

TECHNICAL  
OVERVIEW

# 85024A High Frequency Probe

300 kHz to 3 GHz

## Extend High Frequency Probing Applications

The Keysight Technologies Inc. 85024A high frequency probe offers excellent performance. The probe employs a GaAs IC to obtain extremely low input capacitance of only 0.7 pF shunted by 1 M $\Omega$  of resistance. Because of this low input capacitance, high frequency probing is possible without adversely loading the circuit under test. Also, the 1 M $\Omega$  shunt resistance guarantees minimal circuit loading at lower frequencies. Since the probe has excellent sensitivity, it is well-suited for use with analyzers offering exceptional dynamic range. The 85024A is an excellent accessory for high frequency test equipment, especially Keysight RF network or signal/spectrum analyzers which supply probe power from the front panel.

Probe with less error due to higher input impedance. For example, in a 50  $\Omega$  system at 500 MHz, the 85024A presents 455  $\Omega$  which produces a 10% signal loss from loading effects, while a 3 pF, 100 k $\Omega$  probe presents 106  $\Omega$  causing a 32% signal loss.

## Signal/Spectrum Analysis

Troubleshooting RF and IF signal paths to identify problem areas in a system is convenient and accurate with an 85024A and a signal/spectrum analyzer. Measurements of frequency, power, modulation, distortion, conversion loss, and spectral purity are possible within a circuit. High sensitivity and low distortion levels ensure the probe's ability to detect small signals or search for spurious responses. In fact, the sensitivity of most 85024A applications is limited only by the noise floor of the spectrum analyzer itself. Add a tracking generator to easily perform swept in-circuit measurements.

Figure 1. Troubleshoot IF paths for low level spurious responses.

## Network Analysis

When used with a network analyzer, this versatile probe makes it easy to measure the gain, attenuation, phase linearity, or group delay of individual circuit stages. Also, investigate multi-stage circuits to rapidly determine the location of faults in a system. Low input capacitance and high shunt resistance minimizes the loading to the circuit under test. Excellent frequency response and unity gain of the Keysight 85024A guarantee high accuracy in swept measurements.

Figure 2. Excellent flatness maintains accuracy in swept measurements.

## Advanced Design

Simplicity and reliability are inherent in the design of the 85024A. The front end was designed using a custom GaAs IC to provide low input capacitance. A retractable metal sleeve protects the probe from physical damage to the tip when not in use and, more importantly, from electrostatic discharge (ESD) damage to the probe. By retracting the metal sleeve, the user establishes himself at the same potential as the high frequency probe. Thus, it may be handled with less possibility of electrostatic damage. Finally, the entire probe front end is easily disassembled for quick replacement in the field.

A replaceable state-of-the-art GaAs IC provides high performance and extends the lifetime of the 85024A.

## Compatible with Many Keysight Instruments

Direct compatibility with many RF analyzers further leverages the performance and flexibility of the 85024A high frequency probe.

## Specifications

### Terminated with 11880-60001 type-N adapter

Specifications describe the warranted performance over the temperature range of 25 °C,  $\pm 5$  °C (except where noted). Supplemental characteristics are intended to provide information useful in applying the instrument by giving unwarranted performance parameters. These are denoted as “typical,” “nominal,” or “approximate.”

|                                                                                                                                                       | Description                |
|-------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------|
