify a response to **\*IDN?**, return the instrument to the **FACTory** response if you have changed it, or, if your test software is expecting the **\*IDN** response to indicate Agilent Technologies, configure the instrument to respond with Agilent as the manufacturer.

The current **\*IDN** response is displayed at the top of the panel, followed by the **System IDN Response** and **User IDN** controls.

### 4.2.4.1 System IDN Response

To select the factory-set response, select **FACTory**. To specify your own response, select **USER**. You can enter your desired response using “**User IDN**” on page 386.

If your test software expects the response to indicate Agilent Technologies as the Manufacturer, you can configure this response by selecting **AGILent**.

|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <b>:SYSTem:IDN:CONFigure</b> <b>FACTory</b>   <b>AGILent</b>   <b>USER</b><br>For option details, see “ <b>More Information</b> ” on page 385<br><b>:SYSTem:IDN:CONFigure?</b>                                                                                                                                                                        |
| Example        | <b>:SYST:IDN:CONF</b> <b>FACT</b>                                                                                                                                                                                                                                                                                                                     |
| Notes          | Affects the response returned by all Modes of the instrument, unless the current Mode has <i>also</i> specified a custom response, in which case the current Mode’s custom IDN response takes precedence over the System’s, but only while that Mode is current<br>Survives shutdown and restart of the software and therefore survives a power cycle |
| Preset         | The <b>*IDN</b> response is reset to <b>FACTory</b> by <b>Restore Defaults &gt; “Misc”</b> on page 426 or <b>Restore Defaults &gt; “All”</b> on page 427 and survives subsequent running of the software                                                                                                                                              |

---

### More Information

Here are details of the options available for the System **\*IDN** response:

## Factory

SCPI example: `:SYST:IDN:CONF FACT`

Selects the factory default configuration of `*IDN?`, which indicates the Manufacturer as Keysight Technologies. For example,

`"Keysight Technologies,N9040B,MY00012345,A.15.00"`

where the fields are Manufacturer, Model Number, Serial Number, Firmware Revision.

### NOTE

In products that run multiple instances of the X-Series Application, all instances use the *same* factory System IDN response.

---

## Agilent

SCPI example: `:SYST:IDN:CONF AGIL`

Starting with software version x.14.50, the `*IDN?` response in the Factory configuration indicates the Manufacturer as Keysight Technologies. If your test software is expecting the response to indicate Agilent Technologies, you can configure the response with this menu selection or SCPI command.

For example:

`"Agilent Technologies,N9020A,MY00012345,A.05.01"`

### NOTE

In products that run multiple instances of the X-Series Application, all instances use the *same* Agilent System IDN response.

---

## User

SCPI example: `:SYST:IDN:CONF USER`

Selects your customized configuration of `*IDN?`

Enter your desired response using "User IDN" on page 386.

### 4.2.4.2 User IDN

Allows you to specify your own response to `*IDN?`. You may enter your desired response with the Alpha Editor or a plugin PC keyboard. Once the value is entered, select **USER** under **System IDN Response**.

When you select this control, the active function becomes the current User string and is highlighted, so typing replaces it. If instead you wish to edit the existing string, press the left or right arrow to go to the beginning or the end.

If you enter a null string (for example, by clearing the User String while editing and then pressing **Done**), the instrument automatically reverts to the **FACTory** setting.

**NOTE**

In products that run multiple instances of the X-Series Application, all instances use the *same* User System IDN response.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:SYSTem:IDN &lt;string&gt;</code><br><code>:SYSTem:IDN?</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Notes          | <p>The <code>&lt;string&gt;</code> must consist of four fields, each separated by a comma, example:<br/> <code>:SYST:IDN "XYZ Corp,Model 12,012345,A.01.01"</code></p> <p>The four fields are <code>&lt;manufacturer&gt;</code>, <code>&lt;model number&gt;</code>, <code>&lt;serial number&gt;</code>, <code>&lt;firmware revision&gt;</code>. The fields are comma-delimited, so text within a field cannot contain a comma</p> <p>This affects the response given in all Modes of the instrument, unless the current Mode has <i>also</i> specified a custom response, in which case the current Mode's custom IDN response takes precedence over the System's, but only while that Mode is current</p> <p>Survives shutdown and restart of the software and therefore survives a power cycle</p> <p>Null string as parameter restores the <b>FACTory</b> setting, example:<br/> <code>:SYST:IDN ""</code></p> |
| Preset         | Unaffected by <b>Preset</b> , but set to the original <b>FACTory</b> setting by <b>Restore Defaults &gt; "Misc"</b> on page 426                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

#### 4.2.4.3 SYSTem:PERSONa (Remote Commands Only)

The `:SYSTem:PERSONa` command set permits setting of individual fields of the `*IDN?` response.

- `"SYSTem:PERSONa:DEFault"` on page 387
- `"SYSTem:PERSONa:MANUFACTurer"` on page 388
- `"SYSTem:PERSONa:MANUFACTurer:DEFault"` on page 388
- `"SYSTem:PERSONa:MODel"` on page 388
- `"SYSTem:PERSONa:MODel:DEFault"` on page 389

#### SYSTem:PERSONa:DEFault

Resets the `*IDN` response to the instrument default.

|                |                                                                                                                                                                                                                 |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:SYSTem:PERSONa:DEFault</code><br><code>:SYSTem:PERSONa:DEFault?</code>                                                                                                                                   |
| Notes          | <code>:SYST:PERS:DEF?</code> returns the default value of <code>*IDN?</code> even if the current setting of <code>*IDN?</code> is the non-default value. The query return type is a <code>&lt;string&gt;</code> |

`:SYST:PERS:DEF`  
is equivalent to:  
`:SYSTem:IDN ""`  
`:SYSTem:IDN:CONF DEF`

**SYSTem:PERSONa:MANUFACTURER**

Sets the **MANUFACTURER** field of the **\*IDN?** response. This is the first field of the **\*IDN?** response.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:SYSTem:PERSONa:MANUFACTURER &lt;string&gt;</code><br><code>:SYSTem:PERSONa:MANUFACTURER?</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Notes          | When setting the <b>MANUFACTURER</b> field, the current IDN response string is modified to replace the manufacturer field with the string specified by the command. If the resulting IDN response matches one of the predefined responses ( <code>:SYST:IDN:CONF FACT   AGIL</code> ), then the <code>:SYST:IDN:CONF</code> is set to the corresponding value. If the IDN response with the new manufacturer field is not one of the predefined values, then <code>:SYST:IDN:CONF</code> will be set to <b>USER</b> and <code>:SYST:IDN</code> will be set to the new IDN response string<br>The query returns the current value of the <b>*IDN?</b> Manufacturer field |

**SYSTem:PERSONa:MANUFACTURER:DEFAULT**

Resets the **MANUFACTURER** field of the **\*IDN?** response to the default value.

|                |                                                                                                                                                                                                      |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:SYSTem:PERSONa:MANUFACTURER:DEFAULT</code><br><code>:SYSTem:PERSONa:MANUFACTURER:DEFAULT?</code>                                                                                              |
| Notes          | The query returns the default <b>MANUFACTURER</b> field value of <b>*IDN?</b> even if the current setting of <b>*IDN?</b> is the non-default value. The return type is a <code>&lt;string&gt;</code> |

**SYSTem:PERSONa:MODEL**

Sets the **MODEL** field of the **\*IDN?** response. This is the second field of the **\*IDN?** response.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:SYSTem:PERSONa:MODEL &lt;string&gt;</code><br><code>:SYSTem:PERSONa:MODEL?</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Notes          | When setting the <b>MODEL</b> field, the current IDN response string is modified to replace the model field with the string specified by the command. If the resulting IDN response matches one of the predefined responses ( <code>:SYST:IDN:CONF FACT   AGIL</code> ), then <code>:SYST:IDN:CONF</code> is set to the corresponding value. If the IDN response with the new model field is not one of the predefined values, then <code>:SYST:IDN:CONF</code> will be set to <b>USER</b> and <code>:SYST:IDN</code> will be set to the new IDN response string<br>The query returns the current value of the <b>*IDN?MODEL</b> field |

## SYSTem:PERSon:MODEl:DEFault

Resets the **MODEl** field of the **\*IDN?** response to the default value.

|                |                                                                                                                                                                                         |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <b>:SYSTem:PERSon:MODEl:DEFault</b><br><b>:SYSTem:PERSon:MODEl:DEFault?</b>                                                                                                             |
| Notes          | The query returns the default <b>MODEl</b> field value of <b>*IDN?</b> even if the current setting of <b>*IDN?</b> is the non-default value. The return type is a <b>&lt;string&gt;</b> |

## 4.2.5 LXI

Accesses various **LXI** configuration properties.

|              |                      |
|--------------|----------------------|
| Dependencies | Not available in UXM |
|--------------|----------------------|

### 4.2.5.1 LAN Reset

Resets the LAN connection. This sets parameters as follows, and restarts the LAN operation:

|                               |                 |
|-------------------------------|-----------------|
| DHCP                          | Enabled         |
| Automatic IP Address          | Enabled         |
| ICMP Ping Responder           | Enabled         |
| Web Password                  | <b>keysight</b> |
| Dynamic DNS                   | Enabled         |
| mDNS and DNS-SD               | Enabled         |
| Dynamic Link Local Addressing | Enabled         |
| Auto Negotiation              | Enabled         |

There is no SCPI command for this function.

### 4.2.5.2 Device Identification (Remote Command Only)

Enabling LXI device identification places the LXI Status Indicator in the **Identify** state. Disabling LXI device identification places the LXI Status Indicator in the **No Fault** state. The LXI Status indicator is in the upper left region of the instrument's graphical user interface.

|                |                                                                                |
|----------------|--------------------------------------------------------------------------------|
| Remote Command | <b>:LXI:IDENtify[:STATe] OFF   ON   0   1</b><br><b>:LXI:IDENtify[:STATe]?</b> |
|----------------|--------------------------------------------------------------------------------|

|             |                                                                                                    |
|-------------|----------------------------------------------------------------------------------------------------|
| Example     | :LXI:IDEN ON                                                                                       |
| Preset      | Not part of <b>Preset</b> , but reset to <b>OFF</b> by <b>Restore Defaults</b> > "All" on page 427 |
| State Saved | No                                                                                                 |
| Range       | OFF   ON                                                                                           |

### 4.2.6 Restore I/O Config Defaults

Causes the group of settings associated with the **I/O Config** menu to be reset to their default values. This also happens on **Restore Misc Defaults**, which has a SCPI command.

When **Restore I/O Config Defaults** is selected, a message appears saying:

This will reset all of the I/O Config variables to their default state, including the GPIB address and SCPI LAN settings

It will not affect Alignment data or settings

This action cannot be undone. Do you want to proceed?

The message provides **OK** and **Cancel** buttons so you can affirm or cancel the operation.

### 4.2.7 Query USB Connection (Remote Query Only)

Enables you to determine the speed of the USB connection.

|                |                                     |                                                                                                                                                             |
|----------------|-------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | :SYSTem:COMMunicate:USB:CONNection? |                                                                                                                                                             |
| Example        | :SYST:COMM:USB:CONN?                |                                                                                                                                                             |
| Notes          | NONE                                | Indicates no USB connection has been made                                                                                                                   |
|                | LSpeed                              | Indicates a USB low speed connection (1.5 Mbps)<br>Note that this is reserved for future use, the T+M488 protocol is not supported on low-speed connections |
|                | HSPeed                              | Indicates that a USB high speed connection (480 Mbps) has been negotiated                                                                                   |
|                | FSPeed                              | Indicates that a USB full speed connection (12 Mbps) has been negotiated                                                                                    |
| State Saved    | No                                  |                                                                                                                                                             |
| Range          | NONE   LSPeed   HSPeed   FSPeed     |                                                                                                                                                             |

### 4.2.8 USB Connection Status (Remote Query Only)

Lets you determine the current status of the USB connection.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:SYSTem:COMMunicate:USB:STATus?</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Example        | <code>:SYST:COMM:USB:STAT?</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Notes          | <p><b>SUSPended</b> – Indicates that the USB bus is currently in its suspended state. The bus is in the suspended state when:</p> <ul style="list-style-type: none"> <li>– The bus is not connected to any controller</li> <li>– The controller is currently powered off</li> <li>– The controller has explicitly placed the USB device into the suspended state</li> </ul> <p>When in the suspended state, no USB activity, including start of frame packets are received</p> <p><b>ACTive</b> – Indicates that the USB device is in the active state. When the device is in the active state, it receives periodic frame starts, but is not necessarily receiving or transmitting data</p> |
| State Saved    | No                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Range          | <b>SUSPended</b>   <b>ACTive</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## 4.2.9 USB Packet Count (Remote Query Only)

Lets you determine the number of packets received and transmitted on the USB bus.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:SYSTem:COMMunicate:USB:PACKets?</code>                                                                                                                                                                                                                                                                                                                                                                    |
| Example        | <code>:SYST:COMM:USB:PACK?</code>                                                                                                                                                                                                                                                                                                                                                                                |
| Notes          | <p>Two integers are returned:</p> <ol style="list-style-type: none"> <li>1. The number of packets received since application invocation</li> <li>2. The number of packets transmitted since application invocation</li> </ol> <p>If no packets have been received or transmitted, the response is <b>0,0</b></p> <p>The packet count is initialized to <b>0,0</b> when the instrument application is started</p> |
| State Saved    | No                                                                                                                                                                                                                                                                                                                                                                                                               |

## 4.2.10 Lock Remote I/O Session (Remote Command only)

An instrument can support multiple remote I/O sessions at the same time. However, you cannot *simultaneously* send remote commands from multiple sessions to the same instrument. The results in such a case are undefined.

Ensure that only *one* session actively controls the instrument at a time. Other sessions must wait until the active session finishes the instrument control.

To help achieve this cooperative instrument sharing, the following remote commands are provided:

- "Lock Remote I/O Request (Remote Query only)" on page 393
- "Unlock Remote I/O Session (Remote Command only)" on page 394
- "Remote I/O Session Lock Name (Remote Query only)" on page 394
- "Remote I/O Session Lock Owner (Remote Query only)" on page 395

Example Procedure for Lock Usage

| Step | Action                                                                                                                                                             |
|------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | Each session tries to obtain a lock by sending :SYSTem:LOCK:REQuest?<br>This query can be sent simultaneously from multiple sessions                               |
| 2    | Only one session will be granted. The granted session receives 1 in response to its query                                                                          |
| 3    | The granted session actively controls the instrument<br>Meanwhile, other sessions must wait, and must periodically send :SYSTem:LOCK:REQuest?, requesting the lock |
| 4    | When the active session finishes its task, it releases the lock by sending :SYSTem:LOCK:RELease                                                                    |
| 5    | Now the lock has become available, so when one of the waiting sessions sends :SYSTem:LOCK:REQuest?, it receives 1 in response, granting the lock to that session   |

By repeating steps 3, 4, and 5 above, multiple sessions can share the same instrument in a cooperative fashion.

NOTE

A session can query its own unique session name by sending :SYSTem:LOCK:NAME?. This session name is determined by the instrument.

A session also can query the name of the currently granted session by sending :SYSTem:LOCK:OWNer?.

NOTE

Remote I/O interfaces are grouped in two types: single-session interface and multi-session interface. Both types of interfaces can be used for cooperative instrument sharing.

The recommended interface is LAN HiSLIP.

| Interface | Single-session | Multi-Session |
|-----------|----------------|---------------|
| GPIB      | ü              |               |
| USB-488   | ü              |               |

| Interface         | Single-session | Multi-Session |
|-------------------|----------------|---------------|
| LAN VXI-11 (SICL) | ü              |               |
| LAN Socket        |                | ü             |
| LAN HiSLIP        |                | ü             |
| LAN Telnet        |                | ü             |

If using a single-session interface, care must be taken to ensure only one client uses the single-session interface.

In particular, LAN VXI-11 (SICL) interface is a single-session interface, even though multiple clients could simultaneously connect to this interface. Such multiple VXI-11 clients share the same session context; the same status registers and the same error queue. Even a SCPI query response can be received by another client. Furthermore, the lock obtained by `:SYSTem:LOCK:REQuest?` is shared among all VXI-11 clients, allowing all of them to actively control the instrument.

If a LAN VXI-11 (SICL) interface must be used by multiple clients for a cooperative instrument sharing, then VISA locking *must* be used, *in addition to* Remote I/O Session Lock.

#### 4.2.10.1 Lock Remote I/O Request (Remote Query only)

You can lock the SCPI control of the instrument to the I/O Interface and Session by sending `:SYSTem:LOCK:REQuest?`. This permits cooperative sharing of the instrument between multiple computers, or multiple sessions from the same computer.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

4.2.10.2 Unlock Remote I/O Session (Remote Command only)

You can unlock the SCPI control of the current I/O Interface and Session by sending :SYSTem:LOCK:RELease. Lock requests on an individual interface and session can be nested, and each request increases an internal lock count by 1. For every granted request, you will need to perform a release. The lock is not relinquished until the internal lock count reaches 0.

---

|                |                                                                                               |
|----------------|-----------------------------------------------------------------------------------------------|
| Remote Command | :SYSTem:LOCK:RELease                                                                          |
| Example        | :SYST:LOCK:REL                                                                                |
| Notes          | When the instrument is unlocked, Bit 0 is cleared in the Operation Instrument status register |

---

4.2.10.3 Remote I/O Session Lock Name (Remote Query only)

Use this query to obtain the name of the current I/O Interface and Session.

|         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Example | <code>:SYST:LOCK:NAME?</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Notes   | <p>The information returned is a string of the format:<br/> <code>&lt;I/O Interface&gt;[/&lt;IP address&gt;/&lt;Session ID&gt;]</code></p> <p>Where <b>IP address</b> and <b>Session ID</b> are only provided for interfaces that provide multiple sessions</p> <p>Single Session interfaces (GPIB, USB-488, and LAN VXI-11) only list interface name</p> <p><b>Session ID</b> is an internally generated identifier. It is not guaranteed to be consistent across instrument software versions (the identifier is subject to change when the software of the instrument is updated). The absolute value of <b>Session ID</b> is not significant, but the identifier will be consistent for a given software version, and can be relied upon for lock owner logic comparisons</p> |

#### 4.2.10.4 Remote I/O Session Lock Owner (Remote Query only)

Use this query to determine which I/O Interface and Session has the SCPI locked.  
If no interface and session has the SCPI locked, then the return value is **NONE**.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Remote Command | <code>:SYSTem:LOCK:OWNer?</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Example        | <code>:SYST:LOCK:OWN?</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Notes          | <p>The information returned is a string of the format:<br/> <code>&lt;I/O Interface&gt;[/&lt;IP address&gt;/&lt;Session ID&gt;]</code></p> <p>Where <b>IP address</b> and <b>Session ID</b> are only provided for interfaces that provide multiple sessions</p> <p>Single Session interfaces (GPIB, USB-488, and LAN VXI-11) only list interface name</p> <p><b>Session ID</b> is an internally generated identifier. It is not guaranteed to be consistent across instrument software versions (the identifier is subject to change when the software of the instrument is updated). The absolute value of <b>Session ID</b> is not significant, but the identifier will be consistent for a given software version, and can be relied upon for lock owner logic comparisons</p> <p>If no interface and session has the SCPI locked, then the return value is <b>NONE</b></p> |

### 4.2.11 Multiple Network Interface Card Configuration (Remote Commands Only)

Systems that have multiple Network Interface Cards (NICs) require additional configuration information. The following keys can be added to the XApps configuration file:

- **PrimaryNICIPv4** – IP address value is a string with the exact IP V4 format. Required field in IP v4 networks.
- **PrimaryNICIPv6** – IP address value is a string with the exact IP V6 format. Required field in IP v6 networks.

These commands do not apply to instruments that have only one NIC. The commands apply to all modular deployments that have a controller with multiple NICs.

To configure and query these configuration options, the following remote commands are provided:

- "Multiple Network Adapters Enabled (Remote Query Only)" on page 396
- "Config IPV4 Address (Remote Command Only)" on page 396
- "Config IPV6 Address (Remote Command Only)" on page 397
- "List All Physical Network Adapter IP Addresses (Remote Query Only)" on page 397

#### 4.2.11.1 Multiple Network Adapters Enabled (Remote Query Only)

|                |                                                                                                                                                                                                                                                                                                                                                               |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:SYSTem:COMMunicate:LAN:MULTiple:NIC:ENABled?</code>                                                                                                                                                                                                                                                                                                    |
| Example        | <code>:SYSTem:COMMunicate:LAN:MULTiple:NIC:ENABled?</code>                                                                                                                                                                                                                                                                                                    |
| Notes          | <p>Applies to Instruments that have multiple Network Adapters. When more than one network adapter is present in the system, and they are <b>Enabled</b> (that is, they have a valid IP Address), this query returns:</p> <ul style="list-style-type: none"> <li>– 1, if more than one NIC enabled</li> <li>– 0, if only one or No NICs are enabled</li> </ul> |
| State Saved    | No                                                                                                                                                                                                                                                                                                                                                            |

#### 4.2.11.2 Config IPV4 Address (Remote Command Only)

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:SYSTem:COMMunicate:LAN:IPV4:CONFig &lt;ipaddress&gt;</code><br><code>:SYSTem:COMMunicate:LAN:IPV4:CONFig?</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Example        | <code>:SYSTem:COMMunicate:LAN:IPV4:CONFig "192.168.1.146"</code><br><code>:SYSTem:COMMunicate:LAN:IPV4:CONFig?</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Notes          | <p>Applies to instruments that have multiple Network Adapters. When more than one network adapter is present in the system, you must specify in the instrument config file the IP address to use to enable Remoting channel bindings. If this is not provided, Remoting connections are likely to fail on systems where multiple NICs are enabled</p> <p>Sets the valid IPV4 address, passed in as string in the config file</p> <p>The query returns IPV4 address, as a string</p> <p>If config file is missing, "" (empty string) is returned</p> <p>Changing the IPV4 value requires a restart of the instrument software, to ensure that servers use the configured IP address</p> |
| State Saved    | No                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

#### 4.2.11.3 Config IPV6 Address (Remote Command Only)

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Example        | <code>:SYSTem:COMMunicate:LAN:IPV6:CONFig "2001:0db8:85a3:0000:0000:8a2e:0370:7334"</code><br><code>:SYSTem:COMMunicate:LAN:IPV6:CONFig?</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Notes          | <p>Applies to instruments that have multiple Network Adapters. When more than one network adapter is present in the system, you must specify in the instrument config file the IP address to use to enable Remoting channel bindings. If this is not provided, Remoting connections are likely to fail on systems where multiple NICs are enabled</p> <p>Sets the valid IPV6 address, passed in as string in the config file</p> <p>The query returns IPV6 address, as a string</p> <p>If config file is missing, "" (empty string) is returned</p> <p>Changing the IPV6 value requires a restart of the instrument software, to ensure servers use the configured IP address</p> |
| State Saved    | No                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

#### 4.2.11.4 List All Physical Network Adapter IP Addresses (Remote Query Only)

|                |                                                                                                                                          |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:SYSTem:COMMunicate:LAN:PHYSical:IPADdress:LIST?</code>                                                                            |
| Example        | <code>:SYSTem:COMMunicate:LAN:PHYSical:IPADdress:LIST?</code><br><code>: "192.168.1.146, 2001:0db8:85a3:0000:0000:8a2e:0370:7334"</code> |
| Notes          | Returns the IP Addresses of the physical network adapters found in the PC/Instrument                                                     |
| State Saved    | No                                                                                                                                       |

## 4.3 Preload / Unload Modes

The X-Series platform supports many Modes. Each Mode that is loaded uses a portion of the total available memory. At some point, this may result in insufficient free memory. This can occur during a measurement, or when loading a new Mode. A limited number of Modes can be loaded without impacting performance.

**Preload / Unload Modes** allows you to select and enable Modes to be preloaded at startup, and to specify the default **Power-On Mode**.

The dialog includes the following controls:

- "Power-On Mode" on page 398
- "Table of Modes" on page 399
- "Preload: Select All, Preload: Deselect All" on page 399
- "Move Up, Move Down" on page 399
- "Unload" on page 399

Modes that are not preloaded may be loaded at runtime as needed, resources permitting. However, note that loading more Modes increases memory consumption and may adversely impact performance.

When a memory-full situation occurs, the instrument notifies you with the following message:

Out of memory; Insufficient resources. Please save state if needed. You have following options:

1. Open System Settings > Configure Preload Modes to unload unused Modes
2. Reconfigure preloaded Modes on the above dialog, close and restart the analyzer SW
3. Close and restart the analyzer SW

Option 1 allows you to unload unused Modes and continue running the software, without having to restart it.

The command `:INSTRument:UNLoad <mode>` provides equivalent functionality; see "Unload" on page 399.

### 4.3.1 Power-On Mode

Displays a list of licensed Modes. Use this control to change the factory default Power-On Mode. The instrument will execute the selected Mode after power up. Selecting the Power-On Mode here automatically enables that Mode for preloading.

## 4.3.2 Table of Modes

The table of Modes becomes scrollable when the number of Modes exceeds the dialog's displayable size.

Use the check boxes in the **Preload** column to enable or disable the preloading of the Modes that you want.

Use the check boxes in the **Unload** column to select the Modes that you want to unload.

The Unload check boxes are grayed-out when the Modes are used by other Modes.

Example:

5G NR & V2X Mode cannot be loaded when either Sequence Analyzer Mode or Power Amplifier Mode are already loaded, because these Modes use 5G NR & V2X Mode. To unload 5G NR & V2X Mode, both Sequence Analyzer Mode and Power Amplifier Mode must be unloaded first.

When the active Mode is unloaded, the screen becomes blank except for the message; **"No Mode is active"**. You can then select another desired Mode.

When multiple screens are open, and a Mode is unloaded, inactive screens that have that Mode as their active Modes are closed.

The active screen is never closed.

## 4.3.3 Preload: Select All, Preload: Deselect All

Toggles the **Preload** checkbox state for all Applications listed, except for the Power-On Application, which is always selected.

## 4.3.4 Move Up, Move Down

The default order in which Applications are listed in the table is the order in which they are displayed in the **Mode/Measurement/View** Selector dialog. To change the order in this list, select the desired Application row from the table, then click **Move Up** or **Move Down** to move it to the desired position.

## 4.3.5 Unload

Unloads the specified Mode.

---

Remote `:INSTrument:UNLoad <mode>`

## 4 System

### 4.3 Preload / Unload Modes

|         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Command |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Example | <code>:INST:UNL NR5G</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Notes   | <p>Error message if the specified Mode is not available,<br/> <code>-224,"Illegal parameter value;&lt;mode&gt; is not a valid choice"</code></p> <p>Error message if the specified Mode is not loaded and therefore cannot be unloaded,<br/> <code>-221,"Settings conflict;&lt;mode&gt; is not loaded"</code></p> <p>Error message if the specified Mode is used by other Modes and therefore cannot be unloaded,<br/> <code>-221,"Settings conflict;&lt;mode&gt; is used by &lt;other modes&gt;"</code></p> <p>Error message if the specified Mode does not support Unload Mode feature and therefore cannot be unloaded,<br/> <code>-221,"Settings conflict;Feature not supported for this Mode"</code></p> |

#### 4.3.6 Loaded Modes (Remote Query Only)

Returns a list of loaded Modes.

|                |                                          |
|----------------|------------------------------------------|
| Remote Command | <code>:SYSTem:APPLication:LOADed?</code> |
| Example        | <code>:SYST:APPL:LOAD?</code>            |
| Preset         | Not affected by Preset                   |

#### 4.3.7 User Interface

Configures functions specific to the User Interface, such as the menu panel orientation and the display color theme.

##### 4.3.7.1 Menu Panel Position

Allows the Menu Panel to be positioned on the **RIGHT** or **LEFT** side of the display.

|                |                                                                                                                                                                         |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:SYSTem:DISPlay:MPPosition RIGHT   LEFT</code><br><code>:SYSTem:DISPlay:MPPosition?</code>                                                                        |
| Example        | <code>:SYST:DISP:MPP LEFT</code>                                                                                                                                        |
| Preset         | This is unaffected by <b>Preset</b> but is set to <b>RIGHT</b> by <b>Restore Defaults</b> > "User Interface" on page 425 or <b>Restore Defaults</b> > "All" on page 427 |
| State Saved    | Power On Persistent (survives shutdown and restart)                                                                                                                     |

#### 4.3.7.2 Menu Panel Tabs

Allows the **Menu Panel Tabs** to be positioned on the **RIGHT** or **LEFT** side of the menu panel.

|                |                                                                                                                                                                         |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:SYSTem:DISPlay:MPTab RIGHT   LEFT</code><br><code>:SYSTem:DISPlay:MPTab?</code>                                                                                  |
| Example        | <code>:SYST:DISP:MPT LEFT</code>                                                                                                                                        |
| Preset         | This is unaffected by <b>Preset</b> but is set to <b>RIGHT</b> by <b>Restore Defaults</b> > "User Interface" on page 425 or <b>Restore Defaults</b> > "All" on page 427 |
| State Saved    | Power On Persistent (survives shutdown and restart)                                                                                                                     |

#### 4.3.7.3 Annotations Local Settings/All Off

Overrides the annotation settings for all measurement in all modes and turns them all off. This provides the security based "annotation off" function of previous instruments; hence it uses the legacy SCPI command.

When this control is set to **All Off**, the **Screen Annotation**, **Meas Bar**, **Trace Annotation**, and **Control Annotation** controls under the **Display, Annotation** menu are grayed-out and forced to **OFF** for all measurements in all modes. When **Local Settings** is selected, you can set the local annotation settings on a measurement-by-measurement basis.

|                               |                                                                                                                                                                                                                    |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command                | <code>:DISPlay:WINDow[1]:ANNotation[:ALL] OFF   ON   0   1</code><br><code>:DISPlay:WINDow[1]:ANNotation[:ALL]?</code>                                                                                             |
| Example                       | <code>:DISP:WIND:ANN OFF</code>                                                                                                                                                                                    |
| Preset                        | This is unaffected by <b>Preset</b> but is set to <b>ON</b> by <b>Restore Defaults</b> > "User Interface" on page 425, <b>Restore Defaults</b> > "Misc" on page 426 or <b>Restore Defaults</b> > "All" on page 427 |
| State Saved                   | Power On Persistent (survives shutdown and restart)                                                                                                                                                                |
| Backwards Compatibility Notes | The <b>WINDow</b> parameter and optional subopcode is included for backwards compatibility but ignored – all windows are equally affected                                                                          |

#### 4.3.7.4 Display Theme

Allows you to change the **Display Theme**. This is similar to the Themes selection under Page Setup and Save Screen Image.

The two available themes are:

- **FILLed**: this is the normal theme using filled objects
- **OUTLine**: this theme uses color, but does not use fill for most areas on the display. It is ideal for images that need to be printed on inkjet printers. Although setting **Display Theme** to **OUTLine** does not affect screen image saves or prints, it does show you exactly how screen images will look when using the **OUTLine** theme under **Save Screen Image**, and how prints will look when using the **OUTLine** theme under **Page Setup**.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                                                                                                                                                                                                                                                                                                            |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NOTE           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Although the <b>OUTLine</b> theme eliminates most of the filled area, some objects remain filled. In particular, the selected marker remains filled with the green marker color, to distinguish it from the other markers. This is important, as it is the selected marker whose readout appears in the upper right corner of the display. |
| Remote Command | <b>:DISPlay:THEMe</b> <b>TDColor</b>   <b>TDMonochrome</b>   <b>FCOLor</b>   <b>FMONochrome</b>   <b>FILLed</b>   <b>OUTLine</b><br><b>:DISPlay:THEMe?</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                                                                                                                                                                                                                                                                                                            |
| Example        | <b>:SYST:DISP:THEM OUTL</b><br>sets the display style to <b>OUTLine</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                                                                                                                                                                                                                                                                                                                            |
| Notes          | To permit code compatibility with A-model X-Series Signal Analyzer instruments, the command parameters from the A-models are mapped as follows: <ul style="list-style-type: none"><li>- <b>TDColor</b> and <b>TDMonochrome</b> are both mapped to <b>FILLed</b> (exact full color representation of what is on the screen)</li><li>- <b>FCOLor</b> and <b>FMONochrome</b> are both mapped to <b>OUTLine</b> (uses color for traces and other items, but most filled areas are white)</li></ul> There is no Monochrome theme in the B-model instruments, so the monochrome commands for the A-model instruments yield color themes<br>The query of <b>:DISPlay:THEMe?</b> always returns <b>FILLed</b> or <b>OUTLine</b> . It never returns <b>FCOLor</b> , <b>FMONochrome</b> , <b>TDColor</b> , or <b>TDMonochrome</b> |                                                                                                                                                                                                                                                                                                                                            |
| Preset         | This is unaffected by <b>Preset</b> but is set to <b>FILLed</b> by <b>Restore Defaults &gt; "User Interface" on page 425</b> , <b>Restore Defaults &gt; "Misc" on page 426</b> or <b>Restore Defaults &gt; "All" on page 427</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                                                                                                                                                                                                                                                                                                            |
| State Saved    | Power On Persistent (survives shutdown and restart)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                                                                                                                                                                                                                                                                                            |

4.3.7.5 Backlight

Turns the display **Backlight** on and off. This setting may interact with settings under the Windows **Power** menu.

When the backlight is **OFF**, pressing ESC, TAB, SPACE, ENTER, UP, DOWN, LEFT, RIGHT, DEL, BKSP, CTRL, or ALT turns the backlight **ON** without affecting the

application. Pressing any other key turns backlight **ON**, and could potentially perform the action as well.

|                |                                                                                                                                                                                                                   |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:DISPlay:BACKlight ON   OFF</code><br><code>:DISPlay:BACKlight?</code>                                                                                                                                      |
| Example        | Turn backlight <b>ON</b> :<br><code>:DISP:BACK ON</code><br><br>Turn backlight <b>OFF</b> :<br><code>:DISP:BACK OFF</code>                                                                                        |
| Preset         | Pressing any key turns the backlight back <b>ON</b> , as does <b>Restore Defaults</b> > "User Interface" on page 425, <b>Restore Defaults</b> > "Misc" on page 426 or <b>Restore Defaults</b> > "All" on page 427 |
| State Saved    | Not saved in State                                                                                                                                                                                                |

#### 4.3.7.6 Backlight Intensity

Allows the **Backlight Intensity** to be controlled from the UI settings panel.

|                |                                                                                                                       |
|----------------|-----------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:SYSTem:DISPlay:BACKlight:INTensity &lt;integer&gt;</code><br><code>:SYSTem:DISPlay:BACKlight:INTensity?</code> |
| Example        | <code>:SYST:DISP:BACK:INT 67</code>                                                                                   |
| Preset         | 100                                                                                                                   |
| State Saved    | Power On Persistent (survives shutdown and restart)                                                                   |
| Range          | 0-100                                                                                                                 |

#### 4.3.7.7 Hints

**Hints** are descriptions that provide additional information for a control. You can set **Hints** to be enabled or disabled.

|                |                                                                                                                                                                      |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:SYSTem:DISPlay:HINTs[:STATe] OFF   ON   0   1</code><br><code>:SYSTem:DISPlay:HINTs?</code>                                                                   |
| Example        | <code>:SYST:DISP:HINT OFF</code>                                                                                                                                     |
| Preset         | This is unaffected by <b>Preset</b> but is set to <b>ON</b> by <b>Restore Defaults</b> > "User Interface" on page 425 or <b>Restore Defaults</b> > "All" on page 427 |
| State Saved    | Power On Persistent (survives shutdown and restart)                                                                                                                  |

#### 4.3.7.8 Numeric Entry Auto Open

Configures whether the **Numeric Entry** Panel will appear immediately when an active function control is activated (Auto Open **ON**), or be deferred until you touch it again or begin to enter a value (Auto Open **OFF**). When configured for Auto Open

**OFF** (the default), adjusting the value with the front panel Up/Down keys or the RPG hides the **Numeric Entry** Panel.

|                |                                                                                                                                                                      |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | :SYSTem:DISPlay:NEPimmediate ON   OFF   1   0<br>:SYSTem:DISPlay:NEPimmediate?                                                                                       |
| Example        | :SYST:DISP:NEP OFF                                                                                                                                                   |
| Preset         | This is unaffected by <b>Preset</b> but is set to <b>ON</b> by <b>Restore Defaults</b> > "User Interface" on page 425 or <b>Restore Defaults</b> > "All" on page 427 |
| State Saved    | Power On Persistent (survives shutdown and restart)                                                                                                                  |

#### 4.3.7.9 Touch On/Off

Turns the touch functionality on and off on the display. If **OFF**, you can turn it back on using the front panel **Touch On/Off** key, or by using a mouse to toggle this control.

|             |                                                                                                                                                                                            |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Preset      | Always starts up <b>ON</b><br>Unaffected by <b>Preset</b> but is turned <b>ON</b> by <b>Restore Defaults</b> > "User Interface" on page 425 or <b>Restore Defaults</b> > "All" on page 427 |
| State Saved | Not saved in state, not affected by <b>Preset</b> , not Power On Persistent (does not survive shutdown and restart)                                                                        |

#### 4.3.7.10 Control Size

Configures the size of the controls in the user interface. This can be used to make screen dumps from a large screen instrument match those from a smaller screen instrument, to make the controls more readable on a large-screen instrument, or to display more information on a smaller screen instrument.

|                |                                                                                                                                                                         |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | :DISPlay:UINterface:CSIZe SMALL   LARGE<br>:DISPlay:UINterface:CSIZe?                                                                                                   |
| Example        | :DISP:UINT:CSIZ LARGE                                                                                                                                                   |
| Preset         | This is unaffected by <b>Preset</b> but is set to <b>SMALL</b> by <b>Restore Defaults</b> > "User Interface" on page 425 or <b>Restore Defaults</b> > "All" on page 427 |
| State Saved    | Power On Persistent (survives shutdown and restart)                                                                                                                     |

#### 4.3.7.11 Quick Save Mode

When **Quick Save Mode** is **NORMAL** (the default setting), the instrument does an immediate save of a new file of the same type and to the same directory as the previous **Save** action. When **Quick Save Mode** is in the **PROMPT** state, instead of immediately performing a **Save**, the Alpha Keyboard appears with the proposed

auto-filename in the entry area. You can then press **Enter** to accept the auto filename, or edit the name then press **Enter**. This allows you to easily save a file with a custom file name.

|                |                                                                                                                                                                          |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | :MMEMory:STORe:QSAVe NORMa1   PROMpt<br>:MMEMory:STORe:QSAVe?                                                                                                            |
| Example        | :MMEM:STOR:QSAV PROM                                                                                                                                                     |
| Preset         | This is unaffected by <b>Preset</b> but is set to <b>NORMa1</b> by <b>Restore Defaults</b> > "User Interface" on page 425 or <b>Restore Defaults</b> > "All" on page 427 |
| State Saved    | Power On Persistent (survives shutdown and restart)                                                                                                                      |

4.3.7.12 Screen Tabs Left/Right

This switch, when in the **RIGHT** position, makes the screen tabs start on the right and build across to the left, thus minimizing the finger travel over to the screen tab when there is only one screen. When tabs are added from right to left, they appear as below:

The default is **LEFT**.

|                |                                                                   |
|----------------|-------------------------------------------------------------------|
| Remote Command | :DISPlay:UINTerface:STAB RIGHT   LEFT<br>:INSTrument:SCReen:STAB? |
| Example        | :DISP:UINT:STAB RIGH                                              |

|             |                                                                                                                                                                        |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Preset      | This is unaffected by <b>Preset</b> but is set to <b>LEFT</b> by <b>Restore Defaults</b> > "User Interface" on page 425 or <b>Restore Defaults</b> > "All" on page 427 |
| State Saved | Power On Persistent (survives shutdown and restart)                                                                                                                    |

4.3.7.13 Hide Screen Tabs in Full Screen

This switch, when in the **ON** position, causes the Screen Tabs to be hidden when in Full Screen view, thus maximizing the display area available for results. By also turning off the Meas Bar (in the **Display, Annotation** menu), you can maximize the available area for results, as shown below:

|                |                                                                                                                                                                                                                                                                                |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:DISPlay:UINterface:HTABs ON   OFF   1   0</code><br><code>:DISPlay:UINterface:HTABs?</code><br><code>:DISPlay:UINterface:STFScreen ON   OFF   1   0</code><br>Implemented but with wrong sense; ON turns them off and OFF turns them on; so, don't document to customer |
| Example        | <code>:DISP:UINT:HTAB ON</code><br>Hide the tabs in full screen                                                                                                                                                                                                                |
| Preset         | This is unaffected by <b>Preset</b> but is set to <b>OFF</b> by <b>Restore Defaults</b> > "User Interface" on page 425 or <b>Restore Defaults</b> > "All" on page 427                                                                                                          |
| State Saved    | Power On Persistent (survives shutdown and restart)                                                                                                                                                                                                                            |

#### 4.3.7.14 2-Screen Orientation

When you add a second Screen using the “+” control on the Screen Tabs bar, normally the screen is added to the right of the first screen. However, sometimes it is better to add the new screen below the first screen rather than to the right, as shown below.

New screen added to the right (horizontal orientation)

New screen added below (vertical orientation)

The **2-Screen Orientation** switch allows you to choose between these two orientations for 2-Screen configurations. The default is the **HORizontal** configuration, two Screens side-by-side.

|                |                                                                                                                                                         |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | :INSTrument:SCReen:ORientation VERTical   HORizontal                                                                                                    |
| Example        | :INST:SCR:ORI VERT                                                                                                                                      |
|                | Set the 2 screens to be above/below each other                                                                                                          |
| Preset         | HOR                                                                                                                                                     |
|                | This is unaffected by Preset but is set to <b>HORizontal</b> by Restore Defaults > "User Interface" on page 425 or Restore Defaults > "All" on page 427 |

4.3.7.15 Clock Format

Allows the **Clock Format** to be switched between 12-Hour Format (**HR12**) and 24-Hour Format (**HR24**).

|                |                                                     |
|----------------|-----------------------------------------------------|
| Remote Command | :SYSTem:DISPlay:CFORmat HR12   HR24                 |
|                | :SYSTem:DISPlay:CFORmat?                            |
| Example        | :SYST:DISP:CFOR HR12                                |
| Preset         | HR12                                                |
| State Saved    | Power On Persistent (survives shutdown and restart) |
| Range          | 12-Hour   24-Hour                                   |

### 4.3.7.16 Language

Accesses the selection of **Language** displayed on the menus and controls. **ENGLISH** is the default.

All Measurement Applications that share common controls will display the localized controls.

The description on the control labels is bounded by the control size. Any given language will have labels in that language that are shorter or longer than the equivalent label in English. Any localized text on the controls that does not fit the label size remains in English. Thus, for any given menu, controls may be displayed in English *and* the selected language.

- Labels that are acronyms, engineering, or technology specific terms may remain in English.
- All Application and Measurement names remain in English.
- All data in exported files remain in English.
- The Diagnostic and Service menus in the System Subsystem remain in English.
- The Windows operating system must remain in English. Changing the **Region and Language** settings in the Windows Control Panel is not supported.

External keyboards in English are supported. Localized external keyboards are not supported. When the language selected is not English, a message is displayed to explain that any external keyboard must remain in English.

Other aspects of the Graphical User Interface remain in English. The Remote User Interface (SCPI) remains in English.

|                |                                                                                                                                                                                                                                                    |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:SYSTem:DISPlay:LANGuage ENGLISH   RUSSian</code><br><code>:SYSTem:DISPlay:LANGuage?</code>                                                                                                                                                  |
| Example        | <code>:SYST:DISP:LANG ENGL</code><br><code>:SYST:DISP:LANG RUSS</code><br>Requires Option AKT                                                                                                                                                      |
| Preset         | This is unaffected by <b>Preset</b> but is set to <b>ENGLISH</b> by <b>Restore Defaults</b> > " <b>User Interface</b> " on page 425, <b>Restore Defaults</b> > " <b>Misc</b> " on page 426 or <b>Restore Defaults</b> > " <b>All</b> " on page 427 |

### 4.3.7.17 Restore User Interface Defaults

Causes the group of settings associated with the **User Interface** menu to be reset to their default values. This also happens on **Restore Misc Defaults**.

When **User Interface** is selected, a message appears saying:

This will reset all of the User Interface variables to their default state, including the menu panel location, display theme, and language.

It will not affect Alignment data or settings.

This action cannot be undone. Do you want to proceed?

The message provides **OK** and **Cancel** buttons for you to affirm or cancel the operation.

---

|         |                |
|---------|----------------|
| Example | :SYST:DEF UINT |
|---------|----------------|

**4.3.7.18 User Interface Type (Remote Query Only)**

Use this query to determine if the instrument is running the Multi-Touch user interface or Softkey user interface. This is an easy way to distinguish between A-models (Softkey) instruments and Touch UI (Multi-Touch) instruments.

---

|                |                                                                                                                                   |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | :DISPlay:UINterface:TYPE?                                                                                                         |
| Example        | :DISP:UINT:TYPE?                                                                                                                  |
| Notes          | The query returns <b>MULTITOUCH</b> for instruments with the Multi-Touch UI or <b>SOFTKEY</b> for instruments with the Softkey UI |

## 4.4 Power On

Lets you select how the instrument should power on.

NOTE

In products that run multiple instances of the X-Series Application, the same Power On type is shared between all the instances.

### 4.4.1 Power On State

Lets you select whether the instrument powers up in a default state, or some other state. The options are:

- **MODE** and Input/Output Defaults
- **USER** Preset
- **LAST** State

|                              |                                                                                                                                                 |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command               | :SYSTem:PON:TYPE <b>MODE</b>   <b>USER</b>   <b>LAST</b><br>:SYSTem:PON:TYPE?                                                                   |
| Example                      | :SYST:PON:TYPE <b>MODE</b><br>:SYST:PON:TYPE <b>USER</b><br>:SYST:PON:TYPE <b>LAST</b>                                                          |
| Preset                       | This is unaffected by <b>Preset</b> but is set to <b>MODE</b> by <b>Restore Defaults</b> > "All" on page 427                                    |
| State Saved                  | No                                                                                                                                              |
| Backwards Compatibility SCPI | :SYSTem:PON:TYPE <b>PRESet</b><br>The <b>PRESet</b> parameter is supported for backward compatibility only, and behaves the same as <b>MODE</b> |

### Mode and Input/Output Defaults

When the instrument is powered-on in **MODE** and Input/Output Defaults, it performs "Restore Mode Defaults" on page 550 for all Modes in the instrument, and performs Restore Input/Output Defaults.

Persistent parameters (such as Amplitude Correction tables or Limit tables) are not affected at power-on, even though they are normally cleared by **Restore Input/Output Defaults** and/or **Restore Mode Defaults**.

## User Preset

Sets **Power On State** to **USER** Preset. When the instrument is powered on in User Preset, it will **User Preset** each mode and switch to the "**Power On Application**" on page 413. **Power On User Preset** does not affect any settings other than those set by a normal **User Preset**.

Backwards Compatibility Note: Power On: **User Preset** causes the instrument to power up in the "**Power On Application**" on page 413, *not* the last Mode the instrument was in prior to shutdown. Also, **Power On: User Preset** will **User Preset** all Modes. This does *not* exactly match legacy behavior.

---

### NOTE

In products that run multiple instances of the X-Series Application, the same **User Preset** is shared between all the instances.

---

### NOTE

An instrument can never power up for the first time in **USER** preset.

---

## Last State

Sets **Power On State** to **LAST**. When the instrument is powered on, it will put all modes in the last state they were in prior to when the instrument was put into Power Standby, and it will start up in the mode it was last in prior to powering off the instrument. The saving of the active mode prior to shutdown happens behind the scenes when a controlled shutdown is requested, either via the front panel **Standby** key, or the remote command **:SYSTem:PDOWn**. The non-active modes are saved as they are deactivated and recalled by Power On: Last State.

**Power On: Last State** only works if you completed a controlled shutdown prior to powering on in **LAST**. If a controlled shutdown is not completed when in **Power On: Last State**, the instrument powers up in the last active Mode, but it may not power up in the active Mode's last state. If an invalid Mode state is detected, a **Mode Preset** occurs. To control the shutdown under remote control, use **:SYSTem:PDOWn**.

Backwards Compatibility Note: It is no longer possible to power-up the instrument in the last Mode the instrument was running with that Mode in the preset state. (ESA/PSA **SYST:PRESET:TYPE MODE** with **SYST:PON:PRESET**) You can power-on the instrument in the last Mode the instrument was running in its last state (**:SYST:PON:TYPE LAST**), or you can specify the Mode to power-up in its preset state (**:SYST:PON:MODE <mode>**).

---

### NOTE

In products that run multiple instances of the X-Series Application, each instance has a unique **Last State**.

---

### NOTE

An instrument can never power up for the first time in **LAST**.

---

If line power to the instrument is interrupted, for example by pulling the line cord plug or by switching off power to a test rack, **Power OnLast State** may not work properly. For proper operation, **Power On Last State** depends on your shutting down the instrument using the **Standby** key or the `:SYSTem:PDOWn` command. This ensures the last state of each Mode is saved and can be recalled during a power-up.

## 4.4.2 Power On Application

Accesses a menu that lists the available Modes, and lets you select which Mode is to be the **Power On Application**. Whichever application is selected runs at power-on when the Power On Type is set to “**MODE** and Input/Output Defaults”.

### NOTE

In products that run multiple instances of the X-Series Application, the same Power On Application is shared between all the instances.

|                                |                                                                                                                                                                                                                                                                                                                                                                     |                                |             |                   |              |                           |              |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------|-------------|-------------------|--------------|---------------------------|--------------|
| Remote Command                 | <code>:SYSTem:PON:MODE &lt;mode&gt;</code><br>where <code>&lt;mode&gt;</code> is an item from the same set that can be sent using the <code>:INSTrument[:SElect]</code> command<br><code>:SYSTem:PON:MODE?</code>                                                                                                                                                   |                                |             |                   |              |                           |              |

## 4.4.3 FPGA Configuration

Lets you choose which FPGA image you want loaded into the instrument.

Depending on your hardware configuration, your instrument may contain a Field Programmable Gate Array (FPGA) which handles much of the processing for some of the mathematically intensive features, such as Time Domain Scan (Option TDS) and Enhanced Sweep Speed (Option FS2). The FPGA is not big enough to hold the

functionality for both options, so you must decide which FPGA program you want loaded.

When licenses allow for both FPGA image versions to be available, and you have not explicitly chosen an FPGA image version, then, when the firmware is updated, the Time Domain Scan version will be loaded. In the absence of all licenses, the Enhanced Sweep Speed version will be loaded. Once you have explicitly chosen an FPGA image version, using the FPGA Configuration dialog, any future firmware updates will continue to load the chosen version as long as it is licensed.

Example: loading the Time Domain Scan FPGA image, removing the TDS license, and then updating the firmware will result in the Enhanced Sweep Speed version being loaded.

When multiple capabilities are licensed, the FPGA Configuration presents a dialog that tells you that there is insufficient space to fit all the licensed capabilities, and asks you to choose one of the FPGA programs (images).

If you remove licenses, it is possible to end up with an unlicensed capability loaded in the FPGA while a licensed capability is not loaded. In this case, the dialog does not present the **Preference** group and shows a message about unlicensed/licensed capabilities. You can dismiss the dialog if the licensed capability is not currently needed, and you do not want to take the time to load the licensed FPGA image. However, this dialog will continue to appear each time the instrument is restarted.

### **Behavior when the Enhanced Sweep Speed FPGA Image is Loaded**

When the Enhanced Sweep Speed version of the FPGA image is loaded, sweep behavior still depends on the licenses:

- Option FS2 gives full FPGA enhanced sweep speed
- Option FS1 gives software implemented enhanced sweep speed
- Neither Option FS1 nor FS2 – no enhanced sweep speed
- Both Options FS1 and FS2 – same as Option FS2, the full FPGA enhanced sweep speed

If EMI Receiver Mode and TDS option are licensed, and the Enhanced Sweep Speed FPGA image is loaded, then you will not have the proper FPGA image loaded to fully support EMI Receiver Mode. In particular, the Frequency Scan measurement cannot use Scan Type “Time Domain Scan” (this is the normally the default Scan Type for instruments with the TDS option). Instead, EMI Receiver Mode behaves as if the TDS option is not licensed.

### **Behavior when the Time Domain Scan FPGA Image is loaded**

When the Time Domain Scan version of the FPGA image is loaded, EMI Receiver Mode works as expected with the TDS option licensed, but the Option FS2 capability

silently reverts to FS1 behavior.

### Switching Between Enhanced Sweep Speed and Time Domain Scan FPGA Images

You cannot have both full TDS and FS2 images at the same time, so to switch to the other image, you must go through the process of reloading the FPGA by choosing the desired image with the Selected FPGA control, and pressing **"Load FPGA"** on [page 417](#), or issuing the "Load FPGA" SCPI command below with the proper parameter.

### Incorrect FPGA Configuration

If EMI Receiver Mode, Option TDS, or Option FS2 license is removed while the FPGA image for that license is loaded, the instrument ends up in an incorrect configuration, since the loaded FPGA image version has support for unlicensed functionality that is not accessible and does not support the currently licensed functionality. It will still function, but when the instrument recognizes this situation at startup, it automatically displays the **FPGA Configuration** dialog. The only selections available will be the licensed ones, but you can choose to dismiss the dialog and continue with the current FPGA image version if you do not want to take the time to load the correct FPGA image. The dialog will continue to be presented at each startup until the correct FPGA image is loaded.

### FPGA Updates When Firmware Installs

The FPGA image and X-Series firmware are tightly coupled, so whenever the firmware is updated, the FPGA image is also checked and updated if needed. The rules for choosing between Time Domain Scan and Enhanced Sweep Speed versions of the FPGA image are:

1. Always use Time Domain Scan FPGA image for MXE
2. If neither EMC Mode nor Option TDS nor Option FS2 are licensed, the Enhanced Sweep Speed FPGA image is loaded
3. If EMC Mode and Option TDS are licensed and Option FS2 is not licensed, the Time Domain Scan FPGA image is loaded
4. If EMC Mode and Option TDS are not licensed, and Option FS2 is licensed, the Enhanced Sweep Speed FPGA image is loaded
5. If all are licensed
  - a. If **"FPGA Load Preference"** on [page 416](#) is **Time Domain Scan**, the Time Domain Scan FPGA image is loaded

- b. If **FPGA Load Preference** is **Enhanced Sweep Speed**, the Enhanced Sweep Speed FPGA image is loaded
- c. If **FPGA Load Preference** is **Prompt at Startup**:
  - a. If the last FPGA Configuration Load was Time Domain Scan, the Time Domain Scan FPGA image is loaded
  - b. If the last FPGA Configuration Load was Enhanced Sweep Speed, the Enhanced Sweep Speed FPGA image is loaded
  - c. If no FPGA has been explicitly loaded, the Time Domain Scan FPGA image is loaded

4.4.3.1 FPGA Load Preference

Select either image from the radio buttons at the top of the dialog:

| Option               | SCPI   | Description                                                                                                                                                                   |
|----------------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Time Domain Scan     | TDS    | Load the Time Domain Scan version of the FPGA image                                                                                                                           |
| Enhanced Sweep Speed | FS2    | Load the Enhanced Sweep Speed version of the FPGA image                                                                                                                       |
| Prompt at Startup    | PROMpt | Prompt at each startup, displaying the <b>FPGA Configuration</b> dialog. You can choose to continue with the currently loaded FPGA image version, or load a different version |

If you select the image that is already loaded, you will not be prompted again. If you select a different one, the Selected FPGA control changes to that one and you must then press **"Load FPGA"** on page 417 to load the other image.

When installing new firmware, the **FPGA Load Preference** setting is used to load the preferred FPGA image version if more than one version is available. Selecting **Prompt at Startup** causes you to be prompted at each startup to select the desired version of the FPGA image.

|                |                                                                                                                                                                                                                                                                                        |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

4.4.3.2 Load FPGA

Depending on the **"FPGA Load Preference"** on page 416 selection, there may be a mismatch between the desired FPGA image, and the one that is currently loaded. In that case the **Load FPGA** control at the bottom of the dialog is not grayed-out, and you must press it to actually load the desired FPGA image. The image that is currently loaded is shown on the right:

If you have a mismatch, but do not actually load the other image, the **FPGA Load Preference** is remembered, but the image you had before remains until you return to this dialog and press **Load FPGA**, or until the next time the instrument firmware is updated.

If you press **Load FPGA**, the X-series software exits, the FPGA update program runs, and the instrument reboots. After rebooting, the new image will be loaded in the FPGA.

**NOTE** This can take 15 minutes or more.

**CAUTION** If power is lost during the FPGA load process, the FPGA can become corrupted, in which case the only solution is to return it to Keysight for servicing.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

Sending the SCPI for an unlicensed selection results in error:<br/>-224, "Illegal parameter value; &lt;option&gt; is not licensed"</p> |
| Preset | None. Not affected by <b>Mode Preset</b> nor any <b>"Restore Defaults" on page 424</b>                                                                                                                                                                                                                                                                                                                                                       |

---

#### 4.4.4 Restore Power On Defaults

This selection causes the **Power On** settings to be reset to their default values.

When this button is pressed, a message appears saying:

*This will reset Power On State and Power On Application to their default state.*

*It will not affect Alignment data or settings.*

*This action cannot be undone. Do you want to proceed?*

The message provides **OK** and **Cancel** buttons for you to confirm or cancel the operation.

|---------|----------------------------|
| Example | <code>:SYST:DEF PON</code> |
|---------|----------------------------|

---

#### 4.4.5 Configure Applications – Desktop application

The **Configure Applications** utility runs from the instrument's desktop. You must close the Instrument Application before running **Configure Applications**.

This utility can be used to:

- select applications (Modes) for preload
- determine how many Modes can fit in memory at one time
- specify the order of the Modes in the Mode menu.

The utility consists of a window with instructions, a set of **Select Application** checkboxes, a "fuel bar" style memory gauge, and keys that help you set up your configuration.

---

**NOTE**

In products that run multiple instances of the X-Series Application, the same **Configure Applications** utility is shared between all the instances.

---

For more details, see the following topics:

- "Preloading Applications" on page 419
- "Access to Configure Applications utility" on page 419
- "Virtual memory usage" on page 420

---

Example

Display the Config Applications screen:

`:SYST:SHOW CAPP`

### Preloading Applications

During runtime, if a Mode that is not preloaded is selected using the **Mode** menu or by sending SCPI commands, there will be a pause while the Application is loaded. During this pause, a message that says "**Loading application, please wait ...**" is displayed. Once loaded, the application stays loaded, so the next time you select it during a session, there is no delay.

Preloading lets you "preload" at startup, to eliminate the runtime delay. Preloading an application causes it to be loaded into the instrument's memory when the analyzer program starts up. If you do this, the delay will increase the time it takes to start up the analyzer program, but this may be preferable to having to wait the first time you select an application. Note that, once an application is loaded into memory, it cannot be unloaded without exiting and restarting the analyzer program.

Note that there are more applications available for X-Series than can fit into Windows Virtual Memory. By allowing you to choose which licensed applications to load at startup, the **Configure Applications** utility allows you to make optimal use of the instrument memory.

### Access to Configure Applications utility

A version of the utility runs the first time you power up the instrument after purchasing it from Keysight. The utility automatically configures preloads so that as many licensed applications as possible are preloaded while keeping the total estimated virtual memory usage below the limit. This auto-configuration only takes place at the very first run, and after analyzer software upgrades.

At any time, you can manually start the **Configure Applications** utility by closing the analyzer application and double-tapping the **Configure Applications** icon on the desktop.

The utility's main dialog looks like this:

4 System  
4.4 Power On

Instructions are provided below and in the utility. Use the utility to find a configuration that works best for you, and then restart the analyzer program.

- Select AllMarks all applications in the selection list. This allows you to enable all applications licensed on the instrument for pre-loading, or is a convenience for selecting all applications in one operation and then letting you deselect individual applications
- Deselect AllClears the marks from all applications in the selection list, except the Power On application. The Power On application cannot be eliminated from the pre-load list
- Move UpThe application list is the order that applications appear in the Mode Menu. These keys let you shift the selected application up or down in the list, thus moving the selected application earlier or later in the Mode Menu
- Move Down
- Select Power On ApplicationThis is the same as the "Power On Application" selection on the Power On page of the System Settings dialog

Virtual memory usage

There are more applications available for X-Series than can fit into memory at any one time, so the **Configure Applications** utility includes a memory tracker that serves

two purposes:

1. It will not let you preload more applications than will fit into memory at once
2. You can determine how many of your favorite applications can reside in memory at one time

The utility provides a graphical representation of the amount of memory (note that the amount of memory shown here is *virtual* memory, which is a limitation imposed by the operating system, not by the amount of physical memory you have in your instrument). You select applications to preload by checking the boxes on the left. Checked applications preload at startup. The colored fuel bar indicates the total memory required when all the checked applications are loaded (either preloaded or selected during runtime).

Here is what the fuel bar colors mean:

- RED: the applications you have selected cannot all fit into the instrument's memory. You must deselect applications until the fuel bar turns yellow
- YELLOW: the applications you have selected can all fit into the instrument's memory, but there is less than 10% of the memory left, probably not enough to load any other applications, either via preload or by selecting a Mode while the instrument is running
- GREEN: The indicator is green when <90% of the memory limit is consumed. This means the applications you have selected can all fit into the instrument's memory with room to spare. You will be able to load one or more other applications without running out of memory

If Sequence Analyzer is selected to be preloaded, all apps that are part of the Sequencer Mode (GSM/EDGE, WCDMA, CDMA2K and 1xEVDO) are preloaded (if licensed).

#### 4.4.6 Configure Applications - Instrument boot-up

When the Instrument Application starts, a dialog box similar to the one you see when you run **Configure Applications** is displayed, allowing you to choose which licensed applications are to be loaded. This dialog is only displayed if the memory required to pre-load all the licensed applications exceeds the virtual memory available.

#### 4.4.7 Configure Applications - Remote Commands

The following topics provide details on using remote commands to configure the list of applications you want to load into the instrument memory, or query the virtual

memory utilization for your applications.

- "Configuration list (Remote Command Only)" on page 422
- "Configuration Memory Available (Remote Query Only)" on page 422
- "Configuration Memory Total (Remote Query Only)" on page 422
- "Configuration Memory Used (Remote Query Only)" on page 423
- "Configuration Application Memory (Remote Query Only)" on page 423

#### 4.4.7.1 Configuration list (Remote Command Only)

Used to set or query the list of applications to be loaded in-memory.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:SYSTem:PON:APPLication:LLISt &lt;string of INSTRument:SElect names&gt;</code><br><code>:SYSTem:PON:APPLication:LLISt?</code>                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Example        | <code>:SYST:PON:APPL:LLIS "SA,BASIC,WCDMA"</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Notes          | <p><code>&lt;string of INSTRument:SElect names&gt;</code> contains items that are valid options for the <code>:INSTRument:SElect</code> command</p> <p>The order of the <code>&lt;INSTRument:SElect names&gt;</code> specifies the order in which the applications are loaded into memory, and the order that they appear in the <b>Mode</b> menu</p> <p><b>Error message -225 "Out of Memory"</b> is reported when more applications are listed than can reside in virtual memory. When this occurs, the existing applications load list is unchanged</p> |
| Preset         | Not affected by Preset                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| State Saved    | Not saved in instrument state                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

#### 4.4.7.2 Configuration Memory Available (Remote Query Only)

Returns the amount of Virtual Memory remaining.

|                |                                                           |
|----------------|-----------------------------------------------------------|
| Remote Command | <code>:SYSTem:PON:APPLication:VMEMory[:AVAilable]?</code> |
| Example        | <code>:SYST:PON:APPL:VMEM?</code>                         |
| Preset         | Not affected by Preset                                    |

#### 4.4.7.3 Configuration Memory Total (Remote Query Only)

Returns the limit of Virtual Memory allowed for applications.

|                |                                                     |
|----------------|-----------------------------------------------------|
| Remote Command | <code>:SYSTem:PON:APPLication:VMEMory:TOTal?</code> |
|----------------|-----------------------------------------------------|

|         |                                       |
|---------|---------------------------------------|
| Example | <code>:SYST:PON:APPL:VMEM:TOT?</code> |
| Preset  | Not affected by Preset                |

#### 4.4.7.4 Configuration Memory Used (Remote Query Only)

Returns the amount of Virtual Memory used by all measurement applications.

|                |                                                    |
|----------------|----------------------------------------------------|
| Remote Command | <code>:SYSTem:PON:APPLication:VMEMory:USED?</code> |
| Example        | <code>:SYST:PON:APPL:VMEM:USED?</code>             |
| Preset         | Not affected by Preset                             |

#### 4.4.7.5 Configuration Application Memory (Remote Query Only)

Returns the amount of Virtual Memory a particular application consumes.

|                |                                                                                                                                                                                        |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:SYSTem:PON:APPLication:VMEMory:USED:NAME? &lt;INSTRument:SElect name&gt;</code>                                                                                                 |
| Example        | <code>:SYST:PON:APPL:VMEM:USED:NAME? CDMA2K</code>                                                                                                                                     |
| Notes          | <code>&lt;INSTRument:SElect name&gt;</code> is an item from the same set used by the <code>:INSTru-ment:SElect</code> command<br>If the name provided is invalid, 0 (zero) is returned |
| Preset         | Not affected by Preset                                                                                                                                                                 |

## 4.5 Restore Defaults

Provides initialization of system setting groups, including the option to set the entire instrument back to a factory default state.

NOTE

In products that run multiple instances of the X-Series Application, all instances have the same factory default states for **Restore Defaults**.

|                |                                                                                  |
|----------------|----------------------------------------------------------------------------------|
| Remote Command | :SYSTem:DEFault [ALL]   ALIGn   INPut   MISC   MODes   PON   UINTerface   SCReen |
| Example        | :SYST:DEF                                                                        |
| State Saved    | No                                                                               |

### 4.5.1 Input/Output

**Input/Output Preset** resets the group of settings and data associated with the **Input/Output** front-panel key to their default values. These settings are not affected by a **Mode Preset** because they are associated with connections to the instrument, which you will probably not want to reset every time you press **Mode Preset**.

By using **Input/Output Preset** and **"Restore Mode Defaults"** on page 550, a full preset of the current mode will be performed, with the caveat that since **Input/Output Preset** is a global function, it will affect *all* Modes.

This is the same as the **Input/Output Preset** button in the **Preset** dropdown and the **Input/Output** menu.

When **Input/Output** is selected, a message appears saying:

This will reset all of the Input/Output variables to their default state, including which input is selected, all Amplitude Correction settings and data, all External Mixing settings, all Frequency Reference settings and all Output settings

It will not affect Alignment data or settings

This action cannot be undone. Do you want to proceed?

The dialog includes **OK** and **Cancel** controls, for you to confirm or cancel the operation.

|         |               |
|---------|---------------|
| Example | :SYST:DEF INP |
|---------|---------------|

## 4.5.2 I/O Config

Causes the group of settings associated with the **I/O Config** menu to be reset to their default values. This also happens on **Restore Misc Defaults**, which has a SCPI command, although **I/O Config** does not.

When **I/O Config** is selected, a message appears saying:

This will reset all of the I/O Config variables to their default state, including the GPIB address and SCPI LAN settings

It will not affect Alignment data or settings

This action cannot be undone. Do you want to proceed?

The dialog includes **OK** and **Cancel** controls, for you to affirm or cancel the operation.

## 4.5.3 User Interface

Causes the group of settings associated with the **User Interface** menu to be reset to their default values. This also happens on a **Restore Misc Defaults**.

When **User Interface** is selected, a message appears saying:

This will reset all of the User Interface variables to their default state, including the menu panel location, display theme, and language

It will not affect Alignment data or settings

This action cannot be undone. Do you want to proceed?

The dialog includes **OK** and **Cancel** controls, for you to affirm or cancel the operation.

---

|         |                |
|---------|----------------|
| Example | :SYST:DEF UINT |
|---------|----------------|

## 4.5.4 Power On

Causes the **Power On** settings to be reset to their default values.

The Power On settings are **Power On State** and **Power On Application**.

When **Power On** is selected, a message appears saying:

This will reset Power On State and Power On Application to their default state

It will not affect Alignment data or settings

This action cannot be undone. Do you want to proceed?

The dialog includes **OK** and **Cancel** controls, for you to affirm or cancel the operation.

---

Example      `:SYST:DEF PON`

### 4.5.5 Alignments

Causes the **Alignments** system settings to be reset to their default values. This does not affect any Alignment data stored in the system.

After performing this function, it may impact the auto-alignment time of the instrument until a new alignment baseline has been established.

When **Alignments** is selected, a message appears saying:

*This will reset all of the settings for the Alignment system to their default values*

*No alignment data will be erased*

*This action cannot be undone. Do you want to proceed?*

The dialog includes **OK** and **Cancel** controls, for you to affirm or cancel the operation.

---

Example      `:SYST:DEF ALIG`

### 4.5.6 Misc

Causes miscellaneous system settings to be reset to their default values.

**CAUTION** This function resets the GPIB address to 18.

---

When **Misc** is selected, a message appears saying:

*This will reset miscellaneous system settings to their default values. This includes settings for I/O Config (GPIB and SCPI LAN), the User Interface, the Save/Recall system, and the Preset type*

*It will not affect Alignment data or settings*

*This action cannot be undone. Do you want to proceed?*

The dialog includes **OK** and **Cancel** controls, for you to affirm or cancel the operation.

This Miscellaneous group contains settings that are *not* part of the other Restore Defaults groups. These include:

- All settings on the **I/O Config** page of the **System Settings** dialog
- All settings in the following table:

| Miscellaneous Setting | Default Value  |
|-----------------------|----------------|
| The SYST:PRES:TYPE    | MODE           |
| Auto File Name Number | 000            |
| Save Type             | State          |
| State Save To         | Register 1     |
| Screen Save To        | SCREEN000.png  |
| Save/Recall Shortcuts | Deleted        |
| Display Theme         | Filled         |
| Backlight             | ON             |
| System Annotation     | Local Settings |
| Language              | English        |
| DISP:ENABLE           | ON             |
| Full Screen           | Off            |

Example `:SYST:DEF MISC`

## 4.5.7 All

Comprehensively resets **All** instrument settings to their factory default values.

Resets all **System Settings** groups, performs "[Restore Mode Defaults](#)" on page 550 for all Modes in the instrument, and switches back to the power-on mode. Does not affect the User Preset file, or any user saved files.

When **All** is selected, a message appears:

This will reset all of the settings in the instrument to their factory default values, including the state of all Modes and Screens, the GPIB settings, the Alignment settings, and the Power On Mode

It will not affect Alignment data or settings

This action cannot be undone. We recommend canceling this operation and restoring settings individually (I/O Config, User Interface, Alignments, etc.) instead

Do you want to proceed?

The dialog includes **OK** and **Cancel** controls, for you to confirm or cancel the operation.

### NOTE

If you are using a Keysight USB External Mixer, then you will need to perform **Refresh USB Mixer Connection** (SCPI command `:MIX:BAND USB`) after **Restore Defaults > All**.

|                              |                                                                                                                                                                                              |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Example                      | :SYST:DEF ALL                                                                                                                                                                                |
| Couplings                    | <b>All</b> causes the currently running measurement to be aborted, and sets all modes to a consistent state, so it is unnecessary to couple any settings<br><br>Backwards Compatibility SCPI |
| Notes                        | :SYST:PRES:PERS is the same as :SYST:DEF ALL                                                                                                                                                 |
| Backwards Compatibility SCPI | :SYSTem:PRESet:PERSiStent                                                                                                                                                                    |

## 4.6 Alignments

Accesses the alignment system of the instrument. You can control the automatic alignments, view alignment statistics and manually perform alignments.

The current setting of the alignment system is displayed in the Meas Bar along the top of the display. For conditions that may cause specifications to be impacted, this annotation will be in amber.

### 4.6.1 Auto Align

Lets you configure the automatic background alignments and the alerts from the automatic alignment system.

|              |                                              |
|--------------|----------------------------------------------|
| Dependencies | Does not appear in VXT or M9410E/11E/15E/16E |
|--------------|----------------------------------------------|

#### 4.6.1.1 Auto Align

Configures the method the automatic background alignment will use when it runs.

Automatic background alignments are run periodically between measurement acquisitions. The instrument's software determines when alignments are to be performed to maintain warranted operation. The recommended setting for Auto Align is Normal.

**Auto Align** execution *cannot* be aborted with the **Cancel (ESC)** key. To interrupt **Auto Align** execution, select **Auto Align Off**.

|                |                                                                                                                                                                                                                |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:CALibration:AUTO ON   LIGHT   PARTial   OFF</code><br>For details of each option, see <a href="#">"Auto Align Options" on page 430</a><br><code>:CALibration:AUTO?</code>                               |
| Example        | <code>:CAL:AUTO ON</code>                                                                                                                                                                                      |
| Notes          | While Auto Align is executing, bit 0 of Status Operation register is set                                                                                                                                       |
| Couplings      | Auto Align is set to Off if Restore Align Data is invoked                                                                                                                                                      |
| Preset         | This is unaffected by <b>Preset</b> but is set to <b>ON</b> by <b>Restore Defaults</b> > <a href="#">"Alignments" on page 426</a>                                                                              |
| State Saved    | No                                                                                                                                                                                                             |
| Annotation     | In the Meas Bar: <ul style="list-style-type: none"> <li>– Normal with "All But RF" off: Auto (white)</li> <li>– Normal with "All But RF" on: Auto/No RF (amber)</li> <li>– Partial: Partial (amber)</li> </ul> |

|                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

|                              | – Off: Off (amber)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Status Bits/OPC dependencies | When <b>Auto Align</b> is executing, Bit 0 in the Status Operational register is set<br>An interfering signal at the RF Input may prevent automatic alignment of the RF subsystem. If this occurs, the Error Condition message “Align RF skipped” is reported, the Status Questionable Calibration bit 11 is set, and the alignment proceeds. When a subsequent alignment of the RF subsystem succeeds, either by the next cycle of automatic alignment or from an Align Now, RF, the Error Condition and Status Questionable Calibration bit 11 are cleared |
| Backwards Compatibility SCPI | :CALibration:AUTO ALERT<br>Parameter <b>ALERT</b> is for backwards compatibility only, and is mapped to <b>PARTial</b>                                                                                                                                                                                                                                                                                                                                                                                                                                       |

Auto Align Options

The available settings for Auto Align are as follows:

Normal

SCPI example :CAL:AUTO ON

**Auto Align, Normal** turns on the automatic alignment of all measurement systems. This selection maintains the instrument in warranted operation across varying temperature and over time.

If the condition “Align Now All required” is set, transitioning to **Auto Align, Normal** performs the required alignments, clears the “Align Now All required” condition, then continues with further alignments as required to maintain the instrument adequately aligned for warranted operation.

When **Auto Align, Normal** is selected, the **Auto Align Off** time is set to zero.

When **Auto Align, Normal** is selected, the Meas Bar indicates Align: Auto (in white) or Align: Auto/No RF (in amber). The amber color reminds you that you are responsible for maintaining the RF alignment of the instrument.

Alignment processing because of the transition to **Normal** is executed sequentially. Thus, \*OPC? or \*WAI following :CAL:AUTO ON will return when the alignment processing is complete.

Light

SCPI example :CAL:AUTO LIGH

**Auto Align, Light** turns on the automatic alignment of all measurement systems. The **Auto Align, Light** selection allows more drift in amplitude accuracy to allow much less frequent measurement interruptions to perform alignments. The temperature changes required to trigger each alignment are increased by a factor of three. Alignments also expire from time as well as temperature. In a stable thermal

environment, the alignments occur one-ninth as often as in Normal. With these less frequent alignments, all accuracy specifications (those expressed with  $\pm x$  dB tolerances) change by nominally a factor of 1.4.

If the condition “Align Now, All required” is set, transitioning to **Auto Align, Light** performs the required alignments, clears the “Align Now, All required” condition, and continues with further alignments as required to maintain the instrument adequately aligned for warranted operation.

Alignment processing because of the transition to **Light** is executed sequentially. Thus, **\*OPC?** or **\*WAI** following **:CAL:AUTO LIGHT** will return when the alignment processing is complete.

When **Auto Align, Light** is selected, the **Auto Align Off** time is set to zero.

When **Auto Align, Light** is selected, the Settings Panel indicates Align: Light.

### Partial

SCPI example **:CAL:AUTO PART**

**Auto Align, Partial** disables the full automatic alignment and the maintenance of warranted operation for the benefit of improved measurement throughput. Accuracy is retained for the Resolution Bandwidth filters and the IF Passband, which is critical to FFT accuracy, demodulation, and many measurement applications. With Auto Align set to Partial, you are now responsible for maintaining warranted operation by updating the alignments when they expire. The Auto Align, Alert mechanism will notify you when alignments have expired. One solution to expired alignments is to perform the Align All, Now operation. Another is to return the Auto Align selection to Normal.

**Auto Align, Partial** is recommended for measurements where the throughput is so important that a few percent of improvement is more valued than an increase in the accuracy errors of a few tenths of a decibel. One good application of **Auto Align, Partial** would be an automated environment where the alignments can be called during overhead time when the device-under-test is exchanged.

When **Auto Align, Partial**, is selected the elapsed time counter begins for **Auto Align Off** time.

When **Auto Align, Partial** is selected, the Settings Panel indicates Align: Partial in an amber color. The amber color reminds you that you are responsible for maintaining the warranted operation of the instrument.

### Off

SCPI example **:CAL:AUTO OFF**

**Auto Align, Off** disables automatic alignment and the maintenance of warranted operation, for the benefit of maximum measurement throughput. With **Auto Align**

set to **Off**, you are now responsible for maintaining warranted operation by updating the alignments when they expire. The Auto Align, Alert mechanism will notify you when alignments have expired. One solution to expired alignments is to perform the **Align All, Now** operation. Another is to return the **Auto Align** selection to **Normal**.

The **Auto Align Off** setting is rarely the best choice, because **Partial** gives almost the same improvement in throughput while maintaining the warranted performance for a much longer time. The choice is intended for unusual circumstances, such as the measurement of radar pulses where you might want the revisit time to be as consistent as possible.

When **Auto AlignOff** is selected, the **Auto Align Off** time is initialized and the elapsed time counter begins.

When **Auto AlignOff** is selected, the Settings Panel indicates Align: Off in an amber color. The amber color reminds you that you are responsible for maintaining the warranted operation of the instrument.

4.6.1.2 All but RF

Configures automatic alignment to include or exclude the RF subsystem. (Eliminating the automatic alignment of the RF subsystem prevents the input impedance from changing. The normal input impedance of 50 ohms can change to an open circuit when alignments are being used. Some devices under test do not behave acceptably under such circumstances, for example by showing instability.)

When **All but RF** is **ON**, the operator is responsible for performing an **Align Now RF** when RF-related alignments expire. The Auto Align, Alert mechanism will notify you to perform an **Align Now All** when the combination of time and temperature variation is exceeded.

When **All But RF** is **ON**, the Settings Panel indicates Align: Auto/No RF (in amber). The amber color reminds you that you are responsible for maintaining the RF alignment of the instrument.

|                |                                                                                                         |
|----------------|---------------------------------------------------------------------------------------------------------|
| Remote Command | :CALibration:AUTO:MODE ALL   NRF<br>:CALibration:AUTO:MODE?                                             |
| Example        | :CAL:AUTO:MODE NRF                                                                                      |
| Preset         | Unaffected by <b>Preset</b> but set to <b>ALL</b> by <b>Restore Defaults</b> > "Alignments" on page 426 |
| State Saved    | No                                                                                                      |

4.6.1.3 Alert

The instrument signals an **Alert** when conditions exist such that you will need to perform a full alignment (for example, **Align Now All**). Alert can be configured in one

of four settings:

| Setting                  | Option                    |
|--------------------------|---------------------------|
| Time & Temperature       | <code>TTEmperature</code> |
| Time & Temperature Light | <code>LIGHT</code>        |
| 7 days                   | <code>WEEK</code>         |
| None                     | <code>NONE</code>         |

With **Auto Align** set to **Normal**, the configuration of **Alert** is not relevant, because the instrument's software maintains the instrument in warranted operation.

A confirmation is required when a selection other than `TTEmperature` is chosen. This prevents accidental deactivation of alerts. When setting **Alert** from the front panel to any value but `TTEmperature`, confirmation is required to transition into this setting of Alert. The confirmation dialog is:

*This will suppress alerts from the Alignment system, which would notify you when an Alignment is required to maintain warranted operation. Without the alerts you will be responsible for performing an Align Now All at appropriate intervals to maintain warranted operation*

*Do you want to proceed?*

The dialog includes **OK** and **Cancel** controls, for you to affirm or cancel the operation.

No confirmation is required when **Alert** is configured through a remote command.

For more information see ["Time & Temperature" on page 433](#)

|                              |                                                                                                                                                                         |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command               | <code>:CALibration:AUTO:ALERT TTEmperature   LIGHT   DAY   WEEK   NONE</code><br><code>:CALibration:AUTO:ALERT?</code>                                                  |
| Example                      | <code>:CAL:AUTO:ALER TTEM</code>                                                                                                                                        |
| Preset                       | Unaffected by <b>Preset</b> but set to <code>TTEmperature</code> by <b>Restore Alignment Defaults</b>                                                                   |
| State Saved                  | No                                                                                                                                                                      |
| Status Bits/OPC dependencies | When an alert is generated, the condition message "Align Now All required" appears in the Status Bar, and bit 14 is set in the Status Questionable Calibration register |

The settings for **Alert** are detailed below.

## Time & Temperature

SCPI Example `CAL:AUTO:ALER TTEM`

The instrument signals an alert when alignments expire due to the combination of the passage of time and changes in temperature. The alert is the Error Condition message "Align Now All required". If this choice for Alert is selected, the absence of an alert means that the instrument alignment is sufficiently up-to-date to maintain warranted accuracy.

## Time & Temperature Light

SCPI Example

`CAL:AUTO:ALER LIGH`

This is a light version of Time & Temperature which means for this setting the time/temperature changes required to trigger an alert are increased by a factor of three and the time alerts will occur one-ninth as often as for Time and Temperature.

### 24 hours

SCPI Example

`CAL:AUTO:ALER DAY`

The instrument signals an alert after a time span of 24 hours since the last successful full alignment (for example, **Align Now All** or completion of a full **Auto Align**). You may want to select this option in an environment where the temperature is stable on a daily basis, at a small risk of accuracy errors in excess of the warranted specifications. The alert is the Error Condition message “Align Now All required”.

### 7 days

SCPI Example

`CAL:AUTO:ALER WEEK`

The instrument signals an alert after a time span of 168 hours since the last successful full alignment (for example, **Align Now All** or completion of a full **Auto Align**). You may want to select this option in an environment where the temperature is stable on a weekly basis, at a modest risk of accuracy degradations in excess of warranted performance. The alert is the Error Condition message “Align Now All required”.

### None

SCPI Example

`CAL:AUTO:ALER NONE`

The instrument does not signal an alert. This is provided for rare occasions where you are making a long measurement that cannot tolerate **Auto Align** interruptions, and must have the ability to capture a screen image at the end of the measurement without an alert posted to the display. Keysight does not recommend using this selection in any other circumstances, because of the risk of accuracy performance drifting well beyond expected levels without the operator being informed.

## 4.6.2 Align Now

Accesses alignment processes that are immediate action operations. They perform complete operations and run until they are complete.

Executing immediate alignments from SCPI can be problematic due to the length of time required for the alignments to complete. Alignment commands are by their

nature sequential, meaning they must complete before any other SCPI commands can be processed. In many cases the alignment itself will take longer than the typical SCPI timeout value. Furthermore, status cannot be easily queried while a sequential command is running.

For this reason, overlapped versions of the **Align Now** commands are provided. When using these No-Operation-Pending (**NPENDING**) commands, the SCPI thread will not be blocked (will be released immediately), so that you can use **:STATus:OPERation:CONDition?** to query the alignment status bit and use **:STATus:QUESTionable:CALibration:CONDition?** to check the alignment results. As an example, **:CALibration[:ALL]:NPENDING** is the overlapped replacement for **:CALibration[:ALL]**.

While the alignment is executing, the coming NOP calibration will be ignored, and **error message “Setting Conflict, Alignment is in process”** will be posted. Also, any other operations to the instrument will be pended and postponed until the alignment is completed. The operations include: Preset, Initiate a new measurement, Device clear and so on. Accordingly, changing parameters will not take effect although the UI is updated immediately. To avoid unexpected timeouts and results, these operations are not recommended during any such alignments.

**NOTE**

The Alignments are not performed if the MIMO Sync is running, because the MIMO and Alignments require the same hardware resource. If the instrument is in MIMO Sync and you press a button to execute Alignments, a pop-up window appears as below. Click **OK** to stop MIMO and execute Alignments.

If the instrument is in MIMO sync, and you send a SCPI command to run Alignments, the align process is not executed, and a warning is generated. To execute Alignments, you must first stop MIMO via SCPI (or manually).

### Controls in this Dialog

The selection and order of controls displayed in this dialog depends on the instrument type and options. Select the control of interest from the following list:

- "Align Now All" on page 436
- "Align Now All but RF" on page 439
- "Align Now RF" on page 440
- "Align Now Expired" on page 441
- "Align Now Preselector" on page 442
- "Align Now All but RF Preselector" on page 443
- "Align Now RF Presel Only (20 Hz to 3.6 GHz)" on page 443
- "Align Now External Mixer" on page 444
- "Align Source" on page 445
- "Align Receiver" on page 446
- "Align Fast" on page 447
- "Align LO Leakage" on page 447
- "Align IF Cable" on page 447
- "Align RRH Amplitude" on page 448
- "Align LO Clock" on page 449
- "Align VXT Transceiver" on page 449
- "Align External Mixer Path" on page 454
- "Align Low Band" on page 455
- "Align High Band" on page 456

#### 4.6.2.1 Align Now All

In PXE, the key label is **Align Now All (plus RF Presel 20 Hz – 3.6 GHz)**

Immediately executes an alignment of all subsystems. The instrument stops any measurement currently underway, performs the alignment, then restarts the measurement from the beginning (similar to pressing the **Restart** key).

If an interfering user signal is present at the RF Input, the alignment is performed on all subsystems except the RF. After completion, the Error Condition message “Align RF skipped” is generated. In addition, the Error Condition message “Align Now, RF required” is generated, and bits 11 and 12 are set in the Status Questionable Calibration register.

The query form of the remote commands (**:CALibration[:ALL]?** or **\*CAL?**) invokes the alignment of all subsystems and returns a success or failure value. An interfering user signal is not grounds for failure; if the alignment was able to succeed on all portions but unable to align the RF because of an interfering signal, the resultant will be the success value.

Successful completion of **Align Now All** will clear the “Align Now All required” Error Condition, and clear bit 14 in the Status Questionable Calibration register. It will also begin the elapsed time counter for Last Align Now All Time, and capture the Last Align Now All Temperature.

If the Align RF subsystem succeeded in aligning (no interfering signal present), the elapsed time counter begins for Last Align Now, RF Time, and the temperature is captured for the Last Align Now, RF Temperature. In addition, the Error Conditions “Align RF skipped” are cleared, the Error Condition “Align Now, RF required” is cleared, and bits 11 and 12 are cleared in the Status Questionable Calibration register.

**Align Now All** can be interrupted, by pressing the **Cancel (ESC)** front-panel key, or remotely with Device Clear followed by the **:ABORT** SCPI command. When this occurs, the Error Condition message “Align Now All required” is generated, and bit 14 is set in the Status Questionable Condition register. This is because new alignment data may be employed for an individual subsystem, but not a cohesive set of data for all subsystems. However, this mechanism does not apply to the M941xA based instruments or solutions. As the new alignment data is independent for all subsystems. “Align Now All required” is generated only when alignments expire due to the combination of the passage of time and changes in temperature. You can refer to the data sheet for more details.

In many cases, you might find it more convenient to change alignments to **Normal**, instead of executing **Align Now All**. When the Auto Align process transitions to **Normal**, the instrument will immediately start to update only the alignments that have expired, thus efficiently restoring the alignment process.

|                |                                                                    |
|----------------|--------------------------------------------------------------------|
| Remote Command | <b>:CALibration[:ALL]</b><br><b>:CALibration[:ALL]?</b>            |
| Example        | <b>:CAL</b>                                                        |
| Notes          | <b>:CALibration[:ALL]?</b> returns 0 if successful, or 1 if failed |

|                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Notes                        | <p><b>:CALibration[:ALL]:NPENDING</b> is the same as <b>:CALibration[:ALL]</b>, including all conditions, status register bits, except this SCPI command <i>does not block</i> the SCPI session, so you should use status register bits to query whether the calibration is successfully completed or not</p> <p>Typical usage is:</p> <ol style="list-style-type: none"> <li>1. <b>:CALibration:ALL:NPENDING</b> (Start a calibration)</li> <li>2. <b>:STATus:OPERation:CONDition?</b> (Check if the calibration is completed or not, If bit 0 is set, then the system is doing calibration, you should repeat this SCPI query until the bit is cleared)</li> <li>3. <b>:STATus:QUEStionable:CALibration:CONDition?</b> (Check if there are any errors/-failures in previous calibration procedure)</li> </ol>                                                                                                                                   |

### 4.6.2.2 Align Now All but RF

In PXE, the key label is **Align Now All but RF (not including RF Presel)**

Immediately executes an alignment of all subsystems except the RF subsystem. The instrument will stop any measurement currently underway, perform the alignment, and then restart the measurement from the beginning (similar to pressing the **Restart** key). This can be used to align portions of the instrument that are not impacted by an interfering user input signal.

This operation might be chosen instead of **All** if you do not want the device under test to experience a large change in input impedance, such as a temporary open circuit at the instrument input.

The query form of the remote commands (**:CALibration:NRF?**) invokes the alignment and returns a success or failure value.

Successful completion of **Align Now All but RF** clears the “Align Now All required” Error Condition, and clears Bit 14 in the Status Questionable Calibration register. If “Align Now All required” was in effect prior to executing **All but RF**, the Error Condition message “Align Now RF required” is generated and Bit 12 in the Status Questionable Calibration register is set. It will also begin the elapsed time counter for Last Align Now All Time, and capture the Last Align Now All Temperature.

**Align Now All but RF** can be interrupted, by pressing the **Cancel (ESC)** front-panel key, or remotely with Device Clear followed by the **:ABORT** SCPI command. When this occurs, the Error Condition message “Align Now All required” is generated, and Bit 14 is set in the Status Questionable Condition register. This is because new alignment data may be used for an individual subsystem, but not a full new set of data for all subsystems.

|                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Example        | <code>:CAL:NRF:NPEN</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Notes          | <p><code>:CALibration:NRF:NPENding</code> is the same as <code>:CALibration:NRF</code>, including all conditions, status register bits, except that this SCPI command <i>does not block</i> the SCPI session, so you should use status register bits to query whether the calibration is successfully completed or not</p> <p>Typical usage is:</p> <ol style="list-style-type: none"> <li>1. <code>:CALibration:NRF:NPENding</code> (start the All but RF calibration)</li> <li>2. <code>:STATus:OPERation:CONDition?</code> (If bit 0 is set, then the system is doing calibration, you should do re-query until this bit is cleared)</li> <li>3. <code>:STATus:QUEStionable:CALibration:CONDition?</code> (to check if there are any errors/-failures in previous calibration procedure)</li> </ol> |

#### 4.6.2.3 Align Now RF

In PXE, the key label is **Align Now RF Only**

Immediately executes an alignment of the RF subsystem. The instrument stops any measurement currently underway, performs the alignment, then restarts the measurement from the beginning (similar to pressing the **Restart** key).

This operation might be desirable if the alignments had been set to not include RF alignments, or if previous RF alignments could not complete because of interference which has since been removed.

If an interfering user signal is present at the RF Input, the alignment will terminate and generate the Error Condition message “Align RF skipped”, and Error Condition “Align Now, RF required”. In addition, bits 11 and 12 will be set in the Status Questionable Calibration register.

The query form of the remote commands (`:CALibration:RF?`) invokes the alignment of the RF subsystem and returns a success or failure value. An interfering user signal is grounds for failure.

Successful completion of **Align Now RF** begins the elapsed time counter for Last Align Now, RF Time, and capture the Last Align Now, RF Temperature.

**Align Now RF** can be interrupted, by pressing the **Cancel (ESC)** front-panel key, or remotely with Device Clear followed by the `:ABORT` SCPI command. When this occurs, the Error Condition message “Align Now, RF required” is generated, and Bit 12 is set in the Status Questionable Condition register. None of the new alignment data is used.

| Example                      | <b>:CAL:RF:NPEN</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Notes                        | <p><b>:CALibration:RF:NPENDING</b> is the same as <b>:CALibration:RF</b>, including all conditions, status register bits, except that this SCPI command <i>does not block</i> the SCPI session, so you should use status register bits to query whether the calibration is successfully completed or not</p> <p>Typical usage is:</p> <ol style="list-style-type: none"> <li>1. <b>:CALibration:RF:NPENDING</b> (Start a RF calibration)</li> <li>2. <b>:STATus:OPERation:CONDition?</b> (If Bit 0 is set, then the system is doing calibration, you should do re-query until this bit is cleared)</li> <li>3. <b>:STATus:QUEStionable:CALibration:CONDition?</b> ( to check if there are any errors/-failures in previous calibration procedure)</li> </ol>                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

#### 4.6.2.4 Align Now Expired

Alignments can be Expired when **Auto Align** is **PARTial** or **OFF**.

## 4 System

### 4.6 Alignments

This control runs the alignments that have expired. This differs from performing **Align All, Now.**, which performs an alignment of all subsystems regardless of whether they are needed or not, whereas **Execute Expired Alignments** aligns only the individual subsystems that have become due.

However, if RF Alignment was required, Bits 11 and 12 are set in the Status Questionable Calibration register to indicate Align Now, RF is required</p> |
| Status Bits/OPC dependencies | Bits 11, 12, or 14 may be set in the Status Questionable Calibration register                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

#### 4.6.2.5 Align Now Preselector

Normally, Preselector Alignment runs during power up, and during the twenty minutes after power up, whenever there is a 1-degree internal temperature change.

This alignment is also run when an **"Align Now All"** on page 436 is performed. This feature is helpful during the 20-minute warm-up time to correct for preselector drift while alignments are being held off. This feature can also be used in lieu of using the Preselector Center functionality, to improve speed throughput for remote testing with minimal impact to amplitude accuracy specs. The algorithm centers the preselector at the upper and lower operating frequencies of the YTF preselector.

The **Align Now Preselector** alignment is *not* a substitute for the Characterizer Preselector Advanced Alignment, which creates the default preselector centering curves for the YTF Preselector and is typically run annually.

|                              | Successful completion clears the Error Conditions “Align Preselector failed” and clears Bit 3 in the Status Questionable Calibration Failure (Extended) register<br>A failure encountered during alignment generates the Error Condition message “Align Preselector failed” and sets Bit 3 in the Status Questionable Calibration Failure (Extended) register |
| Status Bits/OPC dependencies | Bit 3 may be set in the Status Questionable Calibration Failure (Extended) register                                                                                                                                                                                                                                                                           |

#### 4.6.2.6 Align Now All but RF Preselector

Only available in models with the RF Preselector, such as the N9048B. It is identical to the **"Align Now All" on page 436** (plus RF Presel) function, except that the RF Preselector is only partially aligned. Only the System Gain, Mechanical attenuator and Electronic attenuator alignments on the RF Preselector path are aligned. The purpose of these alignments is to improve the RF Preselector path amplitude variation compared to the bypass path.

|------------------------------|----------------------------------------------------------------------------------------------|
| Remote Command               | <code>:CALibration:NRFPselector</code><br><code>:CALibration:NRFPselector?</code>            |
| Example                      | <code>:CAL:NRFP</code>                                                                       |
| Dependencies                 | Only appears in N9048B. Sending the SCPI command or query in other models generates an error |
| Status Bits/OPC dependencies | Bits 12 or 14 may be set in the Status Questionable Calibration register                     |

#### 4.6.2.7 Align Now RF Presel Only (20 Hz to 3.6 GHz)

Only available in models with the RF Preselector, such as the N9048B. It executes an alignment of the RF Preselector section. The receiver will stop any measurement currently underway, perform the alignment, and then restart the measurement from the beginning (similar to pressing the **Restart** key). *Only* the RF Preselector is aligned; no Align Now All function is performed first.

The query (`:CALibration:RFPSelector:ONLY?`) invokes the alignment of the RF Preselector on both Conducted and Radiated Band, and returns a success or failure value. Successful completion clears the “Align 20 Hz to 3.6 GHz required” Error Condition, and clears Bit 1 and Bit 2 in the Status Questionable Calibration Extended Needed register.

The elapsed time counter will begin for Last Align Now, Conducted Time and Last Align Now Radiated Time and the temperature is captured for Last Align Now, Conducted Temperature and Last Align Now, Radiated Temperature. The alignment can be interrupted by pressing the **Cancel (ESC)** front-panel key or remotely with Device Clear followed by the `:ABORT` SCPI command. When this occurs, the Error Condition “Align 20 Hz to 3.6 GHz required” is set because new alignment data may

## 4 System

### 4.6 Alignments

be employed for an individual subsystem, but not a cohesive set of data for all subsystems.

The “Align 20 Hz to 3.6 GHz required” Error Condition will appear when this alignment has expired. The user is now responsible to perform the Align Now, 20 Hz to 3.6 GHz in order to keep the receiver in warranted operation. This alignment can only be performed by the user, as it is not part of the Auto Align process.

|                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

#### 4.6.2.8 Align Now External Mixer

Immediately executes an alignment of the External Mixer that is plugged into the USB port. The instrument stops any measurement currently underway, performs the alignment, then restarts the measurement from the beginning (similar to pressing the **Restart** key). As this alignment calibrates the LO power to the mixer, this is considered an LO alignment; and failure is classified as an LO alignment failure.

The query (`:CALibration:EMIXer?`) invokes the alignment of the External Mixer and returns a success or failure value.

|                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

#### 4.6.2.9 Align Source

Accesses source alignment processes that are immediate action operations. They perform complete operations and run until they are complete.

The instrument stops any sequence of the source, performs the alignment, then restarts the sequence from the beginning.

Note: This alignment corrects slow-rate drift, which does not impair specifications for time periods shorter than one week. Thus, it is required to perform this alignment on a weekly basis to maintain specifications. This alignment typically takes >2 minutes to complete.

There is no alert available for the source alignment. Operators are responsible for checking temperature shift since the last **Align Now Source** to determine whether the source alignment needs to be executed.

| Example        | <code>:CAL:INT:SOUR:NPEN</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Notes          | <p><code>:CALibration:INternal:SOURce[:ALL]:NPENding</code> is the same as <code>:CALibration:INternal:SOURce[:ALL]</code>, including all conditions and status register bits, except that this SCPI command <i>does not block</i> the SCPI session, so you should use status register bits to query whether the calibration is successfully completed or not</p> <p>Typical usage is:</p> <ol style="list-style-type: none"> <li>1. <code>:CALibration:INternal:SOURce:NPENding</code> (start an internal source calibration)</li> <li>2. <code>:STATus:OPERation:CONDition?</code> (Check if the calibration is completed or not, If Bit 0 is set, then the system is doing calibration. Repeat this query until the bit is cleared)</li> <li>3. <code>:STATus:QUEStionable:CALibration:EXTEnded:FAILure:CONDition?</code> (Check if Bit 14 is set or not. If this bit is set, that means there are some errors in previous internal source calibration)</li> </ol> |
| Dependencies   | Only appears in VXT models M9410A/11A                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

#### 4.6.2.10 Align Receiver

Accesses receiver alignment processes that are immediate action operations. They perform complete operations and run until they are complete.

##### NOTE

**This alignment corrects slow-rate drift, which does not impair specifications for time periods shorter than one week. Thus, it is required to perform this alignment on a weekly basis to maintain specifications. This alignment typically takes >2 minutes to complete.**

There is no alert available for the receiver alignment. Operators are responsible for checking temperature shift since the last Align Now, Align Receiver, to determine whether the receiver alignment needs to be executed.

|                |                                                                                                                                                       |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:CALibration:INternal:RECeiver[:ALL]</code><br><code>:CALibration:INternal:RECeiver[:ALL]?</code>                                               |
| Example        | <code>:CAL:INT:REC</code>                                                                                                                             |
| Notes          | The query initiates an Alignment and returns 0 if successful, or 1 if failed                                                                          |
| Dependencies   | Only appears in VXT models M9410A/11A                                                                                                                 |
| Couplings      | <p>Initializes the time for the Last Align Receiver Now, All Time</p> <p>Records the temperature for the Last Align Receiver Now, All Temperature</p> |

#### 4.6.2.11 Align Fast

Accesses fast alignment processes, which are immediate action operations and perform complete operations, running until they are complete.

Align Fast is a subset of Align All, it aligns the subsystems that are most sensitive to temperature and time and includes:

- compensating the DC offset, gain imbalance and quadrature phase imbalance of IQ Modulator and/or Demodulator
- compensating the gain offset of RF path

It is suggested to perform Fast Alignment every 8 hours or when temperature has changed more than 5°C from the previous Fast Alignment.

|                |                                                                                                 |
|----------------|-------------------------------------------------------------------------------------------------|
| Remote Command | <code>:CALibration:INTernal:FAST[:ALL]</code><br><code>:CALibration:INTernal:FAST[:ALL]?</code> |
| Example        | <code>:CAL:INT:FAST</code>                                                                      |
| Notes          | The query initiates an Alignment and returns 0 if successful, or 1 if failed                    |
| Dependencies   | Only appears in VXT models M9410A/11A/15A/16A and S9110E                                        |

#### 4.6.2.12 Align LO Leakage

Accesses LO Leakage alignment processes, which are immediate action operations and perform complete operations, running until they are complete.

This alignment reduce the LO Leakage of the instrument.

|                |                                                                                               |
|----------------|-----------------------------------------------------------------------------------------------|
| Remote Command | <code>:CALibration:INTernal:LOLeakage</code><br><code>:CALibration:INTernal:LOLeakage?</code> |
| Example        | <code>:CAL:INT:LOL</code>                                                                     |
| Notes          | The query iinitiates an Alignment and returns 0 if successful, or 1 if failed                 |
| Dependencies   | Only appears in VXT models M9410A/11A/15A/16A and S9110E                                      |

#### 4.6.2.13 Align IF Cable

Accesses IF Cable alignment processes, which are immediate action operations and perform complete operations, running until they are complete.

This alignment aligns the IF cabling to the remote heads.

|                |                                                                                                         |
|----------------|---------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:CALibration:INTernal:RRHead:IFCable</code><br><code>:CALibration:INTernal:RRHead:IFCable?</code> |
|----------------|---------------------------------------------------------------------------------------------------------|

|                    |                                                                              |
|--------------------|------------------------------------------------------------------------------|
| Example            | <code>:CAL:INT:RRH:IFC</code>                                                |
| Notes              | The query initiates an Alignment and returns 0 if successful, or 1 if failed |
| Dependencies       | Only appears in VXT based solutions with M1740A/41A/42A/49A/49B RRH          |
| Backwards          | <code>:CALibration:INTernal:IFCable</code>                                   |
| Compatibility SCPI | <code>:CALibration:INTernal:IFCable?</code>                                  |

#### 4.6.2.14 Align RRH Amplitude

This is an immediate action operation, which runs until complete.

Aligns the Amplitude of Remote Radio Head. This operation could take quite a long time to run.

##### CAUTION

For M1741A/49A/49B RRH, make sure to connect 50-ohm terminations to Head Tx/Rx 1 and 2 ports.

|                    |                                                                                                             |
|--------------------|-------------------------------------------------------------------------------------------------------------|

| Example            | <code>:CAL:INT:RRH:AMPL?</code>                                                                             |
| Notes              | The query initiates an Alignment and returns 0 if successful, or 1 if failed                                |
| Dependencies       | Only appears in VXT based solutions with M1741A/42A/49A/49B RRH                                             |
| Backwards          | <code>:CALibration:INTernal:RRHAmp</code>                                                                   |
| Compatibility SCPI | <code>:CALibration:INTernal:RRHAmp?</code>                                                                  |

#### 4.6.2.15 Align Fast RRH Amplitude

This is an immediate action operation, which runs until complete.

Compare to Align RRH Amplitude, it aligns the amplitude of Remote Radio Head with a wider frequency interval. This operation takes about one minute.

|                |                                                                                                                       |
|----------------|-----------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:CALibration:INTernal:RRHead:AMPLitude:FAST</code><br><code>:CALibration:INTernal:RRHead:AMPLitude:FAST?</code> |
| Example        | <code>:CAL:INT:RRH:AMPL:FAST?</code>                                                                                  |
| Notes          | The query initiates an alignment and returns 0 if successful, or 1 if failed                                          |
| Dependencies   | Only appears in VXT based solutions with M1742A RRH                                                                   |

#### 4.6.2.16 Align RRH LO Power

This is an immediate action operation, which runs until complete.

Aligns the LO Power of Remote Radio Head.

|                |                                                                                                         |
|----------------|---------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:CALibration:INTernal:RRHead:LOPower</code><br><code>:CALibration:INTernal:RRHead:LOPower?</code> |
| Example        | <code>:CAL:INT:RRH:LOP</code>                                                                           |
| Notes          | The query initiates an alignment and returns 0 if successful, or 1 if failed                            |
| Dependencies   | Only appears in VXT based solutions with M1741A/49A/49B RRH                                             |

#### 4.6.2.17 Align LO Clock

This is an immediate action operation, which runs until complete.  
Synchronizes RRH LO Clocks.

|                    |                                                                                                       |
|--------------------|-------------------------------------------------------------------------------------------------------|
| Remote Command     | <code>:CALibration:INTernal:RRHead:LOSync</code><br><code>:CALibration:INTernal:RRHead:LOSync?</code> |
| Example            | <code>:CAL:INT:RRH:LOS?</code>                                                                        |
| Notes              | The query initiates an Alignment and returns 0 if successful, or 1 if failed                          |
| Dependencies       | Only appears in VXT based solutions with M1741A/42A/49A/49B RRH                                       |
| Backwards          | <code>:CALibration:INTernal:LOSync</code>                                                             |
| Compatibility SCPI | <code>:CALibration:INTernal:LOSync?</code>                                                            |

#### 4.6.2.18 Align VXT Transceiver

In M941xE(M941xA+M9471A) and S9110E system, accesses alignment processes in VXT Transceiver(M9410A/11A/15A/16A), which are immediate action operations and perform complete operations, running until they are complete.

The instrument stops any measurement currently underway, performs the alignment, then restarts the measurement from the beginning (similar to pressing the **Restart** key).

There is no alert available for the VXT Transceiver alignment. Operators are responsible for checking temperature shift since the last **Align VXT Transceiver** to determine whether the VXT Transceiver alignment needs to be executed.

|                |                                                                                                           |
|----------------|-----------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:CALibration:INTernal:VXT:TRANsceiver</code><br><code>:CALibration:INTernal:VXT:TRANsceiver?</code> |
| Example        | <code>:CAL:INT:VXT:TRAN</code>                                                                            |
| Notes          | The query initiates an Alignment and returns 0 if successful, or 1 if failed                              |
| Dependencies   | Only appears on M9410E/11E/15E/16E and S9110E                                                             |

#### 4.6.2.19 Align up down converter

In M941xE(M941xA+M9471A) system, accesses alignment processes in up down converter (M9471A), which are immediate action operations and perform complete operations, running until they are complete.

The instrument stops any measurement currently underway, performs the alignment, then restarts the measurement from the beginning (similar to pressing the **Restart** key).

There is no alert available for the up down converter alignment. Operators are responsible for checking temperature shift since the last **Align up down converter** to determine whether the up down converter alignment needs to be executed.

|                |                                                                                           |
|----------------|-------------------------------------------------------------------------------------------|
| Remote Command | <code>:CALibration:UPDown:CONVerter</code><br><code>:CALibration:UPDown:CONVerter?</code> |
| Example        | <code>:CAL:UPD:CONV</code>                                                                |
| Notes          | The query initiates an Alignment and returns 0 if successful, or 1 if failed              |
| Dependencies   | Only appears on M9410E/11E/15E/16E                                                        |

#### 4.6.2.20 Align M9471A up down converter

In S9110E system, accesses alignment processes in up down converter (M9471A), which are immediate action operations and perform complete operations, running until they are complete.

The instrument stops any measurement currently underway, performs the alignment, then restarts the measurement from the beginning (similar to pressing the **Restart** key).

There is no alert available for the up down converter alignment. Operators are responsible for checking temperature shift since the last **Align M9471A up down converter** to determine whether the up down converter alignment needs to be executed.

|                |                                                                                           |
|----------------|-------------------------------------------------------------------------------------------|
| Remote Command | <code>:CALibration:UPDown:CONVerter</code><br><code>:CALibration:UPDown:CONVerter?</code> |
| Example        | <code>:CAL:UPD:CONV</code>                                                                |
| Notes          | The query initiates an Alignment and returns 0 if successful, or 1 if failed              |
| Dependencies   | Only appears on S9110E                                                                    |

#### 4.6.2.21 Align Fast Up Down Converter

In M941xE(M941xA+M9471A), accesses alignment processes in up down converter (M9471A), which are immediate action operations and perform complete operations, running until they are complete.

The instrument stops any measurement currently underway, performs the alignment, then restarts the measurement from the beginning (similar to pressing the **Restart** key).

There is no alert available for the up down converter alignment. You are responsible for checking temperature shift since the last **Align Fast Up Down Converter**, to determine whether the up down converter alignment needs to be executed.

|                |                                                                                                     |
|----------------|-----------------------------------------------------------------------------------------------------|
| Remote Command | <code>:CALibration:UPDown:CONVerter:FAST</code><br><code>:CALibration:UPDown:CONVerter:FAST?</code> |
| Example        | <code>:CAL:UPD:CONV:FAST</code>                                                                     |
| Notes          | The query initiates an alignment and returns 0 if successful, or 1 if failed                        |
| Dependencies   | Only appears on M9410E/11E/15E/16E                                                                  |

#### 4.6.2.22 Align Specified Freq Ranges

VXT models M9410A/11A provide five alignments: **Align Now All**, **Align Source**, **Align Receiver**, **Align Fast** and **Align LO Leakage**. M9415A/16A provide six alignments: **Align Now All**, **Align Fast**, **Align LO Leakage**, **Align Ext. Mixer Path**, **Align High Band**, **Align Low Band**. Every time you execute one of these alignments, the system performs a full span alignment. To save time, it is possible to limit the range of alignment frequency settings. **Align Specified Freq Ranges** allows you to set the start and stop frequency of an alignment.

The example below shows the steps for processing **Align Receiver** on VXT model M9410A, specifying a frequency range from 1.3 GHz to 1.8 GHz, and 2.5 GHz to 3.9 GHz.

- First row: set the Start and Stop Frequency to 1.3 GHz and 1.8 GHz. Enable the first row
- Second row: set the Start and Stop Frequency to 2.5 GHz and 3.9 GHz. Enable the second row
- Click **Align Receiver**. A message appears: “Aligning 1 of 7”

The equivalent SCPI command sequence is:

```
:CAL:INT:ASFR ON
:CAL:INT:ASFR:FRAN 1.3 GHz, 1.8 GHz, 2.5 GHz, 3.9 GHz
:CAL:INT:REC
```

## 4 System

### Enable Extended Freq Range

Allows you to set frequency ranges for VXT models M9410A/11A/15A with Remote Head and/or CIU. When Enable Extended Freq Range is not active, the frequency range is limited by VXT models only.

| Dependencies   | Only appears when <b>"Align VXT Transceiver" on page 449</b> is <b>ON</b><br><b>Error message "Invalid alignment frequency range"</b> is reported if start and stop frequencies are invalid, such as: <ol style="list-style-type: none"> <li>1. Stop frequency - Start frequency &lt; 0</li> <li>2. the count of start and stop frequency is not even</li> <li>3. the frequency is out of range. See <b>"More Information" on page 453</b></li> <li>4. more than 5 pairs of start and stop frequency are listed</li> </ol> |
| Preset         | 1.0 GHz, 2.0 GHz                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## More Information

When **"Enable Extended Freq Range" on page 452** is not active, the frequency range depends on the VXT models. The table below lists the Start and Stop Frequency Ranges for VXT models M9410A/11A/15A:

| Hardware   | Options         | Min Frequency | Max Frequency |
|------------|-----------------|---------------|---------------|
| M9410A/11A | F06             | 330 MHz       | 6.08 GHz      |
| M9410A/11A | F06 & EP6       | 330 MHz       | 6.6 GHz       |
| M9410A/11A | F06 & LFE & EP6 | 6.5 kHz       | 6.6 GHz       |

| Hardware   | Options | Min Frequency | Max Frequency |
|------------|---------|---------------|---------------|
| M9415A/16A | F06     | 330 MHz       | 6.6 GHz       |
| M9415A/16A | F08     | 330 MHz       | 8.6 GHz       |
| M9415A/16A | F12     | 330 MHz       | 12.9 GHz      |

When **Enable Extended Freq Range** is active, the frequency range depends on the extensions connected to VXT models. The table below lists the Start and Stop Frequency Range of VXT models with Remote Radio Heads/CIU:

| Connected with Radio Heads/CIU | Min frequency | Max frequency | IF Frequency range |
|--------------------------------|---------------|---------------|--------------------|
| VXT + CIU                      | 5.9 GHz       | 12 GHz        | 1.4 GHz ~ 4.6 GHz  |
| VXT + CIU + RRH                | 24.25 GHz     | 43.5 GHz      | 2.5 GHz ~ 4.5 GHz  |
| VXT + M1742A                   | 10 GHz        | 32 GHz        | 3.0 GHz ~ 5.5 GHz  |
| VXT + M1749B-F43               | 22.7 GHz      | 43.5 GHz      | 2.5 GHz ~ 4.5 GHz  |
| VXT + M1749B-F49               | 22.7 GHz      | 49.2 GHz      | 2.5 GHz ~ 4.5 GHz  |
| VXT + M9471A + M1749B-F49      | 22.7 GHz      | 49.2 GHz      | 2.5 GHz ~ 4.5 GHz  |

**NOTE**

The Min frequency and Max frequency are also the preset frequencies. It is recommended to keep the preset frequency range for VXT models with extensions. An alignment with the full IF Frequency range will be executed ignoring the specific ranges.

The table below lists the Frequency Range of M941xE(VXT Models with M9471A)

| Options                        | Min Frequency | Max Frequency |
|--------------------------------|---------------|---------------|
| Without LFE                    | 330 MHz       | 26.5 GHz      |
| LFE option in M941xA or M9471A | 750 kHz       | 26.5 GHz      |

## Enable

Enables or disables the selected frequency ranges.

Preset **Row 1: ON**  
**Other rows: OFF**

### 4.6.2.23 Align External Mixer Path

Immediately executes an alignment of the External Mixer Path inside the VXT models M9415A/16A. External Mixer Path is used when the RF Port is connected to an external Remote Radio Head (RRH). It provides a better performance compared to the normal path. External Mixer Path Alignment covers frequencies from 2.4 GHz to 3.4 GHz of the external mixer path.

NOTE

This alignment corrects slow-rate drift, which does not impair specifications for time periods shorter than one week. Thus, you need only perform this alignment on a weekly basis to maintain specifications. This alignment typically takes >2 minutes to complete.

There is no alert for the External Mixer Path alignment. You are responsible for checking the temperature shift since the last **Align Now, External Mixer Path**, to determine whether the external mixer path alignment needs to be executed.

|                |                                                                                                                                                                  |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:CALibration:INTernal:EMPath</code><br><code>:CALibration:INTernal:EMPath?</code>                                                                          |
| Example        | <code>:CAL:INT:EMP</code>                                                                                                                                        |
| Notes          | The query initiates an alignment and returns 0 if successful, or 1 if failed                                                                                     |
| Dependencies   | Only appears in VXT models M9415A/16A when Option MXP is installed                                                                                               |
| Couplings      | Initializes the time for the Last Align External Mixer Path Now, All Time<br>Records the temperature for the Last Align External Mixer Path Now, All Temperature |

#### 4.6.2.24 Align Low Band

Accesses Low Band alignment processes that are immediate action operations. They perform complete operations and run until they are complete. Low Band Alignment covers frequencies from 380 MHz to 4.3 GHz of the non-external mixer path.

NOTE

This alignment corrects slow-rate drift, which does not impair specifications for time periods shorter than one week. Thus, you need only perform this alignment on a weekly basis to maintain specifications. This alignment typically takes >2 minutes to complete.

There is no alert for the Low Band alignment. You are responsible for checking the temperature shift since the last **Align Now, Align Low Band**, to determine whether the Low Band alignment needs to be executed.

|                |                                                                                                                                            |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:CALibration:INTernal:LBAnd[:ALL]</code><br><code>:CALibration:INTernal:LBAnd[:ALL]?</code>                                          |
| Example        | <code>:CAL:INT:LBAN</code>                                                                                                                 |
| Notes          | The query initiates an Alignment, and returns 0 if successful, or 1 if failed                                                              |
| Dependencies   | Only appears in VXT models M9415A/16A                                                                                                      |
| Couplings      | Initializes the time for the Last Align Low Band Now, All Time<br>Records the temperature for the Last Align Low Band Now, All Temperature |

4.6.2.25 Align High Band

Accesses High Band alignment processes that are immediate action operations. They perform complete operations and run until they are complete. High Band Alignment covers frequencies from 4.3 GHz to 12 GHz of the non-external mixer path.

NOTE

This alignment corrects slow-rate drift, which does not impair specifications for time periods shorter than one week. Thus, you need only perform this alignment on a weekly basis to maintain specifications. This alignment typically takes >2 minutes to complete.

There is no alert for the High Band alignment. You are responsible for checking the temperature shift since last **Align Now, Align High Band**, to determine whether the High Band alignment needs to be executed.

|                |                                                                                                                                                       |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:CALibration:INTernal:HBAND[:ALL]</code><br><code>:CALibration:INTernal:HBAND[:ALL]?</code>                                                     |
| Example        | <code>:CAL:INT:HBAN</code>                                                                                                                            |
| Notes          | The query initiates an Alignment, and returns 0 if successful, or 1 if failed                                                                         |
| Dependencies   | Only appears in VXT models M9415A/16A                                                                                                                 |
| Couplings      | Initializes the external time for the Last Align High Band Now, All Time<br>Records the temperature for the Last Align High Band Now, All Temperature |

4.6.3 Path Delay Calibration

Path Delay Calibration is used to remove the time delay differences between multiple power channels of a module.

| Dependencies | Only available in VXT modules M9410A/11A<br>Only for modules with matched Digital board hardware version, which means the modules are in same FPGA version<br>The matched hardware version information is in below table |                |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------|
|              | Digital board Hardware version                                                                                                                                                                                           | Matched module |
|              | M9410A 2,3,4,6,10,11                                                                                                                                                                                                     | Yes            |
|              | M9410A 12, 13                                                                                                                                                                                                            | Yes            |
|              | M9411A 18                                                                                                                                                                                                                | Yes            |
|              | M9411A 20,21                                                                                                                                                                                                             | Yes            |
|              | M9411A 12,13                                                                                                                                                                                                             | Yes            |
|              | M9411A 0,1,2,3,4,6,10,11                                                                                                                                                                                                 | Yes            |

### 4.6.3.1 Source Path Delay Calibration

Accesses the Source Path Delay Calibration processes, which are immediate-action operations and perform complete operations, running until they are complete.

**NOTE** Connect the RF In of the primary module to the OUT port (COMMON, PORT 1) of the power splitter (11667B is recommended).

**NOTE** Before performing Path Delay Calibration of Sources, please confirm that:

**NOTE** Each of the RF Out ports is connected to the RF In port of the Primary channel, using a power splitter (11667B is recommended).

**NOTE** The cables between the power splitter (11667B is recommended) and the Source output ports are of the same length.

**NOTE** A pop-up window will appear, press OK to continue the calibration.

**NOTE** If the is in MIMO sync, and you send a SCPI command to run Calibration, the calibration process is not executed and instrument a warning is generated (“-221,Setting Conflict; Calibrations are not available while MIMO Sync is On”). To execute Calibration, you must first stop MIMO, manually or via SCPI.

|                |                                                                                     |
|----------------|-------------------------------------------------------------------------------------|
| Remote Command | <code>:CALibration:PDElay:SOURce</code><br><code>:CALibration:PDElay:SOURce?</code> |
|----------------|-------------------------------------------------------------------------------------|

|              |                                                                                                                                                                    |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Dependencies | <p>Only appears in VXT models M9410A/11A</p> <p>Only for modules with matched Digital board hardware version, which means the modules are in same FPGA version</p> |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### 4.6.3.2 Path Delay Correction On/Off(Remote Command only)

On/Off the path delay correction to enable the calibration data on the source of the module.

|                |                                                                                                                                                    |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:CALibration:PDElay:CORRection ON   OFF</code><br><code>:CALibration:PDElay:CORRection?</code>                                               |
| Example        | <code>:CAL:PDEL:CORR ON</code>                                                                                                                     |
| Notes          | If the <b>Path Delay Calibration</b> has never been performed and there is no calibration correction data in the controller, an alert is generated |
| Preset         | <code>OFF</code>                                                                                                                                   |
| Range          | <code>ON OFF</code>                                                                                                                                |

### 4.6.4 Temperature Drift Correction On/Off (Remote Command Only)

Lets you turn on/off the temperature drift correction at the instrument side.

|                |                                                                                                                          |
|----------------|--------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:CALibration:RRHead:TDCorrection[:STATe] ON   OFF</code><br><code>:CALibration:RRHead:TDCorrection[:STATe]?</code> |
| Example        | <code>:CAL:RRH:TDC ON</code><br><code>:CAL:RRH:TDC?</code>                                                               |
| Dependencies   | Only supported in S9110A-F32                                                                                             |
| Preset         | <code>OFF</code>                                                                                                         |
| Range          | <code>ON OFF</code>                                                                                                      |

### 4.6.5 Show Alignment Statistics

Shows alignment information you can use to ensure that the instrument is operating in a specific manner. The **Show Alignment Statistics** screen is where you can view time and temperature information.

Values displayed are only updated when the **Show Alignment Statistics** screen is invoked. They are not updated while the **Show Alignment Statistics** screen is being displayed. The remote commands that access this information obtain current values.

Note that some of these statistics only display if your instrument supports them; for example, Last Source Align Now All Time only shows up in instruments which contain a source which supports auto alignments.

An example of the **Show Alignment Statistics** screen would be similar to:

|                           |                                                                                                                                                                                     |                                                                   |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------|
| Std Header                | Product Number: N9020A<br>Serial Number: US46340924<br>Firmware Revision: A.01.01                                                                                                   |                                                                   |

| If TG Option (Not Zorro1) | Time since last Align TG: 2.5 hrs<br>Temperature since last Align TG: +0.2 degC                                                                                                     |                                                                   |
| Opts 508,513 526          | Last Characterize Preselector: Jun 1, 2006 15:00:00<br>Last Characterize Preselector Temperature: +32.1 degC                                                                        | Time & Temperature 'stamp'                                        |

"Time while Auto Align off" is not available in VXT models M9410A/11A.

A successful **Align Now, RF** sets the Last Align RF temperature to the current temperature, and resets the Last Align RF time. A successful **Align Now All** or **Align Now All but RF** sets the Last Align Now All temperature to the current temperature, and resets the Last Align Now All time. A successful **Align Now All** also resets the Last Align RF items if the RF portion of the **Align Now** succeeded.

|         |                                                                                                                                   |
|---------|-----------------------------------------------------------------------------------------------------------------------------------|
| Example | <code>:SYST:SHOW ALIGN</code>                                                                                                     |
| Notes   | The values displayed on the screen are only updated upon entry to the screen, and not updated while the screen is being displayed |

The following data-specific queries are available:

### Query Time since Startup

|                |                                                             |
|----------------|-------------------------------------------------------------|
| Remote Command | <code>:SYSTem:PON:TIME?</code>                              |
| Example        | <code>:SYST:PON:TIME?</code>                                |
| Notes          | Value is the time since the most recent start-up in seconds |
| State Saved    | No                                                          |

### Query Current Temperature

|                |                                                |
|----------------|------------------------------------------------|
| Remote Command | <code>:CALibration:TEMPerature:CURRent?</code> |
| Example        | <code>:CAL:TEMP:CURR?</code>                   |
| Notes          | Value is in degrees Centigrade                 |
| State Saved    | No                                             |

### Query Current Temperature at Remote Radio Head

|                |                                                       |
|----------------|-------------------------------------------------------|
| Remote Command | <code>:CALibration:TEMPerature:CURRent:RRHead?</code> |
| Example        | <code>:CAL:TEMP:CURR:RRH?</code>                      |
| Notes          | Value is in degrees Centigrade                        |
| Dependencies   | Only appears when Align RRH Amplitude is available    |
| State Saved    | No                                                    |

### Query Current Temperature at Remote Radio Head LO

|                |                                                          |
|----------------|----------------------------------------------------------|
| Remote Command | <code>:CALibration:TEMPerature:CURRent:RRHead:LO?</code> |
| Example        | <code>:CAL:TEMP:CURR:RRH:LO?</code>                      |
| Notes          | Value is in degrees Centigrade                           |
| Dependencies   | Only appears when Align RRH LO Power is available        |
| State Saved    | No                                                       |

### Query Time since Last Align Now All

|                |                                                                                                                                   |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:CALibration:TIME:LALL?</code>                                                                                              |
| Example        | <code>:CAL:TIME:LALL?</code>                                                                                                      |
| Notes          | Value is the elapsed time, in seconds, since the last successful <b>Align Now All</b> or <b>Align Now All but RF</b> was executed |
| State Saved    | No                                                                                                                                |

### Query Temperature of Last Align Now All

|                |                                                                                                                              |
|----------------|------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:CALibration:TEMPerature:LALL?</code>                                                                                  |
| Example        | <code>:CAL:TEMP:LALL?</code>                                                                                                 |
| Notes          | Value is in degrees Centigrade at which the last successful <b>Align Now All</b> or <b>Align Now All but RF</b> was executed |
| State Saved    | No                                                                                                                           |

### Query Time since Last Align Now Receiver

|                |                                                                    |
|----------------|--------------------------------------------------------------------|
| Remote Command | <code>:CALibration:TIME:INTernal:RECeiver?</code>                  |
| Example        | <code>:CAL:TIME:INT:REC?</code>                                    |
| Notes          | Value in hours since the last successful <b>Align Now Receiver</b> |
| Dependencies   | Only appears in VXT models M9410A/11A                              |
| State Saved    | No                                                                 |

### Query Temperature of Last Align Now Receiver

|                |                                                                                             |
|----------------|---------------------------------------------------------------------------------------------|
| Remote Command | <code>:CALibration:TEMPerature:INTernal:RECeiver?</code>                                    |
| Example        | <code>:CAL:TEMP:INT:REC?</code>                                                             |
| Notes          | Value in degrees Centigrade when the last successful <b>Align Now Receiver</b> was executed |
| Dependencies   | Only appears in VXT models M9410A/11A                                                       |
| State Saved    | No                                                                                          |

### Query Time since Last Align Now Source

|                |                                                                  |
|----------------|------------------------------------------------------------------|
| Remote Command | <code>:CALibration:TIME:INTernal:SOURce?</code>                  |
| Example        | <code>:CAL:TIME:INT:SOUR?</code>                                 |
| Notes          | Value in hours since the last successful <b>Align Now Source</b> |
| Dependencies   | Only appears in VXT models M9410A/11A                            |
| State Saved    | No                                                               |

### Query Temperature of Last Align Now Source

|                |                                                                                           |
|----------------|-------------------------------------------------------------------------------------------|
| Remote Command | <code>:CALibration:TEMPerature:INTernal:SOURce?</code>                                    |
| Example        | <code>:CAL:TEMP:INT:SOUR?</code>                                                          |
| Notes          | Value in degrees Centigrade when the last successful <b>Align Now Source</b> was executed |
| Dependencies   | Only appears in VXT models M9410A/11A                                                     |
| State Saved    | No                                                                                        |

### Query Time since Last Align Now Fast

|                |                                                                |
|----------------|----------------------------------------------------------------|
| Remote Command | <code>:CALibration:TIME:INTernal:FAST?</code>                  |
| Example        | <code>:CAL:TIME:INT:FAST?</code>                               |
| Notes          | Value in hours since the last successful <b>Align Now Fast</b> |
| Dependencies   | Only appears in VXT models M9410A/11A/15A/16A                  |
| State Saved    | No                                                             |

### Query Temperature of Last Align Now Fast

|                |                                                                                         |
|----------------|-----------------------------------------------------------------------------------------|
| Remote Command | <code>:CALibration:TEMPerature:INTernal:FAST?</code>                                    |
| Example        | <code>:CAL:TEMP:INT:FAST?</code>                                                        |
| Notes          | Value in degrees Centigrade when the last successful <b>Align Now Fast</b> was executed |
| Dependencies   | Only appears in VXT models M9410A/11A/15A/16A                                           |
| State Saved    | No                                                                                      |

### Query Time since Last Align Now LO Leakage

|                |                                                                      |
|----------------|----------------------------------------------------------------------|
| Remote Command | <code>:CALibration:TIME:INTernal:LOLeakage?</code>                   |
| Example        | <code>:CAL:TIME:INT:LOL?</code>                                      |
| Notes          | Value in hours since the last successful <b>Align Now LO Leakage</b> |
| Dependencies   | Only appears in VXT models M9410A/11A/15A/16A                        |
| State Saved    | No                                                                   |

### Query Temperature of Last Align Now LO Leakage

|                |                                                                                               |
|----------------|-----------------------------------------------------------------------------------------------|
| Remote Command | <code>:CALibration:TEMPerature:INTernal:LOLeakage?</code>                                     |
| Example        | <code>:CAL:TEMP:INT:LOL?</code>                                                               |
| Notes          | Value in degrees Centigrade when the last successful <b>Align Now LO Leakage</b> was executed |
| Dependencies   | Only appears in VXT models M9410A/11A/15A/16A                                                 |
| State Saved    | No                                                                                            |

### Query Time since Last Align Now IF Cable

|                              |                                                                     |
|------------------------------|---------------------------------------------------------------------|
| Remote Command               | <code>:CALibration:TIME:INTernal:RRHead:IFCable?</code>             |
| Example                      | <code>:CAL:TIME:INT:RRH:IFC?</code>                                 |
| Notes                        | Value in hours since the last successful <b>Align Now IF Cable</b>  |
| Dependencies                 | Only appears in VXT based solutions with M1740A/41A/42A/49A/49B RRH |

| Notes          | Value in hours since the last successful Align RRH LO Power |
| Dependencies   | Only appears in VXT based solutions with M1741A/49A/49B RRH |
| State Saved    | No                                                          |

### Query Temperature of Last Align RRH LO Power

|                |                                                                                      |
|----------------|--------------------------------------------------------------------------------------|
| Remote Command | <code>:CALibration:TEMPerature:INTernal:RRHead:LOPower?</code>                       |
| Example        | <code>:CAL:TEMP:INT:RRH:LOP?</code>                                                  |
| Notes          | Value in degrees Centigrade when the last successful Align RRH LO Power was executed |
| Dependencies   | Only appears in VXT based solutions with M1741A/49A/49B RRH                          |
| State Saved    | No                                                                                   |

### Query Time since Last Align Now RF

|                |                                                                                                                                                                   |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:CALibration:TIME:LRF?</code>                                                                                                                               |
| Example        | <code>:CAL:TIME:LRF?</code>                                                                                                                                       |
| Notes          | Value is the elapsed time, in seconds, since the last successful <b>Align Now, RF</b> was executed, either individually or as a component of <b>Align Now All</b> |
| State Saved    | No                                                                                                                                                                |

### Query Temperature of Last Align Now RF

|                |                                                                                                                                                             |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:CALibration:TEMPerature:LRF?</code>                                                                                                                  |
| Example        | <code>:CAL:TEMP:LRF?</code>                                                                                                                                 |
| Notes          | Value is in degrees Centigrade at which the last successful <b>Align Now RF</b> was executed, either individually or as a component of <b>Align Now All</b> |
| State Saved    | No                                                                                                                                                          |

### Query Time since Last Align IF

|                |                                                                                               |
|----------------|-----------------------------------------------------------------------------------------------|
| Remote Command | <code>:CALibration:TIME:LIF?</code>                                                           |
| Example        | <code>:CAL:TIME:LIF?</code>                                                                   |
| Notes          | Value is the elapsed time, in seconds, since the last successful <b>Align IF</b> was executed |
| State Saved    | No                                                                                            |

### Query Temperature of Last Align IF

|                |                                                                                          |
|----------------|------------------------------------------------------------------------------------------|
| Remote Command | <code>:CALibration:TEMPerature:LIF?</code>                                               |
| Example        | <code>:CAL:TEMP:LIF?</code>                                                              |
| Notes          | Value is in degrees Centigrade at which the last successful <b>Align IF</b> was executed |
| State Saved    | No                                                                                       |

### Query Time since Last Characterize Preselector

|                |                                                                                                                                                                                                                                                     |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:CALibration:TIME:LPreselector?</code>                                                                                                                                                                                                        |
| Example        | <code>:CAL:TIME:LPR?</code>                                                                                                                                                                                                                         |
| Notes          | Value is the date and time the last successful <b>Characterize Preselector</b> was executed. The date is separated from the time by a space character<br>Returns "" if no <b>Characterize Preselector</b> has ever been performed on the instrument |
| Dependencies   | In models that do not include preselectors, this command is not enabled and any attempt to set or query yields an error                                                                                                                             |
| State Saved    | No                                                                                                                                                                                                                                                  |

### Query Temperature of Last Characterize Preselector

|                |                                                                                                          |
|----------------|----------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:CALibration:TEMPerature:LPreselector?</code>                                                      |
| Example        | <code>:CAL:TEMP:LPR?</code>                                                                              |
| Notes          | Value is in degrees Centigrade at which the last successful <b>Characterize Preselector</b> was executed |

## 4 System

### 4.6 Alignments

|              |                                                                                                                         |
|--------------|-------------------------------------------------------------------------------------------------------------------------|
| Dependencies | In models that do not include preselectors, this command is not enabled and any attempt to set or query yields an error |
|--------------|-------------------------------------------------------------------------------------------------------------------------|

|             |    |
|-------------|----|
| State Saved | No |
|-------------|----|

#### Query Time since Auto Align Off

|                |                                          |
|----------------|------------------------------------------|
| Remote Command | <code>:CALibration:AUTO:TIME:OFF?</code> |
|----------------|------------------------------------------|

|         |                                  |
|---------|----------------------------------|
| Example | <code>:CAL:AUTO:TIME:OFF?</code> |
|---------|----------------------------------|

|       |                                                                                                                                                                                       |
|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Notes | Value is the elapsed time, in seconds, since <b>Auto Align</b> has been set to <b>Off</b> or <b>Off with Alert</b> . The value is 0 if <b>Auto Align</b> is <b>ALL</b> or <b>NORF</b> |
|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|             |    |
|-------------|----|
| State Saved | No |

### 4.6.6 Timebase DAC

Lets you change the setting of the **Timebase DAC** from a factory calibrated setting to your own desired setting.

The display shows the current **Timebase DAC** setting at the top, and gives you a choice of **CALibrated** or **USER** setting. There is also a field for you to enter your desired setting.

|              |                                   |
|--------------|-----------------------------------|
| Dependencies | Does not appear in VXT and M941xE |
|--------------|-----------------------------------|

#### 4.6.6.1 Timebase DAC

Allows control of the internal 10 MHz reference oscillator timebase. This may be used to adjust for minor frequency alignment between your signal's reference and the internal frequency reference. This adjustment has no effect if the instrument is operating with an External Frequency Reference.

If the value of the **Timebase DAC** changes (by switching to **CALibrated** from **USER** with **User Value** set to a different value, or in **USER** with a new value entered) an alignment may be necessary. The alignment system will take appropriate action; which will either invoke an alignment or cause an **Alert**.

The **CALibrated** setting sets the **Timebase DAC** to the value established during factory or field calibration. In this case the value displayed at the top of the screen is the calibrated value.

The **USER** setting sets the **Timebase DAC** to the value set on the **User Value** control. In this case the value displayed at the top of the screen is the user value.

|                |                                                                                                                                     |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:CALibration:FREQuency:REFeRence:MODE CALibrated   USER</code><br><code>:CALibration:FREQuency:REFeRence:MODE?</code>         |
| Example        | <code>:CAL:FREQ:REF:MODE CAL</code>                                                                                                 |
| Notes          | If the value of the timebase is changed the alignment system automatically performs an alignment or alerts that an alignment is due |
| Dependencies   | Not available in UXM                                                                                                                |
| Preset         | Unaffected by <b>Preset</b> , but set to <b>CALibrated</b> by <b>Restore Defaults</b> > <b>"Alignments"</b> on page 426             |
| State Saved    | No                                                                                                                                  |

#### 4.6.6.2 User Value

Lets you set the **Timebase DAC** to a value other than the value established during the factory or field calibration. The current value of the DAC is displayed at the top of the screen. This will be the Calibrated value if **Timebase DAC** is set to **CALibrated**.

|                |                                                                                                                           |
|----------------|---------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:CALibration:FREQuency:REFeRence:FINE &lt;integer&gt;</code><br><code>:CALibration:FREQuency:REFeRence:FINE?</code> |
| Example        | <code>:CAL:FREQ:REF:FINE 8191</code>                                                                                      |

### 4.6.7.1 Characterize Preselector

The Preselector tuning curve drifts over temperature and time. Recognize that the Amplitude, Presel Center function adjusts the preselector for accurate amplitude measurements at an individual frequency. Characterize Preselector improves the amplitude accuracy by ensuring the Preselector is approximately centered at all frequencies without the use of the Amplitude, Presel Center function. Characterize Preselector can be useful in situations where absolute amplitude accuracy is not of utmost importance, and the throughput savings or convenience of not performing a Presel Center is desired. Presel Center is required prior to any measurement for best (and warranted) amplitude accuracy.

Keysight recommends that the Characterize Preselector operation be performed yearly as part of any calibration, but performing this operation every three months can be worthwhile.

**Characterize Preselector** immediately executes a characterization of the Preselector, which is a YIG-tuned filter (YTF). The instrument stops any measurement currently underway, performs the characterization, then restarts the measurement from the beginning (similar to pressing the **Restart** key).

The query (**:CALibration:YTF?**) invokes the alignment of the YTF subsystem, and returns a success or failure value.

A failure encountered during alignment generates the Error Condition message “Characterize Preselector failure” and sets Bit 3 in the **STATus:QUESTionable:CALibration:EXTended:FAILure** status register. Successful completion of **Characterize Preselector** clears this Condition. It also begins the elapsed time counter for Last Characterize Preselector Time, and captures the Last Characterize Preselector Temperature.

The last Characterize Preselector Time and Temperature survives across the power cycle, as this operation is performed infrequently.

## NOTE

The **Characterize Preselector** function can be interrupted, by pressing the **Cancel (ESC)** front-panel key, or remotely with Device Clear followed by the **:ABORt SCPI** command. None of the new characterization data is then used. However, since the old characterization data is purged at the beginning of the characterization, you now have an uncharacterized preselector. You should re-execute this function and allow it to finish before making any further preselected measurements.

| Remote Command | <code>:CALibration:YTF:NPENding</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Example        | <code>:CAL:YTF:NPEN</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Notes          | <p><code>:CALibration:YTF:NPENding</code> is the same as <code>:CALibration:YTF</code>, including all conditions, status register bits, except that this SCPI command <i>does not block</i> the SCPI session, so you should use status register bits to query if the calibration is successfully completed or not</p> <p>Typical usage is:</p> <ol style="list-style-type: none"> <li>1. <code>:CALibration:YTF:NPENding</code> (Start a YTF calibration)</li> <li>2. <code>:STATus:OPERation:CONDition?</code> (Check if the calibration is completed or not, If Bit 0 is set, then the system is doing calibration, and you should repeat this query until the bit is cleared)</li> <li>3. <code>:STATus:QUESTionable:CALibration:EXTended:FAILure:CONDition?</code> (Check whether Bit 2 is set. If this bit is set, that means there are some errors in previous internal source calibration)</li> </ol> |

#### 4.6.7.2 Characterize Reference Clock

Calibrates the Reference Input Phase with the External Reference Output. This feature is only available when either option DP2 or B40 is present. It requires connecting the 10 MHz OUT to the EXT REF IN port with a BNC cable before running the characterization.

See ["Front panel guided calibration sequence" on page 475](#)

| Couplings      | <p>Initializes the time for the Last Characterize Reference Clock Time</p> <p>Records the temperature for the Last Characterize Reference Clock Temperature. Expected to be run after <code>:CAL:REF:CLOC:INIT</code>, and before <code>:CAL:REF:CLOC:END</code></p> |
| Remote Command | <code>:CALibration:REFerence:CLOCK:INITialize?</code>                                                                                                                                                                                                                |

|                |                                                                                                                                                                                                                                           |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Example        | <code>:CAL:REF:CLOC:INIT?</code>                                                                                                                                                                                                          |
| Notes          | Returns 0 if successful, or 1 if failed                                                                                                                                                                                                   |
| Dependencies   | Option DP2 or B40                                                                                                                                                                                                                         |
| Couplings      | Expected to be run before sending <code>:CAL:REF:CLOC?</code> . This will stop the current measurement when it has completed (does not abort the current data acquisition), and prepare the instrument for the expected cabling           |
| Remote Command | <code>:CALibration:REference:CLOCk:END?</code>                                                                                                                                                                                            |
| Example        | <code>:CAL:REF:CLOC:END?</code>                                                                                                                                                                                                           |
| Notes          | Returns 0 if successful, or 1 if failed                                                                                                                                                                                                   |
| Dependencies   | Option DP2 or B40                                                                                                                                                                                                                         |
| Couplings      | Expected to be run after sending <code>:CAL:REF:CLOC?</code> , and after removing the cable used in that Characterize Reference Clock step. This will resume any queued measurements, and concludes the reference clock characterization  |
| Remote Command | <code>:CALibration:TIME:REference:CLOCk?</code>                                                                                                                                                                                           |
| Example        | <code>:CAL:TIME:REference:CLOCk?</code>                                                                                                                                                                                                   |
| Notes          | Value is the date and time the last successful Characterize Reference Clock was executed. The date is separated from the time by a space character. Returns "" if Characterize Reference Clock has never been performed on the instrument |
| Dependencies   | Option DP2 or B40                                                                                                                                                                                                                         |
| State Saved    | No                                                                                                                                                                                                                                        |

## Front panel guided calibration sequence

When selecting **Characterize Reference Clock** via the front panel, the following form is displayed.

Step 1 of the guided calibration sequence:

4 System  
4.6 Alignments

Step 2 of the guided calibration sequence:

Step 3 of the guided calibration sequence:

#### 4.6.7.3 Characterize Noise Floor

On instruments with the NF2 license installed, the calibrated Noise Floor used by Noise Floor Extensions should be refreshed periodically. To do this, press **Characterize Noise Floor**. When you press this control, the instrument stops any measurement currently underway, and a dialog appears with an **OK** and **Cancel** button that says:

*This action will take several minutes to perform. Please disconnect all cables from the RF input and press Enter to proceed. Press ESC to cancel*

When you press **Enter** or **OK**, the characterization proceeds. After the characterization, the instrument restarts the measurement from the beginning (similar to pressing the **Restart** key). The characterization takes many minutes to run.

The noise floor model used by Noise Floor Extensions includes an estimation of the temperature behavior of the noise floor, but this is only an estimation. The noise floor changes little with the age of the components. However, even small changes in the estimated level of the noise floor can make large changes in the effective noise floor, because the effective noise floor is the error in the estimation of the noise floor. Keysight recommends that the **Characterize Noise Floor** operation be performed when the instrument is operating at an ambient temperature that is significantly different than the ambient temperature at which this alignment was last run. In addition, Keysight recommends that the **Characterize Noise Floor** operation be performed after the first 500 hours of operation, and once every calendar year.

The noise floor model from the last operation of **Characterize Noise Floor** survives across the power cycle.

NOTE

The **Characterize Noise Floor** function can be interrupted, by pressing the **Cancel (ESC)** front-panel key, or remotely with Device Clear followed by the **:ABORT SCPI** command. None of the new characterization data is then used. However, since the old characterization data is purged at the beginning of the characterization, you now have an uncharacterized noise floor. You should re-execute this function and allow it to finish before making any further measurements with NFE. Until you do, the instrument will display a “Characterize Noise Floor required” message and set bit 12 in the Status Questionable Calibration register (**STATus:QUEStionable:CALibration:EXTended:NEEDed**).

|                |                                                                                                                                                                                                                                                                                                                      |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <b>:CALibration:NFLoor</b><br><b>:CALibration:NFLoor?</b>                                                                                                                                                                                                                                                            |
| Example        | <b>:CAL:NFL</b>                                                                                                                                                                                                                                                                                                      |
| Notes          | <b>:CALibration:NFLoor?</b> returns 0 if successful, or 1 if failed (including interfering user signal)<br>This command is sequential; it must complete before further commands are processed. Interrupting the alignment from remote is accomplished by invoking Device Clear followed by the <b>:ABORT</b> command |
| Dependencies   | This control does not appear in models that do not contain NF2. In these models the command is accepted without error, but no action is taken                                                                                                                                                                        |

#### 4.6.7.4 Characterize Noise Floor for IQ Measurement

Available in N9042B and N9032B instruments only.

The calibrated noise floor used by IQ-based measurements should be refreshed periodically. To do this, select the **IF Path**, select the **Frequency Range** from the table in this dialog, then press **Characterize Noise Floor for IQ Measurement**. The instrument stops any measurement currently underway, and a dialog appears with an **OK** and **Cancel** button that states:

The NF2 license requires characterization of the analyzer's noise floor.

Characterizing the analyzer's noise floor for IQ measurement is an alignment that can take 30 minutes to several hours to complete depending on the IF Path and frequency range you selected. If all IF Path and all frequency ranges are selected, it will take about 18 hours. This alignment is only needed once every calendar year.

Ensure the instrument has been warmed up for at least an hour before running this alignment.

Please disconnect all cables from the RF input(s) and press Enter to proceed. Press ESC to cancel.

When you press **Enter** or **OK**, the characterization proceeds. After the characterization, the instrument restarts the measurement from the beginning (similar to pressing the **Restart** key). The characterization takes about 30 minutes if 1 or 2 frequency ranges are selected for one **IF Path**. If *all* frequency ranges and **IF Paths** are selected, it will take about 18 hours.

The noise floor model used by IQ based measurements includes an estimation of the temperature behavior of the noise floor, but this is *only* an estimation. The noise floor changes little with the age of the components. However, even small changes in the estimated level of the noise floor can make large changes in the effective noise floor, because the effective noise floor is the error in the estimation of the noise floor. Keysight recommends that the **Characterize Noise Floor for IQ Measurement** operation be performed whenever the instrument is operating at an ambient temperature that is significantly different than the ambient temperature at which this alignment was last run. In addition, Keysight recommends that **Characterize Noise Floor for IQ Measurement** be performed after the first 500 hours of operation, and once every calendar year.

The noise floor model from the last operation of **Characterize Noise Floor for IQ Measurement** survives a power cycle.

NOTE

The **Characterize Noise Floor for IQ Measurement** function can be interrupted, by pressing the **Cancel (ESC)** front-panel key, or remotely with Device Clear followed by **:ABORT**. None of the new characterization data is then used. However, since the old characterization data is purged at the beginning of the characterization, you now have an *uncharacterized* noise floor. You should re-execute this function and allow it to finish before making any further measurements that use the calibrated noise floor.

To perform this alignment, you must first select **"IF Path"** on page 480 and **"Frequency Range Table"** on page 480. If multiple frequency ranges are selected, it will take several hours to complete this alignment. To save time, it is recommended that you only perform this alignment *only* for **IF Path** and **Frequency Ranges** that are used in your measurement.

NOTE

The calibrated noise floor is currently used in IQ-NC in the Modulation Analysis measurement in WLAN, 5G NR, and V2X Modes.

IF Path

Select which **IF Path** on which to perform the alignment in **"Characterize Noise Floor for IQ Measurement"** on page 479

The following options are supported in **Characterize Noise Floor for IQ Measurement**:

| Option  | Path      |
|---------|-----------|
| 1 GHz   | 1 GHz     |
| 1.5 GHz | 1.5 GHz   |
| 2 GHz   | 2 GHz     |
| 4 GHz   | 4 GHz     |
| ALL     | All above |

|             |                                       |
|-------------|---------------------------------------|
| Preset      | 1 GHz                                 |
| State Saved | Yes                                   |
| Range       | 1 GHz   1.5 GHz   2 GHz   4 GHz   All |

Frequency Range Table

Select from this table the frequency range to perform the alignment in **"Characterize Noise Floor for IQ Measurement"** on page 479. The frequency ranges for each IF

Path differ. You can select multiple frequency ranges in this table to do the alignment, but the alignment will take more time if multiple frequency ranges are selected. When the alignment is completed, the **Status** column updates accordingly.

#### 4.6.7.5 Calibration Temperature History

The following queries let you retrieve various statistics regarding the Calibration Temperature history.

##### Minimum Temperature Within Last Number of Seconds

Lets you query the minimum temperature within the last number of seconds. If no data exists for the requested time, the returned value is 9.91e+37.

|                |                                                                |
|----------------|----------------------------------------------------------------|
| Remote Command | <code>:CALibration:TEMPerature:MINimum? &lt;seconds&gt;</code> |
| Example        | <code>:CAL:TEMP:MIN? 60</code>                                 |

##### Maximum Temperature Within Last Number of Seconds

Lets you query the maximum temperature within the last number of seconds. If no data exists for the requested time, the returned value is 9.91e+37.

|                |                                                                |
|----------------|----------------------------------------------------------------|
| Remote Command | <code>:CALibration:TEMPerature:MAXimum? &lt;seconds&gt;</code> |
| Example        | <code>:CAL:TEMP:MAX? 60</code>                                 |

##### Temperature Seconds Ago

Lets you query temperature X seconds ago. If no data exists for the requested time, the returned value is 9.91e+37.

|                |                                                            |
|----------------|------------------------------------------------------------|
| Remote Command | <code>:CALibration:TEMPerature:AGO? &lt;seconds&gt;</code> |
| Example        | <code>:CAL:TEMP:AGO? 75</code>                             |

##### Oldest Temperature Value

Lets you query the oldest recorded temperature value.

|                |                                                             |
|----------------|-------------------------------------------------------------|
| Remote Command | <code>:CALibration:TEMPerature:OLDest[:TEMPerature]?</code> |
| Example        | <code>:CAL:TEMP:OLD?</code>                                 |

##### Oldest Temperature Time

Lets you query how long ago the oldest temperature value was recorded.

|                |                                          |
|----------------|------------------------------------------|
| Remote Command | :CALibration:TEMPerature:OLDest:SEConds? |
| Example        | :CAL:TEMP:OLD:SEC?                       |

4.6.7.6 TDS Alignment

Only appears in N9038B (MXE-B) when Option TDS is installed and licensed.

The TDS alignment includes **AlignNowAll** and **RFPresel** alignment. Immediately executes an alignment of the TDS subsystem. The instrument stops any measurement currently underway, performs the alignment, and then restarts the measurement from the beginning (similar to pressing the **Restart** key).

Align TDS can be interrupted by pressing the **Cancel (ESC)** front-panel key or from remote with Device Clear followed by **:ABORt**. When this occurs, no new TDS alignment data will be employed.

|                |                                                                                                                                                                                                           |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | :CALibration:TDS<br><br>Params missing? What does the query return?<br>:CALibration:TDS?                                                                                                                  |
| Example        | :CAL:TDS                                                                                                                                                                                                  |
| Notes          | This command is sequential; it must complete before further commands are processed. Interrupting the alignment from remote is accomplished by invoking Device Clear followed by the <b>:ABORt</b> command |
| Dependencies   | Only appears in N9038B (MXE-B) models with Option TDS installed and licensed                                                                                                                              |

4.6.7.7 Backup or Restore Align Data...

Opens the utility for backing-up or restoring alignment data. Since this utility cannot be run while the instrument software is running, a prompt tells you to shut down the instrument first:

Press **OK** and the instrument will shut down and open the backup utility.

Alignment data for the instrument resides on the hard drive in a database. Keysight uses high quality hard drives; however, it is highly recommended the alignment data be backed-up to storage outside of the instrument. Additionally, for customers who use multiple CPU Assemblies or multiple disk drives, the alignment that pertains to the instrument must be transferred to the resident hard drive after a CPU or hard drive is replaced. This utility facilitates backing-up and restoring the alignment data.

**NOTE**

**This utility allows you to navigate to any location of the Windows file system. If you are backing up alignment data to storage outside of the instrument, then it is assumed that you will use a USB memory device, or Mapped Network Drive.**

Processor Assembly types PC6 and PC7 contain a removable SD memory card. When one of these CPUs is installed, the Backup and Restore Alignment Data wizard defaults to the SD card as the backup location. At every power-on, the software will check to determine if the calibration data on the SD memory card (the backup) is newer than the data in use on the disk. In such situations, before the application is loaded, you are given the opportunity to restore the data from the backup. If you respond **Yes**, the Backup and Restore Alignment Data wizard (see "[Alignment Data Wizard \(without Flash\)](#)" on page 484) will be invoked to perform the restore.

Processor Assembly types PC6S and PC7S contain an internal flash EEPROM, as well as a removable SD card. When one of these CPUs is installed, the Backup and Restore Alignment Data wizard defaults to the internal flash as the backup location. As with the PC6 and PC7, at every power-on, the software compares the timestamp of the backup on the flash and the timestamp of the alignment data in use on the disk. If the backup on the flash has newer data, you are given the opportunity to restore the data from the backup before the application is loaded. If you respond **Yes**, the Backup and Restore Alignment Data wizard (see "[Alignment Data Wizard \(with Flash\)](#)" on page 494) will be invoked and will prompt you to restore that backup.

For purposes of these instructions, "alignment data" and "calibration data" are used interchangeably.

|                |                                                                                                                                                                       |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Dependencies   | Not available in UXM                                                                                                                                                  |
| Remote Command | <code>:CALibration:DATA:DEFault</code>                                                                                                                                |
| Example        | <code>:CAL:DATA:DEF</code>                                                                                                                                            |
| Notes          | Restores the alignment data files to their default state                                                                                                              |
| Couplings      | Sets <b>Auto Align</b> to <b>OFF</b> . Sets Bit 14 in the Status Questionable Calibration register. The Error Condition message "Align Now All required" is generated |

### Alignment Data Wizard (without Flash)

Guides you through the operation of backing-up or restoring the alignment data.

The default backup location for instruments *without* internal flash will be the first drive identified as an external drive (USB or LAN) if such is available; or, if not, the internal D: partition.

The default file name is `<model number>_<serial number>_<date in YYYYMMDDHHMMSS>.bkz`.

The default file extension for legacy backup files was `.bak`. The Backup and Restore operations support both the `.bak` (legacy format) and `.bkz` formats.

If a USB drive is present, it will be selected by default. The path defaults to the **AlignmentBackups** folder, and a filename is automatically created, in the form: `<model>_<serial number>_<date><time>.bkz`

If you wish to enter a customer filename, you can do so with an external keyboard, or by opening the onscreen Alpha keyboard, by pressing the **Keyboard** hardkey on the front panel:

When the **Next >** button is pressed, you will be prompted to create a new folder if the chosen path does not yet exist.

4 System  
4.6 Alignments

The restore operation checks the validity of the restore file using the database's built-in file validation. If the restore file is corrupt, the existing alignment data will remain in use.

If the serial number information in the backup file being restored is different from that of the instrument, the following message appears (the serial numbers shown are examples):

The default restore location for instruments *without* internal flash will be the first drive identified as an external drive (USB or LAN) if such is available; or, if not, the internal D: partition. The default restore file will be the most recent file that matches the default backup file name format: `<model number>_<serial number>_<date>.bkz`

4 System  
4.6 Alignments

Changing the drive letter also modifies the path displayed in the box below. When this step is first loaded, the drive drop-down menu is populated with connected drives, which provide you with read access.

The path defaults to the **AlignBackups** folder. The most recent backup (\*.bkz or \*.bak) file in the folder will also be selected by default.

4 System  
4.6 Alignments

When restoring data in the legacy **.bak** format, Administrator privileges are required. You will be prompted when you attempt a restore (indicated by the UAC Shield on the **Restore** button below).

**Perform Backup (without Flash) (Remote Command Only)**

Invokes an alignment data backup operation to the provided location.

**NOTE** Keysight recommends that the specified location should be external to the instrument (USB or Mapped Network Drive).

|                |                                                                      |
|----------------|----------------------------------------------------------------------|
| Remote Command | :CALibration:DATA:BACKup <filename>                                  |
| Example        | :CAL:DATA:BACK "F:\AlignDataBackup_N9020A_US00000001_2008140100.bkz" |

**Perform Restore (without Flash) (Remote Command Only)**

Invokes an alignment data restore operation from the provided filename.

|                |                                                                       |
|----------------|-----------------------------------------------------------------------|
| Remote Command | :CALibration:DATA:REStore <filename>                                  |
| Example        | :CAL:DATA:REST "F:\ AlignDataBackup_N9020A_US00000001_2008140100.bkz" |

## Alignment Data Wizard (with Flash)

If your instrument has Processor Assembly type PC6S or PC7S (see ["Show System" on page 372](#)) the instrument has an internal flash EEPROM that can store a backup of the alignment data. In this case, the interface to the Alignment Data Wizard is enhanced to accommodate this internal storage. This section details the use of this internal flash. For details on using external storage, see the previous section (["Alignment Data Wizard \(without Flash\)" on page 484](#)).

The Alignment Data Wizard guides you through the operations of backing up or restoring alignment data.

Having selected **Backup** or **Restore**, you then select the source or destination for the alignment data. As shown below, you can select either:

- Internal flash EEPROM, or,
- External Removable Drive (which includes the SD card described in "[Backup or Restore Align Data...](#)" on page 482)

4 System  
4.6 Alignments

The final page of the wizard asks you to confirm the choices made in the previous pages. When the operation is complete, an indication is displayed on the same page, as below.

## Backup

## Restore

When restoring alignment data, if the serial number information in the backup file being restored is different from that of the instrument, the following message appears (the serial numbers shown are examples):

Immediately before the actual restoration, a final confirmation message is displayed detailing what is being restored and the current database that will be overwritten on the disk (the dates and versions are examples):

When backing up alignment data to the flash, if there is already an existing backup on the flash, a final confirmation message is displayed detailing what is being backed up and what will be overwritten on the flash (again, the dates and versions are examples):

**Perform Backup (with Flash) (Remote Command Only)**

Invokes an alignment data backup operation to the internal flash EEPROM.

|                |                                   |
|----------------|-----------------------------------|
| Remote Command | :CALibration:DATA:INTernal:BACKup |
| Example        | :CAL:DATA:INT:BACK                |

**Perform Restore (With Flash) (Remote Command Only)**

Invokes an alignment data restore operation from the internal flash EEPROM.

|                |                                    |
|----------------|------------------------------------|
| Remote Command | :CALibration:DATA:INTernal:REStore |
| Example        | :CAL:DATA:INT:REST                 |

## Restore Alignment Defaults

Causes the Alignment system settings to be reset to their default values. This does not affect any Alignment data stored in the system.

After performing this function, it may impact the auto-alignment time of the instrument until a new alignment baseline has been established.

When **Alignments** is selected, a message appears saying:

*This will reset all of the settings for the Alignment system to their default values*

*No alignment data will be erased*

*This action cannot be undone. Do you want to proceed?*

The dialog includes **OK** and **Cancel** controls, for you to affirm or cancel the operation.

**Align Now All** must be executed if the value of the Timebase DAC results in a change.

| Example               | :SYST:DEF ALIG                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |           |         |              |            |                      |                  |                  |                                                                                        |                       |     |                  |                    |

### 4.6.7.8 RF Preselector

This menu and all its submenus are only available in models with the RF Preselector, such as N9038B, or N9048B.

|--------------|-----------------------------------------|
| Dependencies | Only available in RF Preselector models |
|--------------|-----------------------------------------|

## Align Now, 20 Hz to 30 MHz

Immediately executes an alignment of the receiver subsystem. The receiver will stop any measurement currently underway, perform an Align Now All, then perform the RF Preselector alignment, and then restart the measurement from the beginning (similar to pressing the Restart key).

The query `:CALibration:RFPSelector:CONDUCTed?` invokes the alignment of the RF Preselector on Conducted Band and returns a success or failure value. Successful completion clears the “Align 20 Hz to 30 MHz required” Error Condition, and clears bit 1 in the Status Questionable Calibration Extended Needed register. The elapsed time counter will begin for Last Align Now, Conducted Time, and the temperature is captured for the Last Align Now, Conducted Temperature. The alignment can be interrupted by pressing the Cancel (ESC) front-panel key or remotely with Device Clear followed by the `:ABORt` SCPI command. When this occurs, the Error Condition “Align 20 Hz to 30 MHz required” is set because new alignment data may be employed for an individual subsystem, but not a cohesive set of data for all subsystems.

The “Align 20 Hz to 30 MHz required” Error Condition will appear when this alignment has expired. User is now responsible to perform the Align Now, 20 Hz to 30 MHz to keep the receiver in warranted operation. This alignment can only be performed by user as it is not part of the Auto Align process.

|                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## Align Now, 30 MHz to 3.6 GHz

Immediately executes an alignment of the receiver subsystem. The receiver will stop any measurement currently underway, perform an Align Now All, then perform the RF Preselector alignment, and then restart the measurement from the beginning (similar to pressing the **Restart** key).

The query (`:CALibration:RFPSelector:RADiated?`) invokes the alignment of the RF Preselector on Radiated Band and returns a success or failure value. Successful completion clears the “Align 30 MHz to 3.6 GHz required” Error Condition, and clears bit 2 in the Status Questionable Calibration Extended Needed register. The elapsed time counter begins for Last Align Now, Radiated Time, and the temperature is captured for the Last Align Now, Radiated Temperature. The alignment can be interrupted by pressing the **Cancel (ESC)** front-panel key, or remotely with Device Clear followed by `:ABORT`. When this occurs, the Error Condition “Align 30 MHz to 3.6 GHz required” is set, because new alignment data may be employed for an individual subsystem, but not a cohesive set of data for all subsystems.

The “Align 30 MHz to 3.6 GHz required” Error Condition appears when this alignment has expired. You must now perform **Align Now, 30 MHz to 3.6 GHz** to keep the receiver in warranted operation.

## Align Now, 20 Hz to 3.6 GHz

Immediately executes an alignment of the receiver subsystem. The receiver will stop any measurement currently underway, perform an Align Now All, then perform the RF Preselector alignment, and then restart the measurement from the beginning (similar to pressing the **Restart** key).

The query (`:CALibration:RFPSelector:FULL?`) invokes the alignment of the RF Preselector on both Conducted and Radiated Band and return a success or failure value. Successful completion clears the “Align 20 Hz to 3.6 GHz required” Error Condition, and clears bit 1 and bit 2 in the Status Questionable Calibration Extended Needed register. The elapsed time counter begins for Last Align Now, Conducted Time and Last Align Now Radiated Time and the temperature is captured for Last Align Now, Conducted Temperature and Last Align Now, Radiated Temperature. The alignment can be interrupted by pressing the **Cancel (ESC)** front-panel key or remotely with Device Clear, followed by `:ABORT`. When this occurs, the Error Condition “Align 20 Hz to 3.6 GHz required” is set, because new alignment data may be employed for an individual subsystem, but not a cohesive set of data for all subsystems.

The “Align 20 Hz to 3.6 GHz required” Error Condition appears when this alignment has expired. You must now perform the Align Now, 20 Hz to 3.6 GHz to keep the receiver in warranted operation.

## Alert

Enables or disables the display of RF Preselector alignment required message on the status line. The instrument powers up with Alert **ON**.

|                |                                                                                                              |
|----------------|--------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:CALibration:RFPSelector:ALERT ON   OFF   0   1</code><br><code>:CALibration:RFPSelector:ALERT?</code> |
| Example        | <code>:CAL:RFPS:ALER OFF</code>                                                                              |
| Notes          | Error Condition is generated when alert is <b>ON</b> and any of the RF Preselector alignments has expired    |
| Preset         | Unaffected by Preset, but set to <b>ON</b> by <b>Restore Defaults</b> > "Alignments" on page 426             |
| State Saved    | No                                                                                                           |
| Range          | <b>OFF</b>   <b>ON</b>                                                                                       |

### 4.6.7.9 Scheduler

Setting the Scheduler to **ON** triggers execution of the scheduled task based on the recurrence and time set in the scheduler since the last successful of the specific alignment. A warning condition of "RF Preselector alignment scheduler is ON" appears when the scheduler is set to **ON**. **OFF** prevents the Scheduler from running any scheduled task.

|                |                                                                                                                                |
|----------------|--------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:CALibration:RFPSelector:SCHeuler:STATe ON   OFF   0   1</code><br><code>:CALibration:RFPSelector:SCHeuler:STATe?</code> |
| Example        | <code>:CAL:RFPS:SCH:STAT OFF</code>                                                                                            |
| Preset         | Unaffected by Preset, but set to <b>ON</b> by <b>Restore Defaults</b> > "Alignments" on page 426                               |
| State Saved    | No                                                                                                                             |
| Range          | <b>OFF</b>   <b>ON</b>                                                                                                         |

## Schedule Setup

Lets you schedule a task to run automatically at the background based on the recurrence and time set in the scheduler. Make sure that the instrument's local time is accurate, because the Scheduler relies on this information to execute the task.

This dialog contains the following controls:

- "Task" on page 508
- "Date/Time" on page 508
- "Hour" on page 509
- "Minute" on page 509
- "Recurrence" on page 509
- "Number of Weeks" on page 510
- "Day" on page 510

Task

There are 3 tasks that can be selected for the scheduler to run.

- Task 1 is the 20 Hz to 30 MHz alignment
- Task 2 is the 30 MHz to 3.6 GHz alignment
- Task 3 is the 20 Hz to 3.6 GHz alignment

|                |                                                                                                                                 |
|----------------|---------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | :CALibration:RFPSelector:SCHeduler:TASK T1   T2   T3<br>:CALibration:RFPSelector:SCHeduler:TASK?                                |
| Example        | :CAL:RFPS:SCH:TASK T1                                                                                                           |
| Notes          | Changing the task does not reset the Scheduler time, and the alignment is based on the current scheduled configuration to occur |
| Preset         | Unaffected by <b>Preset</b> but set to <b>T3</b> by <b>Restore Defaults</b> > "Alignments" on page 426                          |
| State Saved    | No                                                                                                                              |
| Range          | Task 1   Task 2   Task 3                                                                                                        |

Date/Time

Lets you configure the scheduler to run a task starting from this date and time. The date and time rely on the instrument's local time to execute a scheduled task. The date format is "YYYY/MM/DD", and the time is 24-hour clock.

|                |                                                                                                                                                                                  |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | :CALibration:RFPSelector:SCHeduler:TIME:START "date","time"<br>:CALibration:RFPSelector:SCHeduler:TIME:START?<br>This query returns data using the format "YYYY/MM/DD; HH:MM:SS" |
| Example        | :CAL:RFPS:SCH:TIME:STAR "2009/8/20","12:00:00"                                                                                                                                   |

|             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Notes       | <p>“<b>date</b>” is the date the task will run, in the form <b>YYYY/MM/DD</b> where:</p> <ul style="list-style-type: none"> <li>– <b>YYYY</b> is the four-digit representation of year (for example, 2009)</li> <li>– <b>MM</b> is the two-digit representation of month (for example, 01 to 12)</li> <li>– <b>DD</b> is the two-digit representation of the day (for example, 01 to 28, 29, 30 or 31 depending on the month and year)</li> </ul> <p>“<b>time</b>” is the time of day the task will run, in the form <b>HH:MM:SS</b> where:</p> <ul style="list-style-type: none"> <li>– <b>HH</b> is the two-digit representation of the hour in 24-hour format</li> <li>– <b>MM</b> is the two-digit representation of minute</li> <li>– <b>SS</b> is the two-digit representation of seconds</li> </ul> |
| Preset      | Unaffected by <b>Preset</b> but set to Current date and 00:00:00 by <b>Restore Defaults</b> > “Alignments” on page 426                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| State Saved | No                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## Hour

Lets you configure the hour for the scheduled task. The command to configure the date and time parameters of the scheduler is the same; but they each have their own front panel-control.

|             |                                                                                                                  |
|-------------|------------------------------------------------------------------------------------------------------------------|
| Notes       | See “Date/Time” on page 508                                                                                      |
| Preset      | Unaffected by <b>Preset</b> but set to Current hour and 00 by <b>Restore Defaults</b> > “Alignments” on page 426 |
| State Saved | No                                                                                                               |

## Minute

Lets you configure the minute for the scheduled task. The command to configure the date and time parameters of the scheduler is the same; but they each have their own front panel-control.

|             |                                                                                                                    |
|-------------|--------------------------------------------------------------------------------------------------------------------|
| Notes       | See “Date/Time” on page 508                                                                                        |
| Preset      | Unaffected by <b>Preset</b> but set to Current minute and 00 by <b>Restore Defaults</b> > “Alignments” on page 426 |
| State Saved | No                                                                                                                 |

## Recurrence

Lets you configure the scheduler to run the task recurrently on a scheduled date and time. You can schedule it to run daily, weekly, or alternate weeks.

## 4 System

### 4.6 Alignments

|                |                                                                                                                                            |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:CALibration:RFPSelector:Scheduler:REcurrence DAY   WEEK   OFF</code><br><code>:CALibration:RFPSelector:Scheduler:REcurrence?</code> |
| Example        | <code>:CAL:RFPS:SCH:REC DAY</code>                                                                                                         |
| Preset         | Unaffected by <b>Preset</b> but set to <b>OFF</b> by <b>Restore Defaults</b> > <b>"Alignments"</b> on page 426                             |
| State Saved    | No                                                                                                                                         |
| Range          | <code>DAY   WEEK   OFF</code>                                                                                                              |

### *Number of Weeks*

Lets you set the number of weeks that the scheduler will wait to trigger a task.

|                |                                                                                                                                                     |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:CALibration:RFPSelector:Scheduler:REcurrence:WEEK &lt;integer&gt;</code><br><code>:CALibration:RFPSelector:Scheduler:REcurrence:WEEK?</code> |
| Example        | <code>:CAL:RFPS:SCH:REC:WEEK 2</code>                                                                                                               |
| Notes          | New scheduled date to run the alignment task is updated when this parameter is changed                                                              |
| State Saved    | No                                                                                                                                                  |
| Range          | 1-52                                                                                                                                                |
| Min            | 1                                                                                                                                                   |
| Max            | 52                                                                                                                                                  |

### *Day*

Lets you set the Day of the Week the scheduler will run a scheduled task.

|                |                                                                                                                                                                                           |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:CALibration:RFPSelector:Scheduler:REcurrence:DAY SUN   MON   TUE   WED   THU</code><br><code>  FRI   SAT</code><br><code>:CALibration:RFPSelector:Scheduler:REcurrence:DAY?</code> |
| Example        | <code>:CAL:RFPS:SCH:REC:DAY SUN</code>                                                                                                                                                    |
| State Saved    | No                                                                                                                                                                                        |
| Range          | Sunday   Monday   Tuesday   Wednesday   Thursday   Friday   Saturday                                                                                                                      |

## 4.7 Licensing

Accesses capabilities for configuring the licenses in your instrument.

### 4.7.1 License Manager

Opens the License Explorer for Fixed and Transportable licenses.

NOTE

**This feature is not available if Option SF1 is installed.**

---

For help on licensing, select **Help** in the menu bar at the top of the License Explorer window.

There are also several remote commands available for licensing. See:

- "Install License (Remote Command Only)" on page 519
- "Remove License (Remote Command Only)" on page 519
- "List Licenses (Remote Query Only)" on page 520
- "Validate License (Remote Query Only)" on page 521
- "Host ID Query (Remote Query Only)" on page 521
- "List Borrowed Licenses (Remote Query Only)" on page 516
- "Return a Borrowed License (Remote Command Only)" on page 517

---

Notes

No equivalent remote command for this control

### 4.7.2 System Software Version Date

The date of the newest features introduced in this release of the firmware. This is *not* necessarily the same as the build date of the firmware, because the version date only changes when new features are added. For example, if A.18.06 has only defect fixes and no new features compared to A.18.05, then both A.18.05 and A.18.06 would have the same software version date.

For any feature to be enabled, the SW Support Expiration Date of the enabling license must be greater than or equal to the software version date when that feature was first introduced. See the Keysight web site for features related to a specific software application and their required support date.

The SCPI response is 3 integer values: `<year>`, `<month>`, `<day>`.

---

|                |                                |
|----------------|--------------------------------|
| Remote Command | :SYSTem:SOFTware:VERSion:DATE? |
|----------------|--------------------------------|

---

|         |                       |
|---------|-----------------------|
| Example | :SYST:SOFT:VERS:DATE? |
|---------|-----------------------|

---

### 4.7.3 Software Support Expiration Date

This date is encoded in each software license's Version field in the **YYYY.MMDD** format. It specifies the end date of the support contract associated with this license. When a support contract is renewed, a new license is issued with an updated Version corresponding to the new contract's end date. The functionality available for a license is determined by the features available before the expiration date. For example, if feature X is introduced in a release with System Software Version Date of **2017.0831**, then a license with a Software Support Expiration Date of **2017.0831** or greater would enable feature X, but **2017.0830** or earlier would not enable feature X.

The SCPI response is 3 integer values: **<year>**, **<month>**, **<day>**.

---

|                |                                                          |
|----------------|----------------------------------------------------------|
| Remote Command | :SYSTem:LKEY:SOFTware:SUPPort:EXPIration:DATE? <feature> |
|----------------|----------------------------------------------------------|

---

|         |                                                |
|---------|------------------------------------------------|
| Example | :SYST:LKEY:SOFT:SUPP:EXP:DATE? "N9084EM0E-1FP" |
|---------|------------------------------------------------|

---

|              |                                                                                                 |
|--------------|-------------------------------------------------------------------------------------------------|
| Dependencies | When <b>&lt;feature&gt;</b> is not a valid license, one of the following errors will be issued: |
|--------------|-------------------------------------------------------------------------------------------------|

- -224, "IllegalParameterValue;License is not installed"
- -224, "IllegalParameterValue;Unknown license feature"
- -224, "IllegalParameterValue;Support contract not offered for this license"

### 4.7.4 Network Licenses

**Network Licenses** are available over the customer's network from a server the customer configures. The server has a count for each license and will only allow instruments to "check-out" a license up to that count. Once the count is reached for a specific license, further check-outs fail until one of the licenses is checked back in to the server. What this means is that it is possible for an instrument to have different features available to it based on what licenses are still available on the server when it tries to get licenses.

Setting up network licenses is done via the **Keysight Floating License Manager** (available on external Keysight web) and it has an Installation Guide that can be downloaded from that web page.

#### 4.7.4.1 Application Licenses

**Application Licenses** (like N9077EM0E-1NP) are automatically checked out when entering the Mode that uses them, and they are automatically checked-in when leaving that Mode. Because the server may have already checked out the last license for the application to another instrument, there is now the possibility that a mode switch will fail because a required license could not be checked out from the server. If the server has a limited number of licenses compared to the number of users desiring to use that license, this may mean that switching from Mode A to Mode B then back to Mode A may fail when returning to Mode A because another instrument checked out the last available license while the user was in Mode B. Also, for Modes with multiple licenses for different features (like Multi-Standard Radio), the features available may also change when switching out of the Mode and back into it.

So, when using network licenses, it is necessary to check `:SYST:ERR?` after every Mode switch, to verify that it successfully switched. If the Mode's required licenses were not successfully checked out, the instrument posts the error:

-310,"System error; feature not licensed"

There is also a potential performance issue when using network licenses, because the instrument must communicate with the server on each license check-out and check-in. This operation is usually fast (a few milliseconds), but it depends on the network communication lag between the instrument and server. For remote servers on slow or congested networks, this could be significantly slower than that.

#### 4.7.4.2 Instrument Software Options

Instrument software licenses are those that are reported via `*OPT?` the same as HW options. For example, N9040RT1B-1NP is an instrument software option, and is reported via `*OPT?` as `RT1`. Note that the license is composed of the model number (in this case `N9040B`) combined with the option code (`RT1`).

When instrument software options are available from a network server, the instrument automatically checks them out at start-up, and only checks them in when shutting down.

#### 4.7.4.3 License Checked Out Query (Remote Query Only)

Shows whether the specified license is checked out from a server. Since network served licenses may not always be available when there are limited licenses available compared to the desired number of users, the features available on an instrument can vary. Use this query to see whether the feature is currently checked-out to the instrument. The return value is boolean (0 or 1), returning 1 if the feature

exists and is checked out from a server. Note that querying a license that is local to the instrument (-xFP or -xTP) also returns 0, even though the license exists and is valid, because it does not require a check-out. Also, querying a license that does not exist returns 0.

|                |                                                                                                                                                                                                                                         |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | :SYSTem:LKEY:COUT? <feature>                                                                                                                                                                                                            |

| Notes          | <"OptionInfo"> contains the feature and the version. You must specify the feature but can omit the version. If you omit the version, the system regards it as the latest one<br>Return Value:<br>0 if not checked out, 1 if checked out |

4.7.4.4 List Licenses Checked Out (Remote Query Only)

Lists the licenses checked out from a server. Since network served licenses may not always be available when there are limited licenses available compared to the desired number of users, the features available on an instrument can vary. Use this query to see which features are currently checked-out to the instrument.

|                |                                                                                                                                |
|----------------|--------------------------------------------------------------------------------------------------------------------------------|

4.7.4.5 Borrowed Network Licenses

Network licenses can be borrowed from the network license server for a time. The maximum amount of time a license can be borrowed is specified in the license installed on the server and is set at the time the license is generated by Keysight. As part of the borrow operation, you specify how long to borrow the license. This borrow period is in hours and can be any time up to the maximum allowed by the license. Once borrowed, the license appears as a local license and can be used even when not connected to the network, and the instrument software treats them the same as other time-based licenses that are installed on the instrument. This means the licenses are validated when the instrument is started and then are used without the overhead of checking them out and back in when switching Modes. At the time of the borrow, a time is specified for how long the license will be borrowed. When that time expires, the license is automatically returned to the network license server

even if the instrument is not connected to the network. If you are done with the license before it automatically returns to the network server, the license can be explicitly returned earlier.

4.7.4.6 Borrow a License

Licenses are borrowed by using the Keysight License Manager 6 application. This can be launched from the **System Licensing** screen.

Graphic

The corresponding remote command is:

|                |                                                                                                                                                                                                                                                                                                                                                      |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:SYSTem:LKEY:BORRow "&lt;feature&gt;[,&lt;version&gt;]",&lt;return date&gt;</code><br><code>:SYSTem:LKEY:BORRow? "&lt;feature&gt;[,&lt;version&gt;]"</code>                                                                                                                                                                                    |
| Example        | <code>:SYST:LKEY:BORR "N9080EM0E", "20-Aug-2018"</code><br><code>:SYST:LKEY:BORR? "N9080EM0E"</code><br><code>: "20-Aug-2018"</code>                                                                                                                                                                                                                 |
| Notes          | If <code>&lt;version&gt;</code> is not specified, the highest available version will be borrowed<br>The <code>&lt;return date&gt;</code> is the day when the borrow will automatically be returned to the server                                                                                                                                     |
| Dependencies   | For the command, when <code>&lt;feature&gt;</code> is not a valid license, or when a license is not currently available for borrowing, one of the following errors is issued: <ul style="list-style-type: none"><li>- -224,"IllegalParameterValue;License is not installed"</li><li>- -224,"IllegalParameterValue;Unknown license feature"</li></ul> |

- -224, "IllegalParameterValue;License not available for borrowing"

Additionally, the return date is evaluated. If it is not a valid date, the following error is issued:

- -224, "IllegalParameterValue;Invalid return date"
- -200, "Execution error; No Available Borrow Licenses For Feature: <feature>"

The return date may be clipped to the maximum borrow allowed by the license. When this happens, the following warning is issued:

- -221, "Return date clipped to maximum of <max date>"

For the query, the return is the borrow return date (as a string in **dd-mmm-yyyy** format) if the license is borrowed. In all other cases, (not borrowed, not installed, etc.) the return is an empty string

4.7.4.7 Listing Borrowed Licenses and Return a Borrowed License

The Keysight License Manager 6 can also be used to see the currently borrowed licenses or return a license before the automatic return time.

---

#### 4.7.4.8 Enabling Network Checkouts While Borrowed

The default for borrowed license use is that you will be explicitly borrowing all desired network licenses, and that all other available network licenses should be ignored. This allows you to intentionally limit the functionality available to the instrument to what is explicitly borrowed.

For example, the RT1/RT2 options that enable the RTSA Mode are automatically checked out when the instrument is started, because the hardware must be configured for them at startup time. If you do not intend to use RTSA, then by borrowing only the licenses you want to use and disabling other network checkouts, the RT1/RT2 licenses will not be checked out at startup. This leave more RTSA licenses available for others to use. Note that the instrument must be restarted after the borrowing has been done to ensure the release of any network licenses already acquired.

If your intent in borrowing is to ensure access to a particular feature or application, but you still want to opportunistically use other features or applications, the default behavior can be changed to enable network license checkouts even when licenses have been borrowed.

### 4.7.5 USB Portable Licenses

The USB Portable license is implemented with a physical dongle that is a USB device, like a USB thumb drive. It has a Host ID fixed in the dongle HW. It does not contain any writable data and so is acceptable to high security A/D customers. Transporting licenses from one instrument to another just requires moving the dongle and license files to the desired instrument. The license files can be installed on many instruments, but they will only be valid the one instrument that has the dongle. The use of USB portable licenses requires that the Keysight Floating License Manager is installed on the instrument. The licenses can then be added to the instrument's server.

USB Portable licenses are checked out and in like Network licenses. Because the licenses are local, there will be no network latency involved in the check-out/check-in, but there can still be a slight performance degradation compared to Fixed and Transportable licenses. If the instrument allows multiple concurrent instances of the X-Series software (as is the case for modular products), there may also be availability issues if all licenses are already checked out to other X-Series instances. Plugging/un-plugging the dongle is equivalent to transporting a license to/from the instrument, however, the software must be restarted whenever the dongle is plugged in.

### 4.7.6 Configuring Network and USB Portable Licenses

The Keysight Floating License Manager must be used to configure the Network or USB Portable licenses before the licenses can be used. Currently, an instrument can only be configured for Network or USB Portable licenses or both.

- To set up USB Portable licenses, in the Keysight Floating License Manager select “Start a floating license server with a license file” and add files containing the USB Portable licenses desired
- To set up Network licenses, in the Keysight Floating License Manager select “Connect to a floating license server” and enter the network server's name preceded by the “@” character (example: “@myserver”)
- To set up both Network and USB Portable license, first configure the USB Portable license, then configure the Network licenses, but append “;@localhost” to the server name (example: “@myserver;@localhost”). Whenever the configuration is changed, the X-Series software must be restarted

## 4.7.7 Floating License Manager

Opens the License Explorer for Network and USB Portable licenses.

NOTE

This feature is not available if Option SF1 is installed.

For help on licensing, select **Help** in the menu bar at the top of the License Explorer window.

## 4.7.8 Install License (Remote Command Only)

Used to add a license to the instrument.

An example of such a command would be as below. The parameter is a unique 120-character code for each license.

```
SYST:LKEY "N9073A-  
1FP", "027253AD27F83CDA5673A9BA5F427FDA5E4F25AEB1017638211AC9F60D9C639FE53973590  
9C551DE0A91"
```

Another example using one of the optional clauses.

```
SYST:LKEY "N9063EM0E-  
1FP, 2019.0330", "02220210867E187713C9AFD4C90EA0DE2B674615DD0255798EE5B237A146A0D  
4E411E0ABFE04D3CAFDFA", "ISSUED=30-Mar-2018"
```

NOTE

This command does not work for Transportable, Network or USB Portable licenses.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | :SYSTem:LKEY <"OptionInfo">, <"LicenseInfo">, <"Optional1">, <"Optional2">, <"Optional3">, <"Optional4">, <"Optional5">                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Notes          | <p>&lt;"OptionInfo"&gt; contains the feature and the version. You must specify the feature but can omit the version. If you omit the version, the system regards it as the latest one, since the system knows which version is supported for each feature</p> <p>&lt;"LicenseInfo"&gt; contains the signature, the expiration date, and serial number for transport if transportable. You must specify the signature, but you can omit the other information. If you omit the expiration date, the system regards it as permanent. If you omit the serial number, the system regards it as non-transportable. As a result, this supports reverse compatibility</p> <p>&lt;"Optional#"&gt; are optional parameters that may be needed to match the information in the original license</p> |

## 4.7.9 Remove License (Remote Command Only)

Removes a particular license.

An example of such a command would be as below. The parameter is a unique 120-character code for each license.

```
SYST:LKEY:DEL "N9073A-1FP", "027253AD27F83CDA5673A9BA5F427FDA5E4F25AEB1017638211AC9F60D9C639FE539735909C551DE0A91"
```

**NOTE** This command does not work for Transportable, Network or USB Portable licenses.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | :SYSTem:LKEY:DELeTe <"OptionInfo">,<"LicenseInfo">                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Notes          | <p>&lt;"OptionInfo"&gt; contains the feature and the version. You must specify the feature but can omit the version. If you omit the version, the system regards it as the latest one, if more than one version is installed</p> <p>&lt;"LicenseInfo"&gt; contains the signature, the expiration date, and whether be transportable. You must specify the signature, but you can omit the other information. If you omit the expiration date, the system regards it as permanent. If you omit the transportability, the system regards it as non-transportable. As a result, this supports reverse compatibility</p> |

### 4.7.10 List Licenses (Remote Query Only)

Returns a list of installed licenses.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | :SYSTem:LKEY:LIST?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Notes          | <p>Return Value:</p> <p>An &lt;arbitrary block data&gt; of all the installed instrument licenses</p> <p>The format of each license is as follows</p> <p>&lt;Feature&gt;,&lt;Version&gt;,&lt;Signature&gt;,&lt;Expiration Date&gt;,&lt;Serial Number for Transport&gt;,...</p> <p>Return Value Example:</p> <pre>#3136 N9073A-1FP,1.000,B043920A51CA N9060A-2FP,1.000,4D1D1164BE64 N9020A-508,1.000,389BC042F920 N9073A-1F1,1.000,5D71E9BA814C,13-aug-2005</pre> <p>&lt;arbitrary block data&gt; is:</p> <pre>#NMMM&lt;data&gt;</pre> <p>Where:</p> <p>N is the number of digits that describes the number of MMM characters. For example, if the data was 55 bytes, N would be 2</p> |

---

`MMM` would be the ASCII representation of the number of bytes. In the previous example, N would be 55  
`<data>` ASCII contents of the data  
Additional fields may appear depending on the type of license (Fixed, Transportable, Network, USB Portable)

### 4.7.11 Validate License (Remote Query Only)

Lets you query whether a particular license is currently valid.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:SYSTem:LKEY? &lt;"OptionInfo"&gt;</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Example        | <code>:SYST:LKEY? "N9073A-1FP"</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Notes          | <p><code>&lt;"OptionInfo"&gt;</code> contains the feature and the version. You must specify the feature but can omit the version. If you omit the version, the system regards it as the latest one</p> <p>Return Value:</p> <p><code>&lt;"LicenseInfo"&gt;</code> if the license is valid, null otherwise</p> <p><code>&lt;"LicenseInfo"&gt;</code> contains the signature, the expiration date, and serial number if transportable</p> <p>Return Value Example:</p> <p><code>"B043920A51CA"</code></p> |

### 4.7.12 Host ID Query (Remote Query Only)

Returns the Host ID as a string.

|                |                           |
|----------------|---------------------------|
| Remote Command | <code>:SYSTem:HID?</code> |
|----------------|---------------------------|

## 4.8 Security

Accesses capabilities for operating the instrument in a security-controlled environment.

The **Security** page of the **System** menu has two controls: **USB Read/Write** and **Restore Security Defaults**.

|              |                      |
|--------------|----------------------|
| Dependencies | Not available in UXM |
|--------------|----------------------|

### 4.8.1 USB Write Protect

The Windows operating system can be configured to disable write access to the USB ports for users who are in a secure environment where transferring data from the instrument is prohibited. The **USB Write Protect** control is a convenient way for you to disable write access to USB.

NOTE

This control is only available to users with Administrator privileges.

|                |                                                                                                                                                                     |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:SYSTem:SECurity:USB:WPRotect[:ENABle] ON   OFF   0   1</code><br><code>:SYSTem:SECurity:USB:WPRotect[:ENABle]?</code>                                        |
| Example        | Set USB ports to Read-only:<br><code>:SYST:SEC:USB:WPR ON</code><br><br>Set USB ports to Read-Write:<br><code>:SYST:SEC:USB:WPR OFF</code>                          |
| Notes          | When the USB ports are in Read-only mode, then no data can be stored to USB, including the internal USB memory used for a back-up location for the calibration data |
| Dependencies   | Grayed-out unless the current user has Administrator privileges                                                                                                     |
| Preset         | Unaffected by <b>Preset</b> or any <b>"Restore Defaults"</b> on page 424. A Keysight Recovery sets the USB to write protect <b>OFF</b>                              |
| State Saved    | No                                                                                                                                                                  |
| Range          | Read-Write   Read only                                                                                                                                              |

### 4.8.2 Restore Security Defaults

Sets USB Read/Write to Enable.

NOTE

This control is only available to users with Administrator privileges.

## 4.9 Diagnostics

Displays a slider that allows you to view Hardware Statistics.

|              |                      |
|--------------|----------------------|
| Dependencies | Not available in UXM |
|--------------|----------------------|

### 4.9.1 Show Hardware Statistics

Provides a display of various hardware statistics. The statistics include the following:

- Mechanical relay cycles (on models with mechanical relays)
- High and Low temperature extremes
- Elapsed time that the instrument has been powered-on (odometer)

Modular instruments display only time and temperature information.

|         |                              |
|---------|------------------------------|
| Example | <code>:SYST:SHOW HWST</code> |
|---------|------------------------------|

|       |                                                                                                                                  |
|-------|----------------------------------------------------------------------------------------------------------------------------------|
| Notes | The values displayed on the screen are only updated upon entry to the screen and not updated while the screen is being displayed |
|-------|----------------------------------------------------------------------------------------------------------------------------------|

### 4.9.2 Pathwave Calibration Advisor...

This is a separate application that helps maintain your instrument at peak performance. You can set the cal interval, configure cal due reminders, check the cal status, view cal certificates and test reports, and contact Keysight for a cal service.

The embedded help documentation can be accessed in the instrument at: <C:\Program Files\Keysight\Calibration Advisor\PCA.chm>, or via the ? button at the top right of the **PathWave Calibration Advisor** window.

### 4.9.3 Query the Mechanical Relay Cycle Count (Remote Query Only)

Returns the count of mechanical relay cycles.

|                |                                    |
|----------------|------------------------------------|
| Remote Command | <code>:SYSTem:MRELay:COUNT?</code> |
|----------------|------------------------------------|

|         |                               |
|---------|-------------------------------|
| Example | <code>:SYST:MREL:COUN?</code> |
|---------|-------------------------------|

|       |                                                                                                                                                           |
|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| Notes | Query Only<br>The return value is a comma-separated list of the individual counts for each mechanical relay<br>The position of the relays in the list is: |
|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|

|              |                                                                                                                                                                                                                                                                                                                                              |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              | <p>“&lt;Cal Signal&gt;,&lt;AC/DC&gt;,&lt;2dB #1 Atten&gt;,&lt;2dB #2 Atten&gt;,&lt;6dB Atten&gt;,&lt;10dB Atten&gt;,&lt;20dB Atten&gt;,&lt;30dB Atten&gt;,&lt;Fixed Atten&gt;,&lt;Low Noise Path Switch&gt;,&lt;Presel Bypass&gt;”</p> <p>Items in the list not pertaining to your hardware configuration return as -999 for those items</p> |
| Dependencies | Not supported by E6607C                                                                                                                                                                                                                                                                                                                      |

#### 4.9.4 Query the Operating Temperature Extremes (Remote Query Only)

Returns the low operating temperature extreme value. The value survives a power-cycle and is the temperature extreme encountered since the value was reset by the factory or service center.

|                |                                                                                                                                                                                               |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | :SYSTem:TEMPerature:LEXTreme?                                                                                                                                                                 |
| Example        | :SYST:TEMP:LEXT?                                                                                                                                                                              |
| Notes          | Value is in degrees Celsius at which the lowest operating temperature has been recorded since 1st power-up                                                                                    |
| State Saved    | No                                                                                                                                                                                            |
|                | Returns the high operating temperature extreme value. The value survives a power-cycle and is the temperature extreme encountered since the value was reset by the factory or service center. |

|                |                                                                                                             |
|----------------|-------------------------------------------------------------------------------------------------------------|
| Remote Command | :SYSTem:TEMPerature:HEXTreme?                                                                               |
| Example        | :SYST:TEMP:HEXT?                                                                                            |
| Notes          | Value is in degrees Celsius at which the highest operating temperature has been recorded since 1st power-up |
| State Saved    | No                                                                                                          |

#### 4.9.5 Query the Elapsed Time since 1<sup>st</sup> power on (Remote Query Only)

Returns the elapsed on-time in minutes since 1<sup>st</sup> power-on.

|                |                    |
|----------------|--------------------|
| Remote Command | :SYSTem:PON:ETIME? |
| Example        | :SYST:PON:ETIM?    |
| Notes          | Query Only         |

## 4.10 Service

Accesses capabilities performed in the factory or under instructions from repair procedures. This key is only visible when the logged-in user is “[advanceduser](#)” or “[saservice](#)”. The first access to the **Service** menu after invoking the instrument application will require an authentication Service Code.

## 4.11 SCPI Recorder

Lets you view active recording content, and edit the content. Right-click or touch and hold on any UI control to display a menu allowing you to record the SCPI associated with the control.

Selecting this tab displays the **Recorder** dialog on the right. The dialog displays the recorder table with the data in chronological order of recording. The **Function Label** column shows the feature name, for example, **Center Frequency**, and the **SCPI** column shows the full mnemonic corresponding to the feature.

This section describes the following controls:

- "Continuous SCPI Recording" on page 526
- "Recording Limit" on page 527
- "Play All" on page 528
- "Play Selected" on page 528
- "Copy" on page 528
- "Insert \*OPC? Below" on page 528
- "Move Up" on page 528
- "Move Down" on page 529
- "Delete Row" on page 529
- "Delete All" on page 529

You can also **Save** and **Recall** SCPI Recorder lists to and from on-disk files. For details, see:

- Recall "SCPI Recorder" on page 886
- Save "SCPI Recorder" on page 920

### 4.11.1 Continuous SCPI Recording

Toggles the state of continuous recording.

When enabled (**ON**), *all* user interaction with settings that are Immediate Actions, and that have associated SCPI commands or queries, are added as recording entries in chronological order. Not every User Interface action has a corresponding SCPI

command/query, for example, navigation actions between dialogs and menus in the User Interface do not have corresponding SCPI commands. All settings or a measurement that are accessible via menus have SCPI commands, so modifying those settings will create entries in the Recorder.

As a convenience, this feature can also be toggled (without visiting the SCPI Recording menu) by clicking the SCPI icon which has been added to the left of the “gear” icon (as illustrated below):

NOTE

When recording is turned on, some entries are automatically created and added to the recording. These are: `:INST:CONF:<mode>:<meas>` (see ["Mode" on page 56](#)) and `*OPC?` (see ["\\*OPC? - Operation Complete" on page 1034](#)). These commands set the current Mode and Measurement, perform a **Mode Preset**, then cause the instrument to wait for the completion of any previous commands. When **Continuous SCPI Recording** fills the recording container to the limit, a warning message is displayed to notify you that the recording container is full and recording will be stopped, unless the recording limit is increased.

NOTE

To maintain the integrity of recording, stop recording *before* sending remote commands to the instrument. Changes made to the instrument via remote SCPI are *not* recorded.

## 4.11.2 Recording Limit

When ["Continuous SCPI Recording" on page 526](#) is enabled, every change you make is recorded into the recording system, which can lead to extremely large recordings.

This value limits how much content can be saved into the recording table. You may change this number to suit your needs, but the value cannot be less than 0 or greater than 500. When the recording length reaches the limit, a warning is displayed to indicate that the recording size has reached the limit and recording will be stopped.

The default limit is 250. If the limit is reduced after recording entries are added, the reduced count cannot be less than the current number of entries in the recording. If the newly-entered limit is smaller than the existing number of entries, then the actual new limit is set to the current number of entries. Increasing the limit will increase memory consumption.

### 4.11.3 Play All

Clicking this control causes each of the entries in the SCPI Recorder table to be executed.

If execution results in any errors, then a message box showing the SCPI command, and its corresponding error are displayed after play has completed.

### 4.11.4 Play Selected

You can select a row in the SCPI recording table, then click **Play Selected** to play that entry. **Play Selected** is disabled if the recording table is empty, or when no row is selected. You can then select another row and play the selection, but, if you want to play back in a particular order, you must execute the plays in the desired sequence.

After playing the selected entry, the selected row is moved down by one entry.

### 4.11.5 Copy

Copies the SCPI column data to the system clipboard, to make it available for Paste operations.

### 4.11.6 Insert \*OPC? Below

Certain queries and commands must be sent during instrument programming, but there is no corresponding user-interface control for these commands. This control allows you to insert one such query: **\*OPC?** below the selected row.

### 4.11.7 Move Up

Moves the selected / highlighted row up by 1 slot. Note that moving a mode or measurement switch entry in the table may impact context for subsequent entries in the table.

### 4.11.8 Move Down

Moves the selected / highlighted row down by 1 slot. Note that moving a mode or measurement switch entry in the table may impact context for subsequent entries in the table.

### 4.11.9 Delete Row

Deletes the selected entry from the recording table. Note that some entries may have subsequent entries related to the row that you delete, for example, **\*OPC?**, which may be added automatically after a mode or measurement switch.

### 4.11.10 Delete All

Deletes all entries from the recording table. A warning message is displayed: "All recording data will be deleted".

To confirm that you want to delete the entire recording content, click **OK**, or click **Cancel** to avoid deleting it.

## 4.12 Wake on LAN

This feature lets you remotely turn on an instrument that has been in power-off state, by sending a special LAN packet, called Magic Packet. **Wake-On-LAN** is also called **WOL** or **Remote Wake up**. It is part of the **Advanced Configuration and Power Interface (ACPI)**.

This feature is available only when *all* the following conditions are satisfied.

|   |                                                      |                                                                                        |
|---|------------------------------------------------------|----------------------------------------------------------------------------------------|
| 1 | Product Model                                        | Must be one of: N904x, N903x, N902x, N901x, or N900x                                   |
| 2 | CPU Option                                           | Must be one of: PC8, PC9, PCA, or PCB                                                  |
| 3 | BIOS/UEFI and Windows Operating System Configuration | See <a href="#">"BIOS/UEFI and Windows Operating System Configuration" on page 530</a> |
| 4 | Network Configuration                                | See <a href="#">"Network Configuration" on page 530</a>                                |

### 4.12.1 BIOS/UEFI and Windows Operating System Configuration

The procedure varies according to CPU type:

- For [PC8/PC9](#) CPUs, see ["BIOS/UEFI and Windows Operating System Configuration Procedure for PC8 and PC9 CPUs" on page 531](#)
- For [PCA/PCB](#) CPUs, see ["LAN Port, BIOS/UEFI, and Windows Operating System Configuration Procedure for PCA and PCB CPUs" on page 533](#)

### 4.12.2 Network Configuration

Configure the LAN so that the external PC that sends the Magic Packet and the instrument that receives the Magic Packet share all the following:

- Gateway
- Subnet Mask
- DNS Server

### 4.12.3 Procedures to Configure Wake-On-LAN

The following sections explain how to configure:

1. LAN Port connection (PCA/PCB CPUs only)
2. BIOS/UEFI settings
3. Windows Operating System settings

The procedure varies depending on the CPU type. Follow the procedure that matches the instrument's CPU option. For easier operation, we recommend connecting a keyboard and mouse to the instrument.

#### 4.12.3.1 BIOS/UEFI and Windows Operating System Configuration Procedure for PC8 and PC9 CPUs

This section includes:

- "BIOS/UEFI Procedure" on page 531
- "Windows Operating System Procedure" on page 532

##### BIOS/UEFI Procedure

- 1 Restart the instrument
- 2 During the restart, press **Delete** to enter the BIOS/UEFI Setup menu
- 3 Select the **Chipset** tab
- 4 Select **PCH-IO Configuration**
- 5 Press **Enter**

- 6 Select **Wake on LAN FOR S5 Enable**
- 7 If it is not enabled, enable it

#### 4 System

##### 4.12 Wake on LAN

- 8 Press **F10** to save and exit the BIOS/UEFI screen

## Windows Operating System Procedure

- 1 Log in to the instrument as Administrator
- 2 Right-click **Start** and select **Device Manager**

- 3 Navigate to **Network adapters** à **"Intel(R) Ethernet Connection...**
- 4 Right-click, then select **Properties**
- 5 Select the **Advanced** tab
- 6 In the Property list, select **Wake on Magic Packet**
- 7 If the Value is not enabled, select **Enabled** and click **OK**

#### 4.12.3.2 LAN Port, BIOS/UEFI, and Windows Operating System Configuration Procedure for PCA and PCB CPUs

Note that **PCA** and **PCB** have two LAN ports, but only “LAN 1G” port supports Wake On LAN.

This section includes:

- "LAN Port Connection" on page 533
- "BIOS/UEFI Procedure" on page 534
- "Windows Operating System Procedure" on page 535

#### LAN Port Connection

**PCA** and **PCB**-equipped instruments have two LAN ports: **LAN 1G** and **LAN 10G**, but only the **LAN 1G** port supports Wake On LAN. Connect the LAN cable to the **LAN 1G** port.

4 System  
4.12 Wake on LAN

## BIOS/UEFI Procedure

- 1 Restart the instrument
- 2 During the restart, press **Delete** to enter the BIOS/UEFI Setup menu
- 3 Select the **Chipset** tab
- 4 Select **Platform Controller Hub (PCH)**
- 5 Press **Enter**

- 6 Select **Wake on LAN Enable**  
If it is not enabled, enable it
- 7 Press **F10** to save and exit BIOS/UEFI Setup

## Windows Operating System Procedure

- 1 Log in to the instrument as Administrator
- 2 Right-click on the **Start** button and select **Device Manager**

- 3 Navigate to **Network adapters** > **Intel(R) Ethernet Connection...**

4 System  
4.12 Wake on LAN

- 4 Right-click and select **Properties**
- 5 Select the **Advanced** tab
- 6 In the Property list, select **Wake on Magic Packet**
- 7 If the Value is not enabled, select **Enabled** and click **OK**

### 4.13 System Remote Commands (Remote Commands Only)

These commands have no front-panel key equivalent.

- "List installed Options (Remote Query Only)" on page 537
- "Lock the Front-panel keys (Remote Command Only)" on page 538
- "Lock Workstation (Remote Command Only)" on page 538
- "List SCPI Commands (Remote Query Only)" on page 540
- "Front Panel activity history (Remote Query only)" on page 540
- "SCPI activity history (Remote Query only)" on page 541
- "Instrument start time (Remote Query only)" on page 541
- "SCPI Version Query (Remote Query Only)" on page 542
- "Date (Remote Command Only)" on page 542
- "Time (Remote Command Only)" on page 542
- "Input Overload Enable (Remote Command Only)" on page 543
- "Power Up (Remote Query Only)" on page 543

#### 4.13.1 List installed Options (Remote Query Only)

Lists the installed options that pertain to the instrument (signal analyzer).

|                |                                                                                                                                                |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | :SYSTem:OPTions?                                                                                                                               |
| Example        | :SYST:OPT?                                                                                                                                     |
| Notes          | The return string is a comma-separated list of the installed options. For example:<br>"503,P03,PFR"<br>:SYSTem:OPTions? and *OPT? are the same |
| State Saved    | No                                                                                                                                             |

4.13.2 Lock the Front-panel keys (Remote Command Only)

Disables the instrument keyboard to prevent local input when the instrument is controlled remotely. Annunciation showing a “K” for **KLOCK** (keyboard lock) alerts the local user that the keyboard is locked. **KLOCK** is similar to the GPIB Local Lockout function; namely that no front-panel keys are active except for the **Power Standby** key. (The instrument is allowed to be turned-off if **KLOCK** is **ON**.) The **KLOCK** command is used in remote control situations where Local Lockout cannot be used.

Although primary intent of **KLOCK** is to lock-out the front panel, it will lock-out externally connected keyboards through USB. **KLOCK** has no effect on externally connected pointing devices (mice).

The front panel ‘**Local**’ key (**Cancel/Esc**) has no effect if **KLOCK** is **ON**.

See also "Local Button" on page 103.

|                |                                                                                           |
|----------------|-------------------------------------------------------------------------------------------|
| Remote Command | :SYSTem:KLOCK OFF   ON   0   1<br>:SYSTem:KLOCK?                                          |
| Example        | :SYST:KLOC ON                                                                             |
| Notes          | Keyboard lock remains in effect until turned-off, or until the instrument is power-cycled |
| Preset         | Initialized to <b>OFF</b> at startup, unaffected by <b>Preset</b>                         |
| State Saved    | No                                                                                        |

4.13.3 Lock Workstation (Remote Command Only)

Performs the same functionality as the **Win+L** function or the “Lock” function on the **CTL-ALT-DEL** screen in Windows.

As soon as you do this, the computer is locked. The initial login screen appears; no-one can access the computer at that point unless they have an account and know the account's password.

Failure to initiate adds an error to the Windows event log for SA;

## 4 System

### 4.13 System Remote Commands (Remote Commands Only)

"LockWorkStation - Failed to initiate function"

See also "Local Button" on page 103.

|                |                                                 |
|----------------|-------------------------------------------------|
| Remote Command | <code>:SYSTem:LWSTation</code>                  |
| Example        | <code>:SYST:LWST</code>                         |
| Notes          | The lock remains in effect until a user logs in |
| State Saved    | No                                              |

#### 4.13.4 List SCPI Commands (Remote Query Only)

Outputs a list of the valid SCPI commands for the currently selected Mode.

|                |                                                                                                                   |
|----------------|-------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:SYSTem:HELP:HEADers?</code>                                                                                |
| Example        | <code>:SYST:HELP:HEAD?</code>                                                                                     |
| Notes          | The output is an IEEE Block format, with each command separated with the New-Line character ( <code>0x0A</code> ) |

#### 4.13.5 Front Panel activity history (Remote Query only)

Instrument front panel usage can be monitored using `:SYSTem:METRics:FPANel?`. The monitoring occurs for front panel hardkey or softkey operation (including mouse or touch operation on instruments with Multi-Touch User Interface). The information of the usage pertains to the activity since the instrument application was started; the information does not persist after the application is terminated, or the instrument has been rebooted.

To prevent the front panel from being placed into Remote the monitoring must occur via an I/O protocol such as LAN Socket, or the remote program performing the monitoring must explicitly place the instrument into Local after the query has been performed.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:SYSTem:METRics:FPANel?</code>                                                                                                                                                                                                                                                                                                                                                                                         |
| Example        | <code>:SYST:METR:FPAN?</code>                                                                                                                                                                                                                                                                                                                                                                                                |
| Notes          | <p>The return value is a string with the format <code>"YYYY-MM-DD&lt;space&gt;HH:MM:SS"</code>, in instrument local time</p> <p>If no front panel activity has occurred since the instrument was booted (instrument application started), the return value will be the time the instrument application started. The instrument application start time can be obtained with the query <code>:SYSTem:METRics:STIME?</code></p> |

### 4.13.6 SCPI activity history (Remote Query only)

Instrument remote operation usage via SCPI can be monitored using `:SYSTem:METRics:SCPI?`. The monitoring occurs for SCPI control from any I/O channel (GPIB, USB, or LAN). The information of the usage pertains to the activity since the instrument application was started; the information does not persist after the application is terminated, or the instrument has been rebooted.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Remote Command | <code>:SYSTem:METRics:SCPI?</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Example        | <code>:SYST:METR:SCPI?</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Notes          | <p>The return value is a string with the format “YYYY-MM-DD&lt;space&gt;HH:MM:SS”, in instrument local time</p> <p>The following commands are excluded from the history accounting:</p> <ul style="list-style-type: none"> <li>– <code>*IDN?</code></li> <li>– <code>*OPT?</code></li> <li>– <code>:SYSTem:DATE?</code></li> <li>– <code>:SYSTem:TIME?</code></li> <li>– <code>:SYSTem:PON:TIME?</code></li> <li>– Queries in the <code>:SYSTem:ERRor</code> subsystem</li> <li>– Queries in the <code>:SYSTem:LKEY</code> subsystem</li> <li>– Queries in the <code>:SYSTem:METRics</code> subsystem</li> <li>– Queries in the <code>:SYSTem:MODule</code> subsystem</li> </ul> <p>If no SCPI activity has occurred since the instrument was booted (instrument application started), the return value will be the time the instrument application started. The instrument application start time can be obtained with <code>:SYSTem:METRics:STIME?</code></p> |

### 4.13.7 Instrument start time (Remote Query only)

To determine if instrument activity has occurred, `:SYSTem:METRics:STIME?` can be used to determine the instrument application start time.

|                |                                                                                                    |
|----------------|----------------------------------------------------------------------------------------------------|
| Remote Command | <code>:SYSTem:METRics:STIME?</code>                                                                |
| Example        | <code>:SYST:METR:STIM?</code>                                                                      |
| Notes          | The return value is a string with the format “YYYY-MM-DD<space>HH:MM:SS”, in instrument local time |

### 4.13.8 SCPI Version Query (Remote Query Only)

Returns the SCPI version number with which the instrument complies. The SCPI industry standard changes regularly. This command indicates the version used when the instrument SCPI commands were defined.

|                |                  |
|----------------|------------------|
| Remote Command | :SYSTem:VERSion? |
| Example        | :SYST:VERS?      |

### 4.13.9 Date (Remote Command Only)

The recommended access to the Date, Time, and Time zone of the instrument is through the Windows native control (Control Panel, or accessing the Task Bar). You may also access this information remotely, as shown in here and in "Time (Remote Command Only)" on page 542.

Sets or queries the date in the instrument.

|                |                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | :SYSTem:DATE "<year>,<month>,<day>"<br>:SYSTem:DATE?                                                                                                                                                                                                                                                                                                                                   |
| Example        | :SYST:DATE "2006,05,26"                                                                                                                                                                                                                                                                                                                                                                |
| Notes          | <year> is the four-digit representation of year (for example, 2006)<br><month> is the two-digit representation of year (01 to 12)<br><day> is the two-digit representation of day (01 to 28, 29, 30, or 31, depending on the month and year)<br>Unless the current account has Power User or Administrator privileges, sending this command generates an error, and no action is taken |

### 4.13.10 Time (Remote Command Only)

Sets or queries the time in the instrument.

|                |                                                                                                                                                                                                                                                                                                                            |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | :SYSTem:TIME "<hour>,<minute>,<second>"<br>:SYSTem:TIME?                                                                                                                                                                                                                                                                   |
| Example        | :SYST:TIME "13,05,26"                                                                                                                                                                                                                                                                                                      |
| Notes          | <hour> is the two-digit representation of the hour in 24-hour format<br><minute> is the two-digit representation of minute<br><second> is the two-digit representation of second<br>Unless the current account has Power User or Administrator privileges, sending this command generates an error, and no action is taken |

### 4.13.11 Input Overload Enable (Remote Command Only)

Input Overload errors are reported using the Input Overload status bit (bit 12 in the Measurement Integrity Status Register). Input Overloads (for example, ADC Overload errors) can come and go with great frequency, generating many error events (for example, for signals just on the verge of overload), and so are not put into the SCPI error queue by default. Normally the status bit is the only way for detecting these errors remotely.

Use this command to enable or disable Input Overload reporting to the SCPI queue. By default, reporting is disabled. Send **:SYSTem:ERRor:OVERload ON** to enable, or **:SYSTem:ERRor:OVERload OFF** to disable. In either case, Input Overloads *always* set the status bit.

#### NOTE

For versions of firmware before A.10.01, Input Overload was only a Warning and so was never available in the SCPI queue, although it did set the status bit. For A.10.01 and later, Input Overload is an error, which can be enabled to the SCPI queue using this command.

|                |                                                                                   |
|----------------|-----------------------------------------------------------------------------------|
| Remote Command | <b>:SYSTem:ERRor:OVERload[:STATe] 0   1   OFF   ON</b>                            |
| Example        | Enable overload errors:<br><b>:SYST:ERR:OVER 1</b>                                |
| Preset         | Set to <b>OFF</b> by <b>Restore Misc Defaults</b> (no Overload errors go to SCPI) |
| State Saved    | Saved in instrument state                                                         |

### 4.13.12 Power Up (Remote Query Only)

Returns a list of errors encountered during the application boot-up, such as: mismatch FW-FPGA, missing Calibration data, missing hardware, and construction errors.

|                |                                                                                                                                                                                                                                                                                                                             |

## 5 Preset

The Preset functions can be accessed in two ways:

- By pressing the **Mode Preset** or **User Preset** front panel keys:

- From the menu **"Preset Dropdown"** on page 547, which appears when you press the green **Preset** icon (in the upper right corner of the display):

### Types of Preset

The table below shows all possible presets, their corresponding SCPI commands and front-panel access methods.

Instrument settings are tiered in scope from those local to the current measurement to those global to all measurements and Modes. There are presets tailored to each scope. The table identifies the scope of each preset type.

NOTE

To get a Mode back to a fully predefined state, you should execute **"Restore Mode Defaults"** on page 550 and **"Input/Output Preset"** on page 551, but since **Input/Output Preset** is a global function, it affects *all* Modes.

| Type Of Preset            | SCPI Command        | Scope of Preset                                                                                                                                                                                               | Front Panel Access                                      |
|---------------------------|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------|
| Auto Couple               | :COUPle ALL         | Local to the current measurement, only affects Auto/Man variables                                                                                                                                             | Meas Setup menu                                         |
| Meas Preset               | :CONFigure:<meas>   | Local to the current measurement<br>Does not preset the RF Source                                                                                                                                             | Meas Setup menu                                         |

## 5.1 Preset Dropdown

The Preset dropdown contains the following controls. In the image below, click a control for details of that control.

## 5.2 Mode Preset

Returns the current Mode to a known state. **Mode Preset** only presets the current Screen; it does not affect any other Screens.

**Mode Preset** also presets the RF Source. In this sense, it is equivalent to pressing **Source Preset** on the **Input/Output, RF Source** menu panel.

**Mode Preset** can be executed from the ["Preset Dropdown" on page 547](#), or by pressing the **Mode Preset** front panel key:

It does the following for the currently active Mode:

- Aborts the currently running measurement
- Switches to the default measurement and displays the default menu for that measurement
- Sets most parameters for the Mode and all its Measurements to a preset state
- Clears the input and output buffers
- Sets Status Byte to 0

**Mode Preset** does *not* cause a Mode switch, nor affect any **Input/Output** or **System** settings (those set in the **System Settings** dialog).

Furthermore, some Mode settings are unaffected by **Mode Preset** (for example, Noise Floor Extensions, Limit Line data, reference marker numbers, etc.) These are only reset by ["Restore Mode Defaults" on page 550](#). In each parameter's definition table there is a note that indicates whether it is reset by **Mode Preset** or by **Restore Mode Defaults**.

See ["Preset" on page 544](#) for more details.

|                              |                                                                                                                                                                                                                                                                                                                                               |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command               | :SYSTem:PRESet                                                                                                                                                                                                                                                                                                                                |
| Example                      | :SYST:PRES                                                                                                                                                                                                                                                                                                                                    |
| Notes                        | <p><b>*RST</b> is preferred over :SYST:PRES for remote operation. <b>*RST</b> performs <b>Mode Preset</b>, as done by the :SYST:PRES command, and sets the measurement mode to <b>Single</b> measurement rather than <b>Continuous</b>, for optimal remote control throughput</p> <p>See also <a href="#">"*RST - Reset" on page 1035</a></p> |
| Status Bits/OPC dependencies | Clears all pending OPC bits. The Status Byte is set to 0                                                                                                                                                                                                                                                                                      |

## 5 Preset

### 5.2 Mode Preset

---

#### Backwards Compatibility Notes

In X-Series, the legacy “Factory Preset” has been replaced by **Mode Preset**, which only presets the currently active Mode, not the entire instrument. In X-Series, you preset the entire instrument by using **System, Restore System Defaults All**, which behaves essentially the same way as restore System Defaults did in ESA and PSA

There is also no “Preset Type” as there was in PSA. The green **Mode Preset** front-panel key does a Mode Preset, and the **User Preset** front-panel key does a User Preset. The old **PRESet:TYPE** command is ignored (without generating an error), and **SYST:PRES** without a parameter does **Mode Preset**

The settings and correction data under the **Input/Output** front-panel key (examples: Input Z Corr, Ext Amp Gain, etc.) are no longer part of any Mode, so they are not preset by **Mode Preset**. They are preset by **Restore Input/Output Defaults, Restore System Defaults All**. Note that because “**User Preset**” on [page 553](#) performs Recall State, and all these settings are saved in State, they *are* recalled when using **User Preset**

## 5.3 Restore Mode Defaults

Most settings within a Mode are affected by "Mode Preset" on page 548, but some Mode settings are unaffected (for example, Noise Floor Extensions, Limit Line data, reference marker numbers, etc.) **Restore Mode Defaults** resets all these additional settings, as well as all the **Mode Preset** settings, *except* the RF Source.

In each parameter's definition table, there is a note that indicates whether that parameter is reset by **Mode Preset** or by **Restore Mode Defaults**.

Note that a Recall State affects all a Mode's settings, both the **Mode Preset** settings and the ones additionally affected by **Restore Mode Defaults**.

**Restore Mode Defaults** can be executed from the "Preset Dropdown" on page 547.

When **Restore Mode Defaults** is selected, a message appears saying

*This will reset all of the current Mode's variables to their default state.  
This action cannot be undone. Do you want to proceed?*

The message provides **OK** and **Cancel** buttons, to let you confirm or cancel the reset operation.

|                |                                                                                                                                                                              |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | :INSTrument:DEFault                                                                                                                                                          |
| Example        | :INST:DEF                                                                                                                                                                    |
| Notes          | Clears all pending OPC bits. The Status Byte is set to 0                                                                                                                     |
| Couplings      | Causes the currently running measurement to be aborted, and causes the default measurement to be active. Sets the Mode to a consistent state, with all default couplings set |

## 5.4 Input/Output Preset

Resets the group of settings and data associated with the **Input/Output** front-panel key to their default values. These settings are not affected by "Mode Preset" on page 548, because they are generally associated with connections to the instrument, which generally should remain unaltered.

All the variables set under the **Input/Output** front panel key are reset by **Input/Output Preset**, including Amplitude Corrections and Data (described in the **Corrections** section), with the exception of **RF Source** settings, which are unaffected.

By using **Input/Output Preset** and "Restore Mode Defaults" on page 550, a full preset of the current Mode can be performed, with the caveat that, since **Input/Output Preset** is a global function, it affects *all* Modes.

**Input/Output Preset** can be executed from the **Input/Output** menu, from the "Preset Dropdown" on page 547, or from the **Restore Defaults** menu under the **System** key.

When **Input/Output Preset** is selected, a message appears saying:

"This will reset all of the Input/Output variables to their default state, including which input is selected, all Amplitude Correction settings and data, all External Mixing settings, all Frequency Reference settings and all Output settings.

It will not affect Alignment data or settings.

It will not affect RF Source settings.

This action cannot be undone. Do you want to proceed?"

The message provides **OK** and **Cancel** buttons, to let you confirm or cancel the operation.

---

Example

`:SYST:DEF INP`

Presets all **Input/Output** variables to their factory default values

## 5.5 Full Mode Preset

Same as performing "Mode Preset" on page 548, "Restore Mode Defaults" on page 550, and "Input/Output Preset" on page 551. Essentially a factory preset of the current Mode.

When **Full Mode Preset** is selected, a message appears saying:

This will reset all of the current Mode's variables and all of the Input/Output variables to their default state, including Input and Output selection and settings, Amplitude Correction, Frequency Reference and RF Source settings. It will not affect Alignment data or settings.  
This action cannot be undone. Do you want to proceed?

The message provides **OK** and **Cancel** buttons, to let you confirm or cancel the operation.

|                              |                                                          |
|------------------------------|----------------------------------------------------------|
| Remote Command               | :SYSTem:PRESet:FULL                                      |
| Example                      | :SYST:PRES:FULL                                          |
| Status Bits/OPC dependencies | Clears all pending OPC bits. The Status Byte is set to 0 |

## 5.6 User Preset

Recalls a state previously saved using ["Save User Preset" on page 555](#). You can save a **User Preset** state for each Mode, allowing you to define your own favorite state for each Mode and recall it at the touch of a single button.

**User Preset** can be executed by pressing the **User Preset** front panel key, or from the ["Preset Dropdown" on page 547](#).

Because **User Preset** is actually a Recall State, rather than a predefined Preset, it works a little differently from ["Mode Preset" on page 548](#), in that it affects all the variables that normally only reset on ["Restore Mode Defaults" on page 550](#), and it affects the **Input/Output** variables, because both of these are included in State files.

A default **User Preset** file is provided for each Mode, which simply matches the current Mode's state after **Restore Mode Defaults** and ["Input/Output Preset" on page 551](#) has been performed.

NOTE

In products that run multiple instances of the X-Series Application, all instances use the same location to save User Preset state. So, saving User Preset of one instance will overwrite the Save User Preset of another instance.

|                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command                | :SYSTem:PRESet:USER                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Example                       | Save the User Preset:<br>:SYST:PREs:USER:SAVE<br><br>Recall the User Preset:<br>:SYST:PREs:USER                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Notes                         | :SYST:PREs:USER:SAVE is used to save the current state as the user preset state<br><br>If loading a User Preset file from a different instrument, some settings may be limited and/or coupled differently, since the capabilities of the mode may have changed from when the User Preset file was saved                                                                                                                                                                                                                                                                                         |
| Status Bits/OPC dependencies  | Clears all pending OPC bits. The Status Byte is set to 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Backwards Compatibility Notes | In X-Series A-models, the <b>User Preset</b> key opened a menu that let you select from User Preset, Save User Preset, or User Preset All Modes. In B-models, the <b>User Preset</b> key immediately performs a <b>User Preset</b> , and the menu items are found under the <b>Preset</b> dropdown<br><br><b>User Preset</b> actually loads a state, and in legacy analyzers, it was possible to load a state without affecting the trace data, limit lines or correction data. Similarly, it was possible to do a User Preset without affecting the trace data, limit lines or correction data |

---

In X-Series, “state” always includes all of this data; so whenever state is loaded, or **User Preset** is executed, all the traces, limit lines and corrections are affected

In ESA and PSA, **User Preset** affected the entire instrument’s state. In X-Series, **User Preset** only recalls the state for the active Mode. There is a User Preset file for each Mode. **User Preset** can never cause a Mode switch as it could in legacy analyzers. If you want to recall all Modes to their user preset file state, perform User Preset *after* switching into each Mode

**User Preset** recalls Mode state, which can now include data, such as traces, whereas in ESA and PSA, User Preset did not affect data

## 5.7 Save User Preset

Saves the state of the currently active Mode in a unique location, for recall by the key "User Preset" on page 553. Each Mode has one such location, so, for each Mode, one User Preset can be defined.

Save User Preset can be executed from the "Preset Dropdown" on page 547.

All the Mode variables are saved, including those reset by "Mode Preset" on page 548, those only reset by "Restore Mode Defaults" on page 550, and all Input/Output variables, so when you subsequently press User Preset, the instrument returns to the exact same setup that existed when you pressed Save User Preset. Thus, User Preset has wider scope than Mode Preset.

|                |                                                                                                                                                                          |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | :SYSTem:PRESet:USER:SAVE                                                                                                                                                 |
| Example        | :SYST:PRES:USER:SAVE                                                                                                                                                     |
| Notes          | :SYST:PRES:SAVE creates the same file as if you requested *SAV or :MMEM: STOR:STAT, except that Save User Preset does not allow you to specify the file name or location |

## 5.8 User Preset All Modes

Recalls all the User Preset files for each Mode, switches to the Power-on Mode, and activates the saved measurement from the Power-on Mode **User Preset** file.

**User Preset All Modes** can be executed from the "Preset Dropdown" on page 547

See also "User Preset" on page 553.

|                              |                                                                                              |
|------------------------------|----------------------------------------------------------------------------------------------|
| Remote Command               | <code>:SYSTem:PRESet:USER:ALL</code>                                                         |
| Example                      | <code>:SYST:PRES:USER:SAVE</code><br><code>:SYST:PRES:USER:ALL</code>                        |
| Notes                        | <code>:SYST:PRES:USER:SAVE</code> is used to save the current state as the user preset state |
| Status Bits/OPC dependencies | Clears all pending OPC bits. The Status Byte is set to 0                                     |

## 5.9 Restore Defaults All Modes

Resets all Modes in the current Screen back to their default states, just as **Restore Mode Defaults** does, switches the current Screen to the Power-on Mode, and causes the default measurement for the **Power On Mode** to be active in the current Screen. Only the current Screen is affected.

**Restore Defaults All Modes** can be executed from the "Preset Dropdown" on page 547.

When **Restore Defaults All Modes** is selected, a message appears saying:

*This will reset all of the variables for all of the Modes in the current Screen to their default state. This action cannot be undone. Do you want to proceed?*

The message provides **OK** and **Cancel** buttons.

|           |                                                                                                                                                    |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| Example   | :SYST:DEF MOD                                                                                                                                      |
| Couplings | Causes the currently running measurement to be aborted, a switch to the Power-on Mode, and activates the default measurement for the Power-on Mode |

## 5.10 User Preset All Screens

Recalls a screen configuration previously saved using **"Save User Preset All Screens" on page 559**. The complete configuration of all Screens is loaded, including the state of each Screen.

Because **User Preset All Screens** performs a Recall State as part of its function, it affects all variables that are normally only reset by **"Restore Mode Defaults" on page 550**, and affects **Input/Output** variables, because both are included in State files.

Note that recalling a screen configuration in this manner wipes out your current screen configuration, and all states of all Screens.

|                              |                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Notes                        | <p><b>"Save User Preset All Screens" on page 559</b> is used to save the current screen configuration as the "user preset all screens" configuration</p> <p>If loading a <b>User Preset All Screens</b> file from a different instrument, some settings may be limited and/or coupled differently, since the capabilities of the Mode may have changed from when the <b>User Preset All Screens</b> file was saved</p> |
| Status Bits/OPC dependencies | <p>Clears all pending OPC bits</p> <p>The Status Byte is set to 0</p>                                                                                                                                                                                                                                                                                                                                                  |

## 5.11 Save User Preset All Screens

Saves the current Screen Configuration in a unique location, for recall by "[User Preset All Screens](#)" on page 558.

**Save User Preset All Screens** can be executed from the "[Preset Dropdown](#)" on page 547.

Besides the screen configuration, *all* Mode variables of all Screens are saved, including those reset by "[Mode Preset](#)" on page 548, and those only reset by "[Restore Mode Defaults](#)" on page 550, as well as all **Input/Output** variables, so when you subsequently press **User Preset All Screens**, the instrument returns to the exact Screen setup that existed when you pressed **Save User Preset All Screens**.

---

|       |                                                                                                                                                                                      |
|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Notes | Creates the same file as if you requested <b>Screen Config + State</b> save, except that <b>Save User Preset All Screens</b> does not allow you to specify the file name or location |
|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## 5.12 Restore Screen Defaults

Resets the Screen configuration to the factory default; deleting all screens, all screen names, all screen states, and setting "Multiscreen" on page 143 to Off. A single screen will remain, set to the Power-on Mode, in a preset state with the default screen name.

**Restore Screen Defaults** can be executed from the "Preset Dropdown" on page 547.

When **Restore Screen Defaults** is selected, a message appears saying:

This function will delete all defined screens and their settings. This action cannot be undone.

Do you want to proceed?

The message provides **OK** and **Cancel** buttons.

---

Example

:SYST:DEF SCReen

### 5.13 Preset Type (Remote Command Only)

|                |                                                                                                                       |
|----------------|-----------------------------------------------------------------------------------------------------------------------|
| Remote Command | :SYSTem:PRESet:TYPE FACTory   MODE   USER<br>:SYSTem:PRESet:TYPE?                                                     |
| Example        | :SYST:PRES:TYPE FACT                                                                                                  |
| Notes          | Supported for backwards compatibility only. It is a no-op, which does not change the behavior of any preset operation |
| Preset         | Unaffected by Preset, but set to MODE by Restore System Defaults->All                                                 |
| State Saved    | No                                                                                                                    |

## 5.14 Restart Instrument (Shutdown)

Shuts down the instrument, then reboots it.

|                |             |
|----------------|-------------|
| Remote Command | :SYSTem:PUP |
| Example        | :SYST:PUP   |

## 5.15 Restart Application (Application Shutdown)

Restarts the instrument application without rebooting the instrument. Before you send this command, make sure you have saved any trace or measurement data that you want to preserve.

|                |                                                                                                                                                                                                                                                                                                                                                            |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | :SYSTem:PUP:PROcess                                                                                                                                                                                                                                                                                                                                        |
| Example        | :SYST:PUP:PROC<br>After sending this command, you must wait for the instrument software to restart                                                                                                                                                                                                                                                         |
| Notes          | You cannot use *WAI or *OPC? to synchronize operation after a restart. This command stops and restarts the instrument application, so the SCPI operation is terminated and restarted<br>A remote program must wait a fixed time before resuming sending commands to the instrument. The appropriate wait time depends on which applications are pre-loaded |

## 5.16 System Log Off (Remote Command Only)

Provides a means to terminate all open Windows applications, and log off the current user. This is equivalent to performing the Windows command:

```
shutdown -l -f -t0
```

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | :SYSTem:LOFF                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Example        | :SYST:LOFF                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Notes          | Initiates an immediate log off of the current user. Exits the instrument application, so any unsaved measurement results will be lost. You cannot use *WAI or *OPC? to synchronize operation. In addition to the instrument application, all other Windows programs will be terminated, without the opportunity to save any work in progress. To perform a subsequent login, and regain instrument operation, human intervention will be required |

## 5.17 Power Standby (Instrument Shutdown)

Pressing the power switch powers down the instrument. You are warned that shutting down will cause the application to lose unsaved data, and the instrument lets you respond to this warning before shutting down.

The command below has the same effect, except that you can specify Normal mode (**NORMa1**) or Forced mode(**FORCe**):

- In **NORMa1** mode, the system waits until you respond to the warning prompt
- In **FORCe** mode, the system shuts down after 20 seconds, and all data will be lost

If the instrument is not properly shut down prior to removal of line power, the system will validate the Journaling File System and the Power-On Last State (if the instrument is in Power-On Last State) during the following power-on. If a problem is detected, a message appears indicating that the system ‘recovered’ from an inappropriate shutdown. This is only an issue if **Power-On Type** is Last State. If the Last State is not valid, the instrument will power up in the last active Mode, but will perform "**Mode Preset**" on page 548.

|                |                                                   |
|----------------|---------------------------------------------------|
| Remote Command | :SYSTem:PDOWn [NORMa1   FORCe]                    |
| Example        | :SYST:PDOW<br>Executes a normal shutdown          |
| Notes          | If no parameter is sent, <b>NORMa1</b> is assumed |

## 6 Input/Output

Accesses menus that let you control the Input/Output parameters of the instrument. In general, these are functions associated with external connections to the instrument, either to the inputs or the outputs.

Input/output connections tend to be based on situation-specific hardware set up. For that reason, input/output settings do *not*, in general, change when you perform a Mode Preset. You can revert to the default values in one of three ways:

- Use **Restore Input/Output Defaults**, in the **Input/Output** menu
- Use **System->Restore System Defaults->Input/Output Settings**
- Use **System -> Restore System Defaults->All**

The settings survive a Preset and a Power cycle.

A few Input/Output settings *do* respond to Mode Preset. For example, if the Calibrator is on, **Preset** turns it off, and if DC coupling is in effect, **Preset** switches it to AC. These exceptions are noted in the SCPI tables for the excepted functions.

Input/Output features are common across multiple Modes and Measurements. In general, they do not change when you change Mode or Measurement, although some controls appear only in certain measurements.

## 6.1 RF Source

Lets you control and configure the internal RF Source. This tab only appears in models that support a built-in independent RF Source, which include E7760B, and modular products such as EXM and VXT.

External Source Control and built-in Tracking Sources are controlled using the **Source** tab in **Meas Setup**.

|              |                                                                                                   |
|--------------|---------------------------------------------------------------------------------------------------|
| Dependencies | Only appears in models that support a built-in independent RF Source, such as E7760B, EXM and VXT |
|--------------|---------------------------------------------------------------------------------------------------|

### 6.1.1 RF Output

Sets the source RF power output state.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:OUTPut[:EXternal][:STATe] ON   OFF   1   0</code><br><code>:OUTPut[:EXternal][:STATe]?</code>                                                                                                                                                                                                                                                                                                                                     |
| Example        | <code>:OUTP OFF</code><br><code>:OUTP?</code>                                                                                                                                                                                                                                                                                                                                                                                            |
| Notes          | This setting is for the independent mode and has no effect on the <a href="#">"List Sequencer" on page 578</a> . If <b>Sequencer</b> is <b>ON</b> , the List Sequencer controls the source output, and this key is grayed-out<br>When <b>Sequencer</b> is <b>OFF</b> , makes source leave List Sequencer and this setting is blanked out, taking effect immediately                                                                      |
| Dependencies   | For E7760B, the RF Output cannot be set to <b>ON</b> if the RF Output port is set to <b>NONE</b> . If you attempt to set RF Output to <b>ON</b> in this situation, the error message -221, "Settings conflict; Source Output is not available while Output Port is None" is displayed<br><code>:OUTPut:EXternal[:STATe]</code> is supported only when Option ESC is installed. Otherwise, only <code>:OUTPut[:STATe]</code> is supported |
| Preset         | <b>OFF</b>                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Range          | <b>ON OFF</b>                                                                                                                                                                                                                                                                                                                                                                                                                            |

### 6.1.2 RF Output Port

Specifies the RF Output Port used by the internal source.

Switching from the RF Output port to one of the RFIO ports changes the transmitter performance of the instrument.

The **NONE** selection is available to allow setting a half-duplex port to an Input, if it was previously assigned as an Output. Set the Output to **NONE** first, then any port can be assigned as an Input.

When using VXT M9410A/11A/15A/16A with Remote Radio Heads (such as the Keysight M1740A mmWave Transceiver for 5G), the choices in the dropdown menu appear as:

Head h RFHD p

For example, if you have two Radio Heads (numbered 1 and 2), each of which have two RF half-duplex ports, the choices for these ports will appear as below:

| Head and Port           | Choice in dropdown | SCPI parameter |
|-------------------------|--------------------|----------------|
| Head 1, port RF Tx/Rx 1 | Head 1 RFHD 1      | RRH1RFHD1      |
| Head 1, port RF Tx/Rx 2 | Head 1 RFHD 2      | RRH1RFHD2      |
| Head 2, port RF Tx/Rx 1 | Head 2 RFHD 1      | RRH2RFHD1      |
| Head 2, port RF Tx/Rx 2 | Head 2 RFHD 2      | RRH2RFHD2      |

When using the E7770A Common Interface Unit, outputs may come from the DUT IF OUT ports on the rear of the CIU or the half-duplex ports on the front of the CIU labeled DUT IF In/Out. You would select GUI parameter IF Out n or SCPI parameter IFOutn for the DUT IF OUT ports or GUI parameter IFHD n or SCPI parameter IFHDn for the DUT IF In/Out ports. See ["RF Input Port" on page 684](#) "Parameters for VXT M9410A/11A/15A/16A and EXM when used with Radio Heads/CIU" for more details.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Dependencies   | <p>Only appears in models that support multiple output ports. If the SCPI command is sent with unsupported parameters in any other model, an error is generated, -221, "Settings conflict; option not installed"</p> <p><b>RFHD</b> and <b>RFFD</b> are only available on VXT. Option HDX is required to enable RFHD port. Option FDX is required to enable RFFD port</p> <p>For E7760B: Ports IFIO1 and IFIO2 are available if Option RF2 is installed. Ports A1, A2, A3, B1, B2, B3 are available if Option RF3 is installed. Attempting to select a port for which the option is not present generates the error, -241, "Hardware missing; Output not available"</p> <p>A port cannot be selected as an Output while it is occupied as an Input. If the SCPI command is sent while the port is occupied, an error is generated, -221, "Settings conflict; Output Port is not available while occupied by Input"</p> <p>Additionally, the mmWave ports are divided into two banks: the A Bank and the B Bank. A port cannot be selected as an Output if any port on the <i>same</i> bank is occupied as an Input. If the SCPI command is sent for this situation, an error is generated, -221 "Settings conflict; Output Port is not available while</p> |

## 6 Input/Output

### 6.1 RF Source

|                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                              | <p>port bank is occupied by Input”</p> <p>Lastly, if RF3 is present, and RF4 is absent, a mmWave port cannot be selected as an Output if the Input Port is occupied by wwWave Transceiver with a different frequency range. If the SCPI command is sent for this situation an error is generated, -221 “Settings conflict; Output Port is not available while occupied by Input of incompatible frequency”</p> <p>Ports <b>GEN</b> and <b>TR</b> are only available in modular analyzers, and only when the M9470A module is installed, such as in M8920A. Option HDX is required to enable the T/R port</p> <p>When any output is selected in a measurement that does not support it, the "No result; Meas invalid with this output" error condition occurs, and the measurement returns invalid data when queried</p> |
| Preset                       | Unaffected by <b>Mode Preset</b> , but set to default by <b>Source Preset</b> or <b>Restore System Defaults -&gt; All</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| State Saved                  | Saved in State                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Backwards Compatibility SCPI | <p><b>:FEED:RF:PORT:OUTPut IFIO1</b></p> <p><b>IFIO1</b> is treated as <b>IF01</b> and sets the IF output to be the port labeled <b>DUT IF Out</b> on the CIU rear panel. This is for compatibility with earlier implementations on EXM and VXT when using the E7770A Common Interface Unit</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

#### Port Options

| Value                     | Notes                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RF Output<br><b>RFOut</b> | <p>On EXM with hardware M9430A, if RF Output is selected as RF Output Port, use the settings in the <b>Half Duplex Config</b> menu to determine which port (<b>RFIO3</b> or <b>RFIO4</b>) will be used</p> <p>On EXM with hardware M9431A, this setting is not supported. If the SCPI command is sent with this setting, an error is generated, -221, “Settings conflict; option not installed”</p> |
| <b>RFHD</b>               | <p>RFHD port is exclusive for RF Input and RF Output. If HD Port is chosen as RF Input port, pressing this key, or sending SCPI to set it, generates error message: “-221, Settings conflict; RFHD is being used as RF Input Port”</p> <p>Option HDX is required to enable RFHD port</p>                                                                                                            |
| <b>RFFD</b>               | Option FDX is required to enable RFFD port                                                                                                                                                                                                                                                                                                                                                          |

#### 6.1.3 Half Duplex Output Port

Specifies whether **RFIO3** or **RFIO4** is the Half Duplex Output port.

|                |                                                     |
|----------------|-----------------------------------------------------|
| Remote Command | <b>[ :SENSe ]:HDUPlex:PORT:OUTPut RFIO3   RFIO4</b> |
|----------------|-----------------------------------------------------|

|              |                                                                                                                                                                                                                                                                                               |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Example      | <code>:HDUPlex:PORT:OUTPut RFI03</code><br><code>:HDUPlex:PORT:OUTPut?</code>                                                                                                                                                                                                                 |
| Dependencies | Only appears in EXM<br>If <b>RFI03</b> is selected as “Half Duplex Input Port”, then “Half Duplex Output Port” will be set to <b>RFI04</b> automatically<br>If <b>RFI04</b> is selected as “Half Duplex Input Port”, then “Half Duplex Output Port” will be set to <b>RFI03</b> automatically |
| Preset       | <b>RFI04</b>                                                                                                                                                                                                                                                                                  |
| State Saved  | Saved in State                                                                                                                                                                                                                                                                                |

## 6.1.4 RF Power

Lets you control the amplitude of the Source output. Same as "RF Power" on page 570 in **Amplitude Setup**.

|         |                                 |
|---------|---------------------------------|
| Example | <code>:SOUR:POW -100 dBm</code> |
|---------|---------------------------------|

## 6.1.5 T/R Port High Power Attenuator

Controls whether additional attenuation is added at the T/R Port. The T/R port has two output paths, one that provides a 16 dB attenuator, another that bypasses this attenuator. When this control is **ON**, the path includes the 16 dB attenuator, so the maximum output level for this path is 0 dBm. When this control is **OFF**, the 16 dB attenuator is bypassed, so the maximum output level for this path is +5 dBm.

|         |                                           |
|---------|-------------------------------------------|
| Example | <code>:FEED:RF:PORT:TR:HPOW:ATT ON</code> |
|---------|-------------------------------------------|

## 6.1.6 Amplitude Setup

Lets you access the **Amplitude Setup** panel.

|       |                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Notes | This menu under this control is for independent mode, and has no effect on "List Sequencer" on page 578. If "Sequencer" on page 579 is <b>ON</b> , the List Sequencer controls the source output, and this control is grayed-out on the front panel, to indicate out-of-scope. When you set "Sequencer" on page 579 to <b>OFF</b> , makes source leave List Sequencer and this control is blanked out |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### 6.1.6.1 RF Power

Lets you adjust the power level of the source using the numeric keypad, step keys, or RPG. Pressing any digit, 0 through 9 on the numeric keypad displays the unit terminator.

## 6 Input/Output

### 6.1 RF Source

Please refer to the ["RF Power Range" on page 571](#) table below for the valid ranges.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Remote Command | <code>:SOURce:POWer[:LEVel][:IMMediate][:AMPLitude] &lt;ampl&gt;</code><br><code>:SOURce:POWer[:LEVel][:IMMediate][:AMPLitude]?</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Example        | <code>:SOUR:POW -100 dBm</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Notes          | <p>Amplitude corrections can be specified for use with the source. In the event of amplitude corrections being applied, the valid ranges for the RF power do not change dependent on the current amplitude correction setting. If the combination of RF power + amplitude correction is higher or lower than the source output range, the Source Unleveled bit is set, and the "Source Unleveled" indicator will appear on status panel to indicate that the source cannot maintain the output power that has been requested</p> <p>When signal generator is unable to maintain the requested output level, the "Source Unleveled" indicator will appear on status panel. When the source output setting is restored to the normal range, the "Source Unleveled" is removed from status panel</p> <p>Internal source has list sequence mode, which comprises of several steps which contain separate output power, frequency and waveform etc. When the source list sequence playing is complete, the last step keeps playing, and user can use this command to change the list sequence last step's output power</p> <p>For EXT, The multiport adapter RFIO TX ports and GPS ports cannot ensure power accuracy when power setting is lower than -130dBm, this power setting value is defined by the sum of RF Power setting and related amplitude correction value. But user settable value could be lower than this limit. When application detected there exists power setting lower than -130dBm on MPA RFIO TX ports, then popup warning message . When application detected there exists power setting lower than -130dBm on MPA GPS ports, then popup warning message . This is only warning message, and check is performed when RF is <b>ON</b></p> |
| Dependencies   | The RF power is dependent on the RF output port and frequency, such that the current frequency and selected output port determine the valid range of power values                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Couplings      | For if AWGN State is <b>ON</b> and ARB State is <b>ON</b> , this setting is adjusted to the value to maintain the AWGN power relationship defined by Power Control Mode and other noise settings                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

### RF Power Range

| RF Output Port    | Frequency Range              | Min Output Power | Max Output Power |
|-------------------|------------------------------|------------------|------------------|
| High Power RF Out | 10 MHz $\leq$ f $\leq$ 6 GHz | -150 dBm         | 20 dBm           |
| RFIO 1 & RFIO 2   | 10 MHz $\leq$ f $\leq$ 6 GHz | -150 dBm         | 0 dBm            |

Note: This is the UI power range, which is larger than the actual specification.

## VXT model M9420A

| RF Output Port | Frequency Range              | Min Output Power | Max Output Power without Option "1EA" | Max Output Power with Option "1EA" |
|----------------|------------------------------|------------------|---------------------------------------|------------------------------------|
| RF Output      | 60 MHz $\leq$ f $\leq$ 6 GHz | -150 dBm         | 10 dBm                                | 25 dBm                             |
| RFHD           | 60 MHz $\leq$ f $\leq$ 6 GHz | -150 dBm         | 10 dBm                                | 15 dBm                             |
| RFFD           | 60 MHz $\leq$ f $\leq$ 6 GHz | -150 dBm         | 0 dBm                                 | 0 dBm                              |

Note 1: This is the UI power range, which is larger than the actual specification.

Note 2: Max output power with Option 1EA can be set to 25 dBm, but Meas Uncal (measurement uncalibrated) warning is given in the Status Bar in the lower right corner of the screen when output power set higher than 20 dBm.

## VXT models M9410A/11A

| Ports     | Option LFE         | Frequency Range               | Min Output Power | Max Output Power without option "1EA" | Max Output Power with "1EA" |
|-----------|--------------------|-------------------------------|------------------|---------------------------------------|-----------------------------|
| RF Output | With Option LFE    | 1 MHz $\leq$ f $\leq$ 60 MHz  | -150 dBm         | 5 dBm                                 | 5 dBm                       |
|           |                    | 60 MHz $\leq$ f $\leq$ 380MHz | -150 dBm         | 5 dBm                                 | 25 dBm                      |
|           | Without Option LFE | 380 MHz $\leq$ f $\leq$ 6 GHz | -150 dBm         | 5 dBm                                 | 25 dBm                      |
| RFHD      |                    | 1 MHz $\leq$ f $\leq$ 6 GHz   | -150 dBm         | 5 dBm                                 | 5 dBm                       |

Note 1: Min Output Power is the UI power range, which is smaller than the actual specification.

Note 2: Max output power with Option 1EA can be set to 25 dBm for RF Output Port, but Meas Uncal (measurement uncalibrated) warning is given in the Status Bar in the lower right corner of the screen when the output power is set higher than 20 dBm.

Note 3: Option LFE provides Low Frequency Extension, which covers frequency from 1 MHz to 380 MHz.

## VXT models M9415A/16A

| RF Output Port | Frequency Range                                | Min Output Power | Max Output Power without Option "1EA" | Max Output Power with Option "1EA" |
|----------------|------------------------------------------------|------------------|---------------------------------------|------------------------------------|
| RF Output      | $380 \text{ MHz} \leq f \leq 12.3 \text{ GHz}$ | -150 dBm         | 5 dBm                                 | 25 dBm                             |
| RFHD           | $380 \text{ MHz} \leq f \leq 12.3 \text{ GHz}$ | -150 dBm         | 5 dBm                                 | 18 dBm                             |

**Note 1:** For RF output port, the Max output power with Option 1EA can be set to 25 dBm for RF Output Port, but Meas Uncal (measurement uncalibrated) warning is given in the Status Bar in the lower right corner of the screen when the output power is set higher than 20 dBm.

**Note 2:** For RFHD port, the Max output power with Option 1EA can be set to 18 dBm for RF Output Port, but Meas Uncal (measurement uncalibrated) warning is given in the Status Bar in the lower right corner of the screen when the output power is set higher than 10 dBm.

## M9410E/11E/15E/16E

| Ports     | Option LFE         | Frequency Range                                | Min Output Power | Max Output Power |
|-----------|--------------------|------------------------------------------------|------------------|------------------|
| RF Output | With Option LFE    | $1 \text{ MHz} \leq f \leq 380 \text{ MHz}$    | -150 dBm         | 13 dBm           |
|           |                    | $380 \text{ MHz} \leq f \leq 25.9 \text{ GHz}$ | -150 dBm         | 25 dBm           |
|           | Without Option LFE | $380 \text{ MHz} \leq f \leq 25.9 \text{ GHz}$ | -150 dBm         | 25 dBm           |
| RFHD      |                    | $1 \text{ MHz} \leq f \leq 25.9 \text{ GHz}$   | -150 dBm         | 5 dBm            |

## VXT Models with Remote Radio Heads/CIU

| Solution | Port   | Option | Frequency Range      | Min Output Power | Max Output Power              |

## M8920A/20B

| RF Output Port | Frequency Range           | Min Output Power | Max Output Power          |
|----------------|---------------------------|------------------|---------------------------|
| Gen            | 100 kHz $\leq$ f $\leq$ 6 | -150 dBm         | without option 1EA: 3 dBm |

| RF Output Port | Frequency Range     | Min Output Power | Max Output Power                                                                                                   |
|----------------|---------------------|------------------|--------------------------------------------------------------------------------------------------------------------|
| T/R            | 100 kHz ≤ f ≤ 6 GHz | -150 dBm         | with option 1EA: 15 dBm<br>T/R port high power attenuator On: -15 dBm<br>T/R port high power attenuator Off: 5 dBm |

Note: This is the UI power range, which is larger than the actual specification.

6.1.6.2 Set Reference Power

Turns the power reference state to **ON**, sets the reference power value to the current RF output power, maintains this power at the RF output, and sets the displayed power to 0.00 dB. All subsequent RF power values entered under **Source**, **Amplitude**, **RF Power** are interpreted as being relative to this reference power.

When you use a power reference, the signal generator outputs an RF power that is set relative to the reference power by the value entered under **Source**, **Amplitude**, **RF Power** as follows:

Output power = reference power – entered power

Where:

- reference power equals the original RF Power entered under **Source>Amplitude>RF Power** and set as the reference power
- entered power equals a new value entered under **Source>Amplitude>Amptd Offset**

In addition, the displayed power value is the same as a new value entered under **Source**, **Amplitude**, **RF Power**.

NOTE

If Power Ref is **ON** with a reference value set, entering a value under **Source**, **Amplitude**, **RF Power** and pressing **Set Reference Power** adds that value to the existing Power Ref value.

If you wish to change the reference power value to a new value entered under **Source**, **Amplitude**, **RF Power**, first set Power Ref to **OFF**, then press **Set Reference Power**.

|              |                                                                             |
|--------------|-----------------------------------------------------------------------------|
| Dependencies | Unavailable, and grayed-out, when "List Sequencer" on page 578 is <b>ON</b> |
|--------------|-----------------------------------------------------------------------------|

### 6.1.6.3 Power Ref

Lets you toggle the state of the power reference. When you use a power reference, the signal generator outputs an RF power that is set relative to the reference power by the value entered under **Source>Amplitude>RF Power** as follows:

Output power = reference power + entered power

Where:

- reference power equals the original RF Power entered under **Source>Amplitude>RF Power** and set as the reference power
- entered power equals a new value entered under **Source>Amplitude>Amptd Offset**

For more information on Reference Frequency, see ["Set Reference Power" on page 575](#).

|                |                                                                                                                                                                        |

### 6.1.6.5 Amptd Offset

Lets you specify the RF output power offset value.

When the amplitude offset is set to zero (0) and you set a new offset value (positive or negative), the displayed amplitude value changes as follows, and the RF output power does not change:

Displayed value = output power + offset value

Where:

- output power equals the original RF Power entered under **Source, Amplitude, RF Power**
- offset value equals the value entered under **Source, Amplitude, Amptd Offset**

When the amplitude offset is set to a value other than zero (0) and you enter a new RF power value under **Source, Amplitude, RF Power**, the displayed power will be the same as the value entered and the RF output power will be equal to the value entered minus the offset value as follows:

Output power = entered power – offset power

Displayed Power = output power + offset power

Displayed power = entered power

Where:

- entered power equals the amplitude entered under **Source, Amplitude, RF Power**
- offset power equals the value previously entered and set under **Source, Amplitude, Amptd Offset**

|                |                                                                                                                      |
|----------------|----------------------------------------------------------------------------------------------------------------------|
| Remote Command | <b>:SOURce:POWer[:LEVel][:IMMediate]:OFFSet &lt;rel_ampl&gt;</b><br><b>:SOURce:POWer[:LEVel][:IMMediate]:OFFSet?</b> |
| Example        | <b>:SOUR:POW:OFFS 0.00 dB</b>                                                                                        |
| Notes          | The amplitude Offset unit follows the units set in Power Unit                                                        |
| Dependencies   | Unavailable, and grayed-out, when List Sequencer is <b>ON</b>                                                        |
| Preset         | 0.00 dB                                                                                                              |

|     |            |
|-----|------------|
| Min | -200.00 dB |
| Max | 200.00 dB  |

### 6.1.6.6 Amplitude Increment

Changes the step size for the RF Power function. Once an increment size has been selected and the RF Amplitude function is active, the step keys (and the [UP | DOWN](#) parameters for RF Power from remote commands) change the RF Power by the set value. This feature exists in EXG and MXG.

|                |                                                                                                          |
|----------------|----------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:SOURce:POWer:STEP[:INCRement] &lt;amp1&gt;</code><br><code>:SOURce:POWer:STEP[:INCRement]?</code> |
| Example        | <code>:SOUR:POW:STEP 1</code>                                                                            |
| Notes          | The Amplitude Increment unit follows the units set in Power Unit                                         |
| Couplings      | Coupled to the Step size of the RF Power function                                                        |
| Preset         | 1 dB                                                                                                     |
| Min            | 0.1 dB                                                                                                   |
| Max            | 10 dB                                                                                                    |

### 6.1.7 Frequency

Lets you control the frequency of the Source. Same as ["Frequency" on page 603](#) under ["Frequency Setup" on page 603](#).

|         |                                  |
|---------|----------------------------------|
| Example | <code>:SOUR:FREQ 1.00 GHz</code> |
|---------|----------------------------------|

### 6.1.8 List Sequencer

Accesses sub-menus for configuring the **List Sequencer**.

List sequences allow you to enter frequencies and amplitudes at unequal intervals in nonlinear ascending, descending or random order. Each step within the list can also include its own waveform file for playback, step duration, trigger event and trigger output.

The complexities involved in configuring the **List Sequencer** do not lend themselves to manual configuration; hence the manual configuration for this feature is limited. For easier configuration of the List Sequencer, it is recommended that you use either SCPI, or load a tab-delimited file containing the setup parameters in a tabular form. The details of the SCPI for configuring the List Sequencer can be found in ["Step Configuration \(Remote Command Only\)" on page 594](#).

Once the **List Sequencer** has been configured using the front panel, SCPI, or by loading a tab-delimited file, the sequence must be initiated using the front panel **Initiate Sequence** key, or the corresponding SCPI command.

|              |                         |
|--------------|-------------------------|
| Dependencies | Not available in E7760B |
|--------------|-------------------------|

### 6.1.8.1 Sequencer

Sets the state of ["List Sequencer" on page 578](#)

- When **List Sequencer** is **ON**, the source outputs the sequence defined by the sequencer
- When **List Sequencer** is **OFF**, the source outputs a single waveform segment or sequence (independent mode) at a single frequency and amplitude

|                |                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:SOURce:LIST[:STATe] ON   OFF   1   0</code><br><code>:SOURce:LIST[:STATe]?</code>                                                                                                                                                                                                                                                                                          |
| Example        | <code>:SOUR:LIST OFF</code>                                                                                                                                                                                                                                                                                                                                                       |
| Notes          | When the sequencer is <b>ON</b> , the List Sequencer controls the output of the source                                                                                                                                                                                                                                                                                            |
| Dependencies   | Not available in E7760B                                                                                                                                                                                                                                                                                                                                                           |
| Couplings      | When in Sequence Analyzer Mode, and the List Sequencer state is <b>OFF</b> , <b>Include Source</b> is forced to <b>NO</b> , and the <b>Include Source</b> key is grayed-out<br>When in Sequence Analyzer Mode, and the List Sequencer state is <b>ON</b> , <b>Include Source</b> is available to set, and an ARB memory related operation such as load or delete will be rejected |
| Preset         | <b>OFF</b>                                                                                                                                                                                                                                                                                                                                                                        |
| Range          | <b>ON   OFF</b>                                                                                                                                                                                                                                                                                                                                                                   |

### 6.1.8.2 Initiate Sequence

Arms the sequence for single execution. Once the sequence is armed, the source begins the sequence as soon as the trigger is received. If trigger is set to **Free Run**, the sequence starts immediately.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:SOURce:LIST:TRIGger[:IMMediate]</code>                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Example        | <code>:SOUR:LIST:TRIG</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Notes          | When in Sequence Analyzer Mode, and <b>Include Source</b> is <b>ON</b> , the Initiate List Sequencer operation is rejected, and the key is grayed-outIf the file needed by the sequencer is not already in ARB memory, the sequence cannot be initiated, and an error is generated<br>There is a blocking SCPI query that can be used to check whether source list sequence was initiated successfully (see <a href="#">"Remote Software Trigger (Remote command Only)" on page 602</a> ) |
| Dependencies   | In Sequence Analyzer Mode, if <b>Meas Setup</b> , <b>Include Source</b> is set to <b>YES</b> , <b>Source</b> , <b>List Sequencer</b> , <b>Initiate Sequence</b> is disabled<br>Not available in E7760B                                                                                                                                                                                                                                                                                    |

### 6.1.8.3 Repetition

Accesses a sub-menu to select the repetition type for the List Sequencer globally. It cannot be changed between different sequence steps.

In **Single**, the Source list plays one time after initiation. In **Continuous**, the Source list plays continuously after initiation.

This setting is available on EXM.

|                |                                                                            |
|----------------|----------------------------------------------------------------------------|
| Remote Command | <code>:SOURce:LIST:REPetition:TYPE SINGLE   CONTInuous</code>              |

6.1.8.6 Manual Trigger Now

Provides a software trigger event to the List Sequencer. During execution of a sequence, if the sequencer is halted on any step that has been configured with a “Manual” step trigger, then this keypress causes the sequencer to continue and execute the step.

|       |                                     |
|-------|-------------------------------------|
| Notes | No remote command, front panel only |
|-------|-------------------------------------|

6.1.8.7 List Sequencer Setup

Accesses the List Sequencer setup menus.

Number of Steps

Lets you specify the number of steps within the list sequence.

|                |                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | :SOURce:LIST:NUMBer:STEPs <integer><br>:SOURce:LIST:NUMBer:STEPs?                                                                                                                                                                                                                                                                                                                  |
| Example        | :SOUR:LIST:NUMB:STEP 1                                                                                                                                                                                                                                                                                                                                                             |
| Notes          | Increasing the number of steps creates additional steps at the end of the list, with all the settings within the steps set to their default values<br><br>Decreasing the number of steps removes steps from the end of the list. The settings within the removed steps are not reset. This means that increasing the number of steps again would allow you to retrieve these steps |
| Dependencies   | The Step Count parameter is increased or decreased when you insert or delete a point from within the GUI interface to the sequencer<br><br>Not available in E7760B                                                                                                                                                                                                                 |
| Preset         | 1                                                                                                                                                                                                                                                                                                                                                                                  |
| Min            | 1                                                                                                                                                                                                                                                                                                                                                                                  |
| Max            | 1000                                                                                                                                                                                                                                                                                                                                                                               |

Go To Step

Lets you select the step number you wish to view or edit.

|        |   |
|--------|---|
| Preset | 1 |
|--------|---|

|     |            |
|-----|------------|
| Min | 1          |
| Max | Step Count |

## Insert Step Before

Inserts a new step, with default values, before the currently selected step. Inserting a step automatically increases the Step Count parameter by 1. If a sequence has already reached the upper limit of 1000 steps, then this operation is rejected, and error -221, "Setting Conflict; Cannot insert more steps, maximum number of steps reached" is displayed.

|       |                                                                                                  |
|-------|--------------------------------------------------------------------------------------------------|
| Notes | If the list already contains the maximum limit (1000 steps), pressing this control has no effect |
|-------|--------------------------------------------------------------------------------------------------|

## Delete Step

Deletes the current step. Deleting a step automatically decreases the Step Count parameter by 1. If the sequence only has one step left, then this operation is rejected, and error -221, "Setting conflict; Cannot delete current step, minimum number of steps reached" is displayed

|       |                                                                                               |
|-------|-----------------------------------------------------------------------------------------------|
| Notes | If the list already contains the minimum limit of 1 step, pressing this control has no effect |
|-------|-----------------------------------------------------------------------------------------------|

## Clear List

Clears the list. Clearing the list sets the number of steps to the default value (1) and sets the parameters for the only step to their default values.

## Step Trigger

Lets you select the trigger input for the current step.

|                |                                                                                                                                                                                                                                                                                  |

| Free Run                | <a href="#">IMM</a>  | Sets the trigger input for the current step to Free Run                                                                                                                                                                                                                                                                                                                                                              |
| Internal                | <a href="#">INT</a>  | Sets the trigger input for the current step to Internal                                                                                                                                                                                                                                                                                                                                                              |
| Manual<br>(Trigger Key) | <a href="#">KEY</a>  | Sets the trigger input for the current step to Manual (Trigger Key). Any step in the sequence set to Manual will cause the sequence execution to stop until the manual trigger key is pressed. Sending the Bus Trigger SCPI command will have no effect. At any point in the sequence where the List Sequencer is paused waiting for a software trigger, a pop-up dialog is displayed until the trigger event occurs |
| Bus                     | <a href="#">BUS</a>  | Sets the trigger input for the current step to Bus. Any step in the sequence set to Bus will cause the sequence execution to stop until the Bus Trigger command is sent. Pressing the manual trigger key has no effect. At any point in the sequence where the List Sequencer is paused waiting for a software trigger, a pop-up dialog is displayed until the trigger event occurs                                  |
| External 2              | <a href="#">EXT2</a> | Sets the trigger input for the current step to External 2<br>Note: When on EXM, trigger 2 is a bi-directional trigger port. So, when trigger 2 has been configured as OUTPUT type, choosing External 2 as the input trigger for the current step will generate error                                                                                                                                                 |

## Transition Time

Lets you specify the transition time for the current step.

The following table lists recommended values for appropriate settling times to allow for changes within the source.

| Value Changed | Recommended Transition Time                                 |
|---------------|-------------------------------------------------------------|
| Frequency     | 500 $\mu$ s                                                 |
| Amplitude     | 100 $\mu$ s to within 0.1 dB<br>20 $\mu$ s to within 1.0 dB |

If the Transition Time value is shorter than the time necessary for the hardware to settle and a List Sequence is initiated, a **warning** is generated. If the Transition Time value is longer than the Step Duration, an error is generated when initiating a source list sequence. For source list sequence, transition time is included in the step duration length. If the Transition Time value is longer than the Step Duration Time, the real step duration length is extended to equal the transition time and cause a timing shift.

|                |                                                                                                                                                              |

## Device

Lets you specify the radio band link direction for the steps within the list sequence. The link is used in conjunction with the channel band and channel number to determine the output frequency.

| Setting  | Option | Description                                                                                                                         |
|----------|--------|-------------------------------------------------------------------------------------------------------------------------------------|
| Uplink   | UP     | The source calculates the uplink frequency according to an uplink formula together with selected channel band and channel number    |
| Downlink | DOWN   | The source calculates the downlink frequency according to a downlink formula together with selected channel band and channel number |

|                |                                                                                                                           |

## Freq/Chan

Lets you select the frequency or channel value for the current step. If the Band selection for the current row is [NONE](#), you enter a frequency. Otherwise, enter a channel, which causes the frequency to be automatically selected, based on the Band selection.

### Entering a Frequency

If the Band selection for the current row is [NONE](#), enter a Frequency. This field in the table allows you to select the frequency value for the current step.

|                |                                                                                                                                                                                                                                                                                                                         |          |

## Entering a Channel

If the Band selection for the current row is not **NONE**, enter a Channel Number. This field in the table allows you to select the channel value for the current step. The frequency is selected automatically, based on the Band.

|              |                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Example      | <code>:SOUR:LIST:STEP2:SET:CNFR 124</code><br><code>:SOUR:LIST:STEP2:SET:CNFR?</code>                                                                                                                                                                                                                                                                                                                     |
| Notes        | SCPI is supported after A.09.40<br>Used to setup channel number or frequency setting, according to current Radio Band setting. If Radio Band is <b>NONE</b> , then the value is a frequency. If Radio Band is not <b>NONE</b> , then the value is a channel number                                                                                                                                        |
| Dependencies | Not available in E7760B                                                                                                                                                                                                                                                                                                                                                                                   |
| Couplings    | The channel number is coupled to the step frequency value. When the step frequency value is changed, the channel number increases or decreases to match the new step frequency. If the step frequency is not at an exact match for a channel number, the nearest channel number is displayed, along with a greater-than or less-than sign, to indicate the frequency is above or below the channel number |
| Preset       | 1                                                                                                                                                                                                                                                                                                                                                                                                         |
| Min/Max      | 0/10838 (See "Channel" on page 606 for valid ranges)                                                                                                                                                                                                                                                                                                                                                      |

## Power

Lets you specify the power value for the current step.

|                |                                                                                                                                                                                              |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:SOURce:LIST:STEP[1] 2 ... 1000:SETup:AMPLitude &lt;double&gt;</code><br><code>:SOURce:LIST:STEP[1] 2 ... 1000:SETup:AMPLitude?</code>                                                 |
| Example        | <code>:SOUR:LIST:STEP2:SET:AMPL -50dBm</code><br><code>:SOUR:LIST:STEP2:SET:AMPL?</code>                                                                                                     |
| Dependencies   | The RF power is dependent on the RF output port and frequency, such that the current frequency and selected output port determine the valid range of power values<br>Not available in E7760B |
| Preset         | -100 dBm                                                                                                                                                                                     |
| Min/Max        | The range of values depends on the current frequency and selected RF output port<br>See "RF Power" on page 570 and the RF Power Range table for valid ranges                                 |

## Waveform

Lets you select the waveform to be played back during the current step. Options are: CW, a Waveform file, Continue the previous step's waveform, or Off.

|                |                                                                            |
|----------------|----------------------------------------------------------------------------|
| Remote Command | <code>:SOURce:LIST:STEP[1] 2 ... 1000:SETup:WAVEform &lt;string&gt;</code> |
|----------------|----------------------------------------------------------------------------|

|              |                                                                                                                                                                                                                                                                      |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              | <p>where <b>&lt;string&gt;</b> is one of:<br/> <b>"CW"</b>, <b>"waveform name"</b>, <b>"Cont"</b>, <b>"Off"</b><br/> For full details of options, see <a href="#">"More Information" on page 591</a><br/> <b>:SOURce:LIST:STEP[1] 2 ... 1000:SETup:WAVeform?</b></p> |
| Example      | <b>:SOUR:LIST:STEP2:SET:WAV "CW"</b><br><b>:SOUR:LIST:STEP2:SET:WAV?</b>                                                                                                                                                                                             |
| Notes        | SCPI is supported after A.09.40                                                                                                                                                                                                                                      |
| Dependencies | <p>Not available in E7760B</p> <p>For VXT models M9410A/11A/16A, if the Waveform is not Continue Previous, there is always a time gap between the current step and the previous step</p>                                                                             |
| Preset       | <b>CW</b>                                                                                                                                                                                                                                                            |
| Range        | <b>"CW"</b> , <b>"waveform name"</b> , <b>"Cont"</b> , <b>"Off"</b>                                                                                                                                                                                                  |

## More Information

| Parameter         | SCPI                   | Notes                                                                                                                                                                                                                                                                                                    |
|-------------------|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CW                | <b>"CW"</b>            | Sets the current step to output a CW tone                                                                                                                                                                                                                                                                |
| Selected Waveform | <b>"waveform name"</b> | <p>Inserts a waveform from the Select Waveform dialog as the waveform for playback during the current step</p> <p>If the selected waveform contains header (which contains ARB play parameters), source list sequence will automatically apply header settings of the selected waveform in that step</p> |
| Continue Previous | <b>"Cont"</b>          | Sets the current step to continue with playback of the waveform from the previous step. When continuing the previous waveform, the ARB playback will not pause while the source retunes to the new frequency or amplitude that may be defined for the new step                                           |
| Off               | <b>"Off"</b>           | Disable RF output of the current step                                                                                                                                                                                                                                                                    |

## Waveform File

Pressing the slide-aside field of this column (>) opens the ["Select Waveform" on page 649](#) screen, which lets you select a waveform in ARB memory to playback during the current step. When you select a waveform, and press **OK**, it returns to the List Sequencer Setup screen with that file name in the table.

## Step Duration

Lets you select the duration of play for the current step.

The duration can be set to be either the number of times for the ARB file associated with the sequence to play, or a specific time value, or continuous. If the step is set to play a CW tone, the step duration cannot be set to a play count.

## Option Details

| Parameter        | SCPI              | Notes                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Time             | <b>TIME</b>       | Sets the duration of the current step to be a time value for the length of time the step will play<br><br>When <b>TIME</b> is selected, the Time may be set using the second field under <b>Step Duration</b> and/or by the <a href="#">"Duration Time" on page 592</a> command                                                                                                                                                                                           |
| Count            | <b>COUNT</b>      | Sets the duration of the current step to be an integer value for the number of times (play count) the ARB file is selected for playback during this step. For example, a 5 second ARB will be set to play 5 times during the step<br><br>When <b>COUNT</b> is selected, the Count may be set using the second field under <b>Step Duration</b> and/or by the <a href="#">"Play Count" on page 593</a> command                                                             |
| Continuous       | <b>CONTInuous</b> | Sets the current step to be played continuously until the next step starts. The waveform will always play completely before transitioning to the next step                                                                                                                                                                                                                                                                                                                |
| Continuous Abort | <b>CABort</b>     | Sets the current step to be played continuously or until the trigger event of the next step is detected. When a trigger event is received, the waveform play will be aborted after the interval specified by the Duration Time parameter and it will then transition to the next step<br><br>When Continuous Abort is selected, the Duration Time may be set using the second field under Step Duration and/or by the <a href="#">"Duration Time" on page 592</a> command |

## Duration Time

Lets you specify the length of time the current step will play when ["Step Duration" on page 591](#) is Time.

## 6 Input/Output

### 6.1 RF Source

When **"Step Duration" on page 591** is Continuous Abort, this parameter specifies the maximum duration that the waveform will continue to play after a step trigger is received before the transition to the next waveform will occur. Duration is limited to a maximum of 20 seconds.

If the Transition Time value is longer than the Step Duration Time, an error is generated when initiating a source list sequence. For source list sequence, transition time is included in the step duration length (not occupy additional time). If the Transition Time value is longer than the Step Duration Time, the real step duration length is extended to equal the transition time and cause a timing shift.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## Trig Out

Lets you specify the trigger output for the current step. The trigger output signal is sent at the start of the step.

When this is **ON**, a trigger event occurs on both Internal and External2 paths. Selecting **OFF** turns off trigger output.

## Step Configuration (Remote Command Only)

Used to configure the List Sequencer, as detailed in the table below. The command is defined such that you send one command per step, with the step number being specified as a subopcode of the SCPI command. Each command includes all the parameter settings for the step. As a step is set up, the values entered are run through several levels of validation.

|                |                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| Example        | <code>:SOUR:LIST:STEP1:SET INT, 1ms, PGSM, DOWN, 10, -25 dBm, "GSM_Test1.bin", TIME, 10ms, OFF</code>                                                                                                                                                                                                                                                                                                      |
| Dependencies   | The range of subopcode values is 1 to 1000, and the value you enter is determined by the number of steps you have configured. For details see <a href="#">"Number of Steps" on page 581</a>                                                                                                                                                                                                                |

---

If you attempt to remotely set or query a subopcode that is out of range, an error is generated

## Step Configuration Parameters

There are 10 parameters for each step, which must be in the following order in the command:

- |   |                                                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---|------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | Step Trigger<br><code>&lt;step_trigger&gt;</code>          | Data Type: enum<br>Specifies the input trigger for the step. For further details, see <a href="#">"Step Trigger" on page 582</a>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 2 | Transition Time<br><code>&lt;trans_time&gt;</code>         | Data Type: enum<br>Specifies the transition time for the step, in seconds. For further details, see <a href="#">"Transition Time" on page 583</a>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Step Configuration of Step Trigger parameter list (Remote Command Only)

Configures the “Step Trigger” parameter array of the whole List Sequencer at one time. The number of arrays is the same as the step number defined in ["Number of Steps" on page 581](#). As a step is setup, the value entered runs through several levels of validation.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

### Step Configuration of Waveform parameter list (Remote Command Only)

Configures the **Waveform** parameter array of the whole List Sequencer at one time. The number of arrays is same as step number defined in ["Number of Steps" on page 581](#). As a step is set up, the value entered runs through several levels of validation.

|                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                         |                                                                                                                                                                                                                                                                                                   |             |                                                           |           |                   |            |                        |

The filename value is the name of the file within ARB playback memory, it is does not include the windows path to the file on the HDD. If you enter a filename for a waveform that does not reside within ARB playback memory, an error is generated                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                         |                                                                                                                                                                                                                                                                                                   |             |                                                           |           |                   |            |                        |
| <b>CONT</b>             | Continues playback of the ARB file from the previous step                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                         |                                                                                                                                                                                                                                                                                                   |             |                                                           |           |                   |            |                        |

### Step Configuration of Step Duration parameter list (Remote Command Only)

Configures the **Step Duration** parameter array of the whole List Sequencer at one time. The number of arrays is same as step number defined in ["Number of Steps" on page 581](#). As a step is set up, the value entered runs through several levels of validation.

| Notes        | <p>Sets up or queries the parameter array of whole list sequence</p> <p>Step Duration <b>&lt;enum&gt;</b> - specifies the duration of the step. The duration can be specified to be either time, or play count of the ARB file associated with the step, or continuous. If Waveform is set to "CW", this value cannot be set to Play Count and an error will be generated. If continuous is selected, the following Time or Count value is ignored. For further details of this setting, see <a href="#">"Step Duration" on page 591</a></p> <p>Options are:</p> <p><b>TIME   COUNT   CONTinuous</b></p> <p>If input parameter number exceeds the step number defined by <a href="#">"Number of Steps" on page 581</a>, then error -221, "Settings conflict; The number of input parameters is too large and is truncated to current list step number" is generated, and only those parameters whose index number falls within number of steps will be updated</p> |
| Dependencies | <p>The range is 1 to 1000, which is determined by the number of steps you have configured. For details see <a href="#">"Number of Steps" on page 581</a></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

### Step Configuration of Duration Time or Play Count parameter list (Remote Command Only)

Configures the **Duration Time** or **Play Count** parameter array of the whole List Sequencer at one time. The number of arrays is same as step number defined in ["Number of Steps" on page 581](#). As a step is set up, the value entered runs through several levels of validation.

| Notes          | <p>Sets up or queries the parameter array of whole list sequence</p> <p>Time or Count <b>&lt;time/int&gt;</b> - specifies time duration in seconds or play count of the ARB file associated with the step</p> <p>If input parameter number exceeds the step number defined by <a href="#">"Number of Steps" on page 581</a>, then an error is generated, and only those parameters whose index number falls within number of steps will be updated</p> <p>If current <a href="#">"Step Duration" on page 591</a> is "Continuous", then error -221, "Settings conflict; Cannot accept time or count input when step duration type is Continuous on step #" is generated</p> |
| Dependencies   | <p>The range is 1 to 1000, which is determined by the number of steps you have configured. For details see <a href="#">"Number of Steps" on page 581</a></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Step Configuration of Output Trigger parameter list (Remote Command Only)

Configures the **Output Trigger** parameter array of the whole List Sequencer at one time. The number of arrays is same as step number defined in ["Number of Steps" on page 581](#). As a step is set up, the value entered runs through several levels of validation.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:SOURce:LIST:SETup:OUTPut:TRIGger &lt;bool&gt;, &lt;bool&gt;, &lt;bool&gt;, ...</code><br><code>:SOURce:LIST:SETup:OUTPut:TRIGger?</code>                                                                                                                                                                                                                                                                                                                                                                                         |
| Example        | <code>:SOUR:LIST:SET:OUTP:TRIG ON,OFF,ON</code><br><code>:SOUR:LIST:SET:OUTP:TRIG?</code>                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Notes          | Sets up or queries the parameter array of whole list sequence<br>Output Trigger <Boolean> - specifies the output trigger for the step. Options are:<br><code>ON OFF 1 0</code><br><br>If input parameter number exceeds the step number defined by <a href="#">"Number of Steps" on page 581</a> , then error -221, "Settings conflict; The number of input parameters is too large and is truncated to current list step number" is generated, and only those parameters whose index number falls within legal step number are updated |
| Dependencies   | The range is 1 to 1000, which is determined by the number of steps you have configured. For details see <a href="#">"Number of Steps" on page 581</a>                                                                                                                                                                                                                                                                                                                                                                                   |

## Clear List (Remote Command Only)

The SCPI equivalent of the Clear List UI feature described in ["Clear List" on page 582](#).

|                |                                       |
|----------------|---------------------------------------|
| Remote Command | <code>:SOURce:LIST:SETup:CLEAr</code> |
| Example        | <code>:SOUR:LIST:SETup:CLE</code>     |
| Dependencies   | Not available in E7760B               |

### 6.1.8.8 Remote Software Trigger (Remote command Only)

During execution of a list sequence, the sequence halts and waits at any step that has Step Trigger set to "Bus". Sending this command triggers the step and continues the sequence.

|                |                                                        |
|----------------|--------------------------------------------------------|
| Remote Command | <code>:SOURce:LIST:TRIGger:INITiate[:IMMediate]</code> |
| Example        | <code>:SOUR:LIST:TRIG:INIT</code>                      |
| Dependencies   | Not available in E7760B                                |

### 6.1.8.9 Query List Sequence Initiation Armed Status (Remote Query Only)

This is a blocking SCPI query to determine whether a source list sequence has been initiated successfully.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:SOURce:LIST:INITiation:ARMed?</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Example        | <code>:SOUR:LIST:INIT:ARMed?</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Notes          | <p>Returns “1” if list sequence has been initiated successfully, or “0” if not. If the response is “0”, use <code>:SYST:ERR?</code> to query the actual error</p> <p>Like <code>*OPC?</code>, this command can be blocked until event/status “IsSourceSweeping” occurs, and then returns. Doing so can help a script query the armed status only once during the time interval of the initiation. As an ancillary to the existing <code>:SOUR:LIST:TRIGger[:IMMediate]</code> (see <a href="#">"Initiate Sequence" on page 579</a>), send this query after <code>:SOUR:LIST:TRIG</code>. Otherwise, this query will return “1” immediately</p> <p>The return data is in the following format: Integer</p> <p>There is an alias: <code>:SOURce:LIST:TRIGger:INITiation:ARMed?</code></p> |
| Dependencies   | Not available in E7760B                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## 6.1.9 Frequency Setup

Lets you access the Frequency Setup sub-menu panel.

|       |                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Notes | <p>The menu under this control is for independent mode and has no effect on the <a href="#">"List Sequencer" on page 578</a>. If <a href="#">"Sequencer" on page 579</a> is <b>ON</b>, the List Sequencer controls the source output and this key is grayed-out, to indicate out-of-scope. When <a href="#">"Sequencer" on page 579</a> is <b>OFF</b>, source leaves List Sequencer and this button is blanked out</p> |
|-------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### 6.1.9.1 Frequency

Lets you set the RF Output Frequency. You can adjust the frequency of the source using the numeric keypad, step keys, or RPG. Pressing any digit (0 through 9) on the numeric keypad displays the unit terminator.

|                |                                                                                                                                                                                                                                                                                                                       |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Remote Command | <code>:SOURce:FREQuency[:CW] &lt;freq&gt;</code><br><code>:SOURce:FREQuency[:CW]?</code>                                                                                                                                                                                                                              |
| Example        | <code>:SOUR:FREQ 1.00 GHz</code>                                                                                                                                                                                                                                                                                      |
| Notes          | <p>Internal source has list sequence mode, which comprises of several steps that contain separate output power, frequency and waveform etc. When the source list sequence playing is complete, the last step keeps playing, and you can use this command to change the list sequence last step's output frequency</p> |
| Couplings      | <p>The frequency value is coupled to the current channel band and number, such that updates to the band and number will update the frequency value to the corresponding absolute frequency</p>                                                                                                                        |

|        |                                                                                                                                                                                                                                                               |                                                          |
