Keysight X-Series Signal Analyzer

This documentation is for the following X-Series Instruments:

- Multi-Touch Signal Analyzers (UXA, PXA, MXA, EXA, CXA, PXI)
- Multi-Touch PXI Vector Transceivers (VXT)
- Wireless Test Sets

WCDMA Mode User's & Programmer's Reference

Technology Licenses

The hardware and/or software described in this document are furnished under a license and may be used or copied only in accordance with the terms of such license.

U.S. Government Rights

The Software is "commercial computer software," as defined by Federal Acquisition Regulation ("FAR") 2.101. Pursuant to FAR 12.212 and 27.405-3 and Department of Defense FAR Supplement ("DFARS") 227.7202, the US government acquires commercial computer software under the same terms by which the software is customarily provided to the public. Accordingly, Keysight provides the Software to US government customers under its standard commercial license, which is embodied in its End User License Agreement (EULA), a copy of which can be found at http://www.keysight.com/find/sweula. The license set forth in the EULA represents the exclusive authority by which the US government may use, modify, distribute, or disclose the Software. The EULA and the license set forth therein, does not require or permit, among other things, that Keysight: (1) Furnish technical information related to commercial computer software or commercial computer software documentation that is not customarily provided to the public; or (2) Relinquish to, or otherwise provide, the government rights in excess of these rights customarily provided to the public to use, modify, reproduce, release, perform, display, or disclose commercial computer software or commercial computer software documentation. No additional government requirements beyond those set forth in the EULA shall apply, except to the extent that those terms, rights, or licenses are explicitly required from all providers of commercial computer software pursuant to the FAR and the DFARS and are set forth specifically in writing elsewhere in the EULA. Keysight shall be under no obligation to update, revise or otherwise modify the Software. With respect to any technical data as defined by FAR 2.101, pursuant to FAR 12.211 and 27.404.2 and DFARS 227.7102, the US government acquires no greater than Limited Rights as defined in FAR 27.401 or DFAR 227.7103-5 (c), as applicable in any technical data.

Warranty

THE MATERIAL CONTAINED IN THIS DOCUMENT IS PROVIDED "AS IS," AND IS SUBJECT TO BEING CHANGED, WITHOUT NOTICE, IN FUTURE EDITIONS. FURTHER, TO THE MAXIMUM EXTENT PERMITTED BY APPLICABLE LAW, KEYSIGHT DISCLAIMS ALL WARRANTIES, EITHER EXPRESS OR IMPLIED, WITH REGARD TO THIS MANUAL AND ANY INFORMATION CONTAINED HEREIN, INCLUDING BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. KEYSIGHT SHALL NOT BE LIABLE FOR ERRORS OR FOR INCIDENTAL OR CONSEQUENTIAL DAMAGES IN CONNECTION WITH THE FURNISHING, USE, OR PERFORMANCE OF THIS DOCUMENT OR OF ANY INFORMATION CONTAINED HEREIN. SHOULD KEYSIGHT AND THE USER HAVE A SEPARATE WRITTEN AGREEMENT WITH WARRANTY TERMS COVERING THE MATERIAL IN THIS DOCUMENT THAT CONFLICT WITH THESE TERMS, THE WARRANTY TERMS IN THE SEPARATE AGREEMENT SHALL CONTROL.

Safety Information

CAUTION

A CAUTION notice denotes a hazard. It calls attention to an operating procedure, practice, or the like that, if not correctly performed or adhered to, could result in damage to the product or loss of important data. Do not proceed beyond a CAUTION notice until the indicated conditions are fully understood and met.

WARNING

A WARNING notice denotes a hazard. It calls attention to an operating procedure, practice, or the like that, if not correctly performed or adhered to, could result in personal injury or death. Do not proceed beyond a WARNING notice until the indicated conditions are fully understood and met.

1 Documentation Roadmap

This section describes the Keysight products covered by this document, and provides links to related documentation.

– "Products Covered by this Document" on page 80

– "Additional Documentation" on page 81

1.1 Products Covered by this Document

Product Family	Full Product Name	Model Numbers
Multi-Touch Signal Analyzers	UXA Signal Analyzer	N9042B
		N9041B
		N9040B
	PXA Signal Analyzer	N9032B
		N9030B
	MXA Signal Analyzer	N9021B
		N9020B
	EXA Signal Analyzer	N9010B
	CXA Signal Analyzer	N9000B
	PXIe Signal Analyzer	M9391A
Multi-Touch PXIe Vector Transceivers	VXT PXIe Vector Transceiver	M9421A
		M9420A
		M9415A
		M9411A
		M9410A
Wireless Test Sets		E6680A

1.2 Additional Documentation

If your instrument or computer has an internet connection, then you can access the latest editions of all relevant X-Series documentation via the links below.

This document is available in 3 formats:

- **Embedded Help**, in the instrument
- **Online Help**, at Keysight's web site

  For information on this Mode, browse to:

  http://rfmw.em.keysight.com/wireless/helpfiles/WCDMAMode/FlexUI.htm
- **Users & Programmers Reference**, in downloadable PDF format

  For information on this Mode, download from:

  http://literature.cdn.keysight.com/litweb/pdf/N9073-90002.pdf

The following documents are in downloadable PDF format:

Getting Started Guides, Instrument Messages & Security

- N90x0B Getting Started & Troubleshooting Guide
- N9041B Getting Started & Troubleshooting Guide
- X-Series Signal Analyzers Instrument Messages
- Security Features & Statement of Volatility

Specifications Guides

- N9000B CXA Specifications Guide
- N9010B EXA Specifications Guide
- N9020B MXA Specifications Guide
- N9030B PXA Specifications Guide
- N9040B UXA Specifications Guide
- N9041B UXA Specifications Guide

Measurement Guides

- Spectrum Analyzer Mode Measurement Guide
- Real-Time Spectrum Analyzer Measurement Guide
- Noise Figure Measurement Guide
- Analog Demod Measurement Application Measurement Guide
- Phase Noise Measurement Application Measurement Guide
- EMI Measurement Application Measurement Guide

Service Guides

- N9010B EXA Service Guide
- N9020B MXA Service Guide
- N9030B PXA Service Guide
- N9040B UXA Service Guide

2 User Interface

Here are the basic elements of the Multitouch User Interface. For more information, tap a topic.

Included in this section are also topics for several front panel keys not described in other topics. Tap one of these topics for more information.

"Cancel key" on page 165

"Onscreen Keyboard key" on page 166

"Touch On/Off Key" on page 167

"Tab key" on page 168

2.1 Screen Tabs

In the X-Series Multitouch User Interface (or Multitouch UI), you can run many different Measurement Applications, or “Modes”. Examples are Spectrum Analyzer Mode, LTE-A FDD Mode, IQ Analyzer Mode, and Real Time Spectrum Analyzer Mode. Each Mode has its own set of controls, windows and SCPI commands.

Each Mode runs within a “Screen”. The Multitouch UI supports multiple “Screens” (see "Multiscreen" on page 150 for more information). Each screen displays one Measurement in one Mode. The set of configured screens is shown across the top of the display as a set of Screen Tabs, with a + tab at the right for adding new Screens:

You can see up to six tabs at a time on the UXA, and 4 at a time on the CXA, EXA, MXA and PXA. If there are more Screens configured than this, arrows appear to the left and right of the Screen Tabs; pressing the arrows scrolls the Screen Tabs to the left or right. A scroll bar also appears at the bottom of the Screen Tabs, indicating that you can scroll the tabs by dragging them with your finger; you can also scroll them by dragging the scroll bar.

Pressing a Screen Tab selects that screen for operation. Pressing the blue (selected) Screen Tab is the same as pressing the Mode/Meas front panel key.

Both actions open the "Mode/Meas/View Dialog" on page 85. In addition, if you have a PC keyboard plugged in, the sequence CTL-SHIFT-M will open up this dialog.

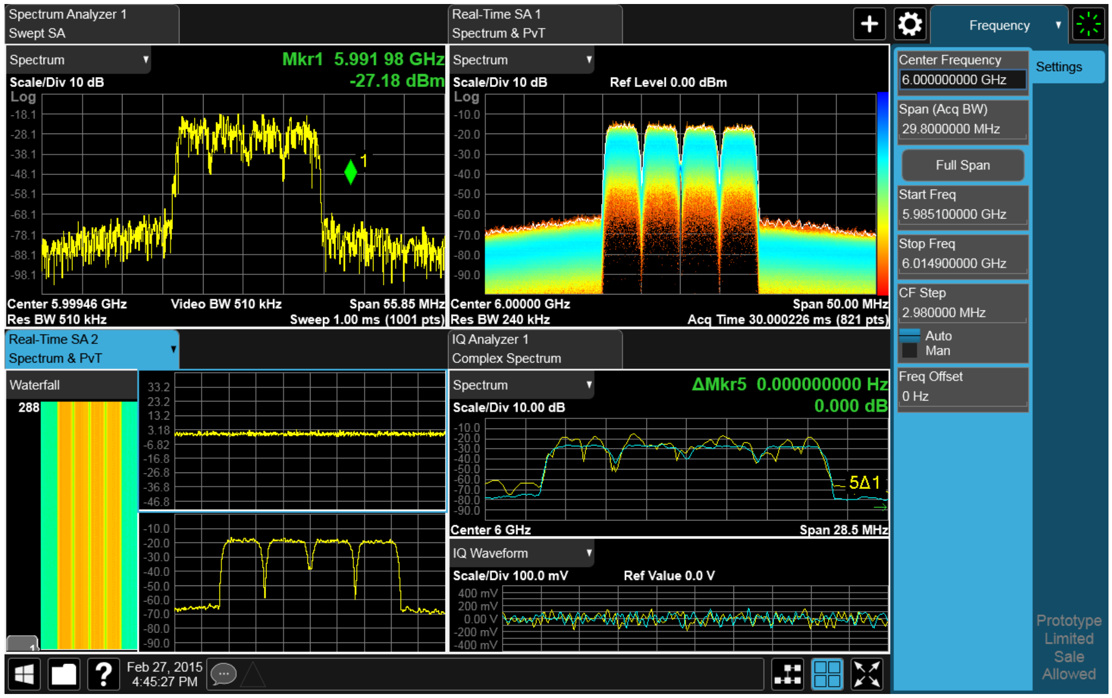
The + tab at the right of the Screen Tabs bar adds a new Screen by cloning the current screen. The new Screen has the identical setup and settings as the current Screen. You can then change the Mode, Measurement and/or settings of the new Screen.

You can define up to 16 screens at once.

Example Multiscreen View

The example below shows a four-screen display in Multiscreen view.

The Screen called “Real-Time SA 2” is selected, as indicated by its blue tab. Touching any other screen or tab selects the screen for that tab and brings it to the foreground.



The following topics provide more information:

– "Mode/Meas/View Dialog" on page 85

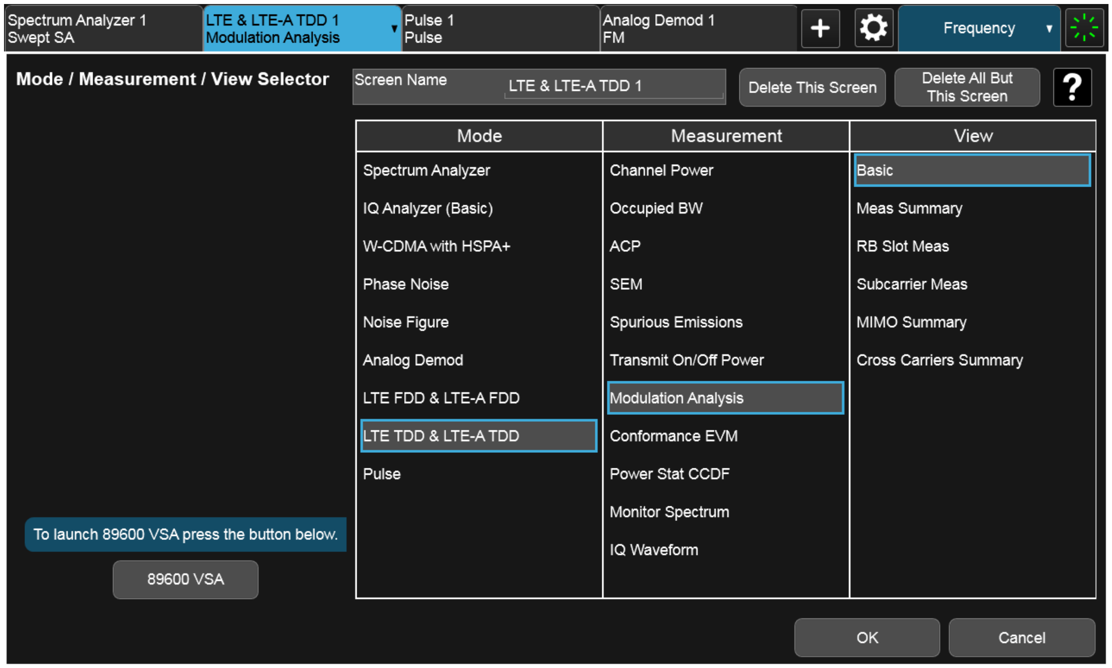
– "Add Screen" on page 101

– "Multiscreen" on page 150

2.1.1 Mode/Meas/View Dialog

The Mode/Meas/View dialog opens when you press the selected (blue) Screen tab (see "Screen Tabs" on page 84) or the **Mode/Meas** front panel key.

This dialog displays lists of available Modes, Measurements and Views, as well as the "Sequencer" on page 95 control for configuring Screens.



2.1.1.1 Mode

The first column in the Mode/Meas/View dialog allows you to select the desired Mode from those currently licensed in your instrument.

Modes, also known as “measurement applications”, are collections of measurement capabilities packaged together to provide you with an instrument personality specific to your measurement needs. Each Mode is ordered separately by Model Number and must be licensed in order for it to be available in the instrument.

You select the Mode you want to run using the Mode/Meas/View dialog. Once a Mode is selected, only the commands that are valid for that mode can be executed

For more information on Modes, preloading Modes, and memory requirements for Modes, see "More Information" on page 88

The `:INSTrument[:SELect]` command is used to remotely select a Mode by sending the instrument a parameter which represents the name of the desired Mode. The Mode Names may be found in the table under "Index to Modes" on page 88.

The `:INSTrument:NSELect` command is used to remotely select a Mode by sending the Mode Number of the desired Mode. See "Instrument Number Select" on page 87. The Mode Numbers may be found in the table under "Index to Modes" on page 88.

The `:INSTrument:CONFigure` command causes a Mode and Measurement switch at the same time. This generally results in faster overall switching than sending the `:INSTrument:SELect` and `CONFigure` commands separately. See "Mode and Measurement Select" on page 87.

Remote Command	`:INSTrument[:SELect] <mode_id>`

	where <mode_id> is one of the values listed in Index to Modes below. `:INSTrument[:SELect]?`
Example	`:INST SA`
Notes	A list of the valid mode choices is returned by the `:INST:CAT?` query
Preset	The default Mode is set to SA on **Restore System Defaults->All**, unless noted below: For N8973B, N8974B, N8975B, or N8976B: `NFIG` For E7760: `BASIC`
State Saved	Saved in instrument state
Annunciation	Application Title is in the Screen Tab

Instrument Number Select

Remote Command	`:INSTrument:NSELect <integer>` `:INSTrument:NSELect?`
Example	`:INST:NSEL 1`
Notes	The Mode Numbers may be found in the table under "Index to Modes" on page 88 SA mode is number 1 The command is sequential: that is, continued parsing of commands cannot proceed until the instrument select is complete and the resultant SCPI trees are available
Preset	The default Mode is set to `1` on **Restore System Defaults->All**, unless noted in the table above
State Saved	Saved in instrument state

Mode and Measurement Select

Remote Command	`:INSTrument:CONFigure:<mode>:<meas>` where `<mode>` is a valid parameter for the `:INST:SEL` command and `<meas>` is a valid parameter for the `:CONF` command in the Mode specified by `<mode>`

Example	`:INST:CONF:SA:SAN`
	selects the Spectrum Analyzer mode and the Swept SA measurement
	`:INST:CONF:WCDMA:RHO`
	selects the WCDMA mode and the Mod Accuracy measurement

Notes	The available parameters for `<mode>` are dependent upon installed and licensed applications resident in the instrument. The available parameters for `<meas>` are dependent on the `<mode>` parameter and the valid measurements available for that mode, which can depend on model numbers and installed options In general this command will execute more quickly than sending the equivalent separate `:INST:SEL` and `:CONF` commands

Index to Modes

The Mode Number in the table below is the parameter for use with the `:INSTrument:NSELect` command. The Mode Parameter is the parameter for use with the `:INSTrument[:SELect]` command. Your actual choices will depend upon which applications are installed in your instrument.

Mode	Mode Number	Mode Parameter <mode_id>
5G NR	109	NR5G
89601 VSA	101	VSA89601
Analog Demod	234	ADEMOD
Avionics	232	AVIONIC
Bluetooth	228	BTooth
Channel Quality / Group Delay	161	CQM
EMI Receiver	141	EMI
GSM/EDGE/EDGE Evo	13	EDGEGSM
I/Q Analyzer (Basic)	8	BASIC
LTE FDD & LTE-A FDD	107	LTEAFDD
LTE TDD & LTE-A TDD	108	LTEATDD
Measuring Receiver	233	MRECEIVE
MSR	106	MSR
Noise Figure	219	NFIGure
Phase Noise	14	PNOISE
Power Amplifier	81	PA
Pulse	151	PULSEX
Radio Test	300	RTS
Real Time Spectrum Analyzer	2	RTSA
Remote Language Compatibility	266	RLC
SCPI Language Compatibility	270	SCPILC
Sequence Analyzer	123	SEQAN
Short Range Comms	218	SRCOMMS
Spectrum Analyzer	1	SA
Vector Modulation Analyzer	200	VMA
WCDMA with HSPA+	9	WCDMA
WLAN	217	WLAN

More Information

The Mode name appears on the Screen Tab, followed by a number identifying which instance of the mode appears on that screen. Each Screen contains one Mode. For example, in the image below there is one Real-Time Spectrum Analyzer and two Spectrum Analyzer screens. The current Screen contains Real-Time SA 1.

It is possible to specify the order in which the Modes appear in the Mode menu, using the Configure Applications utility on the Desktop. It is also possible, using the same utility, to specify a subset of the available applications to load into memory at startup time, which can decrease the startup time of the instrument and the amount of memory consumed.

Each application (Mode) that runs in an X-Series instrument consumes virtual memory. The various applications consume varying amounts of virtual memory, and as more applications run, the memory consumption increases. Keysight characterizes each Mode and assigns a memory usage quantity based on a conservative estimate. The Configure Applications utility shows an estimate for how much memory each Mode will consume.

You can still run a Mode even if it is not preloaded into memory - during runtime, the first time an application that is not loaded into memory is selected (by either pressing that applications Mode key or sending that application's `:INST:SEL` command over SCPI), the Application will be loaded, but this takes a few seconds. The instrument will pause while loading the application while displaying a message box that says "Loading application, please wait..." Preloading the application eliminates this wait time but consumes additional memory.

2.1.1.2 Application Mode Remote Commands

This section contains a number of remote commands that are provided for programming convenience and remote compatibility.

Application Mode Catalog Query (Remote Command Only)

Returns a string containing a comma separated list of names of all the installed and licensed measurement modes (applications). These names can only be used with the :INSTrument[:SELect] command.

Remote Command	`:INSTrument:CATalog?`
Example	`:INST:CAT?`
Notes	Query returns a quoted string of the installed and licensed modes separated with a comma. Example: "SA,PNOISE,WCDMA"
Backwards Compatibility Notes	VSA (E4406A) :INSTrument:CATalog? returned a list of installed INSTrument:SELECT items as a comma separated list of string values, for example: "BASIC","GSM","EDGEGSM","CDMA","SERVICE" X-Series uses the ESA/PSA compatible query of a string contain comma separated values: "SA,PNOISE,NFIG,BASIC"

Current Application Model (Remote Command Only)

Returns a string that is the Model Number of the currently selected application (mode). This information is also displayed in the **Show System** screen.

Remote Command	`:SYSTem:APPLication[:CURRent][:NAME]?`
Example	`:SYST:APPL?`
Notes	Query returns a quoted string that is the Model Number of the currently selected application (Mode). Example: "N9060A" String length between 6 to 9 characters.
Preset	Not affected by Preset
State Saved	Not saved in state, the value will be the selected application when a Save is done.

Current Application Revision (Remote Command Only)

Returns a string that is the Revision of the currently selected application (mode). This information is also displayed in the Show System screen

Remote Command	`:SYSTem:APPLication[:CURRent]:REVision?`
Example	`:SYST:APPL:REV?`
Notes	Query returns a quoted string that is the Revision of the currently selected application (Mode). Example: "1.0.0.0" String length is a maximum of 23 characters. (each numeral can be an integer + 3 decimal points) The format is Major.Minor.Build.Compile, where Major must correspond to the Integer portion of the Version in the license file for the application.
Preset	Not affected by a Preset
State Saved	Not saved in state, the value will be the selected application when a Save is done.

Current Application Options (Remote Command Only)

Returns a string that is the Options list of the currently selected application (Mode). This information is also displayed in the Show System screen

Remote Command	`:SYSTem:APPLication[:CURRent]:OPTion?`
Example	`:SYST:APPL:OPT?`
Notes	Query returns a quoted string that is the Option list of the currently selected application (Mode). The format is the name as the *OPT? or SYSTem:OPTion command: a comma separated list of option identifiers. Example: "1FP,2FP"

	String length is a maximum of 255 characters.
Preset	Not affected by a Preset
State Saved	Not saved in state per se, the value will be the selected application when a Save is invoked.

Application Catalog Number of Entries (Remote Command Only)

Returns the number of installed and licensed applications (Modes).

Remote Command	`:SYSTem:APPLication:CATalog[:NAME]:COUNt?`
Example	`:SYST:APPL:CAT:COUN?`
Preset	Not affected by Preset
State Saved	Not saved in instrument state.

Application Catalog Model Numbers (Remote Command Only)

Returns a list of Model Numbers for the installed and licensed applications (Modes).

Remote Command	`:SYSTem:APPLication:CATalog[:NAME]?`
Example	`:SYST:APPL:CAT?`
Notes	Returned value is a quoted string of a comma separated list of Model Numbers. Example, if SAMS and Phase Noise are installed and licensed: "N9060A,N9068A" String length varies based on licenses. Licenses are between 6 and 9 characters. So the string length will be between COUNt * 7 – 1 and COUNt * 10 – 1. (7 & 10 = Model Number length + 1 for comma. -1 = no comma for the 1st entry.)
Preset	Not affected by a Preset
State Saved	Not saved in instrument state.

Application Catalog Revision (Remote Command Only)

Returns the Revision of the provided Model Number.

Remote Command	`:SYSTem:APPLication:CATalog:REVision? <model>`
Example	`:SYST:APPL:CAT:REV? ‘N9060A’`
Notes	Returned value is a quoted string of revision for the provided Model Number. The revision will be a null-string ("") if the provided Model Number is not installed, licensed, and loaded. Example, if SAMS is installed and licensed: "1.0.0.0" String length is a maximum of 23 characters. (each numeral can be an integer + 3 decimal points)

Preset	Not affected by a Preset.
State Saved	Not saved in instrument state.

Application Catalog Options (Remote Command Only)

Returns a list of Options for the provided Model Number

Remote Command	`:SYSTem:APPLication:CATalog:OPTion? <model>`
Example	`:SYST:APPL:CAT:OPT? 'N9060A'`
Notes	Returned value is a quoted string of a comma separated list of Options, in the same format as *OPT? or :SYSTem:OPTion?. If the provided Model Number is not installed and licensed a null-string ("") will be returned. Example, if SAMS is installed and licensed: "2FP" String length is a maximum of 255 characters.
Preset	Not affected by a Preset
State Saved	Not saved in instrument state.

ESA SA compatibility command (Remote Command only)

Provided for backwards compatibility with ESA. When this command is received, the analyzer aliases it to the appropriate Mode.

Remote Command	`:INSTrument[:SELect] 'SA' | 'PNOISE' | 'EDGE' | 'GSM' | 'BASIC'`
Example	`:INST 'SA'`
Notes	The query is not a quoted string. It is an enumeration as indicated in the Instrument Select table above

GSM Mode compatibility command (Remote Command only)

Provided for backwards compatibility. When this command is received, the analyzer aliases it to the following:

`:INST:SEL EDGEGSM`

Remote Command	`:INSTrument[:SELect] GSM`
Example	`:INST GSM`

SA compatibility command for EMC (Remote Command only)

Provided for ESU compatibility. When this command is received, the analyzer aliases it to the following:

`:INST:SEL SCPILC`

This results in the analyzer being placed in SCPI Language Compatibility Mode, in order to emulate the ESU Spectrum Analyzer Mode.

Remote Command	`:INSTrument[:SELect] SANalyzer`
Example	`:INST SAN`

Receiver compatibility command for EMC (Remote Command only)

Provided for ESU compatibility. When this command is received, the instrument aliases it to the following:

`:INST:SEL EMI`

`:CONF FSC`

This results in the instrument being placed in the EMI Receiver Mode, running the Frequency Scan measurement, in order to emulate the ESU Receiver Mode.

Remote Command	`:INSTrument[:SELect] RECeiver`
Example	`:INST REC`

APD compatibility command for EMC(Remote Command only)

Provided for ESU compatibility. When this command is received, the analyzer aliases it to the following:

`:INST:SEL EMI`

`:CONF APD`

This results in the analyzer being placed in the EMI Receiver Mode, running the APD measurement, in order to emulate the ESU APD Mode.

Remote Command	`:INSTrument[:SELect] APDistribution`
Example	`:INST APD`

IF Mode compatibility command for EMC (Remote Command only)

Provided for ESU compatibility. When this command is received, the analyzer aliases it to the following:

`:INST:SEL EMI`

`:CONF MON`

This results in the analyzer being placed in the EMI Receiver Mode, running the Monitor Spectrum measurement, in order to emulate the ESU IF Mode.

Remote Command	`:INSTrument[:SELect] IFANalyzer`
Example	`:INST IFAN`

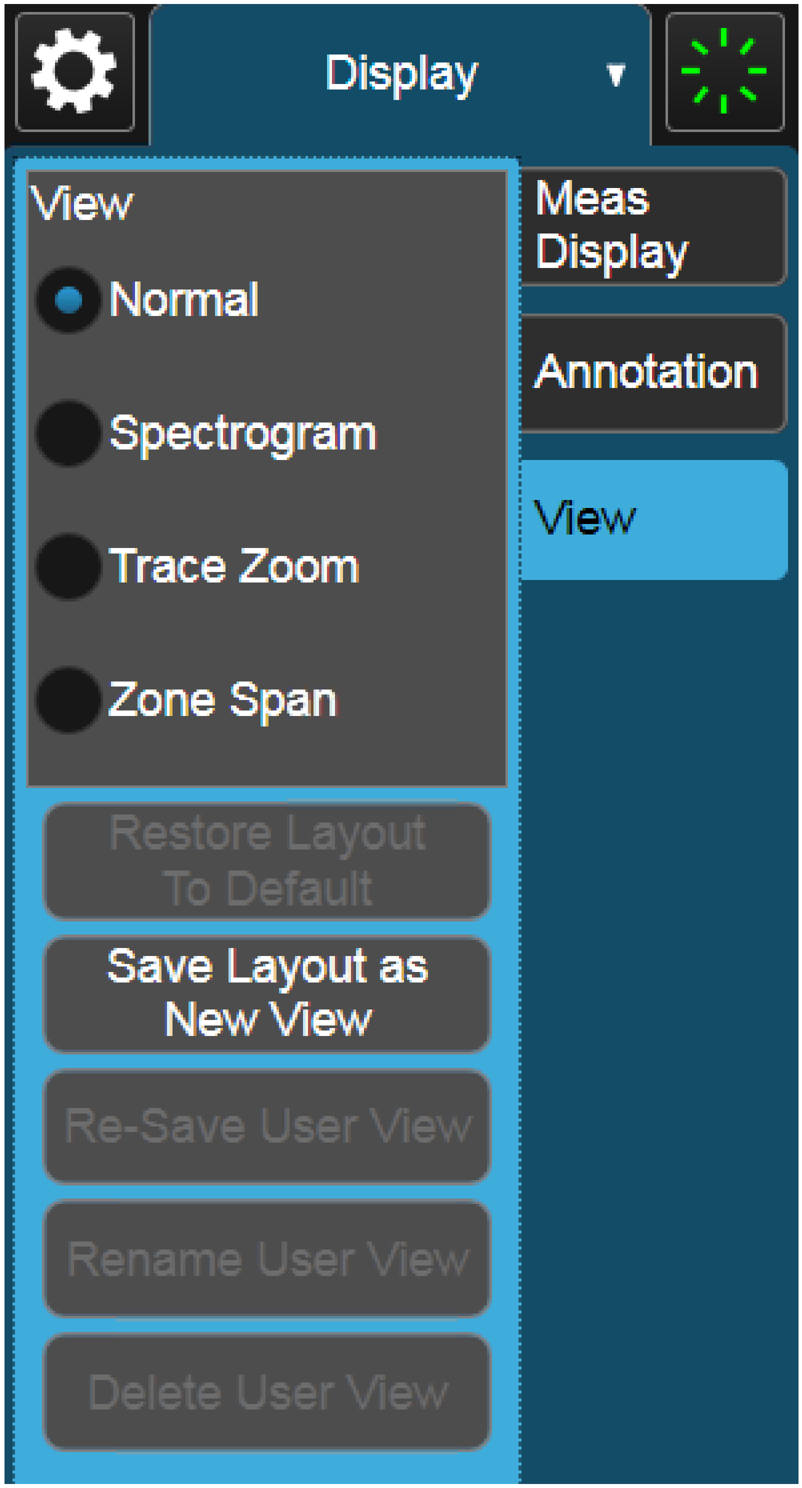
2.1.1.3 Measurement

The Measurement column of the Mode/Meas/View dialog shows all the Measurements available for the Mode which is selected in the first column. Select a Measurement in the second column and the View column will show all the Views available for that measurement. Once you have the Mode, Measurement and View selected, press OK to change the current Screen to that Mode, Measurement and View.

2.1.1.4 View

A View is a collection of Result Windows. The View column of the "Mode/Meas/View Dialog" on page 85 shows all the Views available for the Measurement which is selected in the second column. Once you have the Mode, Measurement and View selected, press OK to change the current Screen to that Mode, Measurement and View.

The View may also be set by using the View tab on the Display menu. The View tab is the last tab on the Display menu for every measurement. The Views are the same as those listed in the "Mode/Meas/View Dialog" on page 85.



2.1.1.5 Sequencer

Allows multiple Screens to update sequentially while in "Multiscreen" on page 150 display mode. Each Screen updates in sequence, and when all have updated, the sequence will start again.

To start the Sequencer, you must have more than one Screen defined, and you must have Multiscreen selected (see "Screen Tabs" on page 84).

If you want each Screen to use a different input, you must turn off **All Screens Use Same Input** under **Input/Output**, **Input**.

CAUTION

Differences in hardware settings between the Screens may cause switches and/or attenuators to cycle as you go from one Screen to another. This could potentially reduce the life of these components. To avoid this, make sure **Attenuation**, **µW Path Control** and other switch settings are the same in each Screen.

NOTE

When the Sequencer is running, the destination of remote commands is unpredictable, so you should stop the Sequencer before sending any measurement-related commands. Once the Sequencer has stopped, select a specific Screen using `:INSTrument:SCReen:SELect`, before sending any further commands. See "Select Screen" on page 152

NOTE

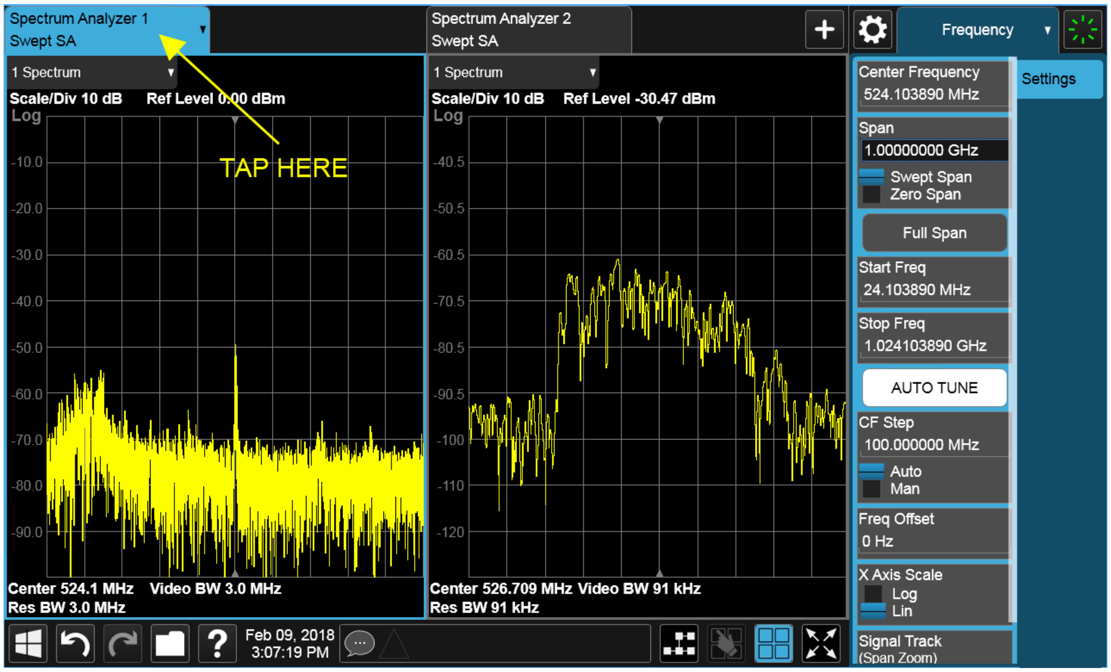
When the Sequencer is running, Auto alignment is temporarily disabled. A pending auto alignment might be executed when the sequencer is stopped.

See "More Information" on page 96

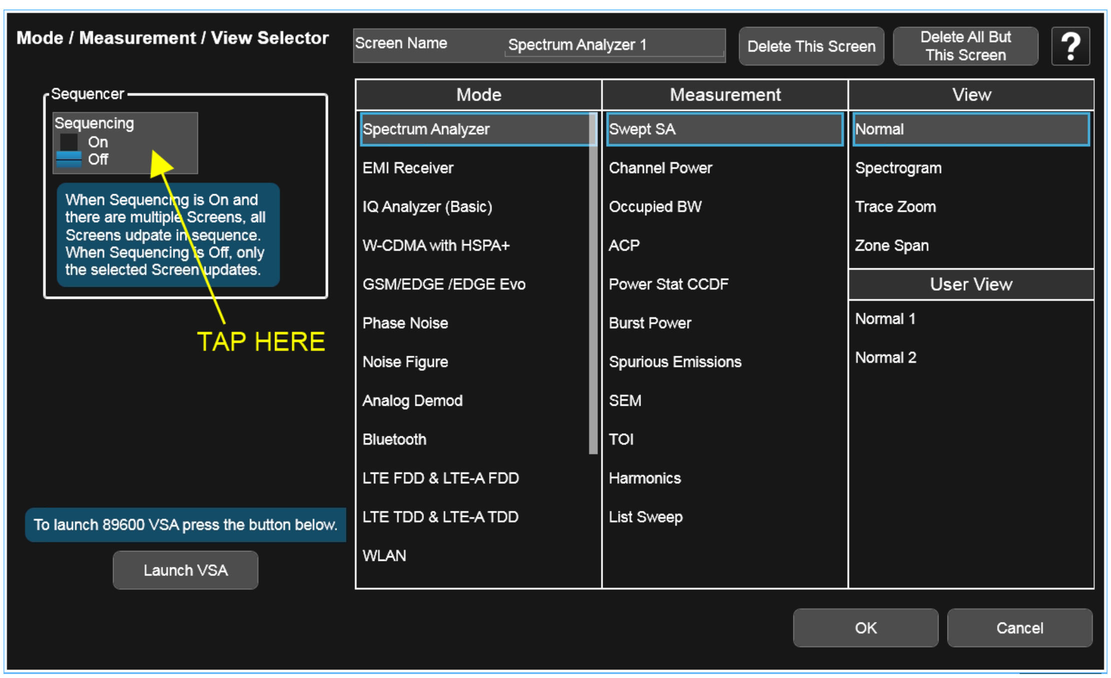
Remote Command	`:SYSTem:SEQuencer ON | OFF | 1 | 0` `:SYSTem:SEQuencer?`
Example	`:SYST:SEQ ON`
Notes	If the display is disabled (via `:DISP:ENAB OFF`) then the error message "-221, Settings conflict; Screen SCPI cannot be used when Display is disabled" is generated
Dependencies	To start the Sequencer, you must have more than one Screen defined and you must have Multiscreen selected
Preset	`OFF`

More Information

To start the Sequencer, tap the current (blue) Screen tab to go into the Mode/Meas/View Dialog:

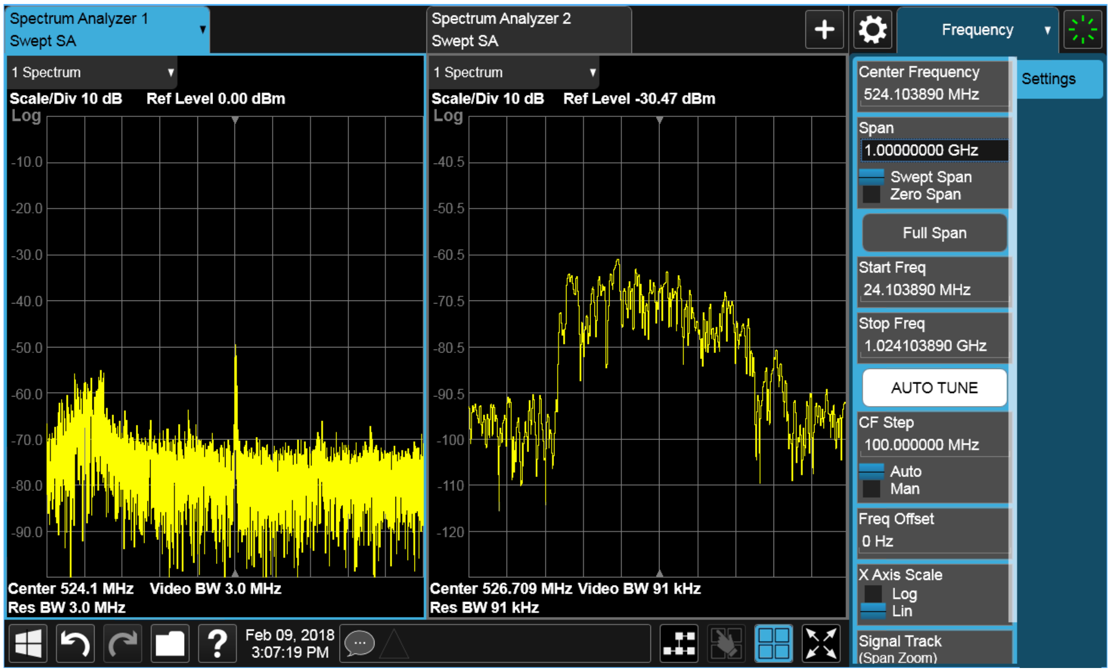


In the Sequencer block in the upper left hand corner, tap the Sequencing switch to turn it On:

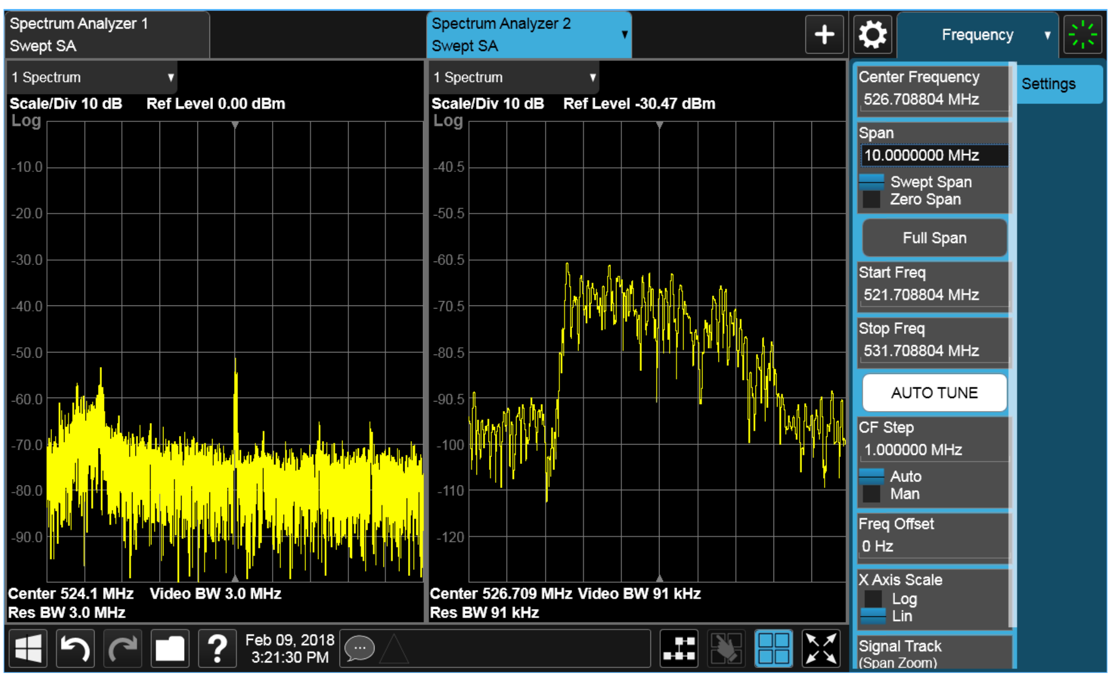


The instrument will immediately exit the Mode/Meas/View Dialog and begin making measurements in each of the screens, one after the other. When a measurement is being made in a particular Screen, that Screen's tab will be blue.

Measurement being made in Screen 1:



Measurement being made in Screen 2:



Touching any key or control on the display will cause the Sequencer to stop, so that you can make desired changes. When this happens, the message “Sequencer stopped” is displayed.

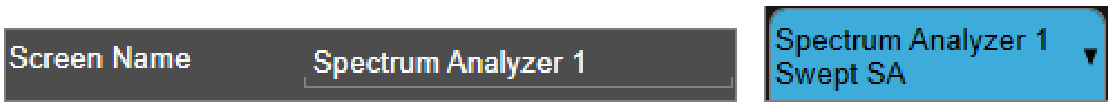
When the Sequencer is running, the screens update in the order in which they were created.

Each Screen takes one measurement then passes control to the next Screen. Each Screen updates as though it were in Single Sweep or Single Measurement mode. Thus, if Averaging is on, a Screen may take multiple sweeps before moving on to the next Screen.

2.1.1.6 Screen Name

By default, the screen name is the Mode (Application) name followed by a number indicating the instance of the application.

You may change the name displayed on the Screen Tab of any screen. The control to do this appears in the "Mode/Meas/View Dialog" on page 85:



When you touch this control an onscreen keyboard appears, allowing you to change the name. Whatever you change it to appears on the Tab, even if you subsequently change the screen to a different Mode.

To reset the name, delete the screen name entirely.

Each Screen Name must be unique; you cannot give the same name to more than one screen.

Remote Command	`:INSTrument:SCReen:REName <alphanumeric>`
Example	`:INST:SCR:REN “Baseband”`
Notes	The currently active screen is renamed. If the `<alphanumeric>` specifying the new name is already present in the list of screen names, the error message “-224, Illegal parameter value; New name <name> already exists” appears If the display is disabled (via `:DISP:ENAB OFF`) then the error message “-221, Settings conflict; Screen SCPI cannot be used when Display is disabled” appears

2.1.1.7 Delete This Screen

Pressing this button deletes the current Screen (the one with the blue tab). Deleting a screen removes it from view and selects the next lower screen in the list of screens. If only one screen is configured, it cannot be deleted.

If you press the **Delete This Screen** button, a prompt appears:

“This function will delete the current screen and its settings. This action cannot be undone. Do you want to proceed?”

Pressing **OK** or Enter deletes the screen, pressing **Cancel** or **ESC** does not.

Remote Command	`:INSTrument:SCReen:DELete`
Example	`:INST:SCR:DEL`
Notes	The currently active screen is deleted If the screen you are attempting to delete is the only configured screen, the error message "-221, Settings conflict; Last screen cannot be deleted" is displayed If the display is disabled (via `:DISP:ENAB OFF`) then the error message "-221, Settings conflict; Screen SCPI cannot be used when Display is disabled" is generated

2.1.1.8 Delete All But This Screen

Pressing this control deletes all the Screens except the current Screen (the one with the blue tab).

If you press the **Delete All But This Screen** button, a prompt appears:

"This function will delete all defined screens and their settings, except for the current screen. This action cannot be undone. Do you want to proceed?"

Pressing **OK** or Enter deletes the screen, pressing **Cancel** or ESC does not.

Remote Command	`:INSTrument:SCReen:DELete:ALL`
Example	`:INST:SCR:DEL:ALL`
Notes	You can reset the instrument to the power-on configuration by invoking `:INST:SCR:DEL:ALL` followed by `:SYSTem:DEFault ALL` If the display is disabled (via `:DISP:ENAB OFF`) then the error message "-221, Settings conflict; Screen SCPI cannot be used when Display is disabled" appears

2.1.1.9 89600 VSA

Pressing this button launches the 89600 VSA software. The 89600 VSA software is powerful, PC-based software, offering the industry's most sophisticated general purpose and standards specific signal evaluation and troubleshooting tools for R&D engineers. Even for proprietary and non-standard signals in SATCOM or MILCOM applications, you can make signal quality measurements with customized IQ constellation.

The 89600 VSA software offers the following features:

– Over 35 general-purpose analog and digital demodulators ranging from 2FSK to 4096QAM

– Flexible and custom IQ and OFDM signal analysis for single carrier

– Standards specific modulation analysis including:

- Cellular: GSM/EDGE, cdma2000, W-CDMA, TD-SCDMA, LTE(FDD/TDD),
- LTE-Advanced and more
- Wireless networking: 802.11a/b/g, 802.11n, 802.ac, 802.16 WiMAX (fixed/mobile), WiSUN (MR-FSK PHY)
- RFID
- Digital satellite video and other satellite signals, radar, LMDS
- Up to 400K bin FFT, for the highest resolution spectrum analysis
- A full suite of time domain analysis tools, including signal capture and playback, time gating, and CCDF measurements
- 20 simultaneous trace displays and the industry's most complete set of marker functions
- Easy-to-use Microsoft Windows graphical user interface

For more information see the Keysight 89600 Series VSA web site at www.keysight.com/find/89600vsa

To learn more about how to use the 89600 VSA in the instrument, start the 89600 VSA software, then open the 89600 VSA Help and navigate to the topic "About Keysight X-Series Signal Analyzer with 89600 VSA Software".

Example	`:INST:SEL VSA89601` `:INST:NSEL 101`

2.1.2 Add Screen

On X-Series analyzers you can configure up to 16 different Screens at one time. Each Screen contains one Mode, each Mode contains one Measurement, and each Measurement contains a number of Windows.

You can add screens by pressing the “+” icon in the "Screen Tabs" on page 84 panel. The icon is shown below:

Every time you add a Screen, the instrument “clones” or “copies” the current Screen into the new Screen. If desired, you can then use the "Mode/Meas/View Dialog" on page 85 to change the Mode, Measurement and/or View of the new Screen, or simply operate a second copy of your previous Screen, thus preserving the settings of your previous Screen.

When you have defined the maximum number of Screens (16), the “+” icon disappears.

For more information about operating the instrument with multiple screens configured, see "Multiscreen" on page 150.

Remote Command	`:INSTrument:SCReen:CREate`
Example	`:INST:SCR:CRE`
Notes	The maximum number of screens is 16. If an attempt to add a screen occurs when the maximum have been defined, the error message “-221, Settings conflict; Screen limit reached” appears When you create a new screen the Screen Name is the current Mode name followed by a number indicating the instance of the Mode. If the display is disabled (via `:DISP:ENAB OFF`) then the error message “-221, Settings conflict; Screen SCPI cannot be used when Display is disabled” appears

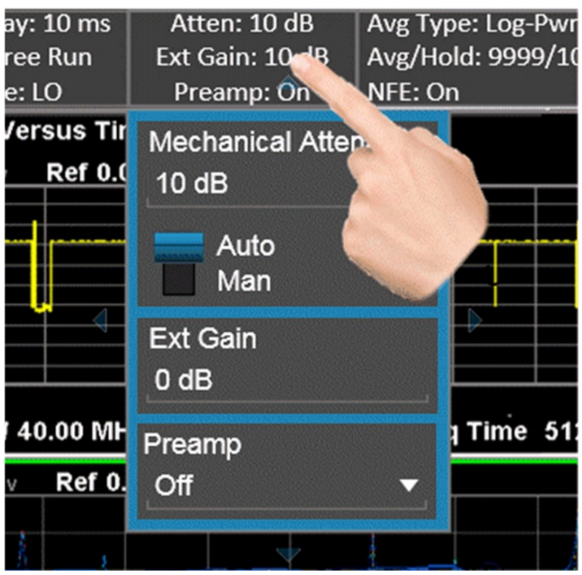
2.2 Meas Bar

The Meas Bar is used to display annotation for the current measurement. There are three primary uses for the Meas Bar:

1. To show annotation for the most important parameters in the measurement so you can see them at a glance
2. To show the annotation that you will most want to have recorded in a screen dump
3. To give you quick access to settings.

The Meas Bar is made up of a number of annotation panels, each of which, when pressed, opens up a dialog below it which contains controls for those settings.

For example, here is what the display looks like when you touch one of the regions of the Meas Bar:



Touching anywhere off the hotspot panel or pressing any hardkey except **Save** or **Quick Save** closes the hotspot panel.

In a hotspot panel, the control in black with the blue border is the active function. Each panel may have its own default active function.

Settings that are colored amber are those that you need to be particularly aware of; for example, if Alignments are off, this is shown in amber, so you will know that you may not be meeting spec. Similarly, if DC coupling is on, this is shown amber, to alert you to be careful what voltage you put on the input.

You can turn the Meas Bar on and off with a switch on the Annotation tab of the Display menu.

System Control Panel

The leftmost panel holds the GPIB/Remote annunciators, the Single/Continuous symbol/control, the LXI indicator and the PASS/FAIL indicator. Tapping this panel drops down controls for Single/Continuous, Pause/Resume and restart.

GPIB/Remote annunciators

The GPIB/Remote annunciators are shown as the letters `KRLTS`. Each letter is shown if the state is true and is not shown if the state is false, as follows:

K	Keylock indicator	This is shown when the instrument is in the Keylock state (turned on and off by the `SYST:KLOCk` command)
R	Remote annunciator	Shown when the instrument is in the remote state, as when being controlled via the IEEE-488 bus (GPIB) or TCP/IP connections
L	GPIB Listen annunciator	Shown when addressed to listen via GPIB orTCP/IP
T	GPIB Talk annunciator	Shown when addressed to talk via GPIB or TCP/IP
S	GPIB SRQ annunciator	Shown when the instrument is asserting SRQ on GPIB. This annunciator is an amber color

Single/Continuous symbol/control

This annunciator shows as an arrow on an oval line when in Continuous, or an arrow on a straight line when in Single.

LXI indicator

This indicator displays in green when LAN is connected, in white when LAN is not connected, and in red when LAN is connected but has a connection problem.

PASS/FAIL indicator

This annunciator displays when Limits are turned on. It is green if all Limits are passing, and a red FAIL if any limit is not passing.

The following command queries the status of the current measurement limit testing. It returns a 0 if the measured results pass when compared with the current limits. It returns a 1 if the measured results fail any limit tests.

Remote Command	`:CALCulate:CLIMits:FAIL?`
Example	`:CALC:CLIM:FAIL?` queries the current measurement to see if it fails the defined limits Returns a 0 or 1: 0 it passes, 1 it fails

Trace Detector Settings Panel

In the Swept SA and some other measurements, there is a special panel summarizing the settings for the traces in the measurement:

There is one column for each trace. The rows are as follows:

- The top row shows the Trace Number, in the trace color.
- The second row shows the Trace Type for each trace (W=Clear/Write, A=Trace Average, M=Max Hold, m=Min Hold); this letter is in white if the trace is Active, in gray if the trace is inactive; there is a bar through the letter if the trace is not being displayed
- The third row shows the detector for each trace (N=Normal, S=Sample, A=Average, P=peak, p=negative peak, Q=Quasi Peak, E=EMI Average, R=RMS Average, f=math function)

In the example above, trace 1 is active, visible, and in Average using the Sample detector, the other traces are inactive, blanked and in Clear/Write using the Normal detector.

Tapping this panel drops down controls for the Traces.

2.3 Measurement Display

The Measurement Display contains one or more data windows displaying the result of the current measurement. These may be graphical or textual windows.

	MODE	TRC	SCL	X	Y	FUNCTION	FUNCTION WIDTH	FUNCTION VALUE
1	Δ2	1	f	(Δ) -23.152 MHz	(Δ) 48.46 dB	Band Power	10.00 MHz	(Δ) 48.46 dB
2	N	1	f	1.023 231 GHz	-91.02 dBm	Band Power	10.00 MHz	-78.75 dBm
3	F	1	f	1.044 671 GHz	-35.56 dBm			
4	N	1	f	1.012 470 GHz	-91.96 dBm			

Each window in the Measurement display contains a "Window Title" on page 106, "Measurement Data" on page 110, and graphical windows also may contain "Annotation Hotspot" on page 113s.

The selected window in the Measurement Display is indicated by a blue border. Window-dependent controls in the menu panel always refer to the selected window.

2.3.1 Window Title

The Window Title appears in the upper left hand corner of the window, and includes a title describing the measurement data currently being displayed in the window. The title may also contain additional information about the data in the window, for example in the LTE measurement supplication, the component carrier being displayed in the window will be indicated (e.g., “CC0”).

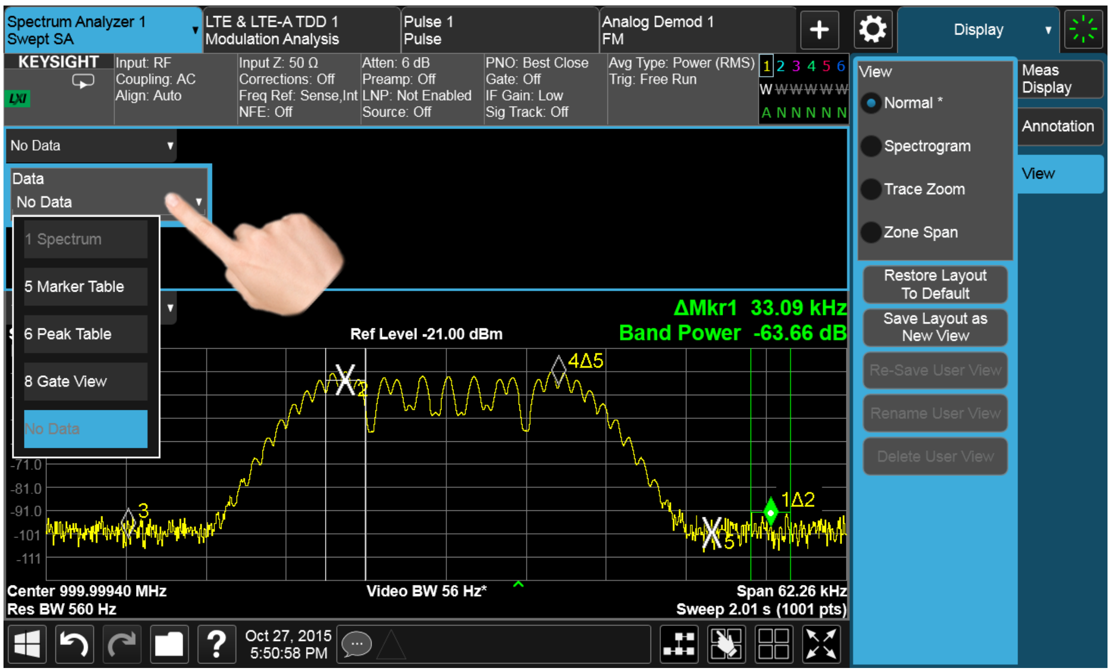
Measurements that support User Views (see "View Editor" on page 128) also display the Window Number in the Window Title, to enable window addressing from SCPI. The number is the number that will be used in the SCPI command to address that window, for example, in the WCDMA Mod Accuracy measurement, Code Domain

Power is assigned window number 6, so you address it with the following SCPI command:

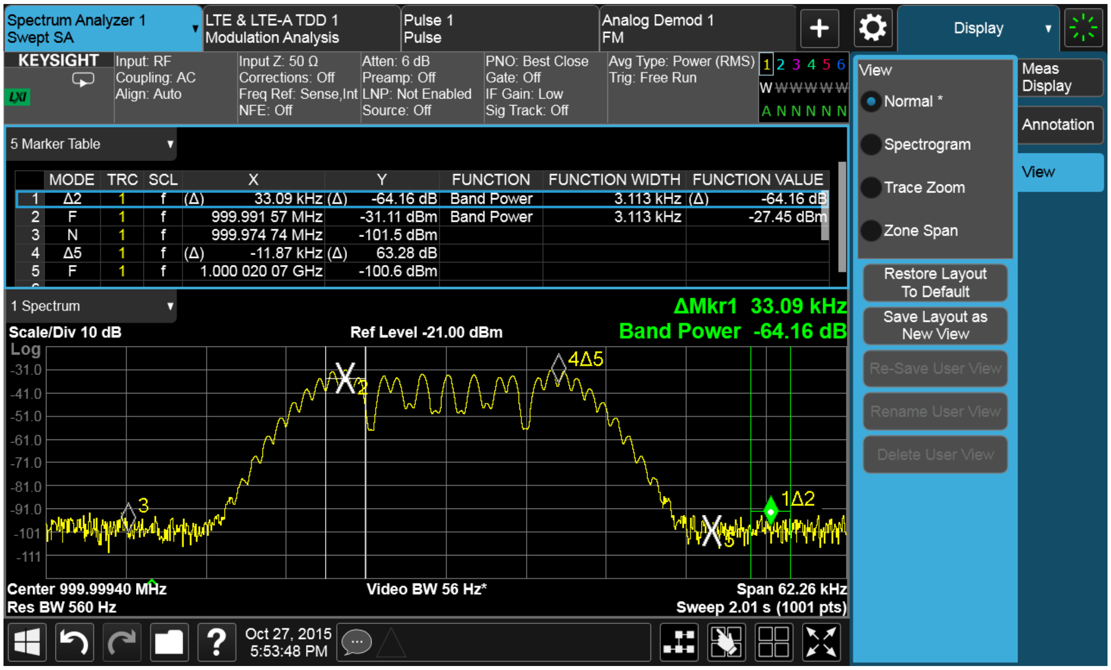
```
:DISP:RHO:WIND6:TRAC:Y:RLEV 0.0
```

Note the arrow pointing down on the right side of the Window Title. This indicates that touching the Window Title will display a dropdown, which enables you to select the Measurement Data to be displayed in the window.

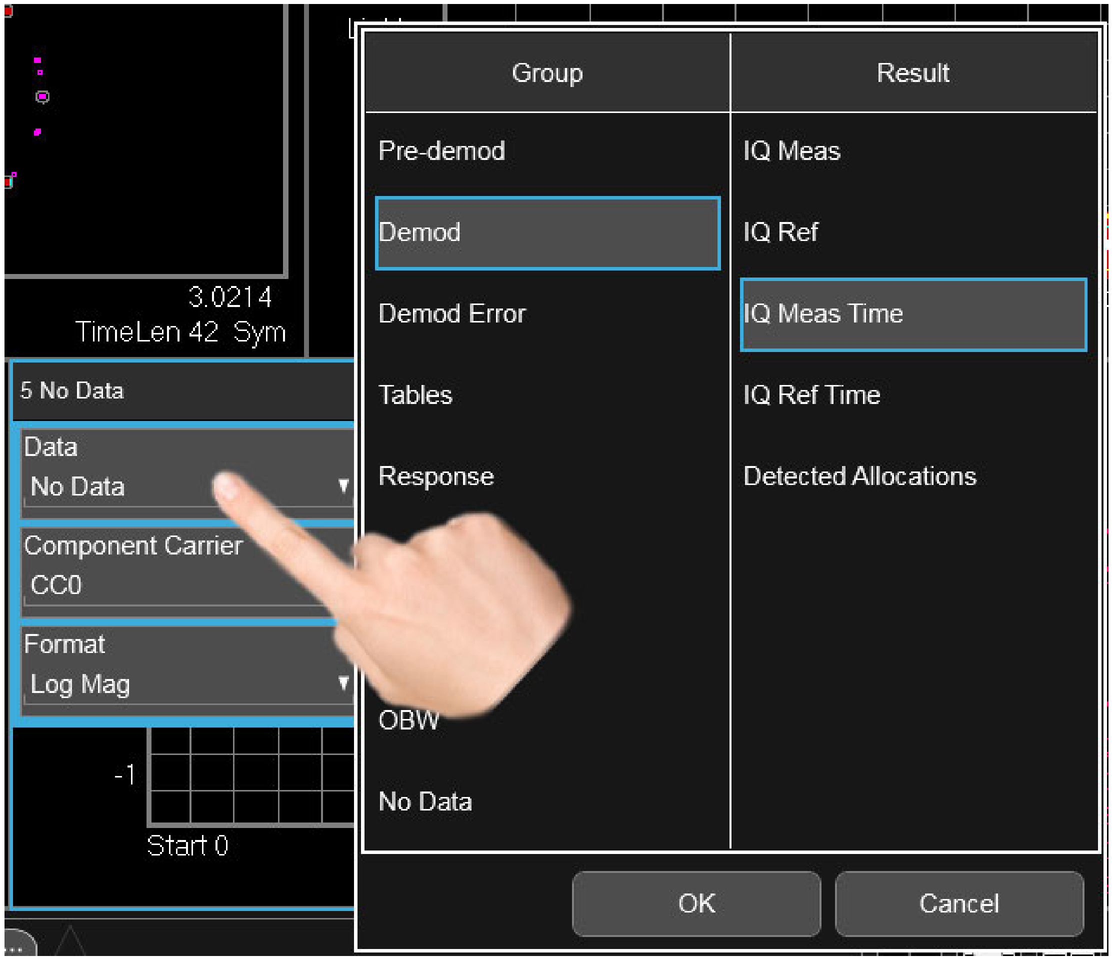
For example, if we wish to assign the results of the upper window in the display below to the Marker Table, we would touch the window title and then the "Data" control that is revealed, as shown:



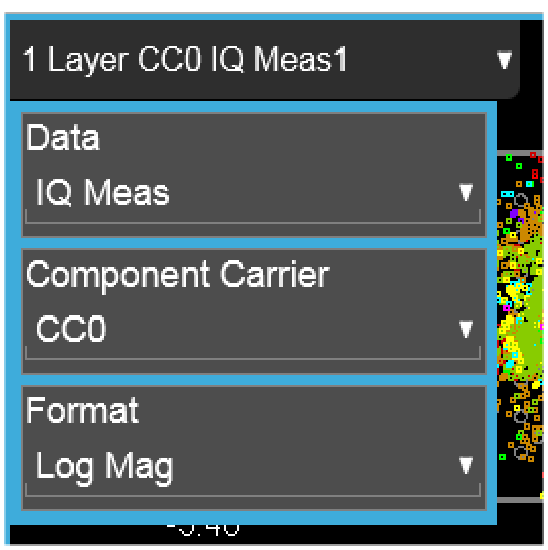
And then select Marker Table, yielding the result below:



Note also that the Window Data dropdown can be a cascaded list, if the number of available results requires categorization to hold them all:



Note also that the Window Data dropdown sometimes includes controls for further configuring the window, for example, in LTE choosing the desired Component Carrier and Data format.



Touching a window's title dropdown also selects the window.

2.3.2 Measurement Data

The Measurement Data region shows graphical or textual data for the Data selected in the Window Title Data control. Below you can see examples of both graphical and textual windows in a four-window display.

There are many gestures which you can use to interact with a measurement display window. They are detailed below.

Swipe

There are several swipe actions, as listed below. One of the most important actions is swiping a spectrum window to the left or right, or up or down, to adjust the frequency and level of the spectrum, as shown below.

Swipe actions are summarized in the table below. Not all of these may be available, depending on the measurement.

Object	Action
Spectrum Trace Left/Right	Drag trace (change Center Frequency)
Spectrum Trace up/down	Drag trace (change Ref Level)
Marker Left/Right	Drag marker along trace
Fixed Marker Left/Right/Up/Down	Drag marker in space
Scrollable area	Scroll vertically or horizontally. Scrollable areas include the Menu Panel (if overfull), tables and lists. A scrollable area is indicated by a vertical or horizontal translucent white bar which can also be dragged by a mouse When scrolling a table: – Row headers remain in place when the table is scrolled horizontally, and scroll with the table when the table is scrolled vertically – Column headers remain in place when the table is scrolled vertically, and scroll with the table when the table is scrolled horizontally
Toggle control	Toggle in that direction

Pinch

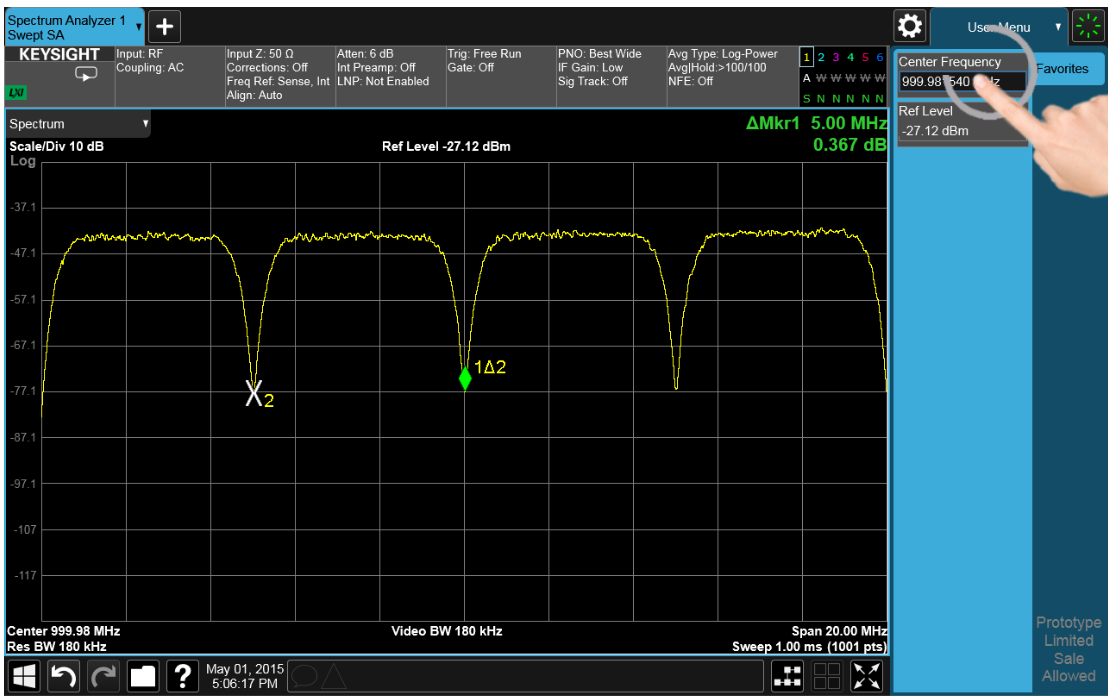
You can also pinch in or out either horizontally or vertically to zoom in the x-axis or y-axis dimension. For example, a pinch horizontally lets you adjust the Span of the

Spectrum window. Also, pinching on the wings of a Band Power or other Band Function allows you to widen or narrow that Band Function.

Pinching may sometimes be easier if you use the index finger of each hand, rather than pinching with one hand.

Touch-and-Hold

You can also touch-and-hold the display, that is, touch it and hold your finger on the display. A circle is drawn, and when the drawing completes, a right-click gesture is performed that depends on the screen feature touched, as listed in the table below.



Right Click on a Trace	Peak Search, Trace Type (Clear/Write, Trace Average, Max Hold, Min Hold), Trace View/Blank (Active, View, Blank, Background). Not all of these may be available, depending on the measurement
Right Click on a Marker	Marker Mode (Normal. Delta, Fixed, Off), Peak Search, Next Peak, Next Pk Right, Next Pk Left). Not all of these may be available, depending on the measurement
Right Click on the Background	Lets you select Help
Right Click on a Menu Panel control	Lets you add or remove that control from the User Menu or get Help on that control

Tap

Tapping an object causes the actions defined in the table below:

Object	Action
Marker	Select
Marker (repeated taps on stacked)	Cycle through stacked markers
Trace	Select. In addition if Marker is the active function, move the selected marker to the point where you tapped
Trace (repeated taps on stacked)	Cycle through stacked traces
Window	Select if unselected
Screen	Select if unselected

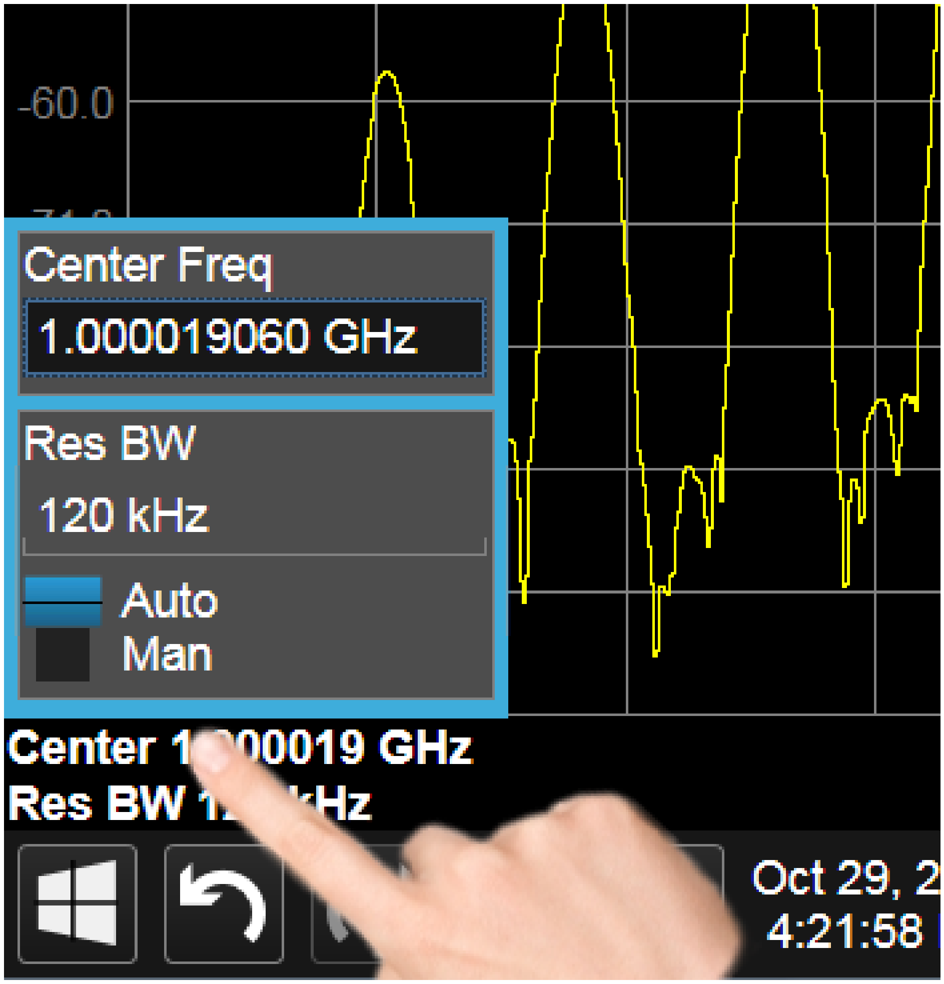
Double Tap

Double-tapping an object causes the actions defined in the table below:

Object	Action
Window	Zoom/Unzoom

2.3.3 Annotation Hotspot

You can tap on a graticule annotation to modify one of the fields in that annotation. For example if you tap on the region with Center Freq and Res BW in it, a menu panel pops up with just those settings on it.



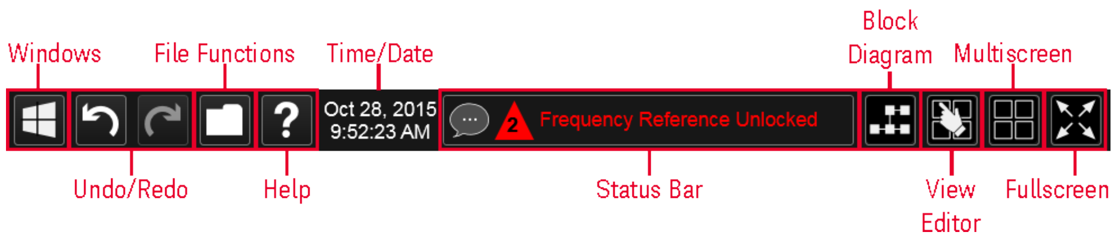
Touching anywhere off the hotspot panel or pressing any hardkey except **Save** or **Quick Save** closes the hotspot panel.

Annotation which is not currently able to be adjusted is not grayed out on the display, but the control in the hotspot that drops down or pops up is grayed out.

In a hotspot panel, the control in black with the blue border is the active function. Each panel may have its own default active function

2.4 Control Bar

The Control Bar contains controls and readouts that let you control instrument functions independent of the current measurement.



2.4.1 Windows

Pressing the Windows icon on the "Control Bar" on page 115 has the same effect as pressing the Windows icon on the Windows taskbar. It displays the Windows taskbar and Start Menu, which allows you to launch Windows programs and access features such as the Control Panel.

2.4.2 Undo/Redo

The Undo button in the "Control Bar" on page 115,

and the Undo front panel key,

are used to undo the most recently executed function.

If you Undo a function, and then decide you should not have done so, you can use the **Redo** button in the "Control Bar" on page 115 to put it back the way it was. The Redo function may also be executed by pressing **Ctrl+Undo** (holding the **Ctrl** key down while pressing the **Undo** font panel key).

Undo allows you to restore a setting, which you had previously set, back to its value before you changed it. When you press the Undo button or front panel key, the last setting you changed is “undone”, that is, its previous setting is restored. You are notified of this fact with an advisory pop up message; for example, if the Center

Frequency had been 300 MHz, and you changed it to 1 GHz and then pressed **Undo**, the message would show:

```
UNDO: Center Freq 1 GHz -> 300 MHz
```

The instrument can store 5 levels of action for Undo.

To truly understand Undo and Redo, it helps to think of two “stacks”, an Undo stack and a Redo stack,

UNDO stack	REDO stack

Whenever you perform an action, it is placed on the Undo stack. So for example, if you set the Center Frequency to 1 GHz, then set the RBW to 1 MHz, then set the Detector to Peak, each of these actions gets “pushed” onto the Undo stack:

UNDO stack	REDO stack
Det = Peak	
RBW = 1MHz	
CF = 1 GHz	

When you press **Undo**, the top item on the Undo stack is removed, the action represented by that item is undone, and the item is placed on the Redo stack. So pressing **Undo** once in the above case would undo the setting of the peak detector, and the stacks would look like this:

UNDO stack	REDO stack
RBW = 1MHz	Det = Peak
CF = 1 GHz	

Now pressing **Undo** again would undo the RBW = 1 MHz action, and the stacks would look like this:

UNDO stack	REDO stack
CF = 1 GHz	RBW = 1MHz
	Det = Peak

Now pressing Redo would Redo the RBW = 1 MHz action, and the stacks would again look like this:

UNDO stack	REDO stack
RBW = 1MHz	Det = Peak
CF = 1 GHz	

Also, whenever you set a value, the Redo stack is cleared; you can't redo an action once you have interrupted the original flow of actions. Think of the Undo stack as the past, and the Redo stack as the future; if you have items in both stacks it means you have gone back to a time in the past; if you then *do* something you have changed the future, so the old future (the Redo stack) gets cleared.

For example, in the example above, if you now were to change another setting, such as VBW = 1 kHz, the Redo stack gets cleared, and the stacks would look like this:

UNDO stack	REDO stack
VBW = 1 kHz	
RBW = 1MHz	
CF = 1 GHz	

Undo can undo changes you make with the knob or step keys, however all contiguous events that affect the same parameter are aggregated into one event for the sake of Undo. For example, if CF is the active function and is 1 GHz, and you turn the knob back and forth, then enter a value, then use the step keys, when you press Undo, the instrument returns to CF = 1 GHz.

Actions that Cannot be Undone

There are some actions that cannot be undone, because these clear the Undo/Redo stack:

- Restore Mode Defaults clears the stack for that Mode in that Screen
- Sending SCPI commands clears the stack for that Mode in that Screen
- Loading a state file (including User Preset) clears the stack for that Mode in that Screen
- Deleting a Screen clears all the stacks in that screen
- Changing Views

Undo/Redo works within the context of a Mode. Each Mode in each Screen keeps its own record. Settings in the Control Panel or System Settings menus are not undoable.

There are several actions that may change many parameters. Among these are Auto Tune, and Adjust Atten for Min Clipping. After executing such a function, Undo sets all parameters back to their value before the function was selected. Auto Tune appears to be a single action, even though the instrument executes it in several steps.

Redo reverses the effect of the last Undo action, assuming that no other settings have been changed since the last Undo. Changing a setting after an Undo clears memory of all settings after that Undo, that is, it clears the Redo stack, as explained above.

When you press the **Redo** icon or **Ctl** and the **Undo** hardkey, you are notified with an advisory popup message; for example, if the Center Frequency had been 300 MHz, and you changed it to 1 GHz and then pressed **Undo**, the message would say:

```
UNDO: Center Freq 1 GHz -> 300 MHz
```

If you then press **Redo**, the message will say:

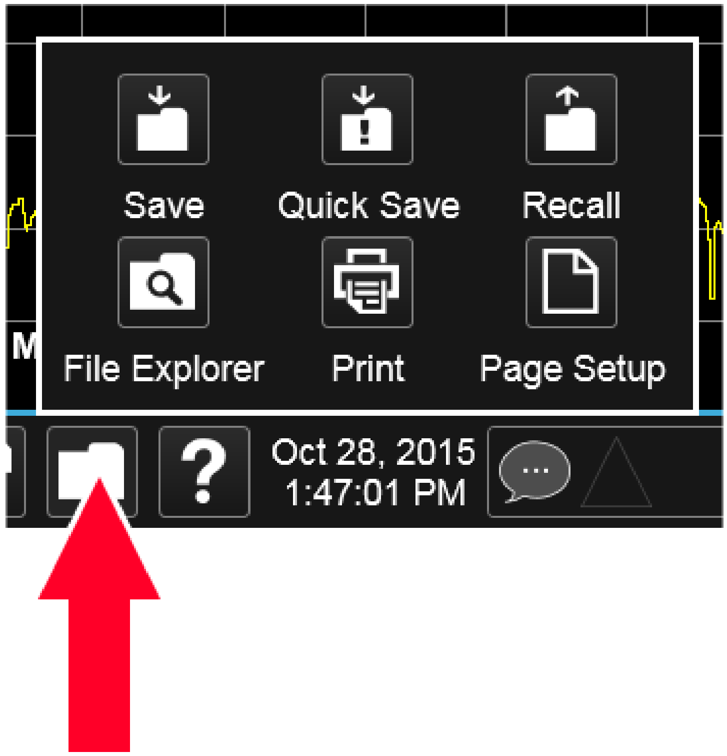
```
REDO: Center Freq 300 MHz -> 1 GHz
```

Neither **Undo** nor **Redo** perform any navigation, and have no effect on which menu panel is displayed nor which function is active.

2.4.3 File Functions

The File Functions popup contains controls for executing Save, Recall, File and Print operations. You display the File Functions popup by tapping the File Functions icon in the "Control Bar" on page 115.

For more information on a control, tap an icon in the image below.



Tapping this folder icon displays the File Functions popup

2.4.3.1 File Explorer

Pressing the File Explorer button in the "File Functions" on page 118 dialog opens the Windows File Explorer, which allows you to perform operating system file functions such as Move, Copy and Delete.

File Explorer also allows you to map network drives to drive letters on your PC or intranet, in order to more easily save screen images, states and other data, and load them back into the instrument.

2.4.4 Help

Pressing the Help button in the "Control Bar" on page 115, the **Help** front panel key, or **F1** if you have a PC keyboard connected, opens the context-sensitive Help system and allows you to get Help on the current menu panel. The Help button appears in the "Control Bar" on page 115 and also in the banner of full-screen dialogs.

You can also use the Help window's Contents pane to navigate to Help for any function in the instrument.

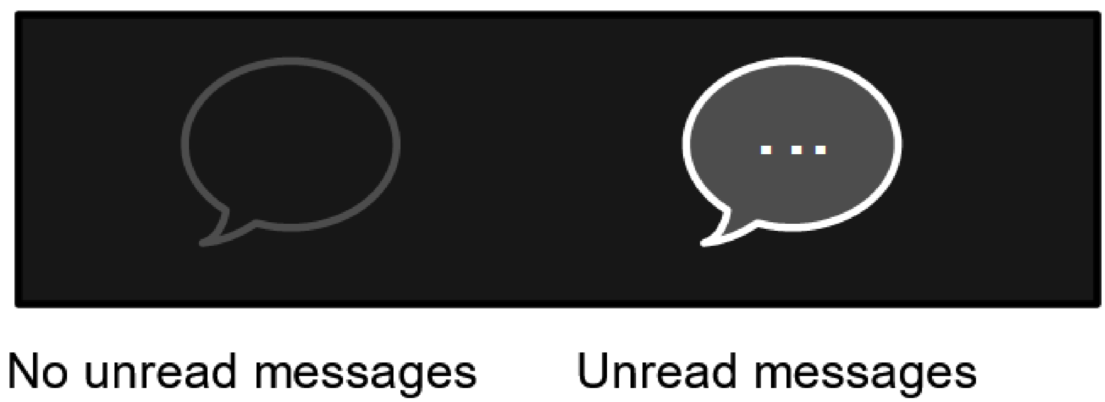
In addition, if you touch and hold a specific control, one of the choices is **Help on this setting**.

The Help window appears in full screen mode, with the Contents pane on the left and the User Documentation pane on the right. The small pullout tab between the Contents pane and the User Documentation pane enables you to hide or view the Contents pane.

2.4.5 Status Bar

The Status Panel (or Status Bar) appears at the bottom of the display and contains three fields:

The Message Balloon appears on the left side of the Status Panel and lets you know when there is an unread message in the queue.



The Message Balloon has a gray outline and no fill if there are no unread messages; it has a gray fill and a white outline and displays a white ellipsis in the middle if there are unread messages.

The Condition Indicator appears to the right of the Message Balloon and shows the current number of open conditions. Below are some examples of what the Condition Indicator can look like:

The triangle is unfilled if no there are no open conditions, filled with yellow if all open conditions are warnings, and filled with red if at least one open condition is an error. The number displayed is the total number of open conditions.

Touching the Condition Indicator opens up the Show Status dialog (see below) with the Current Conditions tab selected. Touching anywhere else on the Status Bar opens up the Show Status dialog with the History tab selected.

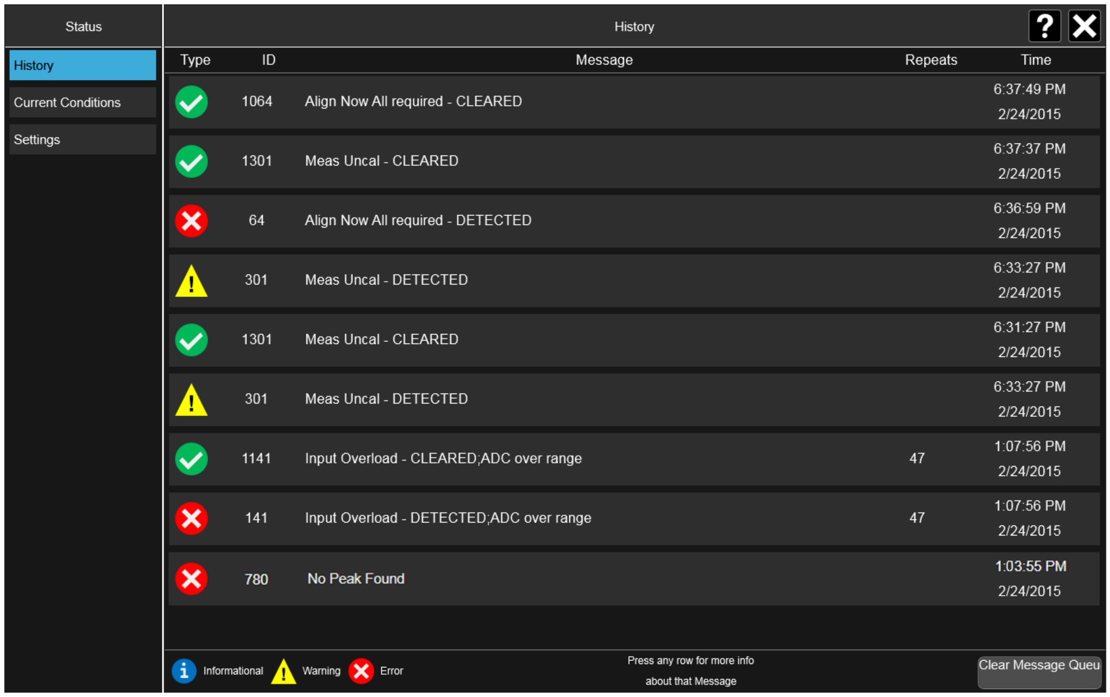
The Condition Message appears to the right of the Condition Indicator. In the example below, the cCondition Message is “Align All, Now required”:

Warning condition messages display in yellow, error condition messages display in red.

If there is more than 1 open condition, the Condition Message cycles through the display of all of the open conditions, one at a time. Each message is displayed for 2 seconds, then the next for 2 seconds, and so on.

Show Status Dialog

The Show Status dialog appears if you tap anywhere in the Status Bar. Touching the Condition Indicator (the triangle in the Status Bar) opens up the Show Status dialog with the Current Conditions tab selected. Touching anywhere else on the Status Bar opens up the Show Status dialog with the History tab selected.



If the display fills up, scrolling is enabled just as in other X-Series Multi-touch UI displays.

The Status dialog automatically refreshes as new messages and conditions occur.

At the bottom of the screen is a Clear Message Queue button. This button clears all errors in all error queues.

Note the following:

- Clear Message Queue does not affect the current status conditions
- Mode Preset does not clear the message queue
- Restore System Defaults (Super Preset) will clear all message queues
- *CLS only clears the queue if it is sent remotely and *RST does not affect any error queue
- Switching Modes does not affect any error queues

See "More Information" on page 123

Remote Command	`:SYSTem:ERRor[:NEXT]?`
Example	`:SYST:ERR?`
Notes	The return string has the format: `<Error Number>,<Error>` Where `<Error Number>` and `<Error>` are those shown on the Show Errors screen

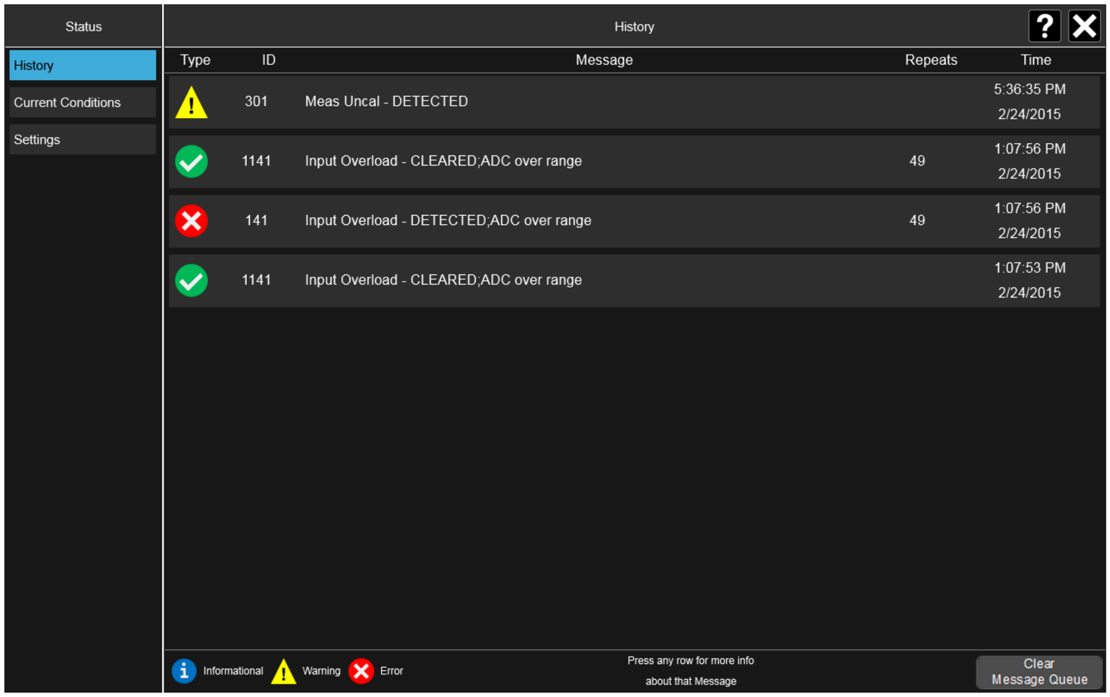
Backwards Compatibility Notes	In some legacy analyzers, the Repeat field shows the number of times the message has repeated since the last time the error queue was cleared. In the X-Series, the Repeat field shows the number of times the error has repeated since the last intervening error. So the count may very well be different than in the past even for identical signal conditions Unlike previous analyzers, in the X-Series all errors are reported through the Message or Status lines and are logged to the event queue. They never appear as text in the graticule area (as they sometimes do in previous analyzers) and they are never displayed in the settings panel at the top of the screen (as they sometimes do, by changing color, in previous analyzers) As a consequence of the above, the user can only see one status condition (the most recently generated) without looking at the queue. In the past, at least in the Spectrum Analyzer, multiple status conditions might display on the right side of the graticule In general, there is no backwards compatibility specified or guaranteed between the error numbers in the X-Series and those of earlier products. Error, event, and status processing code in customers' software will probably need to be rewritten to work with X-Series In the legacy analyzers, some conditions report as errors and others simply turn on status bits. Conditions that report as errors often report over and over as long as the condition exists. In the X-series, all conditions report as start and stop events. Consequently, software that repeatedly queries for a condition error until it stops reporting will have to be rewritten for the X-series

More Information

The Status Dialog has two screens, selectable by the tabs on the right: History and Current Conditions:

History

History brings up a screen displaying the front panel message queue in chronological order, with the newest event at the top. Remember that the front panel queue contains all of the events generated by front panel actions as well as error events from all of the SCPI queues. A typical History display appears below:



The fields on the History display are:

Type Displays the icon identifying the event or condition as an error or warning

ID Displays the error number

Message Displays the message text

Repeat (RPT) This field shows the number of consecutive instances of the event, uninterrupted by other events. In other words, if an event occurs 5 times with no other intervening event, the value of repeat will be 5

If the value of Repeat is 1 the field does not display. If the value of Repeat is >1, the time and date shown are those of the most recent occurrence. If the value of repeat reaches 999,999 it stops there. The Repeat field can run into some pretty large numbers when apps (like the GSM app) report things like “GSM sync burst not found” as events rather than conditions, which is actually fairly common

Note that the repeat count is unavailable over SCPI

Time Shows the most recent time (including the date) at which the event occurred. Time is displayed to the second

To understand the History dialog, and to properly program the instrument’s messaging system, remember that there are two types of occurrences, events and conditions:

– An event is an occurrence of zero duration. Events generate messages which are displayed in the center of the display for a period of time and then fade away. These may be of an advisory nature or may represent errors, for example “No peak found”

– A condition is an occurrence of finite duration, that is, it has a start and an end. Conditions are states of the analyzer characterized by some combination of settings or some kind of failure that the user needs to be told about while it is happening, but then can stop being told once it goes away; for example “Input overload; ADC over range”

The error queue contains error events as well as the DETECTED and CLEARED events for condition errors, as seen in the figure above.

DETECTED events have numbers less than 1000 and CLEARED events have the same number plus 1000. For example,

301, Meas Uncal – DETECTED

and later

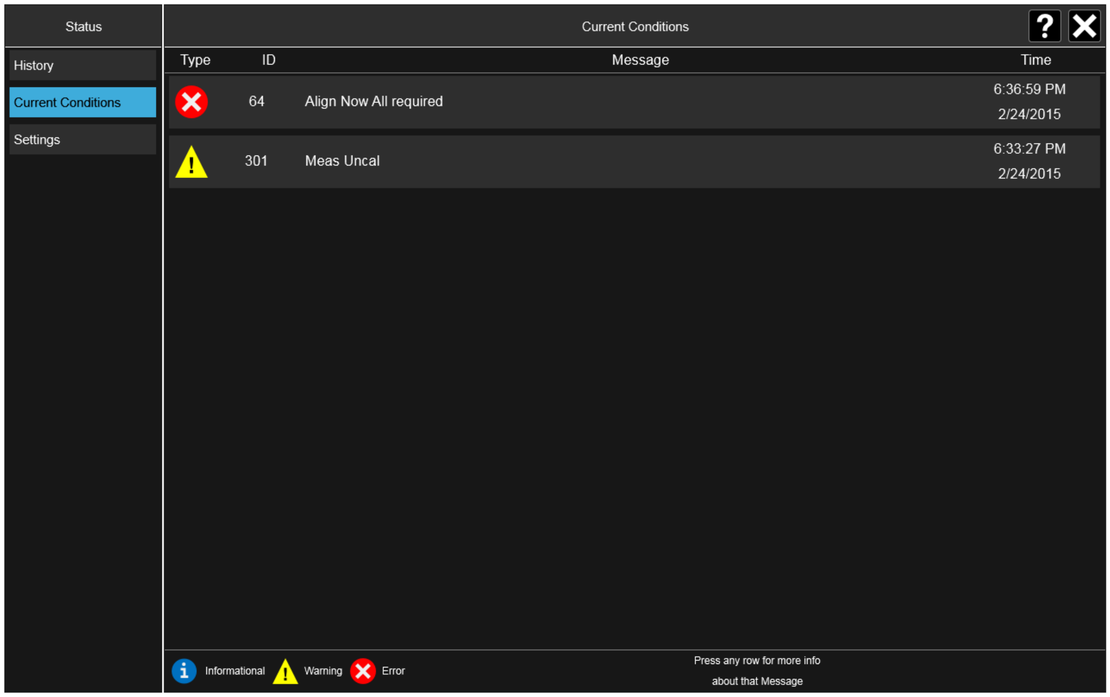
1301, Meas Uncal – CLEARED

To detect a condition error over SCPI, you should read the error queue and note any DETECTED error which is not followed eventually by an associated CLEARED error. This means the condition is still in effect. It is not sufficient to simply read the error queue until you get “No Errors” back. You may still have the condition error; the condition may still be in effect, and if that is the case, all you have done by clearing the error queue is to remove the first event (the DETECTED event) from the queue. For a condition error, you have to read the error queue until you see the CLEARED event for that condition. THEN you know that the condition is gone.

Current Conditions

The **Current Conditions** display shows all of the open conditions in the instrument. An open condition is a condition error or warning for which a start (detected) event has occurred but for which no corresponding stop (cleared) event has occurred.

An example of the Current Conditions screen appears below:

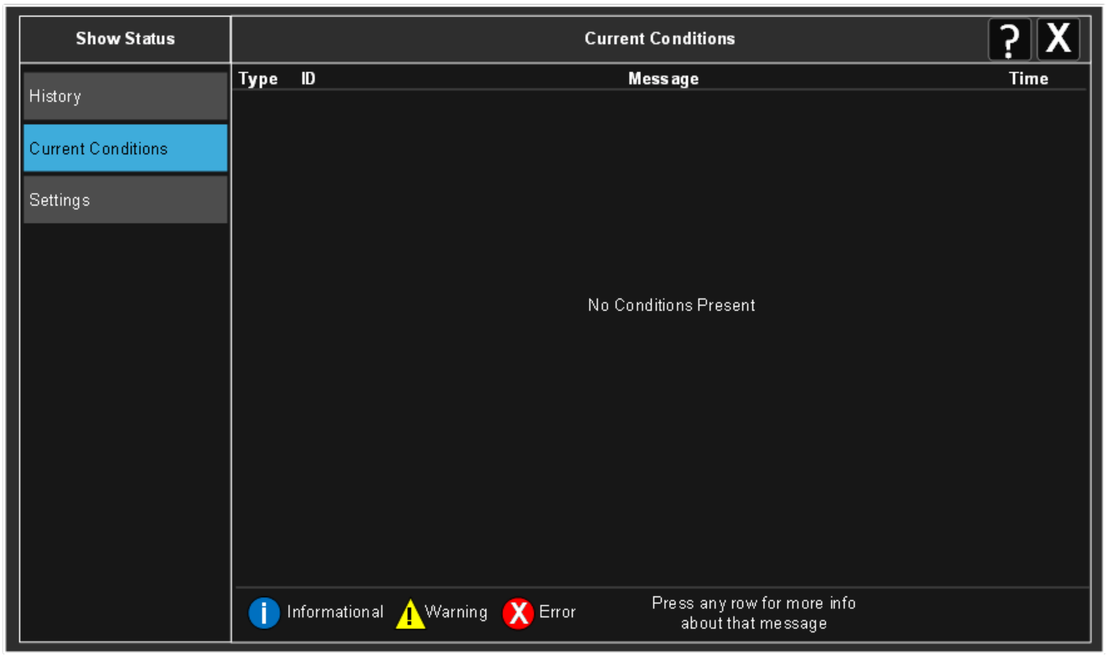


The fields on the Current Conditions display are:

Type	Displays the icon identifying the event or condition as an error or warning or informational
ID	Displays the error number
Message	Displays the message text
Time	Shows the most recent time (including the date) at which the event occurred. Time is displayed to the second

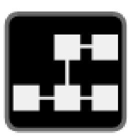
Touching a condition message expands the display of that message. Touching again collapses it. The description is the same as the one that appears on the message dialog. An example of this is shown in the History section, below.

When there are no open conditions, the display is as shown below:



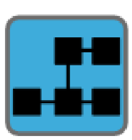
2.4.6 Block Diagram

When you press the Block Diagram button in the "Control Bar" on page 115, the display changes to a stylized pictorial representation of the current internal hardware setup and signal processing path. When you touch one of the blocks on the Block Diagram, the corresponding menu panel opens.



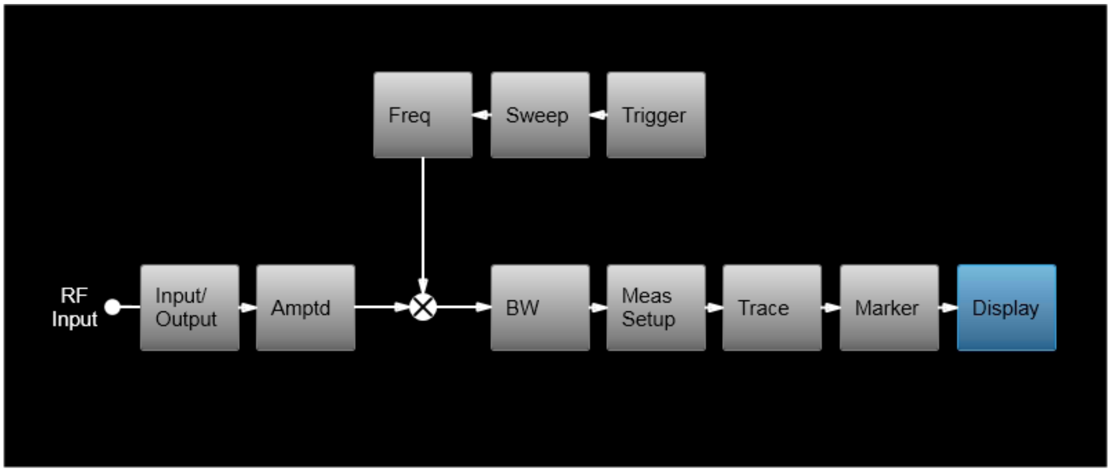
When you press the Block Diagram button, the display changes to a stylized pictorial representation of the current internal hardware setup and signal processing path. When you touch one of the blocks on the Block Diagram, the corresponding menu panel opens.

While in the Block Diagram display, the button is blue colored, as:

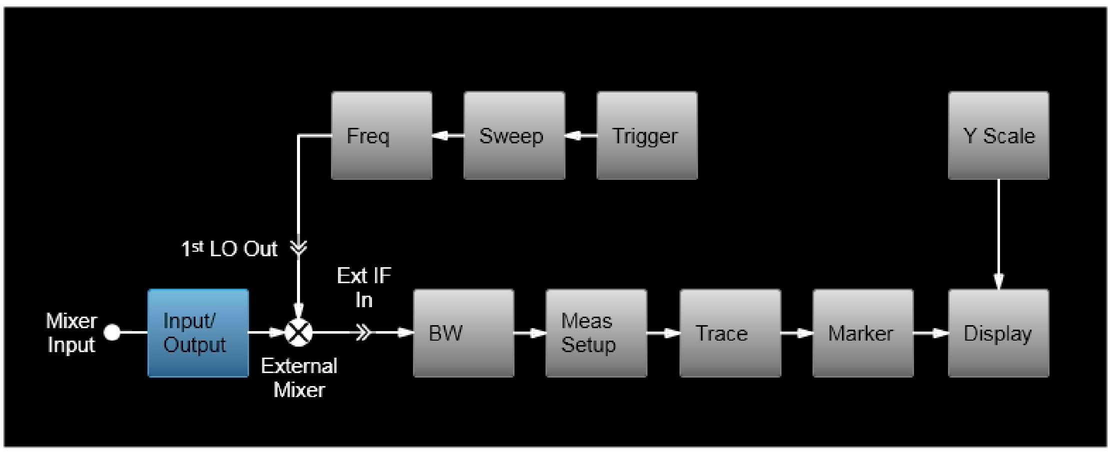


To exit the Block Diagram display, tap the button again.

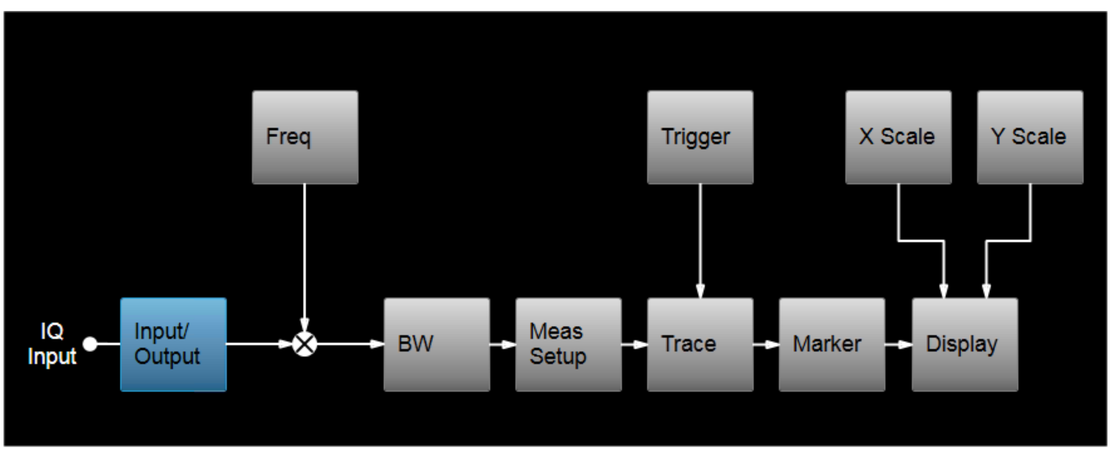
The Block Diagram display is not meant to be a completely accurate representation, but one which can show differences as you change the hardware setup. For example, here is the basic RF Block Diagram:



And here is the Block Diagram when External Mixing is selected:



And here is the Block Diagram when the I/Q inputs are selected:

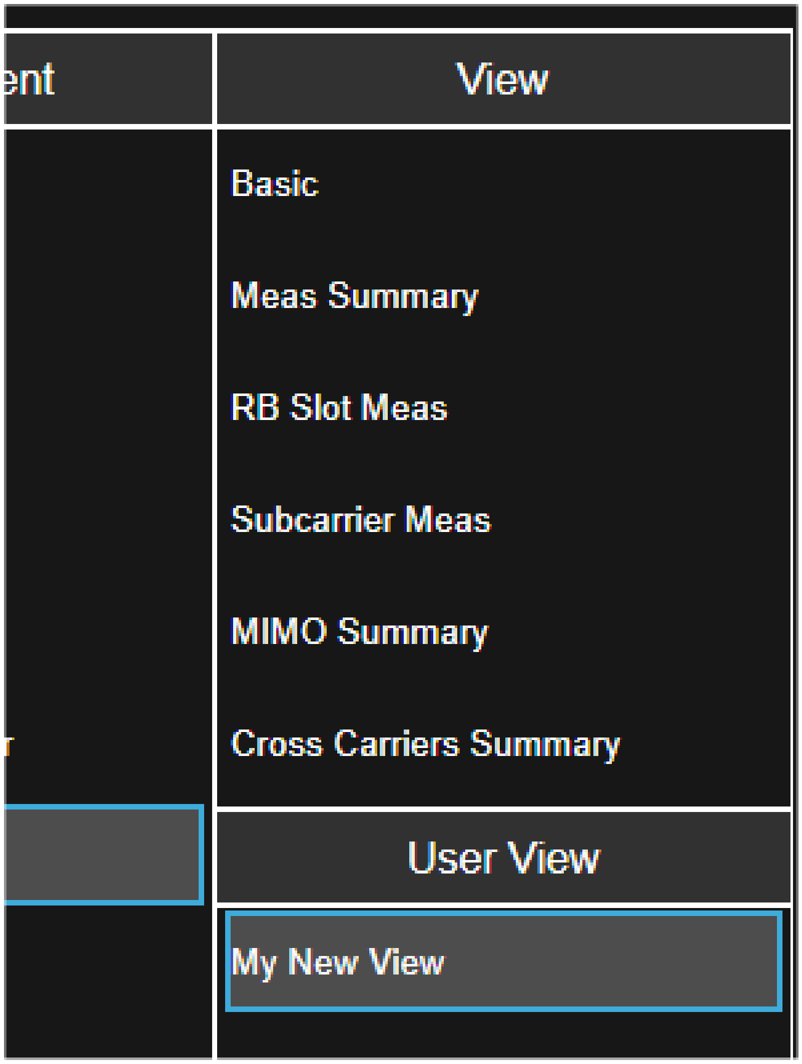


2.4.7 View Editor

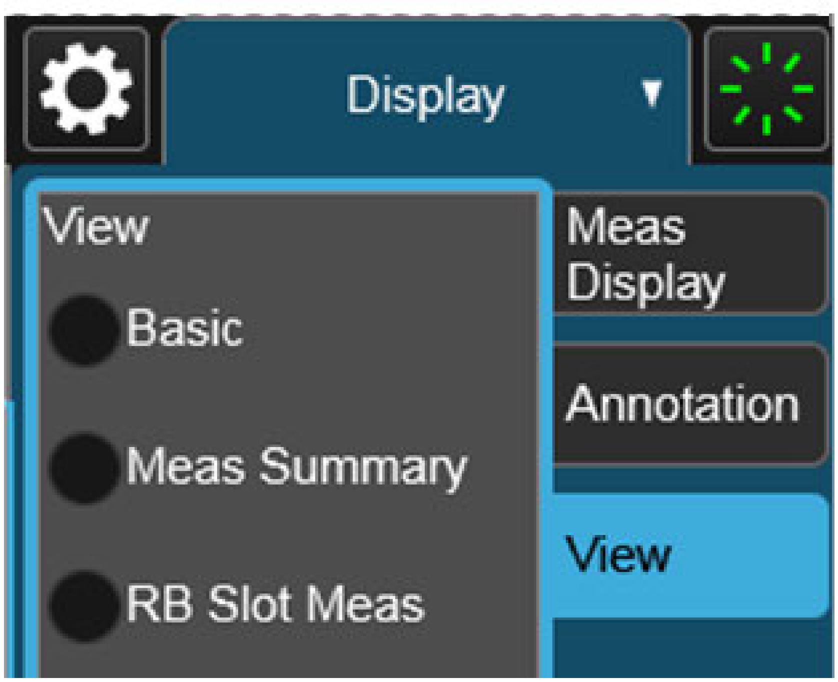
This section describes the use of the View Editor, which allows you to:

- Add windows to and delete windows from the current measurement
- Resize and rearrange windows
- Create User Views

User Views are custom Views that you create by adding, deleting, rearranging, resizing, or changing the contents of the windows in an existing View, and then saving the edited View as a new View. The instrument lists the current User Views for a measurement after the Predefined Views, in the Mode/Meas dialog and on the View menu panel under Display:



ent
View
Basic
Meas Summary
RB Slot Meas
Subcarrier Meas
MIMO Summary
Cross Carriers Summary
User View
My New View



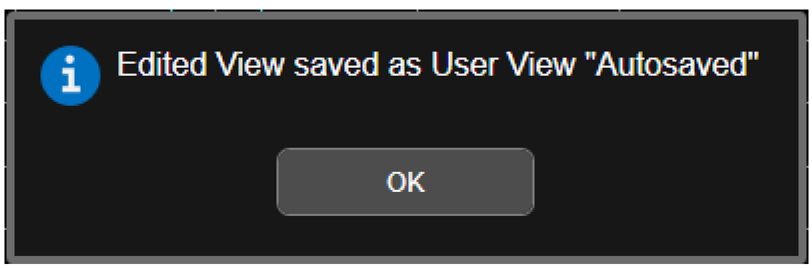
Display
View
Basic
Meas Summary
RB Slot Meas
Meas Display
Annotation
View

You can save an edited View using the **Save Layout as New View** control in the View menu (see "To Save a User View" on page 144).

On occasion, the instrument may automatically save an edited View for you. If you have edited a View, so that the * is displaying next to the View name, you must save that View as a User View before you save State or switch measurements. If you forget that you have made changes to a View, then to keep from losing your edited View when you switch measurements, the instrument will save it for you. If you have an edited View that has not been saved and you try to do any of the following:

- Enter the “Save” menu
- Switch Measurements
- Switch Modes
- Switch Screens

the edited view will be saved for you with the name “Autosaved”. When this happens, you will receive the following message:



If an Autosaved User View already exists, the User View called “Autosaved” will be overwritten with the currently edited view. If you have multiple edited views, the selected edited view will be Autosaved. If there is not an edited view selected the last selected edited view will be Autosaved.

To Open the View Editor

Pressing the View Editor button (shown above) in the "Control Bar" on page 115, at the bottom right of the screen, opens the View Editor.

While in the View Editor, the icon is blue colored, as:

Pressing the View Editor button again exits the View Editor.

To Close the View Editor

Tap the View Editor button again.

The user chooses the desired View through the use of the Mode/Meas/View dialog (see "Mode/Meas/View Dialog" on page 85) or the View menu (a tab under the **Display** key). The View menu allows the user to browse the views in the current measurement. The View menu contains a list of Predefined Views for you to use. If you wish to modify a Predefined View or create your own, new View, you use the View Editor.

User Views & Predefined Views

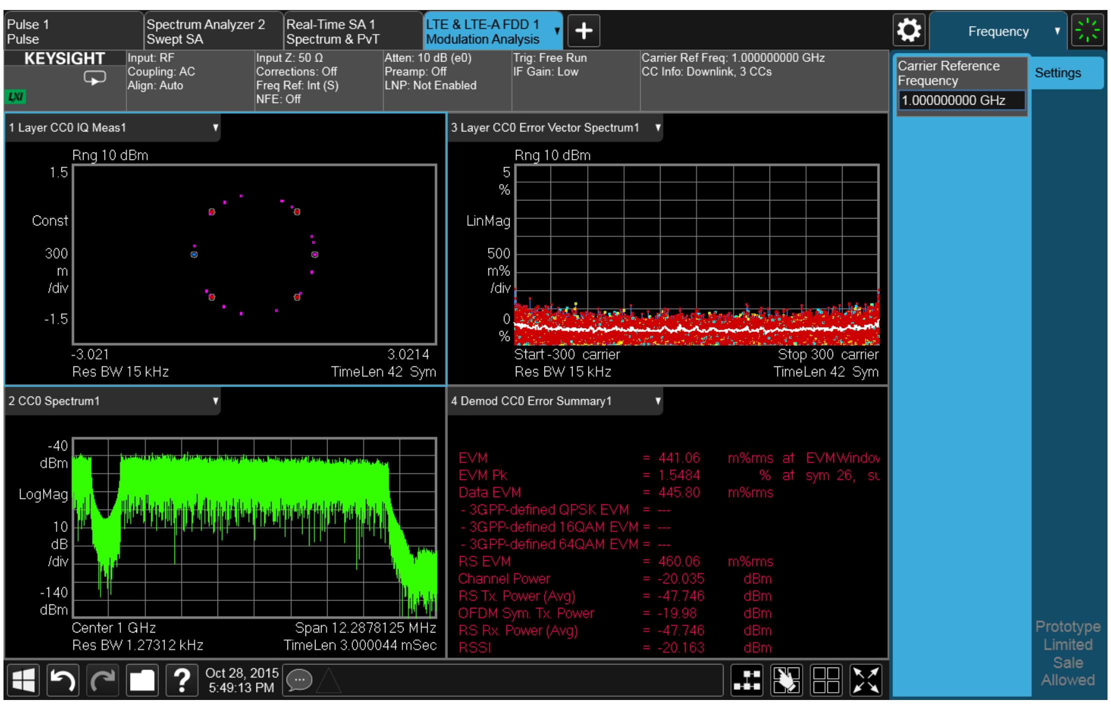
A User View is any View that is not in the list of predefined Views for the current measurement. For example, the Swept SA measurement has four predefined Views: Normal, Spectrogram, Zone Span, and Trace Zoom.

User Views allow you to add, delete, change and rearrange the windows of a predefined View, creating a new custom view.

2.4.7.1 To Create a User View

Whenever you add or delete a window to/from a predefined View, or change what is being displayed in a Predefined View's window, the Predefined View is marked with an asterisk (*), to show that it has been modified.

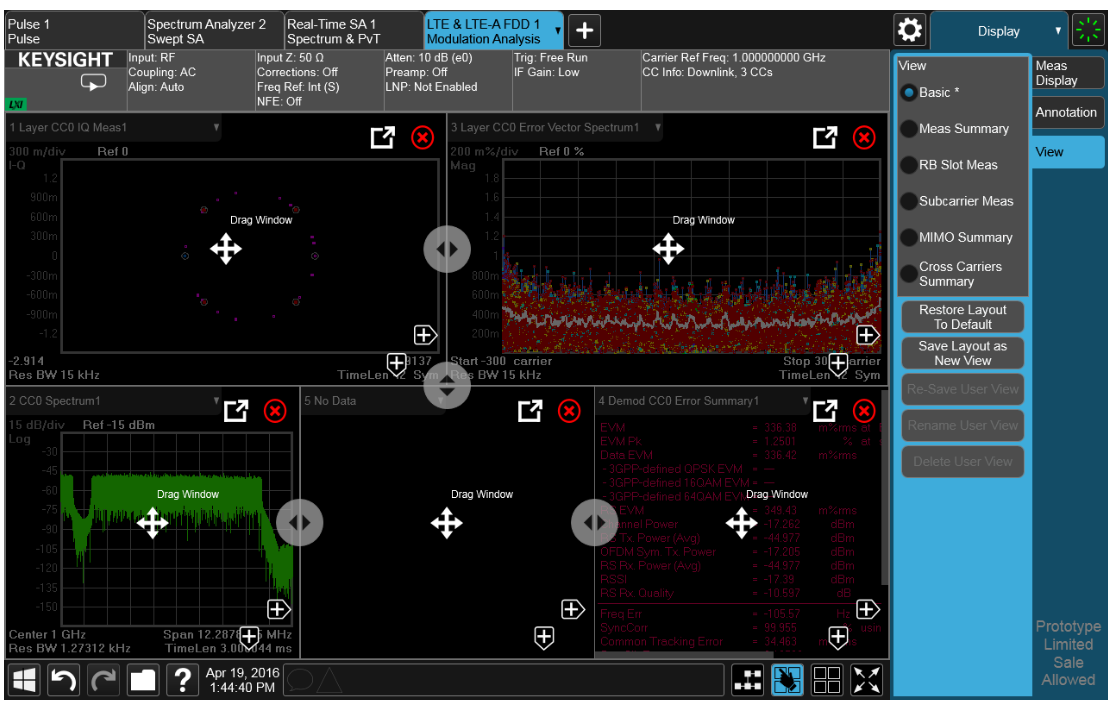
For example, to edit the View shown below, you press the Edit View icon.



When you do this, you get the View Editor screen, which appears as below. The menu panel switches to the View menu. Here we see that we are in the Predefined View called "Basic".

Each window has two arrows containing + signs. Pressing either of the "+" symbols adds a new window on that side. For example, let's say you press the + symbol on the right of the lower left window:

You would then see this:



A fifth window has been added, and is automatically assigned the number 5. (The window number, which is displayed in the Window Title region, is used when sending SCPI commands to that window).

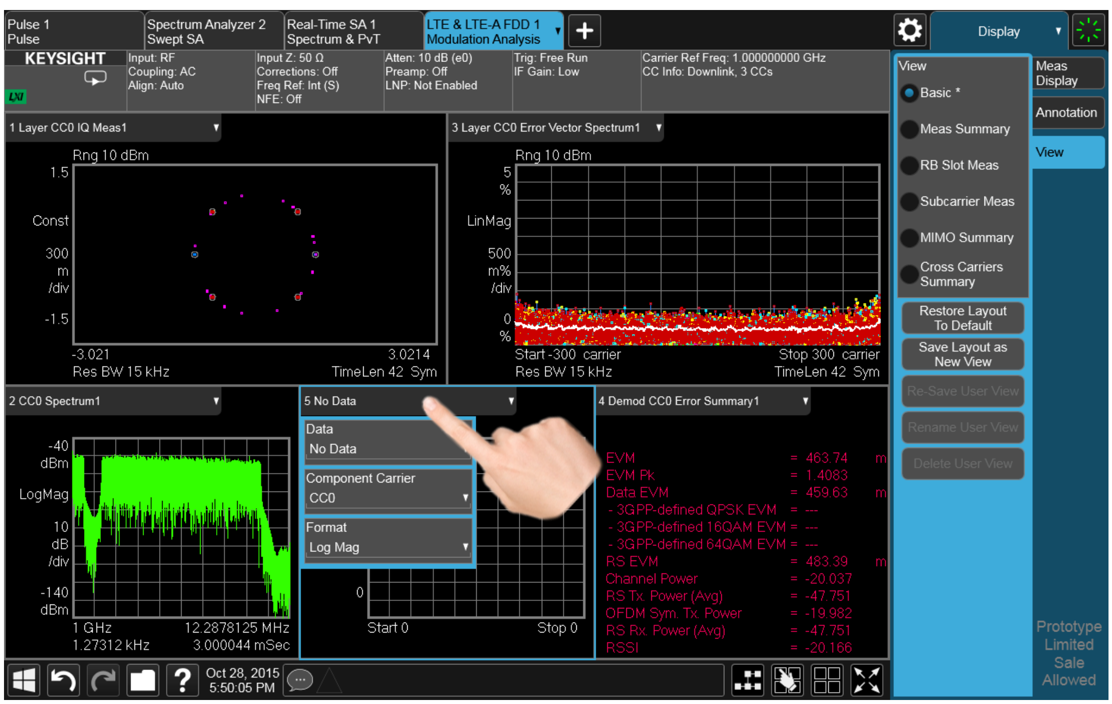
Note the * that now appears next to Basic in the View menu, indicating that you are now in the **modified** Basic View. You see the * if you add, delete or rearrange windows, but simply resizing windows does not display the *. The * means you are in a modified View, which must be saved as a User View before you leave the measurement (if you don't save it, the instrument will save it for you).

Note also that the Restore Layout to Default control is no longer grayed out. If you press this control it restores the Basic View to its default state. Restore Layout to Default becomes available when you add, delete or rearrange windows **and** when you resize them; otherwise it is grayed out.

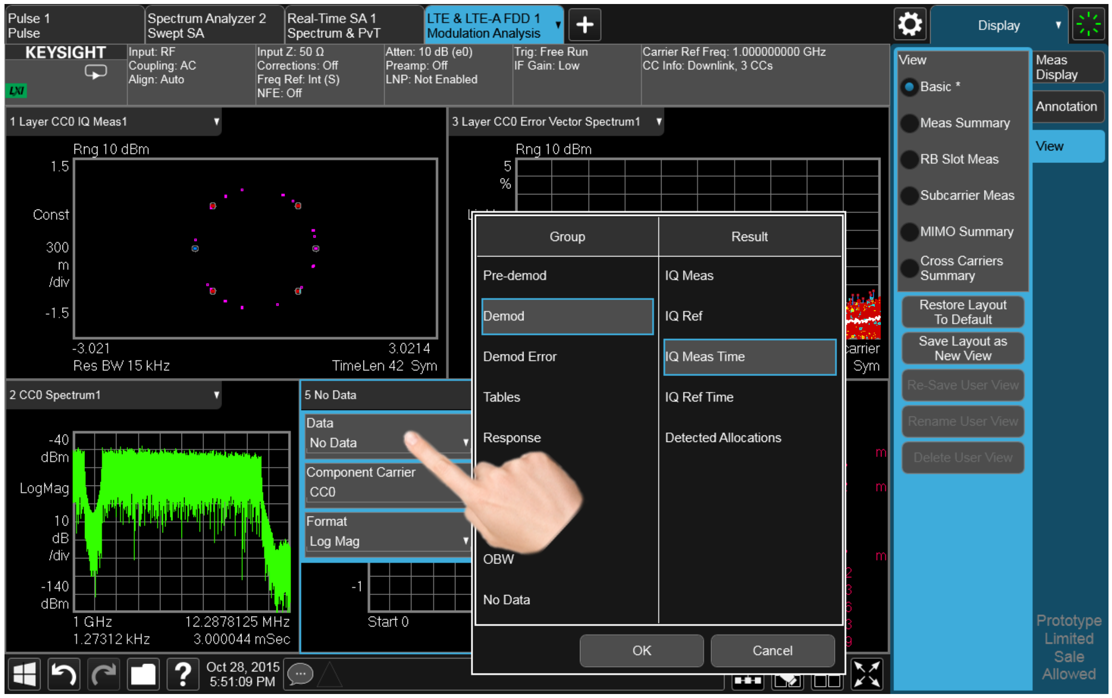
You can add more windows with the "+" arrow symbols. Note that the "+" arrow symbols only appear if the current measurement has more windows available to display. If you are already displaying all the measurement's windows, the "+" symbols disappear.

You can exit the View Editor by again tapping the Edit View icon.

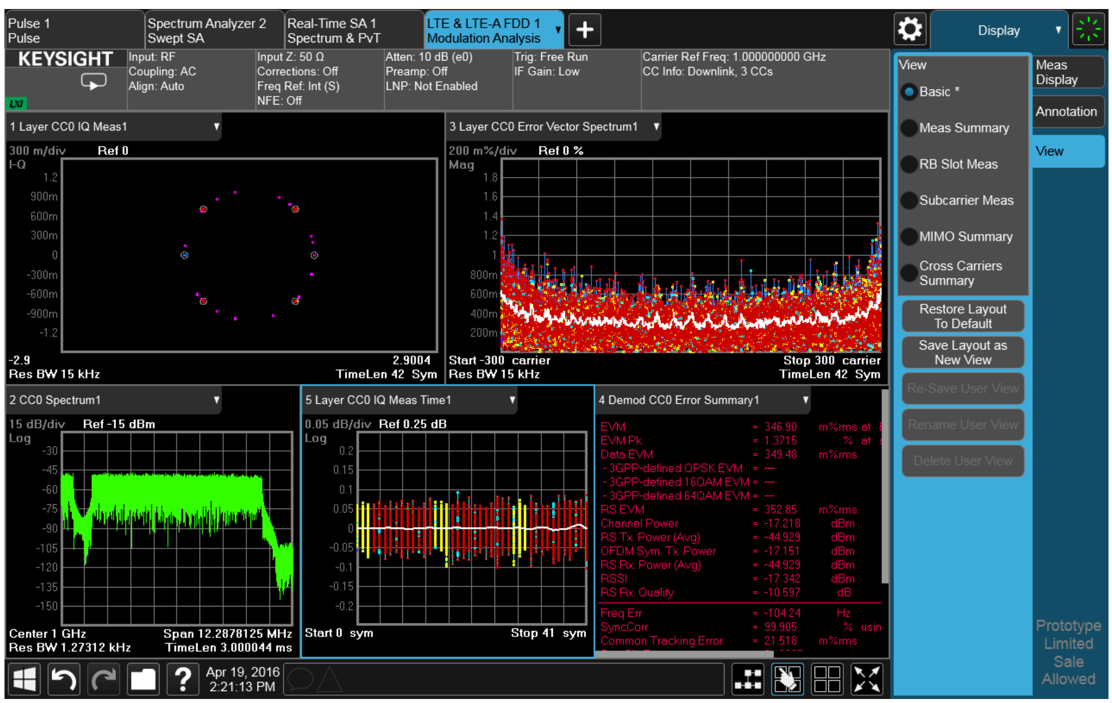
You can specify which result you want to see in the new window by tapping its title region.



A panel drops down, containing a Data control for specifying window results. Some measurements, such as LTE-A in this example, also provide controls on this dropdown for specifying other window parameters, such as the Component Carrier and Data Format, Tap the Data control and you will see a list of available results for the window. In some cases, as in LTE-A, this will be a cascading list, due to the number of results available:



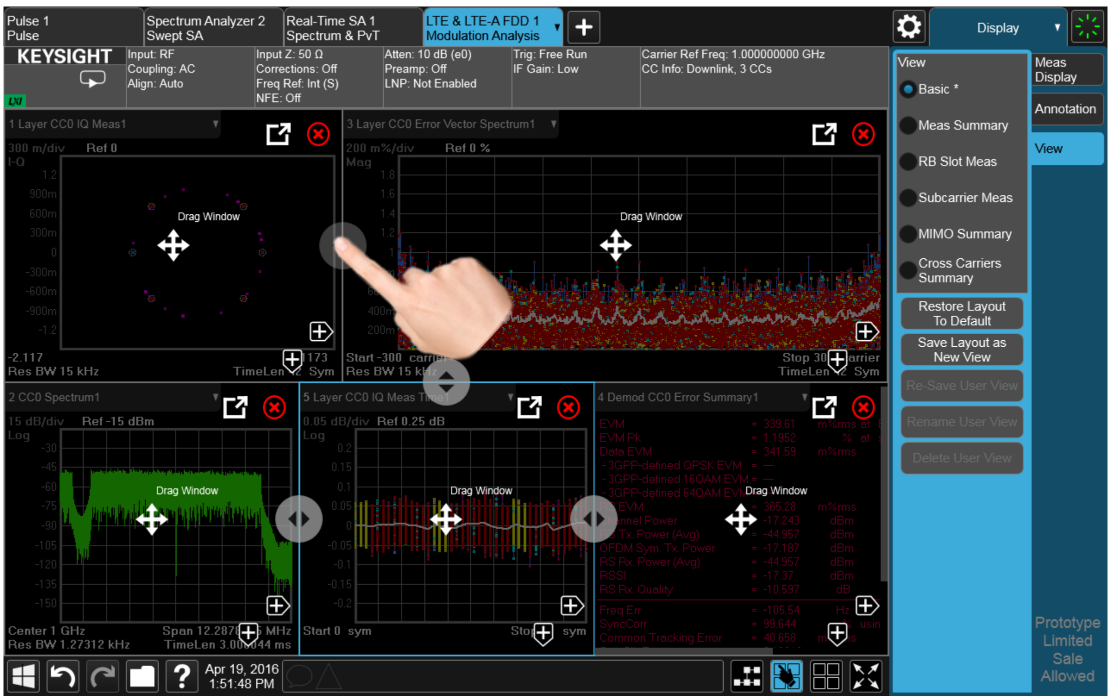
Choose the result you want and tap OK. Here we have chosen IQ Meas Time from the Demod group:



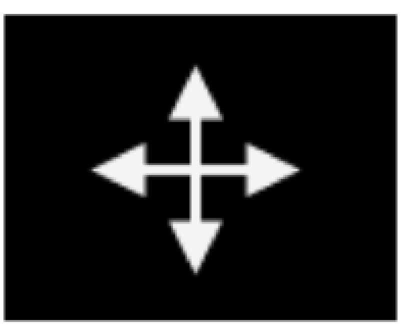
Your new, edited User View is now ready to use.

2.4.7.2 To Resize or Rearrange Windows in a View

Sometimes you may wish to resize a window. To do this go back into the View Editor and note the large, translucent white circles along the edges of the draggable borders. These are the “resize handles”. You can resize the windows by dragging these handles. Note that in their quiescent state they are slightly translucent; when you touch one it turns solid white, indicating that it is draggable. If you touch and drag one of them it moves the axis to which it is attached.

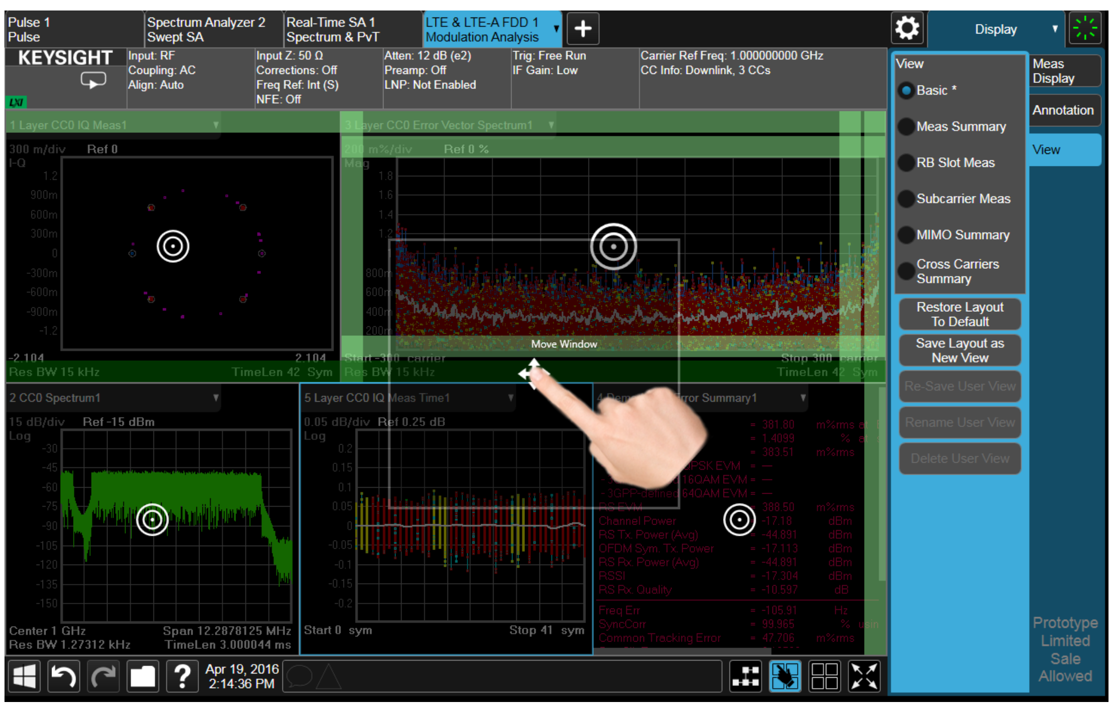


Another feature that comes with the View Editor is the ability to move windows around. You do this by dragging the four-arrow objects in the center of the window; the whole window goes along. Actually you can touch and drag anywhere in the window (except on one of the arrows or the delete circle) and it will drag, but the four-arrow objects give you an indication and a convenient finger target.

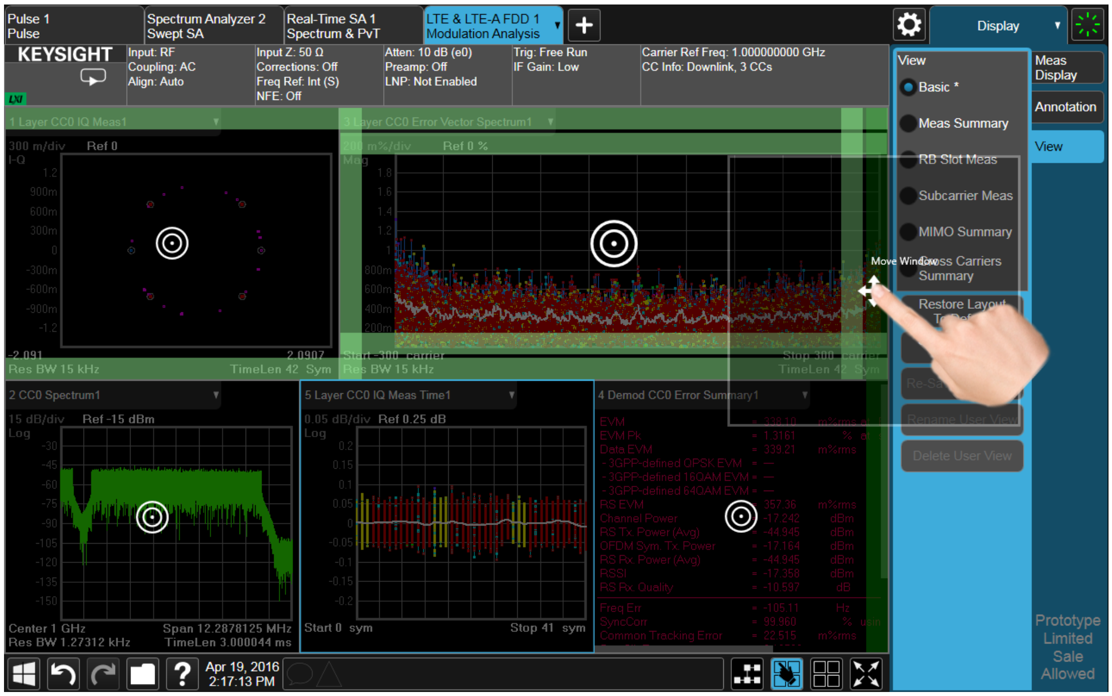


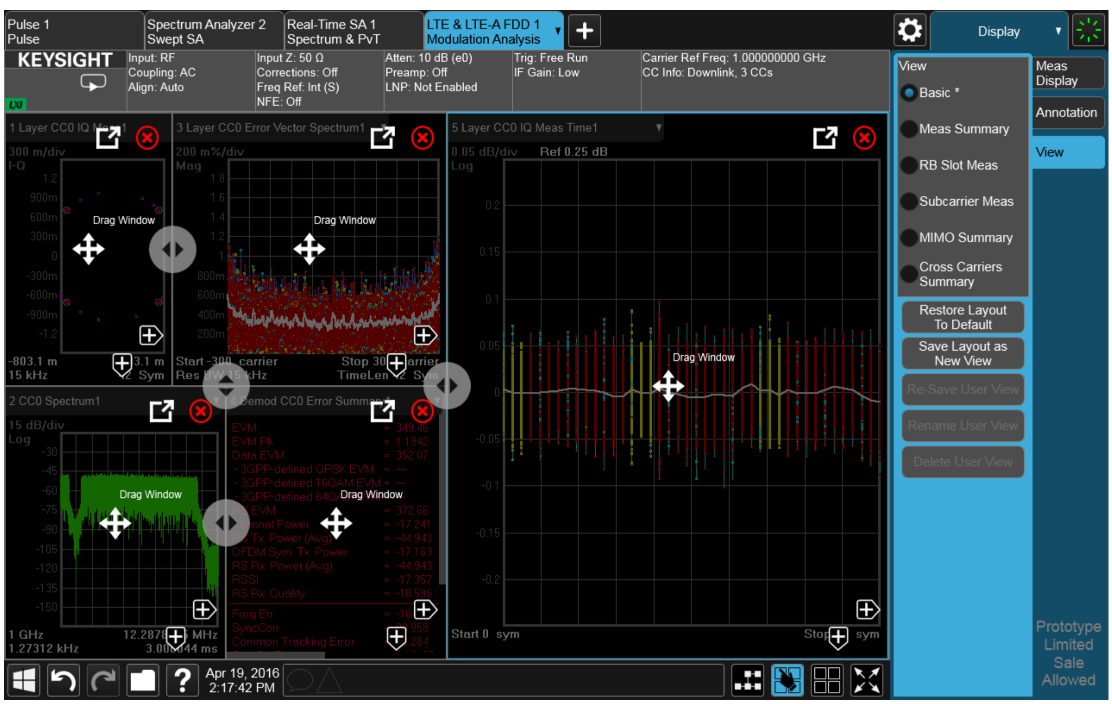
The outline of the window appears as it is being dragged. When you start to drag a window, target symbols appear in the other windows:

If you drop a window on one of the targets, it swaps positions with the target window. If you drag a window's center into another window, green stripes appear on the edges to show you where the window will go when you release it:



When you hover over one of the stripes it gets dimmer, to show the position the window being dragged will take on. If you release a window over an inner stripe, the window you are dragging and the window over which you were hovering resize to share the space the target window originally occupied. If you release a window over an outer stripe, as shown below, the window you are dragging takes on a new position outside the array of other windows:





In either case, one or more of the remaining windows resize to occupy the space formerly occupied by the window you were dragging.

2.4.7.3 To Undock and Redock Windows

You can undock a window from the analyzer's display frame so that it becomes a separate, floating window with its own Windows banner and title. There are two different ways to do this:

1. Drag the window to a spot on the display where its center is not on top of any targets or green stripes. When you do this the note on the window will change to "Undock Window":

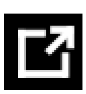
Now release the window and it will undock in place without changing size:

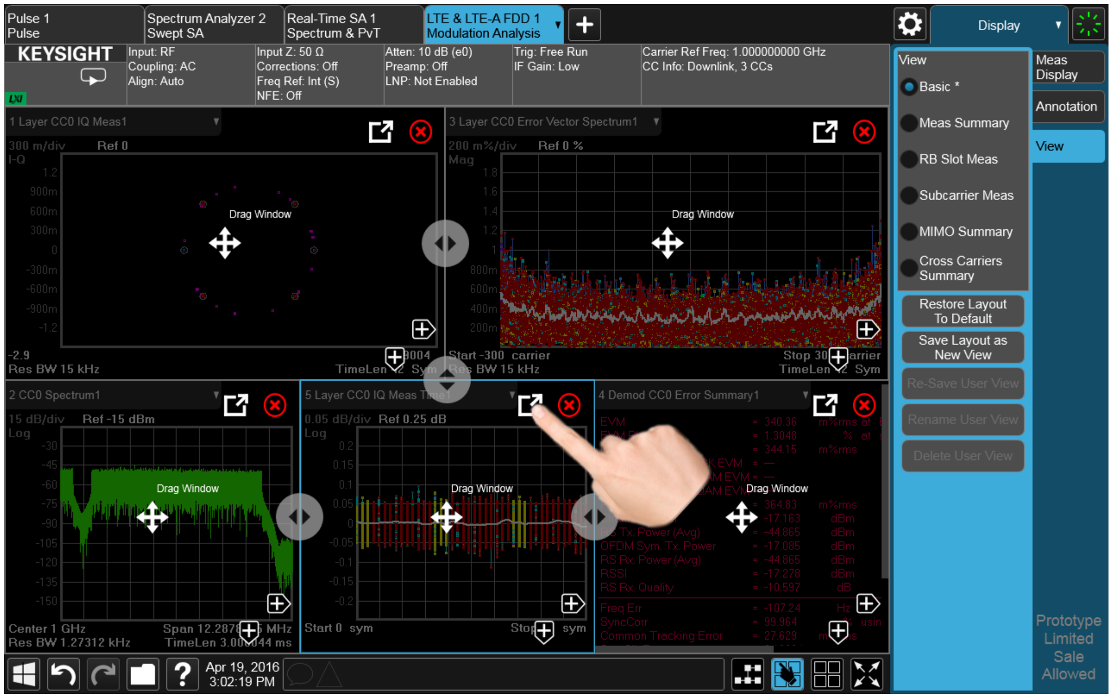
Notice that it now has a banner and a title of its own. The first line of the banner is the Mode name and the second is the Measurement name. If the window is too small, these will be shortened with an ellipsis. The window name and number themselves appear in the upper left corner of the window, as usual.

Note that we are still in Edit View mode so the main window stills display the shaded overlay and, if there is more than one window left on the main display, the "move" arrows and delete and undock controls.

There are no "add" arrows or "drag cross" or "delete X" on the undocked window, because now it is a normal Windows window; so you can minimize it, maximize it, delete it, and resize it in the normal Windows way, whether the main window is in Edit View or not. You can also drag it around or to any monitor, and it will snap to full screen when dragged to an edge like any other Windows window.

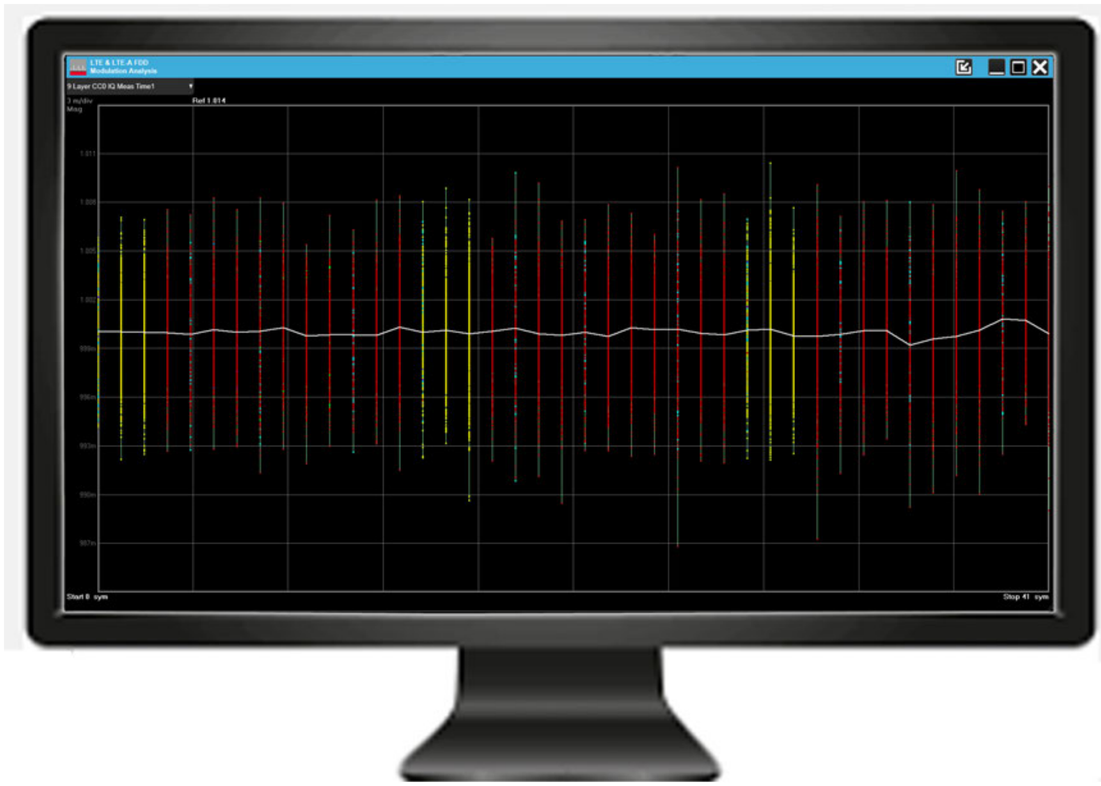
2. Tap the "undock" icon in the corner of the window:





A prompt will appear with a picture which allows you to specify which monitor to which you wish to undock the window:

Tap one of the monitors and you will see the window undock to that monitor, which may be a different monitor than the analyzer:



You can now treat this window like any other in Windows; you can resize it, drag it around and/or to a different monitor, etc.

The undocked windows represent a modified (starred) View and can be saved to a User View. They disappear if you change measurements or Views and return if you change back. If the external monitor is unplugged, the undocked windows land back on the main analyzer window and remain there, undocked, even if the monitor is plugged back in. The same is true if a User View is selected which had windows on a monitor that is not connected.

Note that even with a window undocked, there is still only one selected window in xSA, indicated by a blue window border (for a docked window) or a blue window banner (for an undocked window). Also, all popup messages still appear only on the main analyzer screen.

In multiscreen display mode, all windows for each Screen's current View (docked and undocked) are displayed. In single screen display mode, only the windows associated with the current Screen's current View (docked and undocked) are displayed.

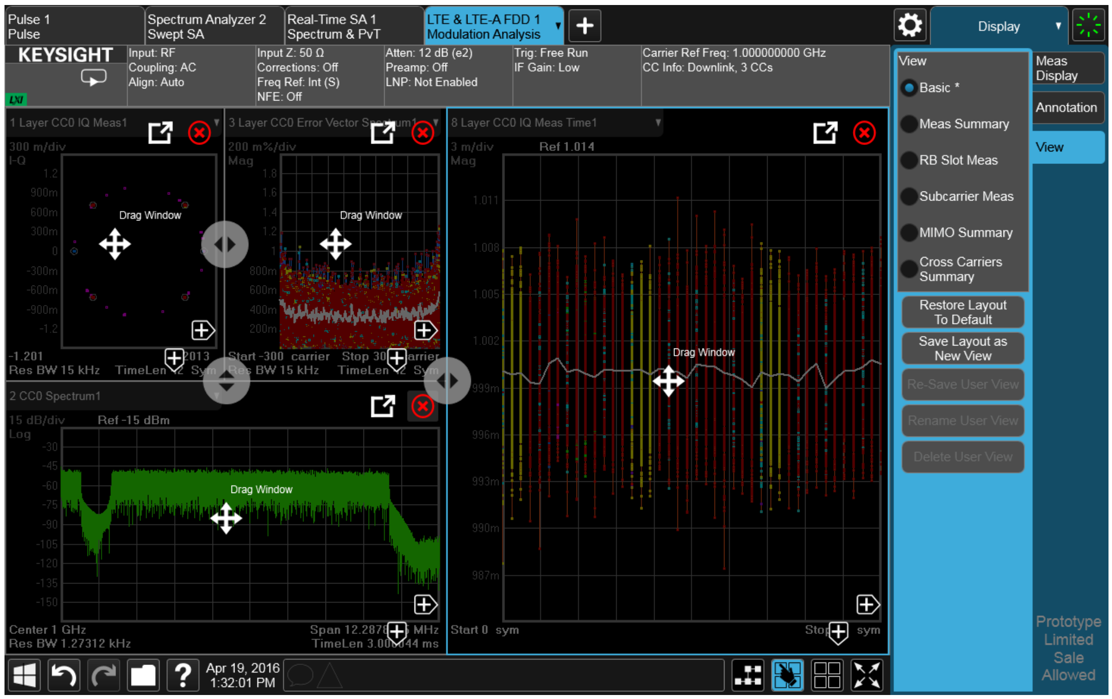
With undocked windows, when you save a Screen Image, the undocked windows are not included in the png.

To redock an undocked window to its original location, tap the "redock" icon in the window's banner:  The window will return to its original location.

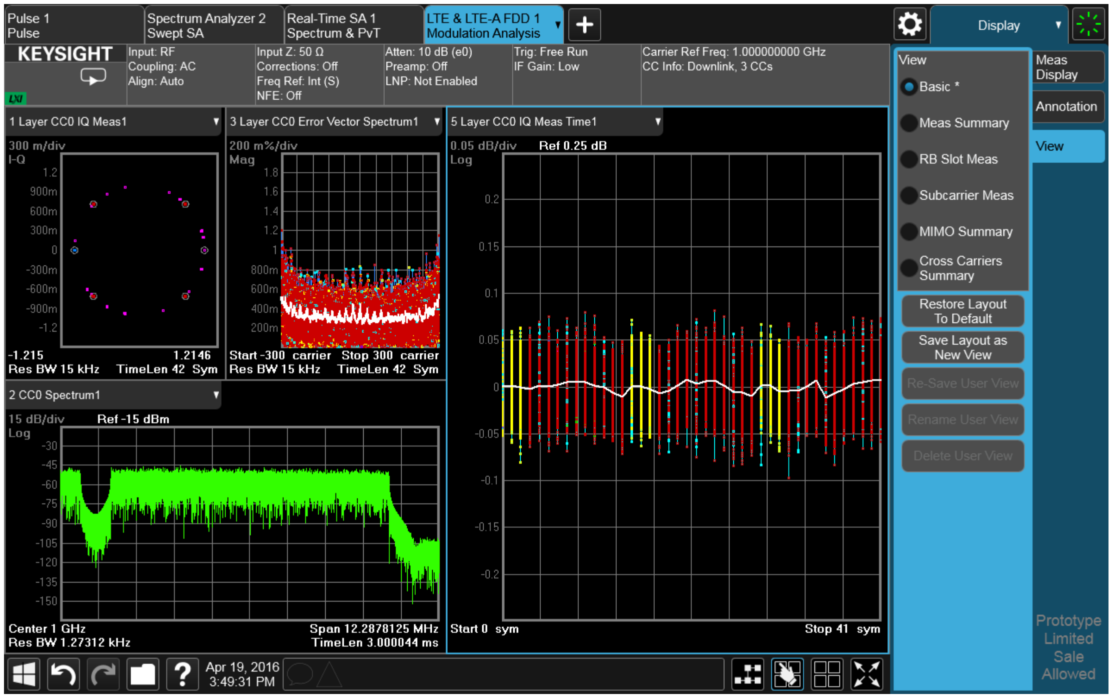
2.4.7.4 To Delete a Window from a View

The View Editor also lets you delete a window. To do this, tap one of the circled red X's, as shown below.

There has to be more than one window for you to see the circled red Xs.



Now press the View Editor button (the blue hand) to exit the View Editor. At this point, you have an edited Predefined View, as shown by the * next to Basic:



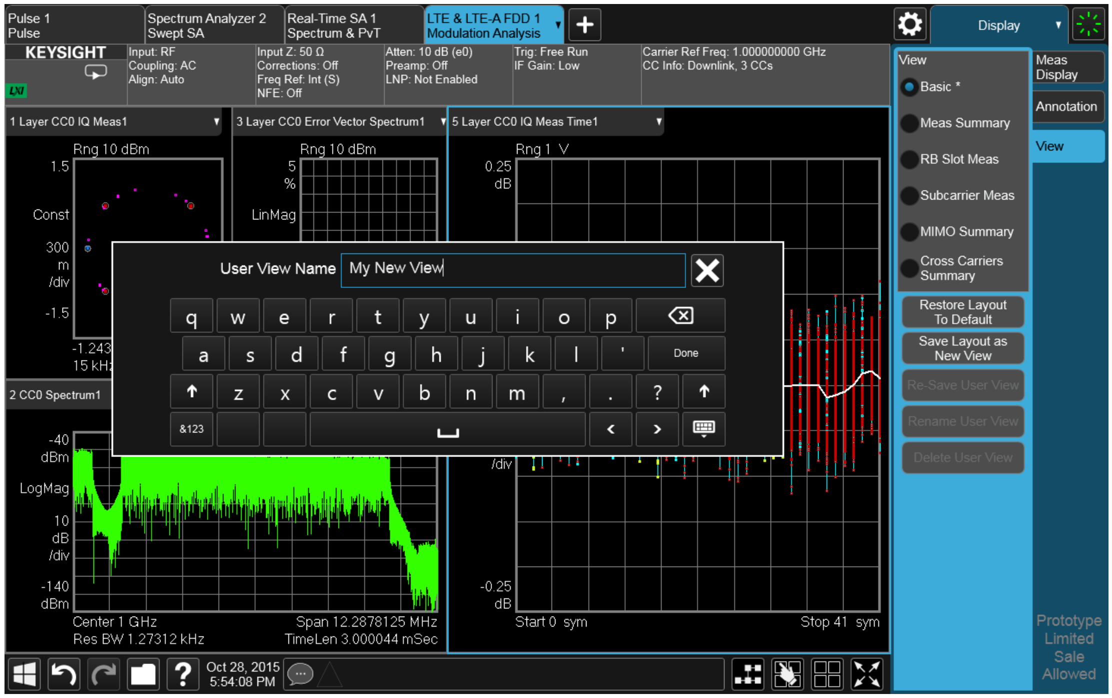
When you are finished with it, you can restore the Layout to the default for Basic by pressing “Restore Layout to Default”. Or you can save your edited View as a “User View” (if you exit the measurement without saving the edited View, the instrument will save it for you as a User View called “Autosaved”).

If you clone the current Screen by pressing the “+” tab, the modified Predefined View will be saved as a User View called “Autosaved”, and it will be available in the new Screen.

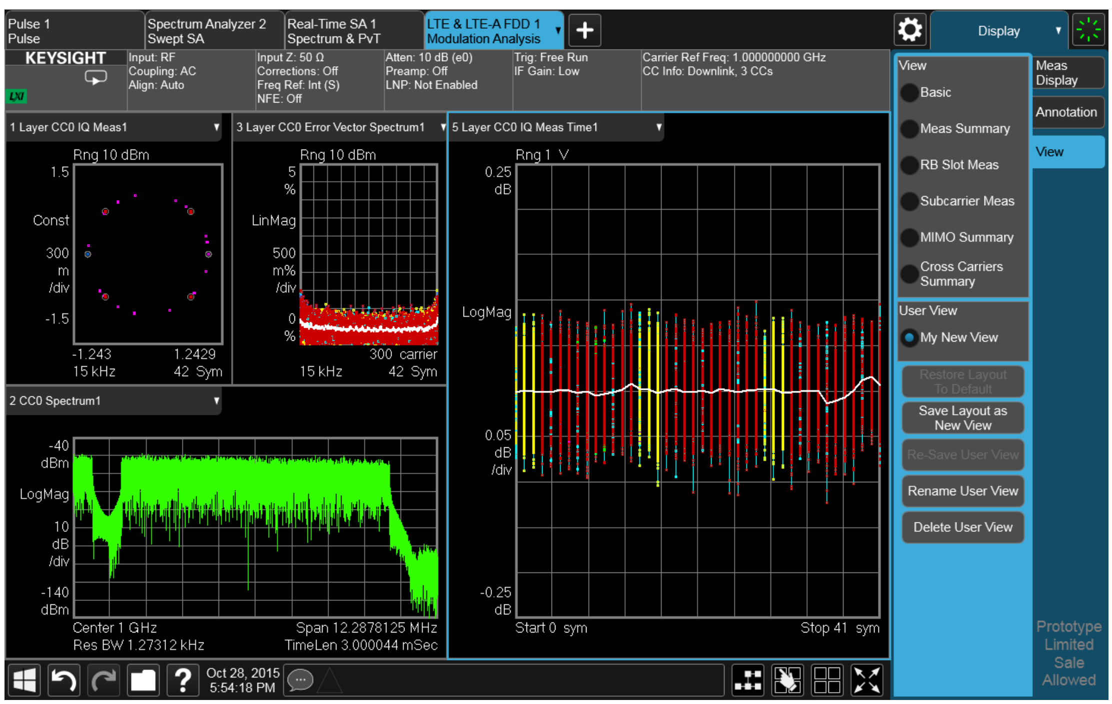
2.4.7.5 To Save a User View

See also "Transferring User Views Between Instruments" on page 146

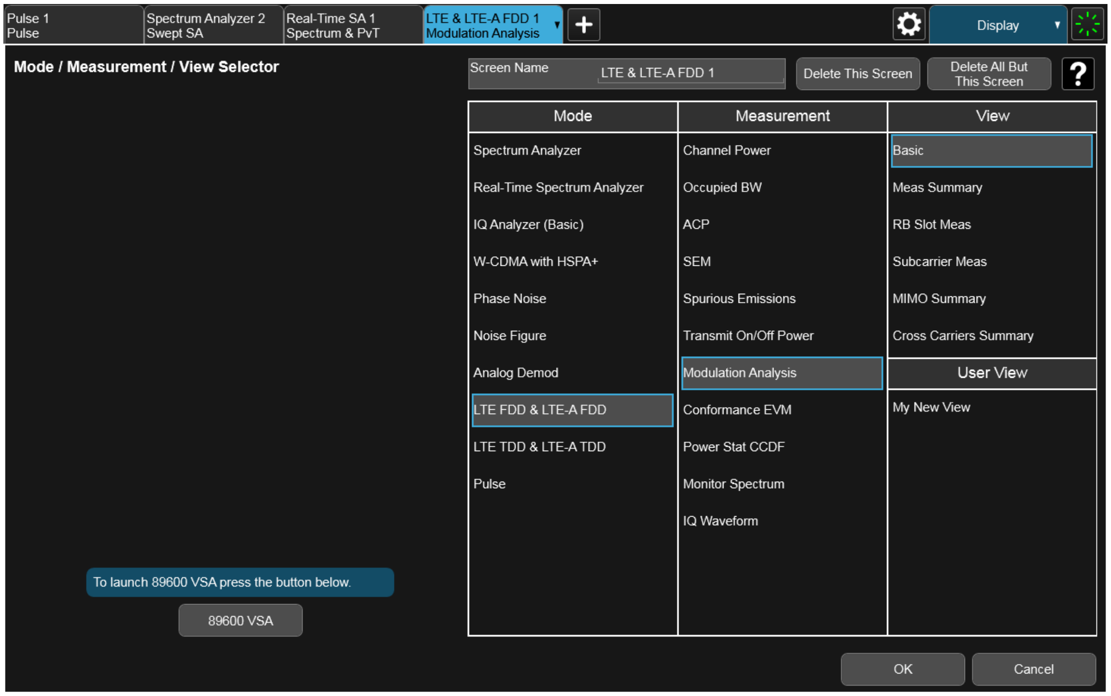
To save your new View as a User View, tap the “Save Layout as New View” control. You will get an alpha keyboard that lets you name your new View; the default is the old View name with a number. Below, we have typed in “My New View”:



When you tap "Done", the View is saved:



Notice the User View region which has appeared on the menu panel above, with the new User View called "My New View. Notice also that "Basic" has returned to its original, unedited state and the * is gone from its name. Note also that "Restore Layout to Default" is grayed out. Note also that if you go to the Mode/Meas dialog, you will see the User View there as well:



When naming a new View, you must choose a name that is not already in use for any User View in any measurement; this is because User Views get written to permanent memory and are available to all instances of the Measurement in any screen. They survive a Mode Preset and also survive shutdown and restart of the application.

Transferring User Views Between Instruments

To transfer a User View to another instrument, you must copy the desired file to a portable drive or to your network and then copy it to the target instrument.

When you save a User View, a file is created (or updated if it already exists) containing all the User Views for the current measurement. All of these files are saved on the D: drive in the instrument, in the folder:

`D:\Users\Instrument\My Documents\UserViews`

(assuming you are logged in as Instrument, which is the default).

Look for the file for your measurement. The file naming convention is:

`ModeName.MeasName.layout`

Where `ModeName` is the long-form SCPI parameter for the `:INST:SEL` command for your Mode, and `MeasName` is the long-form SCPI parameter for the `:CONF` command for your Measurement.

For a full list of all `ModeName` parameters, see **Index to Modes** in "Mode" on page 86.

The following is a full list of all `MeasName` parameters.

Measurement Name	SCPI ID
ACP, Adjacent Channel Power	`ACPower`

Measurement Name	SCPI ID
AM	AM
APD	APD
Burst Power	BPOWer
Channel Power	CHPower
Code Domain	CDPower
Combined GSM	CGSM
Combined WCDMA	CWCDma
Complex Spectrum	SPECtrum
Conformance EVM	CEVM
Digital Demod	DDEMod
Disturbance Analyzer	DANalyzer
EDR In-band Spurious Emissions	IBSPurious
EVM	EEVM
FM	FM
FM Stereo	FMStereo
Frequency Scan	FSCan
GMSK Phase & Freq Error	PFERror
Harmonics	HARMonics
IQ Waveform	WAVeform
LE In-band Emissions	IBEMissions
List Power Step	LPSTep
List Sweep	LIST
Log Plot	LPLot
Mod Accuracy	RHO
Modulation Analysis	EVM
Monitor Spectrum	MONitor
Noise Figure	NFIGure
Occupied BW	OBWidth
Output RF Spectrum	EORFspectr
Output Spectrum BW	OBWidth
PM	PM
Power Amplifier	PAMPlifier
Power Control	PCONtrol
Power Stat CCDF	PSTatistic
Power vs Time	EPVTime
Pulse	PULSe
QPSK EVM	EVMQpsk

Measurement Name	SCPI ID
SEM	SEMask
Spectral Flatness	FLATness
Spectrum & PvT	RTSA
Spot Frequency	SFRequency
Spurious Emission	SPURious
Strip Chart	SCHart
Swept SA	SANalyzer
TOI	TOI
Transmit Analysis	TX
Transmit On/Off Power	PVTime
Transmit Power	TXPower
Tx Band Spur	ETSPur

Examples:

– The User View file for the Swept SA measurement is `SA.SANalyzer.layout`.

– The User View file for the ACP measurement in the WCDMA mode is `WCDMA.ACPower.layout`.

Copy the desired file to a thumb drive or to your network. Then go to the target instrument and copy the file into the D:\Users\Instrument\My Documents\UserViews directory on that instrument (again, assuming you are logged in as Instrument).

NOTE: copying this file to another instrument will overwrite the file already in that instrument, if any, and will destroy any User Views that might have been created on that instrument.

NOTE: When you delete the last User View for a measurement, the file is removed.

2.4.7.6 To Rename a User View

You can rename a User View by selecting that View and tapping “Rename User View.” You can also re-edit a User View; if you do this, an asterisk will appear next to the User View’s name. You can then tap “Re-Save User View to save it back to its existing name, or “Save Layout as New View” to add another, new User View.

2.4.7.7 To Delete a User View

You can delete a User View by doing the following:

1. From the "Mode/Meas/View Dialog" on page 85, *or* from the **View** menu, select the User View that you want to delete
2. Switch to the **Display** menu

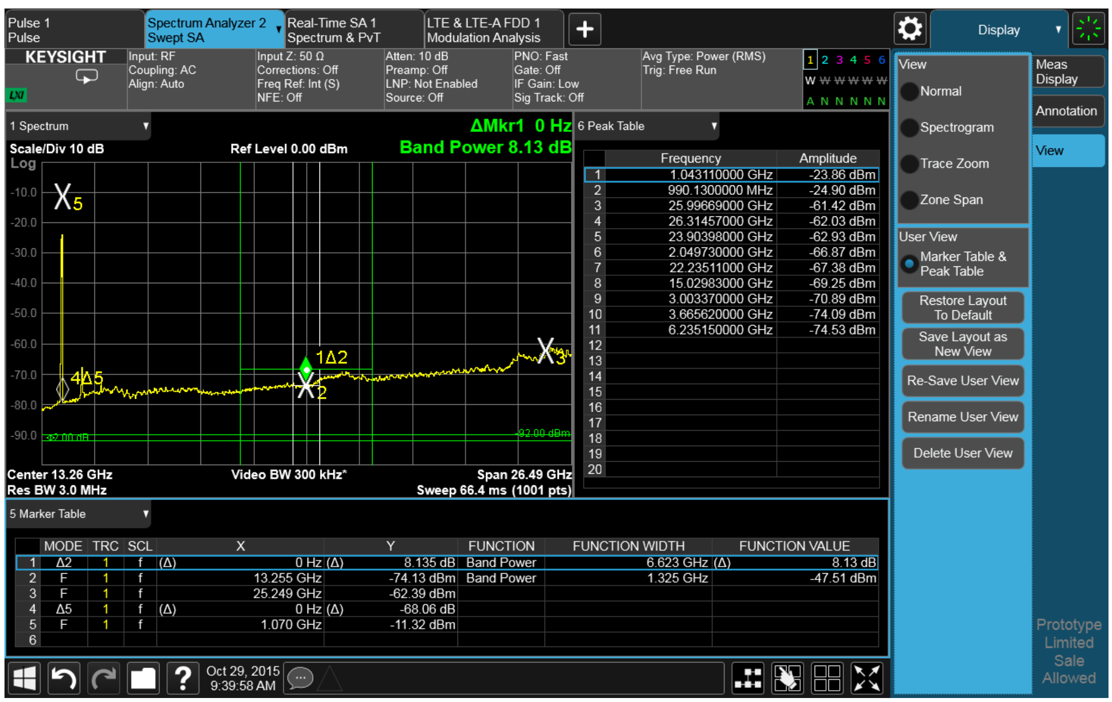
3. Select the **View** tab
4. Tap **Delete User View**

2.4.7.8 To Delete All User Views

You can delete all User Views by tapping “Delete All User Views.” The default view becomes the current view for the Measurement if a User View was the current view when this control was pressed.

2.4.7.9 Use Case: Displaying Marker and Peak Tables

One common application for User Views is to create a View that allows the Spectrum Analyzer to display both a Marker Table and a Peak Table at the same time. To do this, simply add a Marker Table Window and a Peak Table window to the Spectrum window of the Swept SA measurement. The result is shown below; note that the new View has been named “Marker Table & Peak Table”:



NOTE: There are legacy displays like Marker Table, Peak Table, Measure at Marker and Gate View, which are not Views but special display modes. These are retained for backwards compatibility, however they are turned on and off with switches and do not use the View system. Turning on one of these switches does not create a modified View, it merely adds the specified window to the current View; turning the switch back off removes the window. While the switch is on, NO View shows as selected in the View menu. These switches are grayed out if you are in a modified View or a User View. Since only one of these switches can be on at a time, and because these switches turn off on a Preset, User Views offer a superior way of adding windows than using the switches.

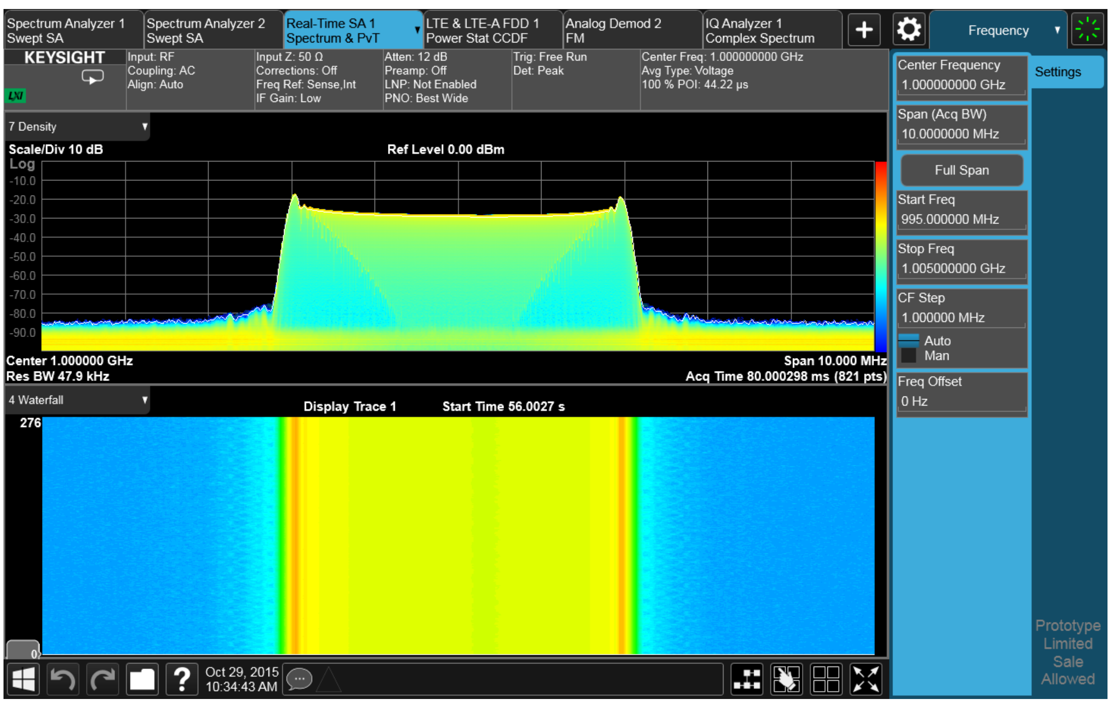
Some measurements do not support User Views; these do not allow adding, deleting or rearranging windows, however they do allow resizing windows. In these measurements you can get into the View Editor but the Add icons, Delete icons and Move icons will not appear. You can still resize the windows and in some cases (e.g. Noise Figure) you can still change window contents.

2.4.7.10 View Editor Remote Commands

Remote Commands for User Views can be found in the documentation for the **Display, View** tab.

2.4.8 Multiscreen

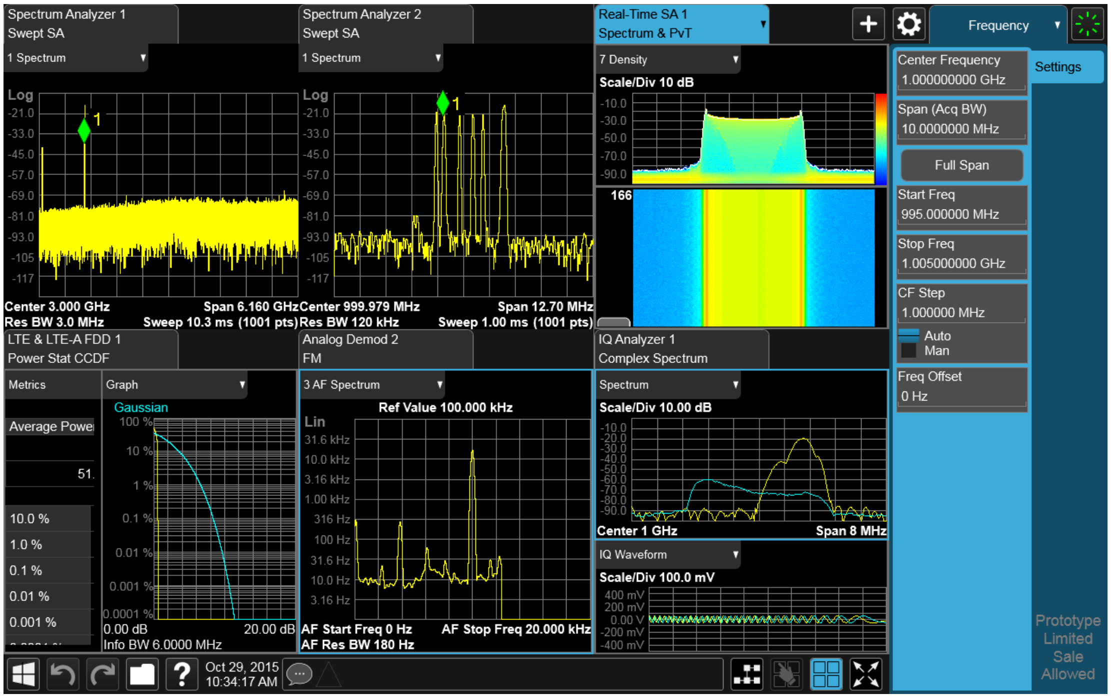
You can configure up to 16 different Screens at a time. Normally, you only see one Screen, and the set of configured screens is shown across the top of the display in a series of "Screen Tabs" on page 84. Touching any screen’s tab brings it to the foreground, makes it the current Screen and starts it updating.



Multiscreen view lets you display all of the configured Screens at once.

You can switch to Multiscreen View by pressing this button in the "Control Bar" on page 115 at the bottom right of the screen:

Multiscreen View looks like this:



While in Multiscreen View, the button changes from a black background to a blue background:

To exit Multiscreen view, tap the button again.

Multiscreen View cannot be activated if only one screen is configured.

Each Screen contains one Mode, each Mode contains one Measurement, and each Measurement contains a number of Windows arranged in Views. You can configure multiple instances of the same Mode along with any combination of other Modes.

In Multiscreen View, just as in Single Screen View, only one screen is active.

You switch Screens by tapping the Screen Tab you want, or when in Multiscreen View, you can tap the Screen itself. When you switch Screens, the current Screen's state and measurement results are preserved, the new Screen's previous state and data are loaded, and the new Screen starts running its Mode.

In Multiscreen View:

– The Meas Bar does not display

– The Screens are presented in an array of equal size boxes, except where the number of Screens means some have to be different sizes (as when you have 3 Screens, 5 Screens, etc.).

– Each Screen has a tab that contains the name of the Mode and Measurement in the box and a number associated with the instance of that Mode. You can enter a custom Screen name that replaces the Mode name, by going into the Mode/Meas dialog

– There is always one and only one selected Screen. It is indicated by a blue tab. Only the selected Screen is actually running a measurement and updating its display

– The selected window in the selected screen is the context for the current menus. It is the only window on the display with a blue border

– As you go from screen to screen, each screen remembers the last menu that was active in that screen and restores it as the active menu

In Multiscreen View, as in Single Screen View, tapping the blue tab or pressing the Mode/Meas front panel key opens the "Mode/Meas/View Dialog" on page 85 which allows you to change the Mode (or Measurement or View) being displayed in that Screen.

Remote Command	`:INSTrument:SCReen:MULTiple[:STATe] OFF | ON | 0 | 1` `:INSTrument:SCReen:MULTiple?`
Example	`:INST:SCR:MULT ON`
Notes	If only one screen is configured, attempting to set Multi-Screen ON generates the error "-221, Settings conflict; Multi-Screen requires >1 screen"
Preset	OFF

For more information, see the following:

– "Select Screen" on page 152

– "Screen List (Remote only command)" on page 153

2.4.8.1 Select Screen

You can select a screen by touching its tab or, in "Multiscreen" on page 150 mode, touching the screen itself. Selecting the Screen activates the screen and suspends the previously selected screen (if any).

Remote Command	`:INSTrument:SCReen:SELect <screen name>` `:INSTrument:SCReen:SELect?`
Example	`:INST:SCR:SEL "Baseband"`
Notes	If the <screen name> is specified but not found in the list of Screens, the error message "-224, Illegal parameter value; Screen Name not found" is generated If the display is disabled (via `:DISP:ENAB OFF`) then the error message "-221, Settings conflict; Screen SCPI cannot be used when Display is disabled" is generated
Preset	Returns the name of the active screen

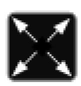
2.4.8.2 Screen List (Remote only command)

You can obtain a list of currently configured Screens. This permits your remote program to manage screens for selection, renaming, or deletion.

Remote Command	`:INSTrument:SCReen:CATalog?`
Example	`:INST:SCR:CAT?`
Notes	The query response is a comma separated list of Screen Names. If only 1 Screen is configured, there is no trailing comma For R&S compatibility, the following query is also available: `:INSTrument:SCReen:LIST?`
Preset	Returns list of currently configured Screens

2.4.9 Fullscreen

The Fullscreen button is in the "Control Bar" on page 115, at the lower right corner of the display.



When **Full Screen** is pressed the measurement window expands horizontally over the entire instrument display. The screen graticule area expands to fill the available display area.

It turns off the display of the menu panel, however the controls that drop down from the Meas Bar and on-screen annotation are still available, and you can still drag the trace and markers and perform a pinch zoom, so you can still operate the instrument.

Pressing **Full Screen** again while Full Screen is in effect cancels Full Screen.

You can get even more screen area for your data display by turning off the Meas Bar using the Annotation tab of the Display menu)

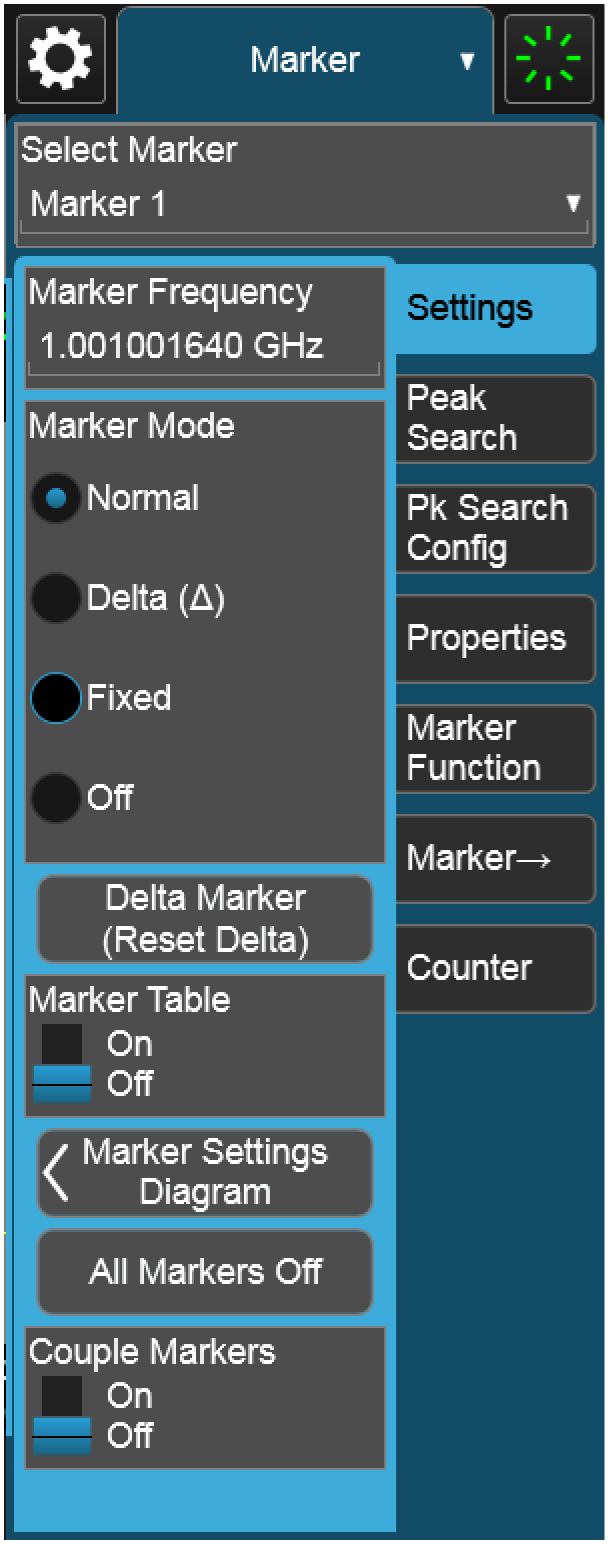
Full Screen is canceled by the **Preset** key.

Remote Command	`:DISPlay:FSCReen[:STATe] OFF | ON | 0 | 1` `:DISPlay:FSCReen[:STATe]?`
Notes	This was set to Off by :SYST:DEF MISC in MXA1, but not by Preset. It is no longer set Off by :SYST:DEF MISC, since it is now meas global instead of mode global
Preset	Unaffected by Preset but set to Off by Restore Misc Defaults or shutdown and restart
State Saved	Not saved in instrument state
Backwards Compatibility SCPI	`:DISPlay:MENU[:STATe] OFF | ON | 0 | 1` This emulates ESA full screen functionality, which is the same as the FSCReen command in PSA except

	that the sense of on/off is reversed (that is, OFF means the menus are OFF, so Fullscreen is ON) and the default is ON (meaning Fullscreen is OFF)
Backwards Compatibility Notes	In ESA/PSA, Full Screen was turned on with a softkey, so pressing any other key turned Full Screen off. In the X-Series, because a hardkey is provided to turn this function on and off, pressing any other key no longer turns off Full Screen

2.5 Menu Panel

The menu panel is the main focus of the X-Series Multitouch user interface. The controls include active functions, dropdowns, action buttons, radio buttons and toggles.

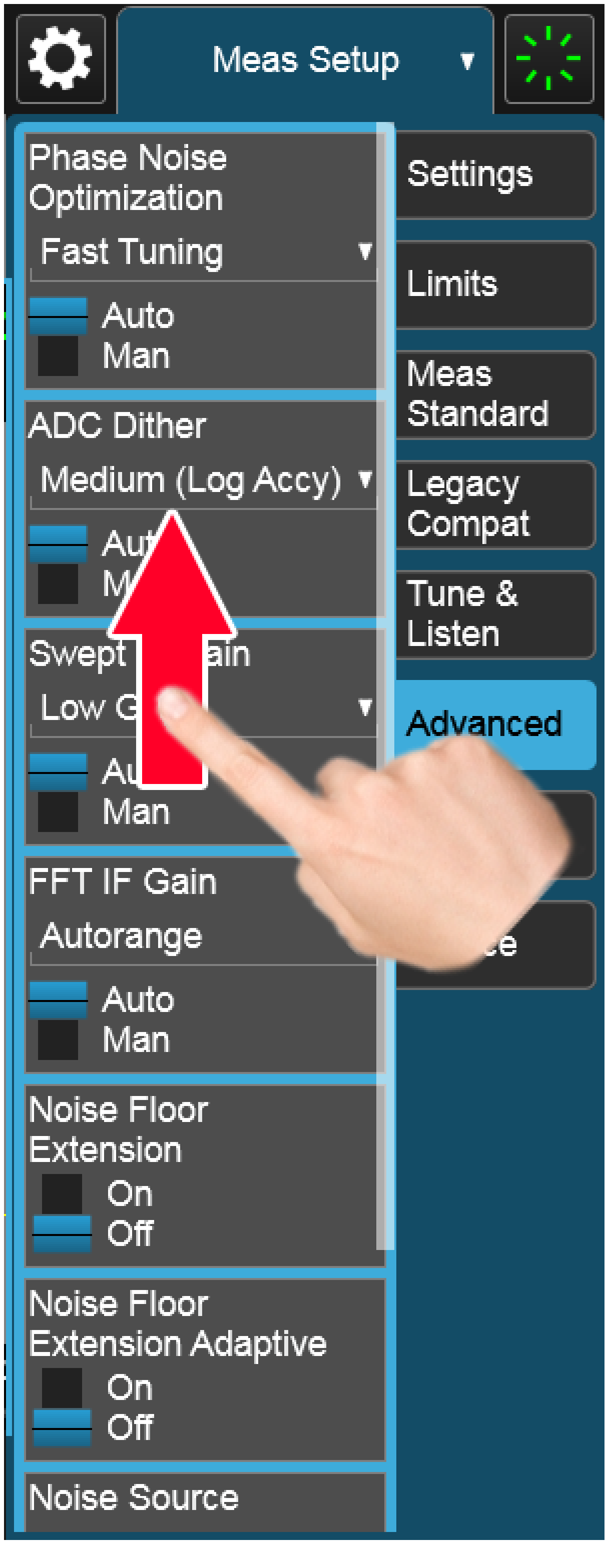


The menu panel normally appears on the right side of the display and consists of a rectangular panel with multiple “sub-panels” lying on top of each other, each sub-panel being accessed by a tab on the right.

You press a front panel key (or “hardkey”) to access a particular menu. On the front panel there are twelve “measurement hardkeys” (the ones in the shaded region in the figures below) – these are the hardkeys that open up menus in the menu panel.

With a menu open, tap a tab to access the controls on its sub-panel. Whenever you press the front panel key associated with a menu, the default (top) tab is selected.

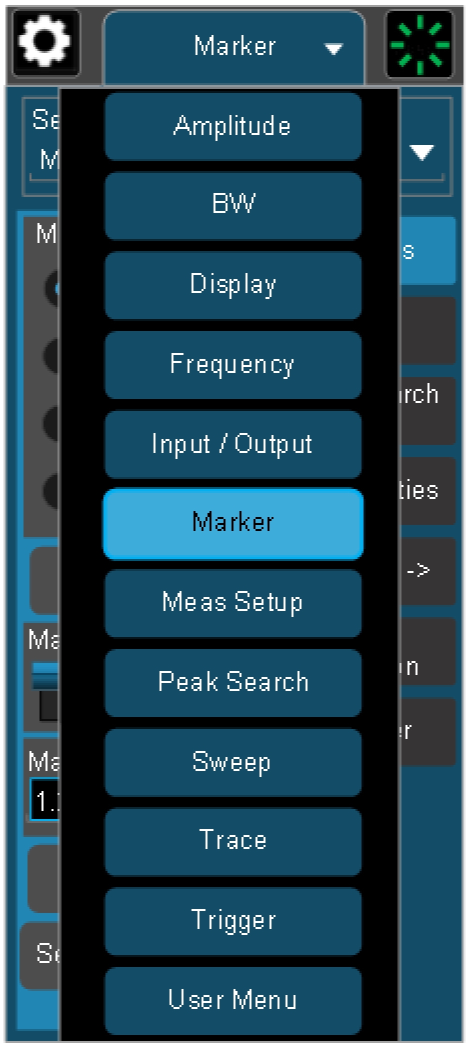
If the number of controls on a panel exceeds the height of the panel, scrolling is enabled, which is indicated by a white bar on the left that fades away after a few seconds. You swipe up or down with your finger to scroll the panel, or you can grab the white bar with a mouse.



If you move to a different menu panel or sub-panel and then come back to a previous panel, the previous panel is always reset to be scrolled all the way back to the top.

Accessing Menus Without Using Front-Panel Keys

You can access the menu panels without using the front panel keys, as you would need to do if you were operating the instrument using Remote Desktop. Touch or click on the menu title, as shown below. A dropdown containing the twelve measurement hardkeys appears. Selecting a hardkey from the dropdown displays the corresponding menu, and the dropdown disappears.



Entering Numeric Values

Many controls on the menu panel allow you to enter numeric values. These are called “active functions.” An active function control displays a number and a suffix, for example 13.255 GHz, as in the example below:

An active function is "active" if the numeric value is surrounded by a black background with a blue border, as below. In this state, it is ready to receive numeric input from the number pad on the front panel, the knob, or the step keys.

When an active function is in the active state, you can start typing or pressing the number keys on the front panel, which causes the Numeric Entry Panel to appear, as shown below. The Numeric Entry Panel displays the typed value, and the terminators to complete the entry.

Here we see a UXA with an active function control in the active state. Although no Numeric Entry Panel is displayed, you can just touch the "2" key:

This causes the Numeric Entry Panel to pop up to receive the numbers you are typing:

Type in as many digits as required, then touch one of the unit terminator buttons in the Numeric Entry Panel to complete the entry. In this case, 2 GHz was the desired entry, so you just touch the “GHz” terminator:

The Numeric Entry Panel disappears and, in the example, the active function value becomes 2 GHz.

It is important to note that you can always pop up the Numeric Entry Panel by touching an active function control while it is active; for example, if you were to touch it in the figure above, the Numeric Entry Panel would pop up right next to the control:

You can display the Numeric Entry Panel by touching any active function control while it is active, but you don’t have to pop up the Numeric Entry Panel first, you can just start typing and it will pop up on its own, thus saving you a keystroke.

You can also adjust a value without displaying the Numeric Entry panel by turning the knob or using the step keys while an active function is active. If you turn the knob or use the step keys while the Numeric Entry Panel is displayed, it disappears, allowing you to see the entire screen while you are making the adjustment.

You can also drag the Numeric Entry Panel to another part of the display if it is covering something that you wish to see while it is on the screen.

2.6 Cancel key

This front-panel key has the same functions as the Windows **Esc** (Escape) key. It does the following:

– Cancels dialogs

– Cancels active functions (unless there is an entry in progress, in which case it cancels that, and reverts to the previous value)

– Resets input overloads

– Aborts print operations

– Cancels certain other operations (such as alignments)

– Returns you to Local Control (if in Remote)

– If the backlight is off, turns on the backlight, and does nothing else

Most of this functionality is the same as earlier X-Series models and similar to ESA and PSA operation.

When the instrument is in Remote, any hardkey that is pressed on the front panel displays this message:

`Analyzer is in Remote. Press ESC to return to Local`

The exception is the **Cancel (ESC)** key, which takes the instrument out of Remote.

When the instrument is also in the LLO (local lockout state), the **Local** key is locked out as well. When this is the case, and the **Local** key is pressed, this message is displayed:

`Local key is locked out by remote computer. Cancel Local Lockout on computer or release remote control`

When you see this message, you should disconnect the remote computer, or use it to take the instrument out of the Local Lockout state.

2.7 Onscreen Keyboard key

This key turns the onscreen alpha keyboard (OSK) on and off.

There are two onscreen keyboards:

– The Multitouch OSK, which pops up automatically if, while using the analyzer application, a text field becomes the active function

– The Windows OSK, which you must open manually when a text field must be entered while interacting with Windows or other apps

2.8 Touch On/Off Key

This front-panel key turns the display touch functionality on and off. If off, you can turn it back on using the front panel **Touch On/Off** key. When the touch functionality is off, you can still use a mouse as a pointer.

When toggled, a dialog box appears midscreen that confirms “Touchscreen On” or “Touchscreen Off”.

This function remains in effect until it is turned off or until the app shuts down. The app always starts up with Touch enabled.

2.9 Tab key

This key has the same function as the **Tab** key on a PC keyboard.

You can use this key to display the Windows Taskbar, as follows.

- Alt-Tab to the Desktop
- Touch the desktop
- Touch **TAB**
- The Taskbar appears

2.10 Local Button

Appears in the Menu Panel when the instrument is in remote, and can be brought back to local via the **Local (ESC)** Key. See also "Cancel key" on page 165.

3 W-CDMA Mode

The W-CDMA with HSPA+ mode can be used for testing a W-CDMA transmitter, including measuring HSDPA/HSUPA signals, manufactured according to the following standards documents:

- 3GPP TS 25.141 Base Station (BS) conformance testing (FDD) V6.10.0 (2005-06)
- 3GPP TS 25.211 Physical channels and mapping of transport channels onto physical channels (FDD) V6.5.0 (2005-06)
- 3GPP TS 25.212 Multiplexing and channel coding (FDD) V6.5.0 (2005-06)
- 3GPP TS 25.213 Spreading and modulation (FDD) V6.3.0 (2005-06)
- 3GPP TS 25.214 Physical layer procedure (FDD) V6.6.0 (2005-06)
- 3GPP TS 34.121 Terminal conformance specification; Radio transmission and reception (FDD) V6.1.0 (2005-06)

These documents define complex, multipart measurements used to create and maintain an interference-free environment. For example, the documents include standardized test methods for the measurement of power in a carrier, a spectrum emission mask, and other critical measurements.

The instrument automatically makes these measurements using the measurement methods and limits defined in the documents. The detailed results displayed by the measurements enable you to analyze W-CDMA system performance. You may alter the measurement parameters for specialized analysis. For infrastructure test, the analyzer will test transmitters of base stations in a non-interfering manner using a coupler or power splitter.

Example	`:INST:SEL WCDMA` `:INST:NSEL 9`
Dependencies	The mode must be installed and licensed in your instrument before it is available for use
Status Bits/OPC dependencies	Changing modes resets all SCPI status registers and mask registers to their power-on defaults. Therefore, event or condition register masks must be re-established after a mode change

3.1 Measurement Commands

The commands for selecting each measurement are shown below. The commands relating to the Views and Windows for each measurement are described in the documentation for each measurement.

Example

Measurement	Command
Channel Power	:CONFigure:CHPower
Adjacent Channel Power	:CONFigure:ACPower
Spectrum Emissions Mask	:CONFigure:SEMask
Spurious Emissions	:CONFigure:SPURious
Occupied Bandwidth	:CONFigure:OBWidth
Power Stat CCDF	:CONFigure:PSTatistic
Code Domain Power	:CONFigure:CDPower
Modulation Accuracy	:CONFigure:RHO
Power Control	:CONFigure:PCONtrol
QPSK EVM	:CONFigure:EVMQpsk
Monitor Spectrum	:CONFigure:MONitor
IQ Waveform	:CONFigure:WAVeform
Combined WCDMA	:CONFigure:CWCDma
List Power Step	:CONFigure:LIST

Preset	MONitor
State Saved	Instrument State

3.2 Monitor Spectrum Measurement

The Monitor Spectrum measurement provides a quick, convenient means of looking at the entire spectrum. While the look and feel are similar to Spectrum Analyzer Mode, the functionality is greatly reduced for easy operation. The main purpose of this measurement is to show the spectrum. The default span should cover an appropriate frequency range of the application.

Monitor Spectrum Measurement Commands

The following commands can be used to retrieve the measurement results:

`:CONFigure:MONitor`

`:CONFigure:MONitor:NDEFault`

`:INITiate:MONitor`

`:FETCh:MONitor[n]?`

`:READ:MONitor[n]?`

`:MEASure:MONitor[n]?`

Remote Command Results for Monitor Spectrum Measurement

The following table describes the results returned by the queries listed above, according to the index value `n`.

n	Results Returned
1 (or not specified)	Returns trace1 data with comma separated floating numbers
2	Returns trace2 data with comma separated floating numbers
3	Returns trace3 data with comma separated floating numbers

3.2.1 Views

For modes other than MSR, LTEAFDD/LTEATDD and 5GNR, there is a single view, **Normal**.

For the MSR, LTEAFDD/LTEATDD and 5GNR modes, there are two views, **Normal** and **Carrier Info**, as described in the table below. The **Normal** view is the same as the common Monitor Spectrum view in other Modes. Carrier Info is available on the spectrum trace.

"Normal" on page 216	This is a single window view of the spectrum In MSR, LTEAFDD/LTEATDD and 5GNR modes you can turn on attributes that show

	the defined carriers and the sub-blocks also
Carrier Info	This view shows the spectrum in the top window and a carrier configuration summary in the bottom window Carrier center frequency can be displayed in either offset or absolute frequency depending on Carrier Freq

View Selection by Name (MSR, LTEAFDD/LTEATDD and 5GNR only)

Remote Command	`:DISPlay:MONitor:VIEW[:SELect] RTRace | CINFormation` `:DISPlay:MONitor:VIEW[:SELect]?`
Example	`:DISP:MON:VIEW RTR` `:DISP:MON:VIEW?`
Preset	`RTRace`
State Saved	Saved in instrument state
Range	Power Results|Carrier Info

View Selection by Number (MSR, LTE-A FDD/TDD and 5G NR only)

Remote Command	`:DISPlay:MONitor:VIEW:NSELect <integer>` `:DISPlay:MONitor:VIEW:NSELect?`
Example	`:DISP:MON:VIEW:NSEL 1` `:DISP:MON:VIEW:NSEL?`
Preset	1
State Saved	Saved in instrument state
Min/Max	1/2

3.2.1.1 Normal

Windows: "Spectrum" on page 174

Single window view of the graph.

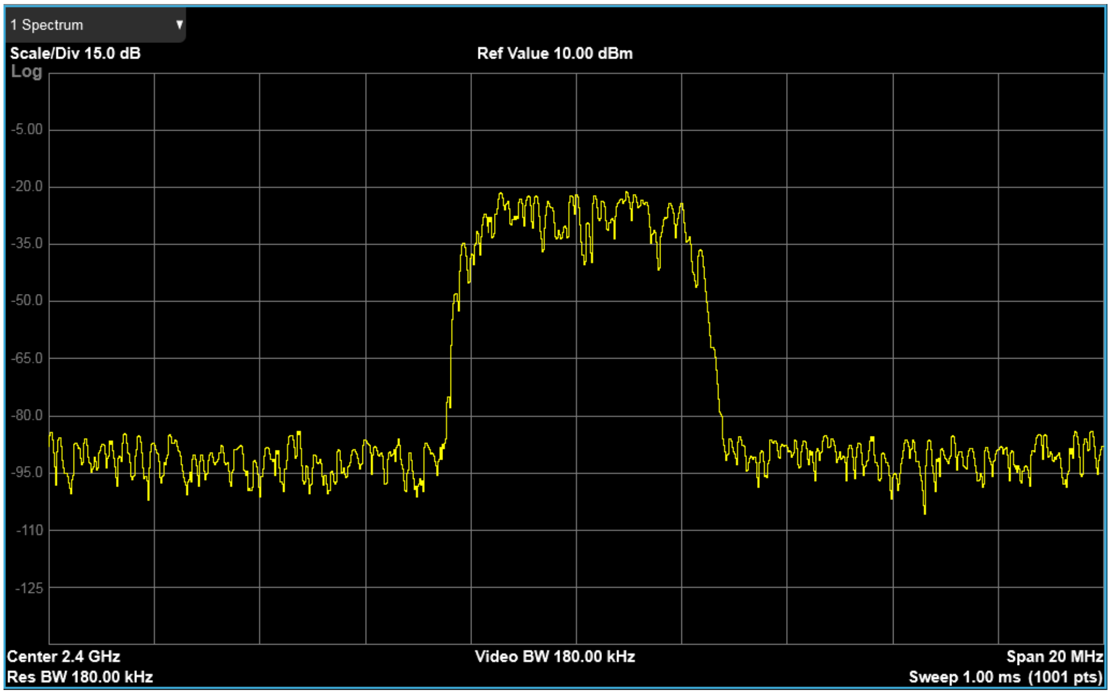
Example	`:DISP:MON:VIEW RTR`
Dependencies	This command is only available in the MSR, LTE-A FDD/TDD and 5G NR modes. In other Modes this is the only View

3.2.2 Windows

This section describes the windows used in the Monitor Spectrum measurement.

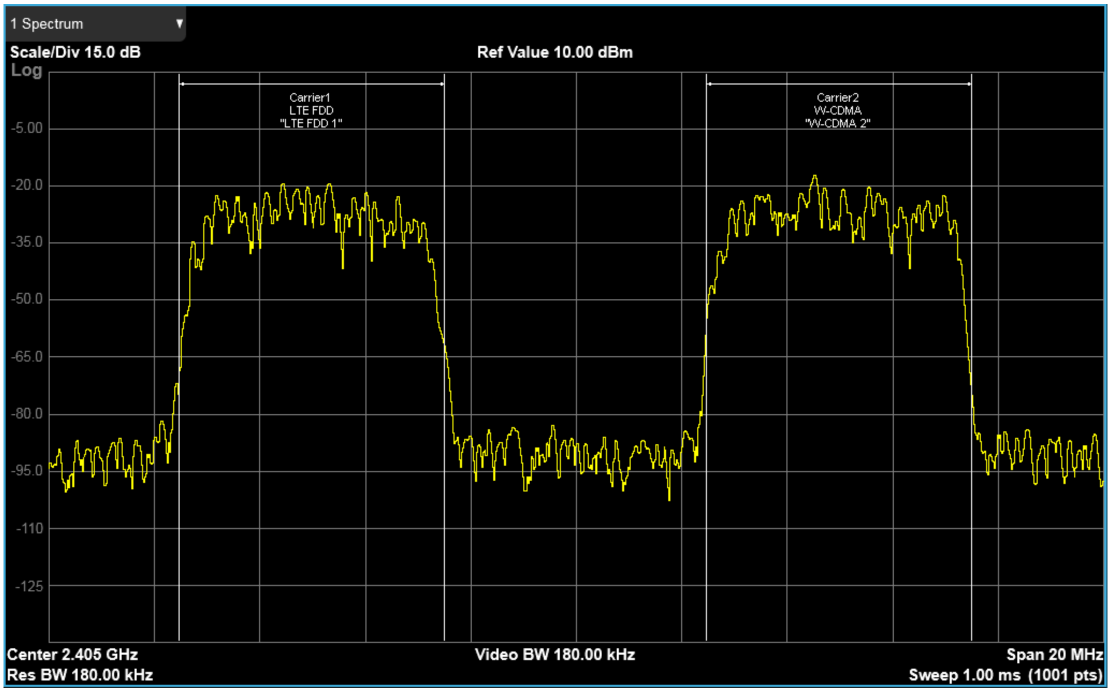
3.2.2.1 Spectrum

In all modes except **MSR, LTEAFDD/LTEATDD, and 5GNR,** this is a single trace window showing the spectrum.

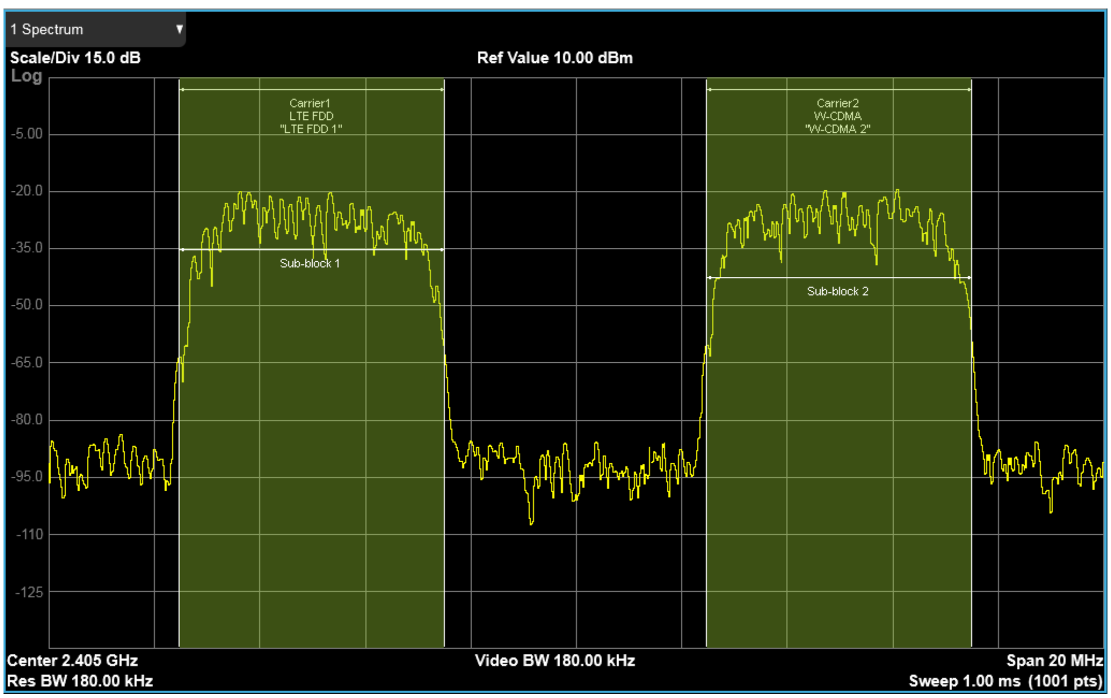


In the **LTEAFDD/LTEATDD, MSR and 5GNR modes**, multi-carriers are supported. The Carrier Attribute on/off and Sub-block Attribute on/off settings (under Display, Meas Display) are defined to allow the carrier and sub-block legends to display.

When the Carrier Attribute is on, the carrier identification and name are shown on the spectrum trace:



When Carrier and Sub-block attributes are both on, the sub-block scope and name are also shown on the spectrum trace:



3.2.3 Amplitude

Activates the Amplitude menu and selects Reference Level or Reference Value as the active function, depending on the measurement.

Some features in this menu apply to multiple measurements. Some other features apply only to specific measurements and their controls are blanked or grayed-out in measurements that do not support the feature.

3.2.3.1 Y Scale

Contains controls that pertain to the Y-Axis parameters of the measurement. These parameters control how data on the vertical (Y) axis is displayed, and control instrument settings that affect the vertical axis.

Ref Value

Sets the value for the absolute power reference. The reference line is at the top, center, or bottom of the graticule, depending on the value of "Ref Position" on page 177.

Remote Command	`:DISPlay:MONitor:WINDow[1]:TRACe:Y[:SCALe]:RLEVel <real>` `:DISPlay:MONitor:WINDow[1]:TRACe:Y[:SCALe]:RLEVel?`
Example	`:DISP:MON:WIND:TRAC:Y:RLEV 2.0` `:DISP:MON:WIND:TRAC:Y:RLEV?`
Couplings	When "Auto Scaling" on page 177 is ON (default), this value is automatically determined by the measurement result. When you set a value manually, **Auto Scaling** changes to `OFF` Attenuation is not coupled to "Ref Value" on page 176
Preset	10.00 dBm
State Saved	Saved in instrument state
Min/Max	-250.00 dBm / 250.00 dBm
Annotation	Ref <value> top left of graph
Backwards Compatibility SCPI	`:DISPlay:MONitor:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:RLEVel`

Scale/Div

For measurements that support a logarithmic Y-Axis, **Scale/Div** sets the height of one division of the graticule in the current Y-Axis unit.

Scale/Div also determines the displayed amplitude range in the log plot graph. Since there are usually 10 vertical graticule division on the display, the total amplitude range of the graph is typically 10x this amount. For example, if **Scale/Div** is 10 dB, then the total range of the graph is 100 dB.

Remote Command	`:DISPlay:MONitor:WINDow[1]:TRACe:Y[:SCALe]:PDIVision <rel_ampl>` `:DISPlay:MONitor:WINDow[1]:TRACe:Y[:SCALe]:PDIVision?`

Example	:DISP:MON:WIND:TRAC:Y:PDIV 5.0 dB :DISP:MON:WIND:TRAC:Y:PDIV?
Couplings	When "Auto Scaling" on page 177 is ON, this value is automatically determined by the measurement result. When you set a value manually, **Auto Scaling** automatically changes to OFF
Preset	10.00 dB / Div
State Saved	Saved in instrument state
Min	0.10 dB
Max	20 dB
Annotation	<value> dB/ left upper of graph
Backwards Compatibility SCPI	:DISPlay:MONitor:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:PDIVision

Ref Position

Positions the reference level at the top, center, or bottom of the Y Scale display. Changing the reference position does not change the reference level value.

Remote Command	:DISPlay:MONitor:WINDow[1]:TRACe:Y[:SCALe]:RPOSition TOP | CENTer | BOTTom :DISPlay:MONitor:WINDow[1]:TRACe:Y[:SCALe]:RPOSition?
Example	:DISP:MON:WIND:TRAC:Y:RPOS CENT :DISP:MON:WIND:TRAC:Y:RPOS?
Preset	TOP
State Saved	Saved in instrument state
Range	TOP|CENTer|BOTTom
Annotation	The greater than (>) and less than (<) symbols are displayed on both sides of the graph to indicate the Reference Position
Backwards Compatibility SCPI	:DISPlay:MONitor:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:RPOSition

Auto Scaling

Toggles the **Auto Scaling** function On or Off.

Remote Command	:DISPlay:MONitor:WINDow[1]:TRACe:Y[:SCALe]:COUPle 0 | 1 | OFF | ON :DISPlay:MONitor:WINDow[1]:TRACe:Y[:SCALe]:COUPle?
Example	:DISP:MON:WIND:TRAC:Y:COUP OFF :DISP:MON:WIND:TRAC:Y:COUP?
Couplings	When **Auto Scaling** is ON, and the **Restart** front-panel key is pressed, this function automatically sets the

	scale per division to 10 dB and determines the reference values based on the measurement results When you set a value to either Scale/Div or Ref Value manually, **Auto Scaling** automatically changes to `OFF`
Preset	1
State Saved	Saved in instrument state
Range	`OFF|ON`
Backwards Compatibility SCPI	`:DISPlay:MONitor:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:COUPle`

3.2.3.2 Attenuation

Controls the attenuator functions and interactions between the attenuation system components.

There are two attenuator configurations in the X-Series. One is a Dual-Attenuator configuration consisting of a mechanical attenuator and an optional electronic attenuator. The other configuration uses a single attenuator with combined mechanical and electronic sections thatcontrols all the attenuation functions. Different models in the X-Series come with different configurations.

– See "Dual-Attenuator Configurations" on page 179

– See "Single-Attenuator Configuration" on page 179

Most attenuation settings are the same for all measurements – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by Meas Preset.

This tab is only available when the hardware set includes an input attenuator, which is typically only the case when using Keysight’s box instruments. For example, this tab does not appear in:

– VXT models M9420A/21A/10A/11A

– E7760

– M9391A

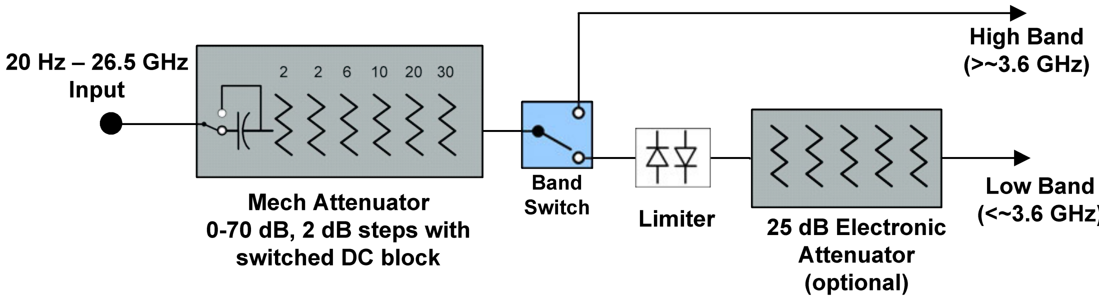
– M9393A

This tab also does not appear in UXM. In UXM all Attenuation and Range settings are disabled, as the expected input power level is handled by the Call Processing App that drives the DUT power control.

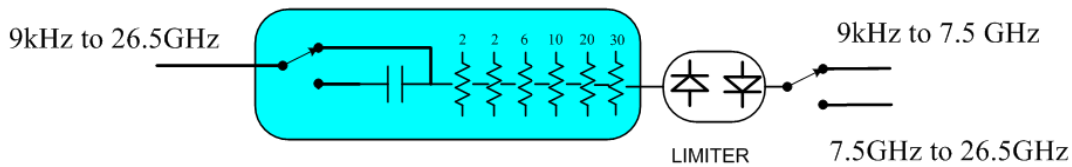
Dependencies	In measurements that support the I/Q inputs, this tab is unavailable when I/Q is the selected input, and is replaced by the Range tab in that case

Dual-Attenuator Configurations

Configuration 1: Mechanical attenuator + optional electronic attenuator

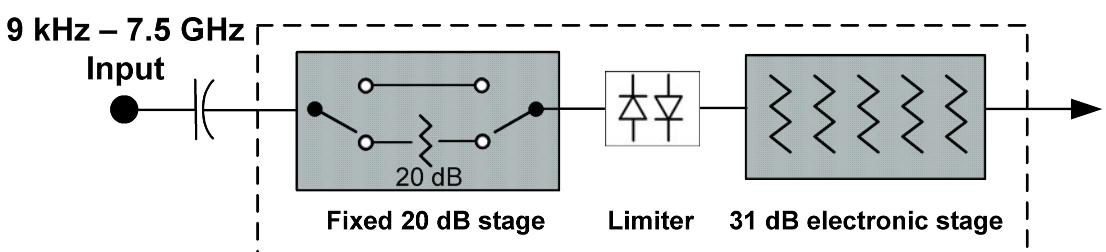


Configuration 2: Mechanical attenuator, no optional electronic attenuator

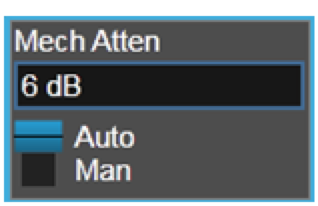


(note that Configuration 2 is not strictly speaking a dual-section attenuator, since there is no electronic section available. However, it behaves exactly like Configuration 1 without the Electronic Attenuator option EA3, therefore for the sake of this document it is grouped into the “Dual-Attenuator” configuration)

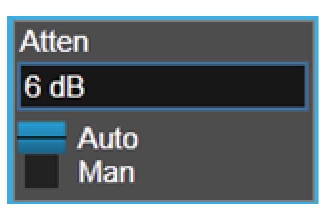
Single-Attenuator Configuration



You can tell which attenuator configuration you have by pressing the Attenuation tab, which (in most Modes) opensthe Attenuation menu. If the first control in the Attenuation menu says **Mech Atten** you have the Dual-Attenuator configuration. If the first control says **Atten** you have the Single-Attenuator configuration.



Dual Attenuator



Single Attenuator

(Note that depending on the measurement, there may be no Auto/Man functionality on the Mech Atten control).

In the Single-Attenuator configuration, youcontrol the attenuation with a single control, as the fixed stage has only two states. In the Dual-Attenuator configuration, both stages have significant range so you are given separate control of the mechanical and electronic attenuator stages.

When you have the Dual-Attenuator configuration, you may still have only a Single-Attenuator, because unless option EA3 (the Electronic Attenuator option) is available, and you purchase it, you will have only the mechanical attenuator.

Full Range Atten

The **Full Range Atten** control and **Attenuator Summary** only appear in N9041B, when the RF input is selected and the RF Input Port is set to RF Input 2, and the Full Range Attenuator is installed. The Full Range Attenuator adds a second input attenuator at the beginning of the RF Input 2, which enhances the protection and optimizes the performance of the extra internal mixers used by RF Input 2.

Remote Command	`[:SENSe]:POWer[:RF]:FRATten <rel_ampl>` `[:SENSe]:POWer[:RF]:FRATten?`
Example	`:POW:FRAT 14` `:POW:FRAT?`
Notes	When you enter an amplitude value that falls between valid values, the value will be incremented to the next smallest valid value
Dependencies	Only appears if input RF is selected, and RF Input Port 2 is selected, and the Full Range Attenuator exists
Couplings	This value is never changed by any coupling, however other couplings use this value. See the **Reference Level** and "Mech Atten" on page 1750 command descriptions
Preset	20 dB
State Saved	Saved in instrument state
Min	0 dB
Max	Only valid values are 0, 6, 14, 20 dB
Annotation	When the Input is RF, and the Input Port is RF Input 2, and the Full Range Attenuator is installed: On the Meas Bar, the field “Atten” displays as follows: – If the sweep is entirely < 50 GHz, the value shown after “Atten:” is equal to Mech Atten + Elec Atten + Full Range Atten – If the sweep is entirely > 50 GHz, the value shown after “Atten:” is equal to Full Range Atten – If the sweep straddles 50 GHz, the value shown after “Atten:” is preceded by the symbol “>=” and is equal to Full Range Atten In the **Amplitude**, "Attenuation" on page 1747 menu, and the Atten Meas Bar dropdown menu panel, a

	summary is displayed as follows: “Total Atten below 50 GHz” followed by the value of Full Range Atten + Mech Atten + Elec Atten “Total Atten above 50 GHz” followed by the value of Full Range Atten For example, if Mech Atten = 6 dB, Elec Atten = 4 dB, and Full Range Atten = 20 dB, the summary below is shown: – Attenuator summary: – Total Atten below 50 GHz: 30 dB – Total Atten above 50 GHz: 20 dB

Mech Atten

This control is labeled **Mech Atten** in Dual-Attenuator models and **Atten** in Single-Attenuator models. In the Dual-Attenuator configuration, this control only affects the mechanical attenuator.

This control lets you modify the attenuation applied to the RF input signal path. This value is normally auto coupled to the Ref Level, the Internal Preamp Gain, any External Gain that is entered, and the Max Mixer Level, as described in the table below.

See "Attenuator Configurations and Auto/Man" on page 183

Remote Command	`[:SENSe]:POWer[:RF]:ATTenuation <rel_ampl>`
	`[:SENSe]:POWer[:RF]:ATTenuation?`
	`[:SENSe]:POWer[:RF]:ATTenuation:AUTO OFF | ON | 0 | 1`
	`[:SENSe]:POWer[:RF]:ATTenuation:AUTO?`

Example	`:POW:ATT 20`
	Dual-Attenuator configuration: sets the mechanical attenuator to 20 dB
	Single-Attenuator mode: sets the main attenuation to 20 dB (see below for definition of “main” attenuation)
	In either case, if the attenuator was in Auto, it is set to Manual
	`:POW:ATT:AUTO ON`
	Turn Auto Mech Atten ON

Dependencies	Some measurements do not support the Auto setting of "Mech Atten" on page 181. In these measurements, the Auto/Man selection is not available, and the Auto/Man toggle function is not available In Dual-Attenuator configurations, when the electronic attenuator is enabled, the mechanical attenuator has no auto setting and the Auto/Man toggle function is not available. The state of Auto/Man is remembered and restored when the electronic attenuator is once again disabled. This is described in more detail in "Elec Atten" on page 1753 See "Attenuator Configurations and Auto/Man" on page 183 for more information on the Auto/Man functionality `:POW:ATT:AUTO` is only available in measurements that support Mech Atten Auto, such as Swept SA

Couplings	If the RF Input Port is the RF Input: – If the USB Preamp is connected to USB, use 0 dB for Mech Atten – Otherwise compute the auto-selected value of Mech Atten based on **Reference Level**, Int Preamp, External Gain, Ref Level Offset, Max Mixer Level, µW Path Control and IF Gain settings. Limit this value to be no less than 6 dB (total attenuation below 6 dB can never be chosen by Auto) – In the N9041B, if the RF Input Port is RF Input 2, use the formula above and subtract the Full Range Atten value from the result to determine the Mech Atten. Limit the value so that it is never lower than 0 dB and so that total attenuation, including Full Range Atten, is never less than 6 dB (total attenuation, including Full Range Atten below 6 dB, can never be chosen by Auto) In External Mixingand BBIQ, where the Attenuator is not in the signal path, the Attenuator setting changes as described above when "Mech Atten" on page 181 is in Auto, but no changes are made to the actual attenuator hardware setting until the input is changed back to the RF Input For CXA-m with option FSA (Fine-Step Attenuator or 2 dB steps), the FSA-like behavior is only available when the frequency setting is <= 7.5GHz. So, when the frequency is changed from below 7.5GHz to above 7.5GHz, the attenuation setting will be changed to a multiple of 10dB which will be no smaller than the previous setting. For example, 4dB attenuation will be changed to 10dB
Preset	The preset for Mech Attenuation is “Auto” The Auto value of attenuation is 10 dB ON
State Saved	Saved in instrument state
Min	0 dB The attenuation set by this control cannot be decreased below 6 dB with the knob or step keys. Values below 6 dB must be directly entered from the keypad or via SCPI. This protects against setting a dangerously small attenuation value, which can put the instrument at risk of damage to input circuitry. If the current mechanical attenuation is below 6 dB, it can be increased with the knob and step keys, but not decreased
Max	CXA Option 503 or 507: 50 dB EXA: 60 dB All other models: 70 dB Note that in the Single-Attenuator configuration, the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB.
Annotation	The current value for Total Atten is displayed in the Measurement Bar at the top of the display. A value appears for Electronic Attenuation only if the Electronic Attenuator is enabled. The annotation appears as Atten: <total> dB (e<elec>) The e letter is in amber in Single-Attenuator configurations For example: Dual-Attenuator configuration: Atten: 24 dB (e14) Indicating the total attenuation is at 24 dB and the electronic attenuation is at 14 dB Single-Attenuator configuration:

A: 24 dB (e14)

Indicating the total attenuation is at 24 dB and the “soft” attenuation is at 14 dB (see below for definition of “soft” attenuation)

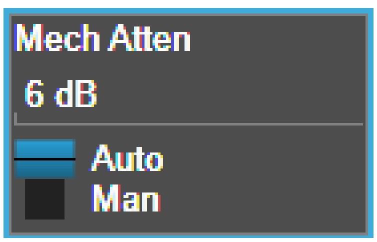
When in Manual, a # sign appears in front of Atten in the annotation

Attenuator Configurations and Auto/Man

As described in "Attenuation" on page 1747 , there are two distinct attenuator configurations available in the X-Series, the single attenuator and Dual-Attenuator configurations. In Dual-Attenuator configurations, we have the mechanical attenuation and the electronic attenuation, and the current total attenuation is the sum of the electronic + mechanical attenuation. In Single-Attenuator configurations, we refer to the attenuation set using "Mech Atten" on page 181 (or `:POW:ATT`) as the “main” attenuation; and the attenuation that is set by `:POW:EATT` as the “soft” attenuation (`:POW:EATT` is honored even in the Single-Attenuator configuration, for compatibility purposes). Then the current total attenuation is the sum of the main + soft attenuation. See "Elec Atten" on page 1753 for more on “soft” attenuation.

NOTE

In some measurements, the **Mech Atten** control has an Auto/Man function. In these measurements, an Auto/Man switch is shown on the **Mech Atten** control:



Note that in configurations that include an Electronic Attenuator, this switch is only shown when the Electronic Attenuator is disabled.

In other measurements, **Mech Atten** has no Auto/Man function. In these measurements, no switch is shown on the **Mech Atten** control:

Mech Atten also appears with no switch, as above, in configurations that include an Electronic Attenuator but when the Electronic Attenuator is enabled.

Elec Atten

Controls the Electronic Attenuator in Dual-Attenuator configurations. This control does not appear in Single-Attenuator configurations, as the control of both the mechanical and electronic stages of the Single-Attenuator is integrated into the single **Atten** control.

This control includes an Enable/Disable toggle switch; it is only possible to enter a value for the Electronic Attenuator when this switch is in the “Enable” position.

See "More Information" on page 185

Remote Command	`[:SENSe]:POWer[:RF]:EATTenuation <rel_ampl>`
	`[:SENSe]:POWer[:RF]:EATTenuation?`
	`[:SENSe]:POWer[:RF]:EATTenuation:STATe OFF | ON | 0 | 1`
	`[:SENSe]:POWer[:RF]:EATTenuation:STATe?`

Example	`:POW:EATT 10`
	`:POW:EATT?`
	`:POW:EATT:STAT ON`
	`:POW:EATT:STAT?`

Notes	Electronic Attenuation’s specification is defined only when Mechanical Attenuation is 6 dB
Dependencies	This control only appears in Dual-Attenuator models with an Electronic Attenuator installed and licensed. It does not appear in models with the Single-Attenuator configuration, as in the Single-Attenuator configuration there is no “electronic attenuator” there is only a single integrated attenuator (which has both a mechanical and electronic stage). However, in the Single-Attenuator configuration, EATT SCPI commands are accepted for compatibility with other X-series instruments and set a “soft” attenuation as described in . The “soft” attenuation is treated as an addition to the “main” attenuation value set by the Atten control or the POW:ATT SCPI command and affects the total attenuation displayed on the Atten control and the Meas Bar The electronic attenuator (and the “soft” attenuation function provided in Single-Attenuator configurations) is unavailable above the low band (0-3.6 GHz, 0-3.4 GHz 0-3GHz, depending on the model). If the low band ranges from 0-3.6GHz, and Stop Frequency of the instrument is > 3.6 GHz, then the **Enabled/Disabled** section of the **Elec Atten** control will be OFF and grayed out If the Internal Preamp is on, meaning it is set to Low Band or Full, the electronic attenuator (and the “soft” attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the **Enabled/Disabled** section of the **Elec Atten** control will be OFF and grayed out If either of the above is true, if the SCPI command is sent, an error indicating that the electronic attenuator is unavailable will be sent If both of the above are true, pressing the control will generate error message -221, in other words, the frequency range lockout takes precedence If the electronic/soft Attenuator is enabled, then the Stop Freq of the instrument is limited to 3.6 GHz and the Internal Preamp is unavailable The SCPI-only “soft” electronic attenuation for the single-attenuator configuration is not available in all measurements; in particular, it is not available in the Swept SA measurement
Couplings	Enabling and disabling the Electronic Attenuator affects the setting of the Mechanical Attenuator (in Dual-Attenuator configurations). This is described in more detail below and in the section "Attenuator Configurations and Auto/Man" on page 1752
Preset	`OFF` (Disabled) for Swept SA measurement `ON` (Enabled) for all other measurements that support the electronic attenuator
State Saved	Saved in instrument state

Min	0 dB
Max	Dual-Attenuator configuration: 24 dB Single-Attenuator configuration: the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB
Annotation	See Annotation under the **Mech Atten** control description

More Information

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear. These advantages primarily aid in remote operation and are negligible for front panel use. See "Using the Electronic Attenuator: Pros and Cons" on page 186 for a detailed discussion of the pros and cons of using the electronic attenuator.

For the Single-Attenuator configuration, for SCPI backwards compatibility, the “soft” attenuation feature replaces the Dual-Attenuator configuration’s electronic attenuator. All the same couplings and limitations apply. See "Attenuator Configurations and Auto/Man" on page 1752

Mechanical Attenuator Transition Rules

When the Electronic Attenuator is enabled, the Mechanical Attenuator transitions to a state that has no Auto function. Below are the rules for transitioning the Mechanical Attenuator. Note that the information below ONLY applies to the Dual-Attenuator configurations, and ONLY when the Electronic Attenuator is installed:

When the Electronic Attenuation is enabled from a disabled state:

The Mechanical Attenuator is initialized to 10 dB (this is its optimal performance setting). You can then set it as desired with SCPI, numeric keypad, step keys, or knob, and it behaves as it normally would in manual mode

The Auto/Man state of (Mech) Atten is saved

The Auto/Man toggle on the (Mech) Atten control disappears and the auto rules are disabled

The Electronic Attenuator is set to 10 dB less than the previous value of the Mechanical Attenuator, within the limitation that it must stay within the range of 0 to 24 dB of attenuation

Examples in the Dual-Attenuator configuration:

Mech Atten at 20 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 10 dB. New total attenuation equals the value before Elec Atten enabled

Mech Atten at 0 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 0 dB. New total attenuation does not equal the value before Elec Atten enabled

Mech Atten at 40 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 24 dB. New total attenuation does not equal the value before Elec Atten enabled

When the Electronic Attenuation is disabled from an enabled state:

The Elec Atten control is grayed out

- The Auto/Man state of (Mech) Atten is restored

If now in Auto, (Mech) Atten recouples

If now in Man, (Mech) Atten is set to the value of total attenuation that existed before the Elec Atten was disabled. The resulting value is rounded up to the smallest value possible given the (Mech) Atten Step setting - (That is, 57 dB changes to 58 dB when (Mech) Atten Step is 2 dB)

Using the Electronic Attenuator: Pros and Cons

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear.

The “finer steps” advantage of the electronic attenuator is beneficial in optimizing the alignment of the instrument dynamic range to the signal power in the front panel as well as remote use. Thus, you can achieve improved relative signal measurement accuracy. Compared to a mechanical attenuator with 2 dB steps, the 1 dB resolution of the electronic attenuator only gives better resolution when the odd-decibel steps are used. Those odd-decibel steps are less accurately calibrated than the even-decibel steps, so one tradeoff for this superior relative accuracy is reduced absolute amplitude accuracy.

Another disadvantage of the electronic attenuator is that the spectrum analyzer loses its “Auto” setting, making operation less convenient.

Also, the relationship between the dynamic range specifications (TOI, SHI, compression, and noise) and instrument performance are less well-known with the electrical attenuator. With the mechanical attenuator, TOI, SHI, and compression threshold levels increase dB-for-dB with increasing attenuation, and the noise floor does as well. With the electronic attenuator, there is an excess attenuation of about 1 to 3 dB between 0 and 3.6 GHz, making the effective TOI, SHI, and so forth, less well known. Excess attenuation is the actual attenuation relative to stated attenuation. Excess attenuation is accounted for in the instrument calibration

Mech Atten Step

Controls thestep size used when making adjustments to the input attenuation.

This control is labeled **Mech Atten Step** in Dual-Attenuator models and **Atten Step** in Single-Attenuator models. In the Dual-Attenuator configuration, this control only affects the step size of the mechanical attenuator.

Remote Command	`[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement] 10 dB | 2 dB` `[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement]?`

Example	`:POW:ATT:STEP 2` `:POW:ATT:STEP?`
Notes	This feature has a toggle choice from the front panel, but it takes a specific value (in dB) when used remotely. The only valid values are 2 and 10
Dependencies	Blanked in EXA, CXA and CXA-m if option FSA (2 dB steps) is not present. If blanked, attempts to set it via SCPI yield an error
Couplings	When the attenuation step size changes, the current mechanical attenuation value is adjusted (if necessary) to be quantized to the new step size. That is, if step is set to 10 dB, mech atten is increased if necessary so it is a multiple of 10 dB
Preset	EXA, CXA and CXA-m: 10 dB (2 dB with option FSA) All other models: 2 dB
State Saved	Saved in instrument state

3.2.3.3 Range (Non-attenuator models)

This tab is only available for Keysight's modular signal analyzers and certain other Keysight products. Examples include:

– VXT

– E7760

– M9391A

– M9393A

This tab also does not appear in UXM. In UXM, all Attenuation and Range settings are disabled, as the expected input power level is handled by the Call Processing App that drives the DUT power control.

State Saved	No

Range

Represents the amplitude of the largest sinusoidal signal that could be present within the IF without being clipped by the ADC. For signals with high peak-to-average ratios, the range may need to exceed the rms signal power by a significant amount to avoid clipping.

This is a measurement global setting.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe <real>` `[:SENSe]:POWer[:RF]:RANGe?`
Example	`:POW:RANG 10 dBm`

	:POW:RANG?
Notes	The MIN and MAX values are affected by the External Gain parameters, and by the **Center Frequency** The hardware compensates for frequency response and alters the Range setting
Preset	0 dBm
State Saved	Yes
Min	-100
Max	100
Annotation	Meas Bar

Adjust Range for Min Clipping

Sets the combination of attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an "immediate action" function, that is, it executes once, when the key is pressed.

This key does not appear in measurements that do not support this functionality.

Remote Command	[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMediate
Notes	Executing Adjust Range for Min Clipping initiates the measurement
Dependencies	This control does not appear in the Swept SA and Monitor Spectrum measurements This control appears in all measurements in E7760

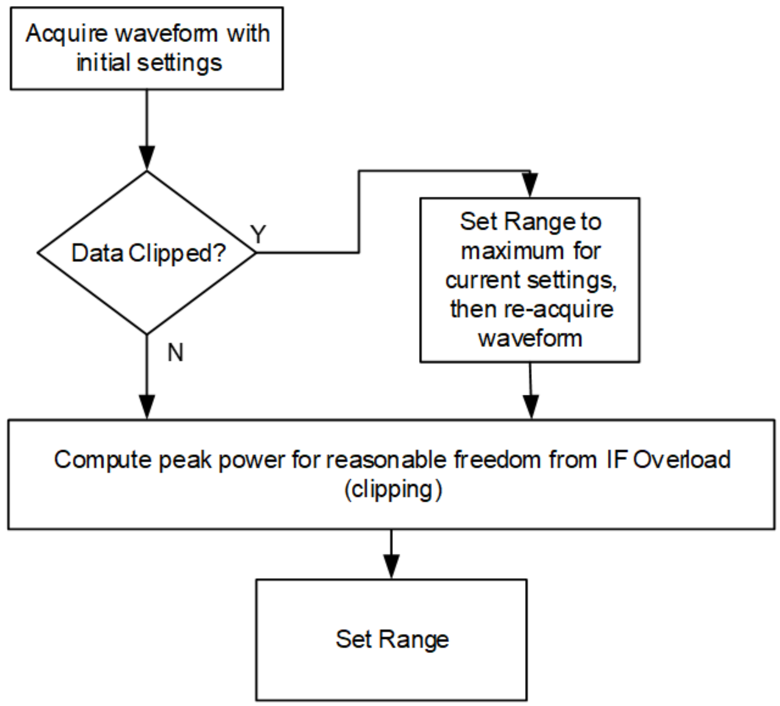
Pre-Adjust for Min Clipping

If this function is ON, it applies the adjustment described under Adjust Range For Min Clipping each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

Remote Command	[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF | ON | ELECtrical | COMBined [:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?
Notes	Because there is no attenuator control available in these models, the control displays only ON and OFF choices. However, for SCPI compatibility with other platforms, all three parameters (ELECtrical, COMBined, and ON) are honored and all are mapped to ELECtrical, so if any of these three parameters is sent, a subsequent query will return ELEC
Dependencies	This control does not appear in the Swept SA and Monitor Spectrum measurements This control appears in all measurements in E7760
Preset	OFF for Swept SA measurement; ON for all other measurements that support **Pre-Adjust for Min Clipping**
State Saved	Saved in instrument state

Adjustment Algorithm

The algorithm for the adjustment is documented below:



Peak-to-Average Ratio

Used with "Range (Non-attenuator models)" on page 1864 to optimize the level control in the instrument. The value is the ratio, in dB, of the peak power to the average power of the signal to be measured. A ratio of 0 should be used for sinusoidal signals; for 802.11g OFDM signals use 9 dB.

All Applications (Modes) show the current value of Peak-to-Average ratio on the control. However, some applications do not permit changing the value. In these situations, the control is grayed-out.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:PARatio <real>` `[:SENSe]:POWer[:RF]:RANGe:PARatio?`
Example	`:POW:RANG:PAR 12 dB`
Notes	In some Applications (Modes) this parameter is read-only; meaning the value will appear on the control and query via SCPI, but is not changeable. In such applications the control is grayed-out. Attempting to change the value via SCPI will be ignored but no error message will be generated
Dependencies	This control does not appear in Spectrum Analyzer Mode
Preset	10 dB VXT Models M9410A/11A: 0 dB
State Saved	Saved in instrument state

Min	0 dB
Max	20 dB VXT Models M9410A/11A: 50 dB

Mixer Lvl Offset

This is an advanced setting to adjust target Range at the input mixer, which in turn affects the signal level in the instrument's IF. This setting can be used when additional optimization is needed after setting "Peak-to-Average Ratio" on page 1866. Positive values of offset optimize noise performance over distortion, negative values optimize distortion performance over noise.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet <real>` `[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet?`
Example	`:POW:RANG:MIX:OFFS -5 dB`
Preset	0 dB
State Saved	Saved in instrument state
Min	-35 dB VXT Models M9410A/11A: -34 dB
Max	30 dB

3.2.3.4 Signal Path

Contains controls that pertain to the routing of the signal through the frontend of the instrument.

In general, this tab only appears in instruments whose hardware supports this signal routing. For example, this tab does not appear in many of the modular instrument products, including VXT Models M9420/21A. It also does not appear in UXM.

This tab *does* appear in VXT Models M9410A/11A because the Software Preselection control is in this tab, and VXT Models M9410A/11A implement a version of Software Preselection.

Presel Center

Pressing this control adjusts the centering of the preselector filter to optimize the amplitude accuracy at the frequency of the selected marker. If the selected marker is not on when **Presel Center** is pressed, the instrument turns on the selected marker, performs a peak search, and then performs centering on the marker's center frequency. If the selected marker is already on and between the start and stop frequencies of the instrument, the instrument performs the preselector calibration on that marker's frequency. If the selected marker is already on, but outside the frequency range between Start Freq and Stop Freq, the instrument first performs a peak search, and then performs centering on the marker's center frequency.

The value displayed on "Preselector Adjust" on page 1869 will change to reflect the new preselector tuning.

A number of considerations should be observed to ensure proper operation. See "Proper Preselector Operation" on page 191.

Remote Command	`[:SENSe]:POWer[:RF]:PCENter`
Example	`:POW:PCEN`
Notes	Note that the rules outlined above under the control description apply for the remote command as well as the key. The result of the command is dependent on marker position, etc. Any message shown by the control press is also shown in response to the remote command
Dependencies	Does not appear in CXA-m Does not appear in VXT Models M9410A/11A Grayed-out if the microwave preselector is off – If the selected marker's frequency is below Band 1, an advisory message is generated "Preselector not used in this frequency range" and no action is taken – Grayed-out if entirely in Band 0, that is, if Stop Freq is below about 3.6 GHz – Grayed-out if entirely above 50 GHz, that is, if Start Freq is above 50 GHz – Blank in models that do not include a preselector, such as option 503. If the remote command is sent in these instruments, it is accepted without error, and the query always returns 0 – Grayed-out in the Spectrogram View
Couplings	The active marker position determines where the centering will be attempted If the instrument is in a measurement such as averaging when centering is initiated, the act of centering the preselector restarts averaging, but the first average trace will not be taken until the centering is completed The offset applied to do the centering reads out on the "Preselector Adjust" on page 1869 control
Status Bits/OPC dependencies	When centering the preselector, `*OPC` will not return true until the process is complete and a subsequent measurement has completed, nor will results be returned to `:READ` or `:MEASure` queries The Measuring bit should remain set while this command is operating and should not go false until the subsequent sweep/measurement has completed

Proper Preselector Operation

A number of considerations should be observed to ensure proper operation:

1 If the selected marker is off, the instrument turns on a marker, performs a peak search, and adjusts the preselector using the selected marker's frequency. It uses the "highest peak" peak search method unqualified by threshold or excursion, so that there is no chance of a 'no peak found' error. It continues with that peak, even if it is the peak of just noise. Therefore, for this operation to work properly, there should be a signal on screen in a preselected range for the peak search to find

2 If the selected marker is already on, the instrument attempts the centering at that marker's frequency. There is no preselector for signals below about 3.6 GHz, so if the marker is on a signal below 3.6 GHz, no centering will be attempted and an advisory message generated

3 In some models, the preselector can be bypassed. If it is bypassed, no centering will be attempted in that range and a message will be generated

Preselector Adjust

Allows you to manually adjust the preselector filter frequency to optimize its response to the signal of interest. This function is only available when "Presel Center" on page 1868is available.

For general purpose signal analysis, using **Presel Center** is recommended. Centering the filter minimizes the impact of long-term preselector drift. **Preselector Adjust** can be used instead to manually optimize the preselector. One application of manual optimization would be to peak the preselector response, which both optimizes the signal-to-noise ratio and minimizes amplitude variations due to small (short-term) preselector drifting.

When **Presel Center** is performed, the offset applied to do the centering becomes the new value of **Preselector Adjust**.

Remote Command	`[:SENSe]:POWer[:RF]:PADJust <freq>` `[:SENSe]:POWer[:RF]:PADJust?`
Example	`:POW:PADJ 100KHz` `:POW:PADJ?`
Notes	The value on the control reads out to 0.1 MHz resolution
Dependencies	– Does not appear in CXA-m – Does not appear in VXT Models M9410A/11A – Grayed-out if microwave preselector is off – Grayed-out if entirely in Band 0, that is, if Stop Freq is below about 3.6 GHz – Grayed-out if entirely above 50 GHz, that is, if Start Freq is above 50 GHz – Blank in models that do not include a preselector, such as option 503. If the SCPI is sent in these instruments, it is accepted without error, and the query always returns 0 – Grayed-out in the Spectrogram View
Preset	0 MHz
State Saved	The **Preselector Adjust** value set by **"Presel Center" on page 1868**, or by manually adjusting **Preselector Adjust** It is not saved in instrument state, and does not survive a Preset or power cycle

Min	-500 MHz
Max	500 MHz
Backwards Compatibility SCPI	[:SENSe]:POWer[:RF]:MW:PADJust [:SENSe]:POWer[:RF]:MMW:PADJust

Notes	PSA had multiple preselectors, and you could select which preselector to adjust. Since the X-Series has only one mm/uW preselector, the preselector selection control is no longer available. However, to provide backward compatibility, we accept the legacy remote commands The command form has no effect, the query always returns MWAVe
Backwards Compatibility SCPI	[:SENSe]:POWer[:RF]:PADJust:PRESelector MWAVe | MMWave | EXTernal [:SENSe]:POWer[:RF]:PADJust:PRESelector?

Internal Preamp

Accesses a menu of controls for the internal preamps. Turning on the preamp gives a better noise figure, but a poorer inter-modulation distortion (TOI) to noise floor dynamic range. You can optimize this setting for your particular measurement.

The instrument takes the preamp gain into account as it sweeps. If you sweep outside of the range of the preamp, the instrument will also account for that. The displayed result always reflects the correct gain.

For some measurements, when the preamp is on and any part of the displayed frequency range is below the lowest frequency for which the preamp has specifications, a warning condition message appears in the status line. For example, for a preamp with a 9 kHz lowest specified frequency: "Preamp: Accy unspec'd below 9 kHz".

Selection	Example	Note
Off	:POW:GAIN OFF	
Low Band	:POW:GAIN ON :POW:GAIN:BAND LOW	Sets the internal preamp to use only the low band. The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Low Band selection in the dropdown
Full Range	:POW:GAIN ON :POW:GAIN:BAND FULL	Sets the internal preamp to use its full range. The low band (0-3.6 GHz, 0-3.4 GHz, 0-3GHz, depending on the model) is supplied by the low band preamp and the frequencies above low band are supplied by the high band preamp The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Full Range selection in the dropdown. If the high band option is not installed the Full Range selection does not appear

Remote Command	`[:SENSe]:POWer[:RF]:GAIN:BAND LOW | FULL`
	`[:SENSe]:POWer[:RF]:GAIN:BAND?`
	`[:SENSe]:POWer[:RF]:GAIN[:STATe] OFF | ON | 0 | 1`
	`[:SENSe]:POWer[:RF]:GAIN[:STATe]?`

Example	`:POW:GAIN:BAND LOW`
	`:POW:GAIN:BAND?`
	`:POW:GAIN OFF`
	`:POW:GAIN?`

Dependencies	Preamp is not available on all hardware platforms. If the preamp is not present or is unlicensed, the control is not shown Does not appear in VXT Models M9410A/11A/15A If `:POW:GAIN:BAND FULL` is sent when a low band preamp is available, the preamp band parameter is set to `LOW` instead of `FULL`, and an "Option not installed" message is generated The preamp is not available when the electronic/soft attenuator is enabled
Preset	`LOW` `OFF`
State Saved	Saved in instrument state
Annotation	When the USB Preamp is not connected to USB, the Preamp annotation in the Meas Bar says “Off” if the preamp is off and displays the frequency range of the low band or full range preamp depending on the setting. For example, if the Preamp is set to Low Band and the Low Band is 3.6 GHz the annotation says “3.6 GHz”. If it is a 13.6 GHz preamp and it is set to Full Range the annotation says “13.6 GHz” When the USB Preamp is connected to USB, the Preamp annotation says “Preamp: USB” if the internal preamp is off or “Preamp: USB, Int” if the internal preamp is on (only for measurements that support the USB preamp)

LNA

Lets you turn the Low Noise Amplifier (**LNA**) on or off.

The LNA is an additional preamplifier that provides superior DANL and frequency range compared to the Internal Preamp. The LNA provides lower system noise figure, especially at frequencies above 100 MHz, and can be operated up to the full range of 50 GHz instruments.

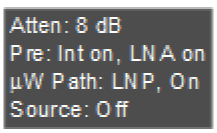
For best possible sensitivity, the LNA can be turned on together with the "Internal Preamp" on page 1870, although if you operate both preamps together, note that the TOI (distortion) specifications are impacted. The sensitivity improvement of this combination is substantial when operating in high band (frequencies above 3.6 GHz).

See "More Information" on page 195

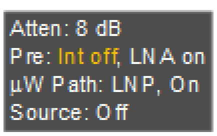
Remote Command	`[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe] OFF | ON | 0 | 1` `[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe]?`
Example	`:POW:GAIN:LNA ON`
Dependencies	Requires option LNA Option LNA is not required by VXT model M9415A Does not appear in VXT models M9420A/21A/10A/11A May not appear in some measurements
Preset	`OFF`
State Saved	Saved in State

More Information

When the LNA is installed, the preamp annotation changes to show the state of both the LNA and the Internal Preamp. Below is an example:



Note that when operating entirely in the low band (below about 3.6 GHz), if the LNA is on, the Internal Preamp is switched off (even if you have its switch set to ON). This is because the noise performance is actually degraded in low band if both preamps are on. In this case, the annotation reflects the actual state of the two preamps, but the Internal Preamp annotation displays in amber, to warn you that the actual state of the Internal Preamp does not match the **Internal Preamp** switch control display:



µW Path Control

Options for this control include **µW Preselector Bypass** (Option MPB), **Low Noise Path** (Option LNP) and **Full Bypass Enable** in the High Band path circuits.

When the µW Preselector is bypassed, flatness is improved, but will be subject to spurs from out of band interfering signals. When **Low Noise Path Enable** is selected, the instrument automatically bypasses certain circuitry in the high frequency bands that can contribute to noise, when it is appropriate based on other instrument settings.

For most applications, the preset state is **Standard Path**, which provides the best remote-control throughput, minimizes acoustic noise from switching and minimizes the risk of wear in the hardware switches, particularly in remote test scenarios where both low band and high band setups will follow in rapid succession. In this path, the bypass of the low band/high band switch and microwave preamp is never activated, which can cause some noise degradation but preserves the life of the bypass switch.

For applications that utilize the wideband IF paths, the preset state is **µW Preselector Bypass**, if option MPB is present. This is because, when using a wideband IF such as the 140 MHz IF, the µW Preselector's bandwidth can be narrower than the available IF bandwidth, causing degraded amplitude flatness and phase linearity, so it is desirable to bypass the preselector in the default case.

You may choose **Low Noise Path Enable** for a lower noise floor, especially in the 21-26.5 GHz region, though without improving many measures of dynamic range, and without giving the best possible noise floor. The preamp, if purchased and used, gives better noise floor than does **Low Noise Path Enable**, but the preamp's compression threshold and third-order intercept are much poorer than that of **Low Noise Path Enable**.

A fourth choice is **Full Bypass Enable**, which combines **µW Preselector Bypass** and **Low Noise Path Enable**. Because this can bypass most of the circuitry between the input and the first mixer, care should be taken when using this setting to avoid damaging the mixer. **Full Bypass Enable** is only available if both options LNP and MPB are present, as well as option FBP.

Path	Example	Note
Standard Path	:POW:MW:PATH STD	Normal setting for most measurements. µW Preselector in circuit, Low Noise Path disabled
Low Noise Path Enable	:POW:MW:PATH LNP	See "Low Noise Path Enable" on page 200
µW Preselector Bypass	:POW:MW:PATH MPB	See "µW Preselector Bypass" on page 202
Full Bypass Enable	:POW:MW:PATH FULL	See "Full Bypass Enable" on page 202

Remote Command	[:SENSe]:POWer[:RF]:MW:PATH STD | LNPath | MPBypass | FULL [:SENSe]:POWer[:RF]:MW:PATH?
Example	:POW:MW:PATH LNP Enables the Low Noise path :POW:MW:PATH?
Notes	If "Presel Center" on page 1868 is performed, the instrument will momentarily switch to the Standard Path, regardless of the setting of **µW Path Control** The DC Block will always be switched in when the low noise path is switched in, to protect succeeding circuitry from DC. Note that this does not mean "when the low noise path is enabled" but when, based on the Low Noise Path rules, the path is actually switched in. This can happen when the selection is **Low Noise Path Enable** or **Full Bypass Enable**. In the case where the DC Block is switched in the instrument is now AC coupled. However, if you selected DC coupling, the UI would still behave as though it were DC coupled, including all annunciation, warnings, status bits, and responses to SCPI queries. This is because, based on other settings, the instrument could switch out the low noise path at

	any time and hence go back to being DC coupled Alignment switching ignores the settings in this menu, and restores them when finished
Dependencies	Does not appear in CXA-m Does not appear in VXT Models M9410A/11A Does not appear in BBIQ and External Mixing The **Low Noise Path Enable** selection does not appear unless Option LNP is present and licensed The **µW Preselector Bypass** selection does not appear unless Option MPB is present and licensed The **Full Bypass Enable** selection does not appear unless options LNP and MPB are both present as well as option FBP In any of these cases, if the required options are not present and the SCPI command is sent, error -241, "Hardware missing; Option not installed" is generated **Low Noise Path Enable** and **Full Bypass Enable** are grayed-out if the current measurement does not support them **Low Noise Path Enable** and **Full Bypass Enable** are not supported in Avionics and MMR Modes. In any of these cases (that is, the feature is not supported in either measurement or mode), if the SCPI command is sent, the following error is generated: -221, “Setting Conflict; Feature not supported for this measurement”
Preset	All except modes specified below: `STD` IQ Analyzer, VXA, Pulse and Avionics mode: – MPB option present and licensed: `MPB` – MPB option not present and licensed: `STD`
State Saved	Save in instrument state
Range	Standard Path|Low Noise Path Enable|µW Presel Bypass|Full Bypass Enable
Annotation	In the Meas Bar, if the Standard path is chosen, it says: µW Path: Standard If Low Noise Path is enabled but the LNP switch is not thrown, it shows: µW Path: LNP,Off If the Low Noise Path is enabled and the LNP switch IS thrown, it shows: µW Path: LNP,On If the preselctor is bypassed, it says: µW Path: Bypass If Full Bypass Enable is selected but the LNP switch is not thrown, it shows: µW Path: FByp,Off If Full Bypass Enable is selected and the LNP switch IS thrown, it shows: µW Path: FByp,On

µW Path Control Auto [Mode: VMA, WLAN, NR5G, CQM]

In VMA, WLAN, 5G NR, CQM modes, an Auto/Man switch is added to **µW Path Control**:

This allows the function to automatically switch based on certain Auto Rules as shown below:

VMA Mode

Measurement	When µW Path Control is in Auto:
Digital Demod	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Monitor Spectrum	Always Presel Bypass
IQ Waveform	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Custom OFDM	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Channel Power	Always Presel Bypass
Occupied BW	Always Presel Bypass
CCDF	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
ACP	Always Presel Bypass
SEM	Always Presel Bypass
Spurious Emissions	Always Standard Path

WLAN Mode

Measurement	When µW Path Control is in Auto:
Modulation Analysis	Always Presel Bypass
Spectral Flatness	Always Presel Bypasss
Power vs Time	Always Presel Bypass
Monitor Spectrum	Always Presel Bypass
IQ Waveform	Always Presel Bypass
Channel Power	Always Presel Bypass
Occupied BW	Always Presel Bypass
CCDF	Always Presel Bypass
SEM	1. For 11be 320M, when 'Enabled Wideband IF for FFT' is OFF or 'Sweep Type Rule' is Best Dynamic Range, auto µW path is standard. 2. For other cases, auto µW path is presel bypass if presel bypass is enabled,

Measurement	When µW Path Control is in Auto:
	auto µW path is standard if presel bypass is not enabled.
Spurious Emissions	Always Standard Path

5G NR Mode

Measurement	When µW Path Control is in Auto:
Modulation Analysis	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Full Bypass if conditions warrant(FBP Option is available and “Allow Full Bypass in Auto” is On), otherwise choose Preselector Bypass
Monitor Spectrum	Always Standard Path
IQ Waveform	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Full Bypass if conditions warrant(FBP Option is available and “Allow Full Bypass in Auto” is On), otherwise choose Preselector Bypass
Channel Power	Always Standard Path
Occupied BW	Always Standard Path
CCDF	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
ACP	Always Standard Path
SEM	Always Standard Path
Spurious Emissions	Always Standard Path
Transmit On|Off Power	Use Standard Path unless tuned frequency > 3.6 GHz and Info BW > 15 MHz, in which case choose Preselector Bypass

Channel Quality Mode

Measurement	When µW Path Control is in Auto:
Group Delay	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Full Bypass if conditions warrant(FBP Option is available and “Allow Full Bypass in Auto” is On), otherwise choose Preselector Bypass
Monitor Spectrum	Always Standard Path
IQ Waveform	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
CCDF	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass

Remote Command	`[:SENSe]:POWer[:RF]:MW:PATH:AUTO ON | OFF | 1 | 0` `[:SENSe]:POWer[:RF]:MW:PATH:AUTO?`
Example	`:POW:MW:PATH:AUTO ON` `:POW:MW:PATH:AUTO?`

Dependencies	Only appears in VMA, WLAN, 5G NR and CQM modes
Couplings	See the tables above
Preset	ON
Range	ON|OFF

Low Noise Path Enable

You may select **Low Noise Path Enable**, which gives a lower noise floor under some circumstances, particularly when operating in the 21-26.5 GHz region. With the Low Noise Path enabled, the low band/high band switch and microwave preamp are bypassed whenever all of the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz
- the internal preamp is not installed or (if installed) is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Low Noise Path Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the **Low Noise Path Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Low Noise Path Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

For measurements that use IQ acquisition, the low noise path is used when **Center Frequency** is in High Band (> 3.6 GHz) and no preamp is in use. In other words, the rules above are modified to use only the center frequency to qualify which path to switch in. This is not the case for FFTs in the Swept SA measurement; they use the same rules as swept measurements.

Note that the Low Noise Path, while giving improved DANL, has the disadvantage of decreased TOI performance and decreased gain compression performance relative to the standard path.

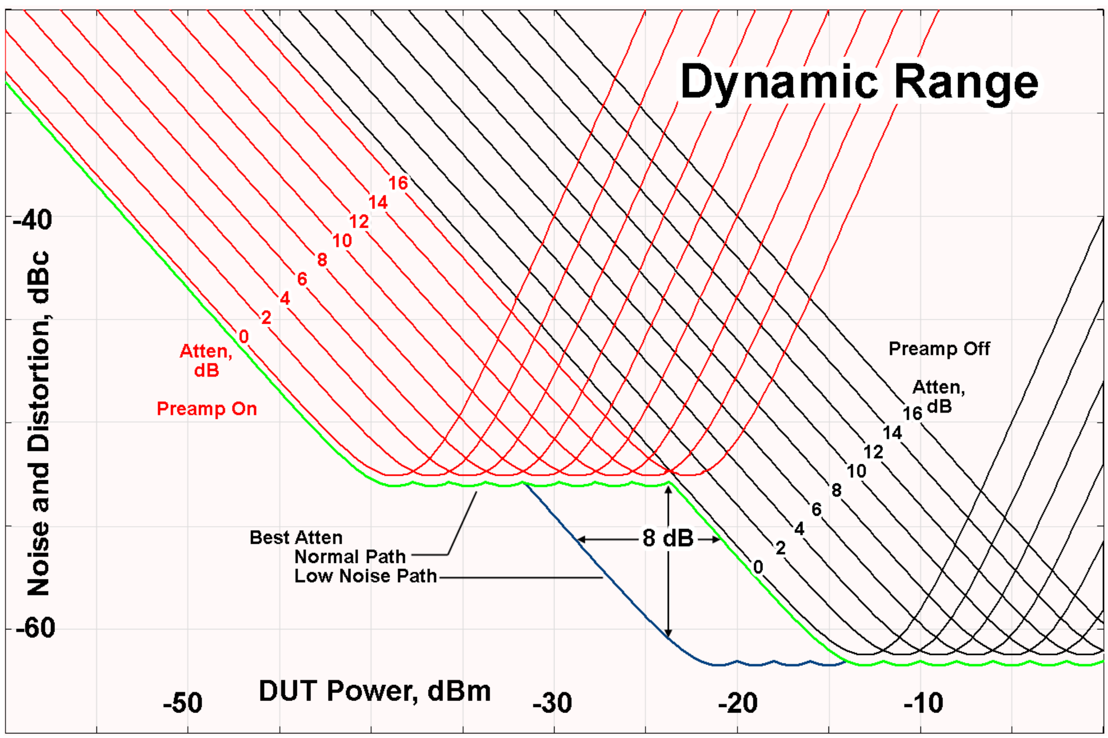
Note also that the bypass switch is a mechanical switch and has finite life, so if the **Low Noise Path Enable** is selected, it is possible to cause frequent cycling of this switch by frequently changing instrument settings such that the above conditions hold true only some of the time. A user making tests of this nature should consider opting for the **Standard Path**, which will never throw the bypass switch, at the expense of some degraded noise performance.

The low noise path is useful for situations where the signal level is so low that the instrument performance is dominated by noise even with 0 dB attenuation, but still high enough that the preamp option would have excessive third-order intermodulation or compression. The preamp, if purchased and used, gives better

noise floor than does the “Low Noise Path.” However, its compression threshold and third-order intercept are much poorer than that of the non-preamp path.

There are some applications, typically for signals around –30 dBm, for which the third-order dynamic range of the standard path is good enough, but the noise floor is not low enough even with 0 dB input attenuation. When the third-order dynamic range of the preamp path is too little and the noise floor of the standard path is too high, the Low Noise Path can provide the best dynamic range

The graph below illustrates the concept. It shows, in red, the performance of an instrument at different attenuation settings, both with the preamp on and off, in a measurement that is affected by both instrument noise and instrument TOI. The green shows the best available dynamic range, offset by 0.5 dB for clarity. The blue shows how the best available dynamic range improves for moderate signal levels with the low noise path switched in. In this illustration, the preamp improves the noise floor by 15 dB while degrading the third-order intercept by 30 dB, and the low noise path reduces loss by 8 dB. The attenuator step size is 2 dB.



There are other times where selecting the low noise path improves performance, too. Compression-limited measurements such as finding the nulls in a pulsed-RF spectrum can profit from the low noise path in a way similar to the TOI-limited measurement illustrated. Accuracy can be improved when the low noise path allows the optimum attenuation to increase from a small amount like 0, 2 or 4 dB to a larger amount, giving better return loss at the instrument input. Harmonic measurements, such as second and third harmonic levels, are much improved using the low noise path because of the superiority of that path for harmonic (though not intermodulation) distortion performance.

µW Preselector Bypass

Toggles the preselector bypass switch for band 1 and higher. When the microwave presel is on, the signal path is preselected. When the microwave preselector is off, the signal path is not preselected. The preselected path is the normal path for the instrument.

The preselector is a tunable bandpass filter which prevents signals away from the frequency of interest from combining in the mixer to generate in-band spurious signals (images). The consequences of using a preselector filter are its limited bandwidth, the amplitude and phase ripple in its passband, and any amplitude and phase instability due to center frequency drift.

Option MPB or pre-selector bypass provides an unpreselected input mixer path for certain X-Series signal analyzers with frequency ranges above 3.6 GHz. This signal path allows a wider bandwidth and less amplitude variability, which is an advantage when doing modulation analysis and broadband signal analysis. The disadvantage is that, without the preselector, image signals will be displayed. Another disadvantage of bypassing the preselector is increased LO emission levels at the front panel input port.

Image responses are separated from the real signal by twice the 1st IF. For IF Paths of 10 MHz and 25 MHz, the 1st IF is 322.5 MHz, so the image response and the real signal will be separated by 645 MHz. The 1st IF will be different for other IF Path settings. When viewing a real signal and its corresponding image response in internal mixing, the image response will be to the left of the real signal.

Also, the image response and the real signal typically have the same amplitude and exhibit the same shape factor.

However, if Option FS1, Fast Sweep Capability, is enabled, the image response in the Swept SA measurement appears lower in amplitude and has a much wider shape factor compared to the real signal.

Full Bypass Enable

With **Full Bypass Enable** selected, the microwave preselector is bypassed. In addition, the low band/high band switch and microwave preamp are bypassed whenever all of the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz.
- the internal preamp is not installed or (if installed) is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. The only time the Low

Noise Path is used is when **Full Bypass Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

CAUTION

When **Full Bypass Enable** is selected, and "Attenuation" on page 1747 is set to 0 dB, there will be a direct AC connection between the input and the first converter when the Low Noise Path switches in (when Start Freq >3.6 GHz and the Preamp is either not licensed, set to Low Band, or Off). This puts the first converter at high risk to be damaged by high AC power. Consequently, whenever **Full Bypass Enable** is selected, a warning message appears in the status bar:

Full Bypass Enabled, maximum safe input power reduced

Microwave Preselector Bypass Backwards Compatibility

Example	`:POW:MW:PRES OFF` Bypasses the microwave preselector
Notes	Included for Microwave Preselector Bypass backwards compatibility The `ON` parameter sets the `STD` path (`:POW:MW:PATH STD`) The `OFF` parameter sets path `MPB` (`:POW:MW:PATH MPB`)
Preset	`ON`
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe] ON | OFF | 0 | 1` `[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe]?`

Frequency Extender Preselection Bypass

Frequency Extender Preselection Bypass only applies to the high frequency path of the Frequency Extender and only if the Frequency Extender allows it. For example, the V3050A high frequency path is 50 – 110 GHz and does allow control of the preselector bypass.

When the Frequency Extender's preselection is bypassed, flatness is improved, but will be subject to spurs from out of band interfering signals. For bandwidths greater than 2.5 [GHz], it is recommended that the signal bypass the Frequency Extender Preselector since the max bandwidth of the Preselector can be as narrow as 2.5 [GHz].

For most applications, the preset state is `OFF`, which gives the best remote-control throughput, minimizes acoustic noise from switching, minimizes out of band spurs, and minimizes the risk of wear in the hardware switches.

Coupling with Microwave Preselector Control

The control of whether to apply or bypass the Frequency Extender's preselection is dependent on the Microwave Path Control setting.

The coupling between the Microwave Path Control and Frequency Extender Preselector Bypass is described below.

UW PATH CTRL	UW PRESELECTOR	VIKING PRESELECTOR
Standard Path	On	**On**
Low Noise Path Enable	On	**On**
uW Presel Bypass	Off	**Off**
Full Bypass Enable	Off	**Off**

In other words…

uW Path Ctrl == Standard
uW Path Ctrl == Low Noise
→ Viking PreselBypass == Off

uW Path Ctrl == Bypass
uW Path Ctrl == Full Bypass
→ Viking PreselBypass == On

For the Frequency Extender Preselector Bypass to take effect, it requires a Frequency Extender device (such as V3050A) be connected and External RF (ERFIN) selected as the input.

The Frequency Extender Preselector is applied or bypassed depending on the Microwave Path Control setting only when the acquisition is above 50 [GHz]. Hence, it will be bypassed only when the acquisition is above 50 [GHz].

Preselector and Bandwidth Conflict

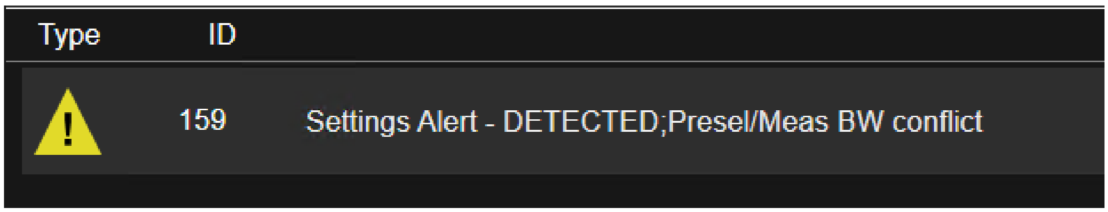
When the Frequency Extender Preselector is applied and the signal bandwidth is greater than 2.5 [GHz], then a settings alert message will show to warn the user that the signal may be distorted due to the limitation of the Frequency Extender Preselector bandwidth.

An example of the settings alert message is shown below.

Settings Alert message in the Status Bar at the bottom of the display.

Settings Alert message in the error queue

.



Software Preselection

Software Preselection is provided in some instruments, either to compensate for issues with provided hardware preselection or to provide the preselection function when there is no hardware preselector.

N9041B

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

In the N9041B, Software Preselection only applies for frequencies above 50 GHz, therefore it is only used for RF Input 2. Even if it is turned on, it will not be used for other inputs and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that in the N9041B, in Swept SA, Software Preselection will work even if the measurement is using an FFT sweep type. In measurements other than Swept SA, Software Preselection will not be used if the measurement is using an FFT sweep type.

N9042B+V3050A

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 88 GHz, software preselection must be used to suppress and separate images above 88 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

For N9042B+V3050A, Software Preselection only applies for frequencies above 88 GHz, therefore it is only used for External RF. Even if it is turned on, it will not be used for other inputs and never for frequencies below 88 GHz. This is why the label of this control contains the parenthetical note “(>~88 GHz)”.

Note that for N9042B+V3050A, in Swept SA, Software Preselection will work even if the measurement is using an FFT sweep type. In measurements other than Swept SA, Software Preselection will not be used if the measurement is using an FFT sweep type.

VXT models M9410A/11A

Software Preselection is used to provide the preselection function, as there is no hardware preselector in these models. Two background traces are taken and compared point by point, and the point with the lowest amplitude from the two traces is used. This provides a method to reduce spurs that are internally generated within the VXT, but the user should note the following when using Software Preselection:

- There is some speed cost due to the need to take multiple captures
- Taking the point with the lowest amplitude in each trace will make the average noise level lower at all points that do not have a spur. This can reduce the accuracy of the measurement of noise and noise-like signals.

Because of the difficulty in identifying spurs manually, you are encouraged to leave Software Preselection ON at all times in VXT models M9410A/11A. If you turn it off in order to speed up your measurement or improve noise accuracy, be aware of unwanted onscreen spurs.

Remote Command	`[:SENSe]:POWer[:RF]:SWPResel:STATe 0 | 1 | ON | OFF` `[:SENSe]:POWer[:RF]:SWPresel:STAT?`
Example	`:POW:SWPR:STAT 1` `:POW:SWPR:STAT?`
Dependencies	Only appears in N9041B, N9042B+V2050A, and VXT models M9410A/11A. Does not appear in all measurements
Couplings	Sweep Time is affected by SW Preselection. Also Auto Tune supports SW Preselection, so set SW Preselection state and then do Auto Tune
Preset	N9041B: OFF N9042B+V3050A: ON M9410A/11A: ON
State Saved	Saved in instrument state

SW Preselection Type

Specifies the algorithm used for software preselection.

Two hidden sweeps are taken in succession. The second sweep is offset in LO frequency by 2*IF/N. For each point in each trace, the smaller amplitude from the two traces is taken and placed in that point in the selected trace. The Peak detector is auto-selected to improve the image suppression effectiveness. Responses of each trace that lie on top of one another will remain and are valid signals. Other signals are images and are suppressed. The action of taking the smaller of the two traces will make the average noise level lower in all points that do not have an image, thus reducing the accuracy of the measurement of noise and noise-like signals.

- NORMal - mathematically removes all image and multiple responses of signals present at the input
- ADVanced - any trace processing (such as “max hold” or trace averaging) is performed on the points of both candidate traces before the “select minimum” operation occurs. This form of processing works better for non-stationary signals, such as pulsed-RF signals

Remote Command	[:SENSe]:POWer[:RF]:SWPResel NORMal | ADVanced [:SENSe]:POWer[:RF]:SWPResel?
Example	:POW:SWPR NORM :POW:SWPR?
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method When "Software Preselection" on page 1883 is Disabled, this control is grayed-out. Its grayout message is “Unavailable unless SW Presel enabled”
Preset	N9041B: ADVanced N9042B+V3050A: NORMal
State Saved	Saved in instrument state

SW Preselection BW

Specifies the effective bandwidth to be used for Software Preselection.

The choices are:

- NORMal – when making Swept measurements, a software preselection algorithm is used which takes up to 4 background acquisitions, then post-processes the result. This algorithm can remove images from signals with an occupied bandwidth up to around 3 GHz. (Default/Preset setting). When making FFT measurements, this algorithm is not used, instead the same algorithm is used as for NARRow (below)
- NARRow– a software preselection algorithm is used which takes two background acquisitions, then post-processes the result to detect and remove images from wideband signals with occupied bandwidths up to 2 GHz. This increases the risk of images failing to be rejected, but improves the measurement speed

Remote Command	[:SENSe]:POWer[:RF]:SWPResel:BW NORMal | NARRow [:SENSe]:POWer[:RF]:SWPResel:BW?
Example	:POW:SWPR:BW NARR
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method When "Software Preselection" on page 1883 is Disabled, this control is grayed out. Its grayout message is “Unavailable unless SW Presel enabled” For N9042B+V3050A the parameter is SCPI only and always set to NARRow when Software

	Preselection is enabled
Preset	N9041B: NORMal N9042B+V3050A: NARRow
State Saved	Saved in instrument state

High Freq Prefilter

Lets you set the state of Prefilter for Center Frequencies above 1310 MHz.

In VXT Models M9410A/11A, the Receiver RF path has a bank of filters that come after the RF Attenuator in the signal path. Since this bank of filters precedes the mixer they are known as the “Prefilter” bank. Their purpose is to eliminate unwanted in-band mixing products by filtering out all but the desired frequencies before the signals get to the mixer. There are 13 prefilter bands to cover the frequencies between 9 kHz and 6000 MHz. The Prefilter provides the necessary rejection of the unwanted signal.

Remote Command	`[:SENSe]:<measurement>:PFILter[:STATe] ON | OFF | 1 | 0` `[:SENSe]:<measurement>:PFILter[:STATe]?`

Example	For example, to enable High Freq Prefilter in IQ Analyzer Mode:
	For the Complex Spectrum Measurement:
	`:SPEC:PFIL ON`
	For the IQ Waveform Measurement:
	`:WAV:PFIL ON`
	`:`

Dependencies	This control only appears in VXT models M9410A/11A with center frequency above 1310 MHz
Preset	See “Prefilter Presets” below
State Saved	Saved in instrument state

Prefilter Presets

Meas	Mode	Preset
SPEC	BASIC	OFF
WAV	BASIC, WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA	OFF
MON	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA	OFF
RHO	WCDMA	OFF
CDP	WCDMA	OFF
PCON	WCDMA	OFF
EVMQ	WCDMA	OFF
CHP	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF

Meas	Mode	Preset
OBW	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
ACP	WCDMA, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
SEM	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
PST	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
PVT	WLAN, LTEAFDD, LTEATDD, 5GNR	OFF
EVM	WLAN, LTEAFDD, LTEATDD, 5GNR	OFF
FLAT	WLAN	OFF
EVMM	WLAN	OFF
CEVM	LTEAFDD, LTEATDD	OFF
PAVT	5GNR, VMA	OFF
DDEM	VMA	OFF
OFDM	VMA	OFF
SAN	SA	ON
HARM	SA	ON

3.2.4 BW

Opens the Bandwidth (**BW**) menu, which contains controls for the Resolution Bandwidth and Video Bandwidth functions of the instrument.

3.2.4.1 Settings

Contains the basic bandwidth functions. It is the only tab under **BW**.

Res BW

Activates the resolution bandwidth active function, which allows you to manually set the Resolution Bandwidth (RBW) of the instrument.

Normally, **Res BW** (Auto) selects automatic coupling of the Res BW to Span using the ratio set by the Span:3 dB RBW control (some measurements do not have a Span:3 dB RBW control, in which case the measurement chooses the optimal ratio). To decouple the resolution bandwidth, press the **Auto/Man** toggle on the **Res BW** control, or simply enter a different value for **Res BW**.

When the **Res BW** is manually selected, it may be returned to the coupled state by pressing the **Auto/Man** toggle on the **Res BW** control. This may also be done by pressing Auto Couple or by performing a **Preset**.

Only certain discrete resolution bandwidths are available. The available bandwidths are dependent on the **EMC Standard**. If an unavailable bandwidth is entered with the numeric keypad, the closest available bandwidth is selected.

See "RBW Presets" on page 210

Remote Command	[:SENSe]:MONitor:BANDwidth[:RESolution] <bandwidth> [:SENSe]:MONitor:BANDwidth[:RESolution]? [:SENSe]:MONitor:BANDwidth[:RESolution]:AUTO ON | OFF | 1 | 0 [:SENSe]:MONitor:BANDwidth[:RESolution]:AUTO?
Example	:MON:BAND 5 MHz :MON:BAND? :MON:BAND:AUTO ON :MON:BAND:AUTO?
Notes	For numeric entries, all RBW Types choose the nearest (arithmetically, on a linear scale, rounding up) available RBW to the value entered The setting and querying of values depends on the current bandwidth type
Couplings	Sweep time is coupled to the RBW. As the RBW changes, the sweep time (if set to Auto) is changed to maintain amplitude calibration Video bandwidth (VBW) is coupled to the RBW. As the resolution bandwidth changes, the video bandwidth (if set to Auto) changes to maintain the ratio of VBW/RBW (10:1) When the Res BW is set to Auto, the resolution bandwidth is auto-coupled to the span. The ratio of Span/RBW is approximately 106:1 when auto coupled. When Res BW is set to Man, and the bandwidths are entered manually, these bandwidths are used regardless of other instrument settings
Preset	Auto (unless noted in the table below) See "RBW Presets" on page 210 below
State Saved	Saved in instrument state
Min	1 Hz
Max	8 MHz is the max equivalent –3 dB RBW, which means that the named RBW (the one shown on the control etc.) can actually exceed 8 MHz if using a filter other than –3 dB Gaussian
Annotation	A “#” mark appears before “RBW” in the annotation when it is switched from Auto to Manual coupling
Backwards Compatibility Notes	For backwards compatibility this command obeys both the BANDwidth and BWIDth forms For ESA, the maximum Res BW was 5 MHz; on X-Series it is 8 MHz

RBW Presets

Unless noted in the table below, the Preset value of RBW is **Auto**.

Mode	Preset RBW
WLAN	100 kHz
LTE, LTETDD, LTEAFDD, LTEATDD	100 kHz
5GNR	100 kHz

Video BW

Lets you change the instrument post-detection filter (VBW or "video bandwidth") from 1 Hz to 8 MHz in approximately 10% steps. In addition, a wide-open video filter bandwidth may be chosen by selecting 50 MHz. The VBW is annotated at the bottom of the display, in the center.

Normally, **Video BW (Auto)** selects automatic coupling of the Video BW to RBW using the ratio set by the VBW:3 dB RBW control. To decouple the resolution bandwidth, press the **Auto/Man** toggle on the **Video BW** control, or simply enter a different value for **Video BW**.

When the **Video BW** is manually selected, it may be returned to the coupled state by pressing the **Auto/Man** toggle on the **Video BW** control. This may also be done by pressing Auto Couple or by performing a **Preset**.

Remote Command	`[:SENSe]:MONitor:BANDwidth:VIDeo <bandwidth>`
	`[:SENSe]:MONitor:BANDwidth:VIDeo?`
	`[:SENSe]:MONitor:BANDwidth:VIDeo:AUTO ON | OFF | 1 | 0`
	`[:SENSe]:MONitor:BANDwidth:VIDeo:AUTO?`

Example	`:MON:BAND:VID 2.4 MHz`
	`:MON:BAND:VID?`
	`:MON:BAND:VID:AUTO ON`
	`:MON:BAND:VID:AUTO?`

Notes	For numeric entries, the instrument chooses the nearest (arithmetically, on a linear scale, rounding up) available VBW to the value entered. The 50 MHz VBW is defined to mean "wide open" The values shown in this table reflect the conditions after a Mode Preset
Dependencies	Sometimes the displayed Video BW is not actually used to process the trace data: – When the Average Detector is selected and **Sweep Type** is set to **Swept**, the video bandwidth filter cannot be used, because it uses the same hardware as the Average Detector – When the Quasi-Peak, EMI Average or RMS Average detector is selected the VBW is implemented by the digital IF as part of the detector When this is the case, the VBW still acts to change the Sweep Time, if Sweep Time is in Auto, and still affects the data on other traces for which this is not the case
Couplings	Video bandwidth (VBW) is normally coupled to RBW. If **VBW** is set to Auto, then the VBW is changed as the RBW changes, to maintain the ratio set by the VBW:3 dB RBW control (usually 10:1 for measurements that do not have a VBW:3 dB RBW control)
Preset	Auto (unless noted in table below) `ON`
State Saved	Saved in instrument state
Min	1 Hz

Max	50 MHz
Annunciation	A "#" mark appears before "VBW" in the annotation when it is not coupled
Annotation	In the bottom center of the screen, "VBW <value> <units>" indicates the current video bandwidth value. Note that for some detectors this is not the value actually used for VBW (see above)
Backwards Compatibility Notes	For backwards compatibility this command obeys both the `BANDwidth` and `BWIDth` forms

VBW Presets

Unless noted in the table below, the Preset value of VBW is **Auto**.

Mode	Preset VBW
`WLAN`	1 MHz
`LTE, LTETDD, LTEAFDD, LTEATDD`	1 MHz
`5GNR`	1 MHz

VBW:3dB RBW

Selects the ratio between the video bandwidth and the equivalent 3 dB resolution bandwidth to be used for setting VBW when VBW is in Auto.

VBW:3dB RBW (Auto) selects automatic coupling of the VBW:3 dB RBW ratio to Detector using the rules described below in "Coupling Auto Rules" on page 213 To decouple the ratio, press the **Auto/Man** toggle on the VBW:3 dB RBW control, or simply enter a different value for VBW:3 dB RBW.

When the VBW:3dB RBW is manually selected, it may be returned to the coupled state by setting the toggle on the VBW:3 dB RBW control back to **Auto**. This may also be done by pressing Auto Couple or by performing a **Preset**.

Remote Command	`[:SENSe]:MONitor:BANDwidth:VIDeo:RATio <real>`
	`[:SENSe]:MONitor:BANDwidth:VIDeo:RATio?`
	`[:SENSe]:MONitor:BANDwidth:VIDeo:RATio:AUTO OFF | ON | 0 | 1`
	`[:SENSe]:MONitor:BANDwidth:VIDeo:RATio:AUTO?`

Example	`:MON:BAND:VID:RAT 2`
	`:MON:BAND:VID:RAT?`
	`:MON:BAND:VID:RAT:AUTO 0`
	`:MON:BAND:VID:RAT:AUTO?`

Notes	The values shown in this table reflect the conditions after a Mode Preset
Couplings	See "Coupling Auto Rules" on page 213

Preset	1 ON
State Saved	Saved in instrument state
Min	0.00001
Max	3000000
Backwards Compatibility Notes	For backwards compatibility this command accepts both the `BANDwidth` and `BWIDth` forms

Coupling Auto Rules

The Auto Rules for the **VBW:3dB RBW** function are as follows.

First, if Source Mode is set to "Tracking": Use 1.0

Otherwise, we go through the following list of detector numbers and find the lowest numbered detector being used on any active traces (traces for which Update is On):

1. Peak
2. Normal
3. Average
4. Sample
5. Negative Peak
6. EMI Average
7. Quasi Peak
8. RMS Average

Use that detector to pick the ratio based on the following criteria:

1. If the measurement supports EMC Standard, and the detector is Peak and the EMC Standard is set to either CISPR or MIL, use 10.0 (we use wide VBWs to capture peak levels accurately).
2. Otherwise, if the detector is **Negative Peak**, use 1.0 (in the Negative Peak case, there are no known significant use models so we use a medium ratio).
3. Otherwise, if the detector is **Normal**, use 1.0.
4. Otherwise, if the detector is **Average**, and the span is nonzero, use 0.1. The use of a small ratio in Average detection is desirable because of its effect on the sweep time equations. The VBW filter is not actually in-circuit when the average detector is on. If the detector is Average, and the span is zero, use 10.0, which gives optimal behavior for Interval Markers in zero span. Note that only the Swept SA measurement supports Zero Span.

5. Otherwise, if the detector is EMI Average, Quasi Peak or RMS Average, use 10.0. In fact, this is a “don’t care” since no VBW is used for these detectors, as noted under “Dependencies” for the VBW control

6. Otherwise, the detector is simply **Peak** or **Sample**. These two detectors can use the same rules. In these cases, if any active trace is in max hold or min hold, use 10.0, because Max and Min Hold operations will usually be intended to capture peaks and pits without smoothing from the VBW filter; otherwise, use 1.0 as a compromise, because you have not set the instrument in a way that implies that you are measuring noise, pulsed-RF or CW signals, and for backward compatibility with earlier instruments.

Note that because the above couplings depend on which traces are active, they are re-examined whenever any trace goes active or inactive, except when this leaves no traces active. Transitioning to the state where no traces are active should not affect the couplings; in that way, the annotation will always reflect the state of the last trace which was active.

Note also that some detectors are not available in some measurements, but because of the way the above rules that does not change the logic of the rules.

Span:3dB RBW

Selects the ratio between span and resolution bandwidth.

Normally, Span:3dB RBW (Auto) selects a Span:3 dB RBW ratio of 106:1. If you manually enter the ratio, the toggle on the Span:3dB RBW control will change to **Man.** This enables you to manually select ratios more suitable for certain measurements.

When the Span:3dB RBW is manually selected, it may be returned to the coupled state by setting the toggle on the RBW:3 dB RBW control back to **Auto**. This may also be done by pressing Auto Couple or by performing a **Preset**.

Remote Command	`[:SENSe]:MONitor:FREQuency:SPAN:BANDwidth[:RESolution]:RATio <integer>`
	`[:SENSe]:MONitor:FREQuency:SPAN:BANDwidth[:RESolution]:RATio?`
	`[:SENSe]:MONitor:FREQuency:SPAN:BANDwidth[:RESolution]:RATio:AUTO OFF | ON | 0 | 1`
	`[:SENSe]:MONitor:FREQuency:SPAN:BANDwidth[:RESolution]:RATio:AUTO?`

Example	`:MON:FREQ:SPAN:BAND:RAT 200`
	`:MON:FREQ:SPAN:BAND:RAT?`
	`:MON:FREQ:SPAN:BAND:RAT:AUTO ON`
	`:MON:FREQ:SPAN:BAND:RAT:AUTO?`

Notes	The values shown in this table reflect the conditions after a Mode Preset

Preset	106 ON
State Saved	Saved in instrument state
Min	2
Max	10000
Backwards Compatibility SCPI	[:SENSe]:MONitor:FREQuency:SPAN:BWIDth[:RESolution]:RATio

3.2.5 Display

Opens the **Display** menu, which lets you configure display items for the current Mode, Measurement View or Window.

3.2.5.1 View

Contains controls for selecting the current **View**, and for editing User Views.

Views

For modes other than MSR, LTEAFDD/LTEATDD and 5GNR, there is a single view, **Normal**.

For the MSR, LTEAFDD/LTEATDD and 5GNR modes, there are two views, **Normal** and **Carrier Info**, as described in the table below. The **Normal** view is the same as the common Monitor Spectrum view in other Modes. Carrier Info is available on the spectrum trace.

"Normal" on page 216	This is a single window view of the spectrum In MSR, LTEAFDD/LTEATDD and 5GNR modes you can turn on attributes that show the defined carriers and the sub-blocks also
Carrier Info	This view shows the spectrum in the top window and a carrier configuration summary in the bottom window Carrier center frequency can be displayed in either offset or absolute frequency depending on Carrier Freq

View Selection by Name (MSR, LTEAFDD/LTEATDD and 5GNR only)

Remote Command	:DISPlay:MONitor:VIEW[:SELect] RTRace | CINFormation :DISPlay:MONitor:VIEW[:SELect]?
Example	:DISP:MON:VIEW RTR :DISP:MON:VIEW?

Preset	RTRace
State Saved	Saved in instrument state
Range	Power Results|Carrier Info

View Selection by Number (MSR, LTE-A FDD/TDD and 5G NR only)

Remote Command	`:DISPlay:MONitor:VIEW:NSELect <integer>` `:DISPlay:MONitor:VIEW:NSELect?`
Example	`:DISP:MON:VIEW:NSEL 1` `:DISP:MON:VIEW:NSEL?`
Preset	1
State Saved	Saved in instrument state
Min/Max	1/2

Normal

Windows: "Spectrum" on page 174

Single window view of the graph.

Example	`:DISP:MON:VIEW RTR`
Dependencies	This command is only available in the MSR, LTE-A FDD/TDD and 5G NR modes. In other Modes this is the only View

User View

Lets you choose a View from the saved User Views for the current measurement. This panel only appears if a User View exists for the current measurement.

Remote Command	`:DISPlay:VIEW:ADVanced:SELect <alphanumeric>` `:DISPlay:VIEW:ADVanced:SELect?`
Example	Select Baseband as the current View `:DISP:VIEW:ADV:SEL “Baseband”`
Notes	You must be in the measurement whose View you are trying to set to send the command. You can only set Views for the current measurement using this command For predefined views, the parameter is derived from the view name that is shown in the View list in the user interface. For example, if you are trying to select the Trace Zoom view in the Swept SA measurement, you send: `:DISP:VIEW:ADV:SEL "Trace Zoom"` because “Trace Zoom” is the name of the View as seen in the Mode/Meas dialog or in the Display, View menu

	You *cannot* use the legacy View parameter (which in this case would be `TZOom`) with `:DISP:VIEW:ADV:SEL`
	`<alphanumeric>` is case insensitive; you can specify mixed case, however the name will be evaluated on a single case. Thus, both of the following forms work:
	`:DISP:VIEW:ADV:SEL "Trace Zoom"`
	`:DISP:VIEW:ADV:SEL "TRACE ZOOM"`
	If the specified view is not a valid View, the query returns the error message "-224, Illegal parameter value; View with the name <alphanumeric> does not exist"
	If the display is disabled (via `:DISP:ENAB OFF`) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated

Backwards Compatibility SCPI	The legacy node `:DISPlay:VIEW[:SELect]` is retained for backwards compatibility, but it only supports predefined views

Restore Layout to Default

Restores the Layout to the default for Basic.

Modified Views are very temporary; if you exit the current measurement they are discarded, and they are not saved in State. To retain this View for later use, and to be able to return easily to your original Basic View, you can save your edited View as a "User View".

Save Layout as New View

Saves your new View as a User View. An alpha keyboard appears, which lets you name your new View; the default is the old View name plus a number.

Remote Command	`:DISPlay:VIEW:ADVanced:NAME <alphanumeric>`
Example	`:DISP:VIEW:ADV:NAME "Baseband"` Creates a new View named `Baseband` from the current View, and selects it as the current View
Notes	`<alphanumeric>` is case insensitive; you can specify mixed case, however the name will be evaluated on a single case If `<alphanumeric>` name already exists as a View, the error message "-224, Illegal parameter value; View <alphanumeric> already exists" is generated If the display is disabled (via `:DISP:ENAB OFF`) then the error message "-221, Settings conflict; User View SCPI cannot be used while Display is disabled" is generated

Re-Save User View

You can re-edit a User View; if you make changes, then an asterisk will appear next to the User View's name. You can then tap **Re-Save User View** to save it back to its existing name, or **Save Layout as New View** to add another, new User View.

This is a front panel function only, there is no remote command available to perform this function. To do this remotely, you must first perform **Save Layout as New View**, then delete the old User View and rename the new one with the name of the View you just deleted.

Rename User View

You can rename the current View by giving it a new unique name. Only User Views can be renamed, if the current View is a Predefined View, an error occurs.

Remote Command	`:DISPlay:VIEW:ADVanced:REName <alphanumeric>`
Example	`:DISP:VIEW:ADV:REN "Baseband"`
Notes	`<alphanumeric>` is case insensitive; you can specify mixed case, however the name will be evaluated on a single case If the `<alphanumeric>` specifying the new name is already present in the list of View names, the error message "-224, Illegal parameter value; View <alphanumeric> already exists" is generated If the current View is a Predefined View, the error message "-224, Illegal parameter value; Cannot rename a Predefined View" is generated If the display is disabled (via `:DISP:ENAB OFF`) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated

Delete User View

You can delete the current View if it is a User View. The default view becomes the current view for the Measurement.

Remote Command	`:DISPlay:VIEW:ADVanced:DELete`
Example	`:DISP:VIEW:ADV:DEL`
Notes	`<alphanumeric>` is case insensitive; you can specify mixed case, however the name will be evaluated on a single case If the `<alphanumeric>` is not present in the list of View names, the error message "-224, Illegal parameter value; View <alphanumeric> does not exist" is generated If the current View is a Predefined View, the error message "-224, Illegal parameter value; Cannot delete a Predefined View" is generated If the display is disabled (via `:DISP:ENAB OFF`) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated

Delete All User Views

Deletes all previously saved User Views. The default view becomes the current view for the Measurement if a User View was the current view when this command was executed.

Remote Command	`:DISPlay:VIEW:ADVanced:DELete:ALL`
Example	`:DISP:VIEW:ADV:DEL:ALL`
Notes	Disabled if there are no User Views

View Editor Remote Commands

The following remote commands help you manage Views and User Views. Note that the SCPI node for User Views handles both Predefined and User Views. The legacy nodes, `:DISPlay:VIEW[:SELect]` and `:DISPlay:VIEW:NSEL`, are retained for backwards compatibility, but they only support predefined views.

View Listing Query

Returns a string containing a comma-separated list of names for *all* the Views, including User Views, available for the current Measurement.

Remote Command	`:DISPlay:VIEW:ADVanced:CATalog?`
Example	`:DISP:VIEW:ADV:CAT?`
Notes	Returns a quoted string of the available Views for the current measurement, separated by commas. The list includes names for *all* the Views, including User Views, available for the current Measurement Example: `"Normal,Trace Zoom,Spectrogram,Baseband,myView1,yourView1"` No distinction is made between Predefined and User Views If you switch measurements with the display disabled (via `:DISP:ENAB OFF`), then query the list of available Views, the result is undefined

User View Listing Query

Returns a string containing a comma-separated list of names for *only* the User Views available for the current Measurement.

Remote Command	`:DISPlay:VIEW:ADVanced:USER:CATalog?`
Example	`:DISP:VIEW:ADV:USER:CAT?`
Notes	Returns a quoted string of the available User Views for the current measurement, separated by commas. Example: `"Baseband,myView1,yourView1"` If you switch measurements with the display disabled (see "Display Enable (Remote Command Only)" on page 1894), then query the list of available Views, the result is undefined

3.2.5.2 Annotation

Contains controls for setting up the annotation for the current Mode or Measurement.

Graticule

Turns the display graticule On or Off for all windows with graticules in all measurements in the current Mode. Also turns the graticule Y-Axis annotation on and off.

Remote Command	`:DISPlay:GRATicule[:STATe] OFF | ON | 0 | 1` `:DISPlay:GRATicule[:STATe]?`
Example	`:DISP:GRAT OFF`
Notes	The graticule is the set of horizontal and vertical lines that make up the grid/divisions for the X-Axis and Y-Axis
Preset	`ON`
State Saved	Saved in instrument state

Backwards Compatibility SCPI	`:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe] OFF | ON | 0 | 1`
	`:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe]?`
	This command is accepted for backwards compatibility with older instruments, but the `WINDow`, `TRACe` and `GRID` parameters are ignored

Screen Annotation

Controls the display of the annunciation and annotation around the graticule, including any annotation on lines (such as the display line, the threshold line, etc.) and the Y-Axis annotation, for all windows with screen annotation in all measurements in the current Mode.

This does *not* include marker annotation (or the N dB result). When `OFF`, the graticule expands to fill the entire graticule area, leaving only the 1.5% gap above the graticule, as described in the **Trace** section.

Remote Command	`:DISPlay:ANNotation:SCReen[:STATe] OFF | ON | 0 | 1` `:DISPlay:ANNotation:SCReen[:STATe]?`
Example	`:DISP:ANN:SCR OFF`
Dependencies	Grayed-out and forced to `OFF` when **System Display Settings**, **Annotation** is `OFF`
Preset	`ON` This remains `OFF` through a Preset when **System Display Settings**, **Annotation** is set to `OFF`
State Saved	Saved in instrument state

Trace Annotation

Turns on and off the labels on the traces, showing their detector (or their Math Mode) as described in the **Trace** section, for all windows in all measurements in the current Mode for which Trace Annotation on/off is supported.

If Trace Math is being performed on a trace, then the Trace Math annotation replaces the detector annotation.

For measurements that support limit lines, this key also turns on and off the labels on the Limit Lines. The label is the Limit number annotation and Limit Comment displayed on the graph. If the length of the comment is greater than 20 characters, the first 8 characters and the last 8 characters are displayed, joined with ....

Remote Command	`:DISPlay:ANNotation:TRACe[:STATe] ON | OFF | 1 | 0` `:DISPlay:ANNotation:TRACe[:STATe]?`
Example	`:DISP:ANN:TRAC OFF`
Preset	`OFF`
State Saved	Saved in instrument state

Control Annotation

Turns on and off the display of values on the Active Function controls for all measurements in the current Mode. This is a security feature.

Remote Command	`:DISPlay:ACTivefunc[:STATe] ON | OFF | 1 | 0` `:DISPlay:ACTivefunc[:STATe]?`
Example	`:DISP:ACT OFF`
Dependencies	Grayed out and forced to `OFF` when **System Display Settings**, **Annotation** is `OFF`
Preset	`ON` This remains `OFF` through a Preset when **System Display Settings**, **Annotation** is set to `OFF`
State Saved	Saved in instrument state

Meas Bar

Turns the Measurement Bar at the top of the screen on and off for all measurements in the current Mode. When `OFF`, the graticule area expands to fill the area formerly occupied by the Measurement Bar.

Remote Command	`:DISPlay:ANNotation:MBAR[:STATe] OFF | ON | 0 | 1` `:DISPlay:ANNotation:MBAR[:STATe]?`
Example	`:DISP:ANN:MBAR OFF`
Dependencies	Grayed out and forced to `OFF` when **System Display Settings**, **Annotation** is `OFF`

Preset	ON This remains OFF through a Preset when **System Display Settings**, **Annotation** is set to OFF
State Saved	Saved in instrument state

Display Enable (Remote Command Only)

Turns the display on/off, including the display drive circuitry. The backlight stays lit to confirm that the instrument is on. The display enable setting is mode global. Theare three reasons for turning the display off:

1. To increase speed as much as possible by freeing the instrument from having to update the display
2. To reduce emissions from the display, drive circuitry
3. For security purposes

If you have turned off the display:

- and you are in local operation, the display can be turned back on by pressing any key or by sending `:SYSTem:DEFaults MISC` or `:DISPlay:ENABle ON` (neither `*RST` nor :SYSTem:PRESet enable the display)
- and you are in remote operation, the display can be turned back on by pressing the **Local** or **Esc** keys, or by sending `:SYSTem:DEFaults MISC` or `:DISPlay:ENABle ON` (neither `*RST` nor `:SYSTem:PRESet` enable the display)
- and you are using either the `:SYSTem:KLOCk` command or GPIB local lockout, then *no* front-panel key press will turn the display back on. You must turn it back on remotely.

If the display is `OFF`, many SCPI commands related to User Views and Multiscreen functionality do not work, and return the error messages “-221, Settings conflict; Screen SCPI cannot be used when Display is disabled” or “221, Settings conflict; View SCPI cannot be used while Display is disabled”. These commands include:

Name	Command
Select User View	:DISPlay:VIEW:ADVanced:SELect
Rename User View	:DISPlay:VIEW:ADVanced:REName
Delete User View	:DISPlay:VIEW:ADVanced:DELete
Create User View	:DISPlay:VIEW:ADVanced:NAME
Select Screen	:INSTrument:SCReen:SELect
Delete Screen	:INSTrument:SCReen:DELete
Delete All But This Screen	:INSTrument:SCReen:DELete:ALL
Add Screen	:INSTrument:SCReen:CREate
Rename Screen	:INSTrument:SCReen:REName
Sequencer On/Off	:SYSTem:SEQuencer

Remote Command	`:DISPlay:ENABle OFF | ON | 0 | 1` `:DISPlay:ENABle?`
Example	`:DISP:ENAB OFF`
Couplings	`:DISP:ENAB OFF` turns Backlight `OFF` and `:DISP:ENAB ON` turns Backlight `ON`, but changing Backlight settings does *not* change the state of `:DISP:ENAB`
Preset	`ON` Set by `:SYST:DEF MISC`, but not affected by `*RST` or `:SYSTem:PRESet`
State Saved	Not saved in instrument state
Backwards Compatibility Notes	`:SYST:PRES` no longer turns on `:DISPlay:ENABle` as it did in legacy analyzers

3.2.6 Freq

Opens the **Frequency** menu, which contains controls that allow you to control the Frequency and Channel parameters of the instrument.

Some features in this menu are the same for all measurements in the current Mode – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by Meas Preset. For example, the Center Freq setting is the same for all measurements - it does not change as you change measurements.

3.2.6.1 Settings

The Settings tab contains the basic Bandwidth functions. In most measurements it is the only tab under Bandwidth.

Center Frequency

Sets the frequency that corresponds to the horizontal center of the graticule. While adjusting the Center Frequency the Span is held constant.

The center frequency setting is the same for all measurements within a mode, that is, it is Meas Global. Some modes are also able to share a Mode Global center frequency value. If this is the case, the Mode will have a **Global** tab in its **Meas Setup** menu.

The **Center Freq** function sets (and queries) the Center Frequency for the currently selected input. If your instrument has multiple inputs, and you select another input, the Center Freq changes to the value for that input. SCPI commands are available to directly set the Center Freq for a specific input.

Center Freq is remembered as you go from input to input. Thus, you can set a Center Freq of 10 GHz with the RF Input selected, change to BBIQ, and set a Center Freq of 20 MHz, then switch to External Mixing and set a Center Freq of 60 GHz, and when

you go back to the RF Input the Center Freq will go back to 10 GHz; back to BBIQ and it is 20 MHz; back to External Mixing and it is 60 GHz.

See:

– "Center Frequency Presets" on page 226
– "VXT Models with Radio Heads/CIU Frequency Range" on page 228
– "RF Center Freq" on page 228
– "Ext Mix Center Freq" on page 228
– "I/Q Center Freq" on page 229

Remote Command	`[:SENSe]:FREQuency:CENTer <freq>` `[:SENSe]:FREQuency:CENTer?`

Example	`:FREQ:CENT 50 MHz`
	sets Center Frequency to 50 MHz
	`:FREQ:CENT UP`
	increments the Center Frequency by the value of CF Step
	`:FREQ:CENT?`
	returns the current value of Center Frequency

Notes	Sets the RF, External Mixing or I/Q Center Frequency depending on the selected input: – For RF input it is equivalent to `:FREQ:RF:CENT` – For I/Q input it is equivalent to `:FREQ:IQ:CENT` – For External Mixer it is equivalent to `:FREQ:EMIX:CENT` Preset and Max values are dependent on Hardware Options (5xx) If no terminator (for example, MHz) is sent, the terminator Hz is used. If a terminator with unit other than Frequency is used, an invalid suffix error message is generated
Couplings	In LTEAFDD/LTEATDD and 5GNR: Center Frequency, Center Frequency Offset and Carrier Reference Frequency are coupled with the following equation: Center Frequency = Carrier Reference Frequency + Center Frequency Offset If the following conditions are satisfied at the same time: – the Num Component Carrier equals to 1 – the Center Frequency Offset equals to 0 Hz – the mode of the Center Frequency is Auto the Center Frequency is equivalent to Carrier Reference Frequency The major purpose of this coupling is to keep BWCC with legacy LTE, in which

	`:SENSe:FREQuency:CENTer` is used to set up the Frequency of the measurement Otherwise, the Center Frequency Offset is changed following the Center Frequency and the Carrier Reference Frequency keeps intact In MSR, Center Freq, Center Freq Offset and Carrier Ref Freq are coupled with the equation, Center Freq = Carrier Ref Freq + Center Freq Offset. When Center Freq is changed, Center Freq Offset is updated and Carrie Ref Freq is not When auto, Center Freq Offset remains the same value. Thus, Center Freq changes the same amount of Carrier Ref Freq change when Carrier Ref Freq is changed. The auto state changes to manual when either Center Freq is changed In BT Mode: – Center Frequency is coupled to Channel and Geography – If Geography is France: Center Frequency 2454 MHz + (channel number* channel space) MHz – If Geography is Others: Center Frequency 2402 MHz + (channel number* channel space) MHz – If Radio Stand is Basic or EDR, channel space is 1 MHz – If Radio Stand is Low Energy, channel space is 2 MHz In other Modes: Any value of the Center Frequency or Span that keeps start frequency and stop frequency within the frequency range of the instrument is allowed when the value is being set through the front panel numeric keypad or the SCPI command. Other frequency parameters are forced to different values if needed, to keep the start and stop frequencies within the instrument's frequency range
Preset	Depends on instrument maximum frequency, mode, measurement, and selected input See "Center Frequency Presets" on page 226, "RF Center Freq" on page 228, "Ext Mix Center Freq" on page 228, "I/Q Center Freq" on page 229 and "VXT Models with Radio Heads/CIU Frequency Range" on page 228
State Saved	Saved in instrument state
Min/Max	Depends on instrument maximum frequency, mode, measurement, and selected input See "Center Frequency Presets" on page 226, "RF Center Freq" on page 228, "Ext Mix Center Freq" on page 228, "I/Q Center Freq" on page 229 and "VXT Models with Radio Heads/CIU Frequency Range" on page 228
Annotation	Center <value> appears in the lower left corner of the display
Status Bits/OPC dependencies	Non-overlapped

Remote Command	`[:SENSe]:FREQuency:CENTer:AUTO ON | OFF | 1 | 0` `[:SENSe]:FREQuency:CENTer:AUTO?`
Example	`:FREQ:CENT:AUTO OFF` `:FREQ:CENT:AUTO?`
Dependencies	This is only available in the MSR, LTEAFDD/LTEATDD and 5GNR modes
Couplings	When the Center Frequency is changed, the state is automatically changed to Manual **Center Frequency**, **Center Frequency Offset** and **Carrier Reference Frequency** are coupled. When

	Carrier Reference Frequency changes: – Center Frequency : Auto Center Frequency = Carrier Reference Frequency + Center Frequency Offset (fixed) – Center Frequency : Man Center Frequency (fixed) = Carrier Reference Frequency + Center Frequency Offset
Preset	ON
State Saved	Saved in instrument state
Range	Auto|Man

Center Frequency Presets

The following table provides the Center Frequency Presets for the Spectrum Analyzer mode, and the Max Freq, for the various frequency options:

Freq Option	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
503 (all but CXA)	1.805 GHz	3.6 GHz	3.7 GHz
503 (CXA)	1.505 GHz	3.0 GHz	3.08 GHz
507 (all but CXA)	3.505 GHz	7.0 GHz	7.1 GHz
507 (CXA)	3.755 GHz	7.5 GHz	7.58 GHz
508 (all but MXE)	1.805 GHz	3.6 GHz	8.5 GHz
508 (MXE)	4.205 GHz	8.4 GHz	8.5 GHz
513	6.805 GHz	13.6 GHz	13.8 GHz
526 (except CXA and MXE)	13.255 GHz	26.5 GHz	27.0 GHz*
526 (CXA)	13.255 GHz	26.5 GHz	26.55 GHz
526 (MXE)	1.805 GHz	3.6 GHz	27.0 GHz
532	16.005 GHz	32.0 GHz	32.5 GHz
540	20.005 GHz	40.0 GHz	40.5 GHz
543	21.505 GHz	43.0 GHz	43.0 GHz
544	22.005 GHz	44.0 GHz	45.0 GHz
550	25.005 GHz	50.0 GHz	52 GHz
F03 (CXA-m)	1.505 GHz	3.0 GHz	3.08 GHz
F07 (CXA-m)	3.755 GHz	7.5 GHz	7.575 GHz
F13 (CXA-m)	6.805 GHz	13.6 GHz	13.8 GHz
F26 (CXA-m)	13.255 GHz	26.5 GHz	26.55 GHz
504 (M9420A/21A, M8920A)	2.145 GHz	3.88GHz	3.88 GHz
506 (M9420A/21A, M8920A)	3.245 GHz	6.08GHz	6.08 GHz
F06 (M9410A/11A)	1.0 GHz	6.08 GHz	6.08 GHz

Freq Option	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
F06 (M9415A)	1 GHz	1.08 GHz	6.6 GHz
F08 (M9415A)	1 GHz	1.08 GHz	8.6 GHz
F12 (M9415A)	1 GHz	1.08 GHz	12.9 GHz

*For option 526, the Max CF in RTSA is 26.999999995 GHz.

N9041B Center Freq Presets

Input	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
Input 1, all models	25.005 GHz	50.0 GHz	52 GHz
Input 2, opt 585	42.505 GHz	85.0 GHz	86 GHz
Input 2, opt 590	45.005 GHz	90.0 GHz	92 GHz
Input 2, opt 5CX	55.005 GHz	110.0 GHz	110 GHz

Input 2, CXA and MXE

Model	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
CXA opt C75	0.7505 GHz	1.5 GHz	1.58 GHz
MXE	505 MHz	1 GHz	1.000025 GHz

Tracking Generator Frequency Limits (CXA only)

Tracking Generator Option	Min Freq (clips to this freq when turn TG on and can’t tune below while TG on)	If above this Freq, Stop Freq clipped to this Freq when TG turned on	Max Freq (can't tune above) while TG on
T03	9 kHz	3.0 GHz	3.08 GHz
T06	9 kHz	6.0 GHz	6.05 GHz

Tracking Generator Frequency Limits(CXA-m only)

Tracking Generator Option	Min Freq (clips to this freq when turn TG on and can’t tune below while TG on)	If above this Freq, Stop Freq clipped to this Freq when TG turned on	Max Freq (can't tune above) while TG on
T03	2 MHz	3.08 GHz	3.08 GHz
T07	2 MHz	7.575 GHz	7.575 GHz
T13	2 MHz	13.8 GHz	13.8 GHz
T26	2 MHz	26.55 GHz	26.55 GHz

VXT Models with Radio Heads/CIU Frequency Range

The following table shows the Center Frequency Presets and Range for VXT modes with Radio Heads/CIU.

Products with Radio Heads/CIU	Preset	Start frequency	Stop frequency
M9421A + CIU	6 GHz	5.9 GHz	12 GHz
M9410A + CIU	6 GHz	5.9 GHz	12 GHz
M9410A + CIU + RRH	25 GHz	24.25 GHz	43.5 GHz

RF Center Freq

Specifies the RF Center Frequency. This command sets the Center Frequency to be used when the RF input is selected, even if the RF input is not the input that is selected at the time the command is sent. Note that "Center Frequency" on page 223 in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command	`[:SENSe]:FREQuency:RF:CENTer <freq>` `[:SENSe]:FREQuency:RF:CENTer?`
Example	`:FREQ:RF:CENT 30 MHz` `:FREQ:RF:CENT?`
Notes	This command is the same in all modes, but the parameter is Measurement Global. So, the value is independent in each mode and common across all the measurements in the mode
Dependencies	If the electronic/soft attenuator is enabled, any attempt to set Center Frequency such that the Stop Frequency would be >3.6 GHz fails and results in an advisory message. If the equivalent SCPI command is sent, this same message is generated as part of a “-221, Settings conflict” warning
Preset	See "Center Frequency Presets" on page 226 above
State Saved	Saved in instrument state
Min	-79.999995 MHz
Max	See table above. Basically, instrument maximum frequency - 5 Hz If the knob or step keys are being used, also depends on the value of Span

Ext Mix Center Freq

Specifies the External Mixer Center Frequency. This command sets the Center Frequency to be used when the External Mixer is selected, even if the External Mixer input is not the input that is selected at the time the command is sent. Note that "Center Frequency" on page 223 in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command	`[:SENSe]:FREQuency:EMIXer:CENTer <freq>` `[:SENSe]:FREQuency:EMIXer:CENTer?`
Example	`:FREQ:EMIX:CENT 60 GHz`

	`:FREQ:EMIX:CENT?`
Notes	This command is the same in all Modes, but the parameter is Measurement Global. So, the value is independent in each mode and common across all the measurements in the mode
Couplings	When returning to External Mixing after having been switched to one of the other inputs (e.g., RF), you will come back into the settings that you had when you left External Mixing. So, you will come back to the band you were in with the Center Frequency that you had. However, Span is not an input-dependent parameter, therefore you will bring the span over from the other input. Therefore, the instrument comes back with the span from the previous input, limited as necessary by the current mixer setup
Preset	When a Mode Preset is performed while in External Mixing, the Start frequency of the current Mode is set to the nominal Min Freq of the lowest harmonic range in the Harmonic Table for the current mixer setup. Similarly, the Stop frequency of the current Mode is set to the nominal Max Freq of the highest harmonic range in the Harmonic Table. The Center Freq thus presets to the point arithmetically equidistant from these two frequencies Note that, if the current measurement has a limited Span available to it, and cannot achieve the Span shown in the table (Span=Stop Freq – Start Freq), the instrument uses the maximum Span the measurement allows, and still sets the Center Freq to the midpoint of the Start and Stop Freq values in the Harmonic Table When Restore Input/Output Defaults is performed, the mixer presets to the 11970A, whose Start and Stop frequencies are 26.5 and 40 GHz respectively. The center of these two frequencies is 33.25 GHz Therefore, after a Restore Input/Output Defaults, if you go into External Mixing and do a Mode Preset while in the Spectrum Analyzer Mode, the resulting Center Freq is 33.25 GHz
State Saved	Yes
Min	The minimum frequency in the currently selected mixer band + 5 Hz If the knob or step keys are being used, also depends on Span
Max	The maximum frequency in the currently selected mixer band - 5 Hz If the knob or step keys are being used, also depends on Span

I/Q Center Freq

Specifies the I/Q Center Frequency. This command sets the Center Frequency to be used when the I/Q input is selected, even if the I/Q input is not the input that is selected at the time the command is sent. Note that "Center Frequency" on page 223 in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command	`[:SENSe]:FREQuency:IQ:CENTer <freq>` `[:SENSe]:FREQuency:IQ:CENTer?`
Example	`:FREQ:IQ:CENT 30 MHz`
Notes	This command is the same in all modes, but the parameter is Measurement Global. So, the value is independent in each mode and common across all the measurements in the mode
Preset	0 Hz
State Saved	Saved in instrument state
Min	-40.049995 MHz
Max	40.049995 MHz

Span

Changes the displayed frequency range symmetrically about the center frequency. While adjusting the Span, the Center Frequency is held constant, this means that both Start Frequency and Stop Frequency will change.

If the Span is set to a value greater than the maximum allowable span of the instrument, an error message is generated indicating the data is out of range and was clipped to upper limit.

See "Span Presets" on page 230

Remote Command	`[:SENSe]:MONitor:FREQuency:SPAN <freq>` `[:SENSe]:MONitor:FREQuency:SPAN?`
Example	`:MON:FREQ:SPAN 10 MHz` `:MON:FREQ:SPAN?`
Dependencies	If the electrical attenuator is enabled, any attempt to set Span such that the Stop Frequency would be >3.6 GHz results in an error In instruments with an RF Preselector, such as MXE, you cannot sweep across the band break at 3.6 GHz while the RF Preselector is on in Continuous sweep, as there is a mechanical switch which bypasses the RF Preselector above 3.6 GHz
Couplings	Span affects RBW, sweeptime, FFT & Sweep choice (including FFT Width, Phase Noise Optimization and ADC Dither auto couplings) – Any value of the Center Frequency or Span that is within the frequency range of the instrument is allowed when the value is being set through the front panel numeric keypad or the SCPI command. The other parameter is forced to a different value if needed, to keep the Start and the Stop Frequencies within the instrument's frequency range – When using the knob or the step up/down keys or the UP|DOWN keywords in SCPI, the value that is being changed i.e., the Center Frequency or Span, is limited so that the other parameter is not forced to a new value
Preset	Depends on instrument maximum frequency, mode, measurement, and selected input See "Span Presets" on page 230
State Saved	Saved in instrument state
Min	10 Hz
Max	Depends on instrument maximum frequency, mode, measurement, and selected input; see "Span Presets" on page 230 If the knob or step keys are being used, depends on the value of the other three interdependent parameters Center Frequency, Start Frequency, Stop Frequency
Annunciation	Data out of range, value clipped to upper limit
Annotation	Span <value> appears on the first line of the annotation in the lower right corner of display

Span Presets

The following table provides the Max Span, for the various frequency options:

Freq Option	Max Span (can't set higher than this)
503 (all but CXA)	3.7 GHz
503, F03 (CXA, CXA-m)	3.08 GHz
507 (all but CXA)	7.1 GHz
507 (CXA, CXA-m)	7.575 GHz
508 (all but MXE)	8.5 GHz
508 (MXE)	8.5 GHz
513, F13	13.8 GHz
526 (all but CXA and MXE)	27.0 GHz
526 (MXE)	27.0 GHz
526, F26 (CXA, CXA-m)	26.55 GHz
544	44.5 GHz
550	52 GHz
M9415A-F06	6.27 GHz
M9415A-F08	8.27 GHz
M9415A-F12	12.57 GHz

Input 2:

Model	Max Span (can't set higher than this)
CXA opt C75	1.58 GHz
MXE	1.000025 GHz

Note that if you are in External Mixing, the maximum Span will be equal to the Maximum Stop Frequency – Minimum Start Frequency for the currently selected mixer.

Span Presets by Mode

Mode	Radio Std	Preset Value
WCDMA		10.0 MHz
PN		1.0 MHz
GSM/EDGE		1.0 MHz
WLAN	802.11a/b/g/n/ac/ax/be (20 MHz)	25 MHz
	802.11n/ac/ax/be (40MHz)	50 MHz
	802.11ac/ax/be (80MHz)	100 MHz
	802.11ac /ax/be (160MHz)	200 MHz
	802.11be (320MHz)	400 MHz
MSR		20 MHz
LTEAFDD, LTEATDD		20 MHz

Mode	Radio Std	Preset Value
5GNR		150 MHz
RTS		40 kHz
CQM		10 MHz

CF Step

Changes the step size for the center frequency and start and stop frequency functions. Once a step size has been selected and the center frequency function is active, the step keys (and the UP|DOWN parameters for Center Frequency from remote commands) change the center frequency by the step-size value. The step size function is useful for finding harmonics and sidebands beyond the current frequency span of the instrument.

Note that the start and stop frequencies also step by the CF Step value.

Remote Command	`[:SENSe]:FREQuency:CENTer:STEP[:INCRement] <freq>`
	`[:SENSe]:FREQuency:CENTer:STEP[:INCRement]?`
	`[:SENSe]:FREQuency:CENTer:STEP:AUTO OFF | ON | 0 | 1`
	`[:SENSe]:FREQuency:CENTer:STEP:AUTO?`

Example	`:FREQ:CENT:STEP 500 MHz`
	`:FREQ:CENT UP`
	increases the current center frequency value by 500 MHz
	`:FREQ:CENT:STEP?`
	`:FREQ:CENT:STEP:AUTO ON`
	`:FREQ:CENT:STEP:AUTO?`

Notes	Preset and Max values are dependent on Hardware Options
Dependencies	Not available in the MSR, LTEAFDD/LTEATDD, 5GNR and Channel Quality modes If the electronic/soft attenuator is enabled, any attempt to change the value of the center frequency >3.6 GHz by pressing the Up-arrow key, fails and results in an advisory message. If the equivalent SCPI command is sent, this same message is generated as part of a "-221, Settings conflict" warning
Couplings	When auto-coupled, the center frequency step size is set to 10% of the span
Preset	Auto `ON`
State Saved	Saved in instrument state
Min	– (the maximum frequency of the instrument). That is, 27 GHz max freq instrument has a CF step range of +/- 27 GHz. Note that this is the maximum frequency given the current settings of the instrument, so in External Mixing, for example, it is the maximum frequency of the current mixer band
Max	The maximum frequency of the instrument. That is, 27 GHz max freq instrument has a CF step range of

	+/- 27 GHz. Note that this is the maximum frequency given the current settings of the instrument, so in External Mixing, for example, it is the maximum frequency of the current mixer band
Status Bits/OPC dependencies	non-overlapped

3.2.7 Marker

Accesses a menu that enables you to select, set up and control the markers for the current measurement. If there are no active markers, **Marker** selects marker 1, sets it to Normal and places it at the center of the display. If the selected marker is Off, it is set to Normal and placed it at the center of the screen on the trace determined by the **Marker Trace** rules.

For more detailed information on the types of Markers and the interaction between Markers, see the Marker section of the Swept SA measurement.

3.2.7.1 Select Marker

Specifies the *selected marker*. The term “selected marker” is used throughout this document to specify which marker will be affected when you change marker settings, perform a Peak Search, etc.

This control appears above the menu panel, indicating that it applies to all controls in the Marker menu panels. Select Marker is blanked if you select a tab whose controls do *not* depend on the selected marker (for example, Counter).

On any menu tab for which Select Marker displays, the first control is always **Marker Frequency|Time**.

Notes	The selected marker is remembered even when not in the Marker menu and is used if a Search is done or a Band Function is turned on or for Signal Track or Continuous Peak
Preset	Marker 1
State Saved	The number of the selected marker is saved in instrument state
Annunciation	Appears in the marker results block label for **Normal** and **Delta** markers

3.2.7.2 Settings

The controls on this tab include the Marker active function and a radio button selection of the marker control mode (Normal, Delta, or Off) for the selected marker, as well as additional functions that help you use markers.

Marker Frequency

Sets the marker X Axis value in the current marker X Axis Scale unit. It has no effect if the control mode is **Off,** but is the SCPI equivalent of entering an X value if the control mode is **Normal** or **Delta**.

Remote Command	`:CALCulate:MONitor:MARKer[1]|2|...|12:X <freq>` `:CALCulate:MONitor:MARKer[1]|2|...|12:X?`
Example	`:CALC:MON:MARK3:X 0` `:CALC:MON:MARK3:X?`
Notes	If no suffix is sent, uses the fundamental units for the current marker X Axis Scale. If a suffix is sent that does not match the current marker X Axis Scale unit, an error "Invalid suffix" is generated The query returns the marker's absolute X Axis value if the control mode is **Normal**, or the offset from the marker's reference marker if the control mode is **Delta**. The query is returned in the fundamental units for the current marker X Axis scale: Hz for **Frequency** and Inverse Time, seconds for Period and Time
Preset	After a preset, all markers are turned OFF, so Marker X Axis Value query returns a not a number (NAN)
State Saved	Saved in instrument state
Min	-9.9E+37
Max	9.9E+37
Annotation	Mkr # <X value> and <Marker value> upper right on graph

Marker X Axis Position (Remote Command Only)

Sets the marker X Axis Scale position in trace points. This setting has no effect if the control mode is Off, but is the SCPI equivalent of entering a value if the control mode is Normal or Delta - except in trace points rather than X Axis Scale units. The entered value is immediately translated into the current X Axis Scale units for setting the value of the marker.

Remote Command	`:CALCulate:MONitor:MARKer[1]|2|...|12:X:POSition <real>` `:CALCulate:MONitor:MARKer[1]|2|...|12:X:POSition?`
Example	`:CALC:MON:MARK:X:POS 0` `:CALC:MON:MARK:X:POS?`
Notes	The query returns the marker's absolute X Axis value in trace points if the control mode is **Normal**, or the offset from the marker's reference marker in trace points if the control mode is **Delta**. The value is returned as a real number, not an integer, corresponding to the translation from X Axis Scale units to trace points . When a Marker is turned on, it is placed center of the screen on the trace. Therefore, the default value depends on instrument condition. If the marker is Off the response is not a number
Preset	After a preset, all markers are turned `OFF`, so Marker X Axis Value query returns a not a number (`NAN`)
State Saved	Saved in instrument state
Min	-9.9E+37
Max	9.9E+37

Marker Y Axis Value (Remote Command only)

Returns the marker Y Axis value in the current marker Y Axis unit.

Remote Command	`:CALCulate:MONitor:MARKer[1]|2|...|12:Y?`

Example	:CALC:MON:MARK11:Y?
Notes	The query returns the marker Y-axis result if the control mode is **Normal** or **Delta.** If the marker is **Off** the response is Not A Number
Preset	Result dependent on Markers setup and signal source
State Saved	No
Backwards Compatibility SCPI	:CALCulate:MONitor:MARKer[1]|2|...|12:FUNCtion:RESult?

Marker Mode

Sets the marker control mode to **Normal** (POSition), **Delta**, or **Off**. All interactions and dependencies detailed under the control description are enforced when the remote command is sent. If the selected marker is Off, pressing Marker sets it to Normal and places it at the center of the screen on the trace determined by the **Marker Trace** rules. At the same time, **Marker X Axis Value** appears on the Active Function area.

The default active function is the active function for the currently selected marker control mode. If the current control mode is **Off**, there is no active function and the active function is turned off.

Remote Command	:CALCulate:MONitor:MARKer[1]|2|...|12:MODE POSition | DELTa | OFF :CALCulate:MONitor:MARKer[1]|2|...|12:MODE?
Example	:CALC:MON:MARK:MODE POS :CALC:MON:MARK:MODE?
Preset	OFF
State Saved	Saved in instrument state
Range	POSition|DELTa|OFF
Annotation	Mkr # <X value> and <Marker value> upper right on graph

Backward Compatibility SCPI Commands

Sets or queries the state of a marker. Setting a marker that is OFF to ON (1) puts it in **Normal** mode and places it at the center of the screen.

Remote Command	:CALCulate:MONitor:MARKer[1]|2|...|12:STATe OFF | ON | 0 | 1 :CALCulate:MONitor:MARKer[1]|2|...|12:STATe?
Example	:CALC:MON:MARK3:STAT ON :CALC:MON:MARK3:STAT?
Preset	OFF

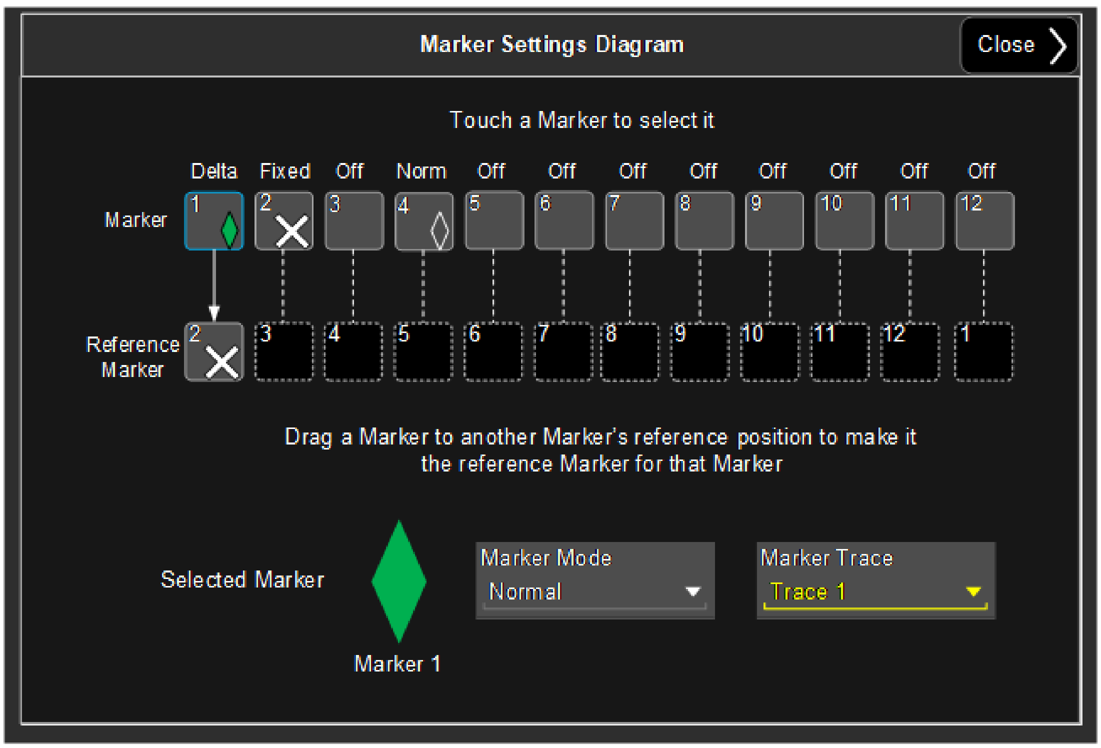
State Saved	Saved in instrument state
Range	OFF | ON

Delta Marker (Reset Delta)

Pressing this button has exactly the same effect as selecting the **Delta** selection in "Marker Mode" on page 235. The selected marker becomes a Delta Marker. If the selected marker is already a Delta marker, the reference marker is moved to the current position of the selected marker, thus resetting the Delta to zero.

Marker Settings Diagram

Lets you configure the Marker system using a visual utility.



All Markers Off

Turns off all markers.

Remote Command	:CALCulate:MONitor:MARKer:AOFF
Example	:CALC:MON:MARK:AOFF

Couple Markers

When this function is ON, moving any marker causes an equal X Axis movement of every other marker that is not Off. By "equal X Axis movement" we mean that we preserve the difference between each marker's X Axis value (in the fundamental x-axis units of the trace that marker is on) and the X Axis value of the marker being moved (in the same fundamental x-axis units).

This may result in markers going off screen.

Remote Command	`:CALCulate:MONitor:MARKer:COUPle[:STATe] ON | OFF | 1 | 0` `:CALCulate:MONitor:MARKer:COUPle[:STATe]?`
Example	`:CALC:MON:MARK:COUP ON` `:CALC:MON:MARK:COUP?`
Preset	`OFF` Presets on Mode Preset and All Markers Off
State Saved	Saved in instrument state

3.2.7.3 Peak Search

The controls on this tab allow you to move the marker to selected peaks of the signal, giving you enormous analysis capabilities, particularly when combined with the Delta Marker function.

NOTE Pressing the **Peak Search** hardkey automatically moves you to the **Peak Search** page of the **Marker** menu and performs a Peak Search.

Pressing the **Peak Search** tab once you are already *in* the **Marker** menu does *not* perform a Peak Search.

Marker Frequency

This is the fundamental control that you use to move a marker around on the trace. This is the same as "Marker Frequency" on page 233 on the **Settings** tab.

Peak Search

Moves the selected marker to the trace point which has the maximum y-axis value for that marker's trace.

NOTE Pressing the **Peak Search** hardkey automatically moves you to the **Peak Search** page of the **Marker** menu and performs a Peak Search.

If the selected marker was off, then it is turned on as a normal marker, and a peak search is performed.

Remote Command	`:CALCulate:MONitor:MARKer[1]|2|...|12:MAXimum`

Example	`:CALC:MON:MARK2:MAX`
	`:SYST:ERR?`
	can be used to query the errors to determine if a peak is found. If a search is unsuccessful, then the message "Execution error; No peak found" (-200) will be returned

Notes	Sending this command selects the subopcoded marker

Next Peak

Moves the selected marker to the peak that is next lower in amplitude than the current marker value. If there is no valid peak lower than the current marker value, an "Execution error; No peak found" message is generated and the marker is not moved.

If the selected marker was off, then it is turned on as a normal marker and a peak search is performed.

Remote Command	`:CALCulate:MONitor:MARKer[1]|2|...|12:MAXimum:NEXT`
Example	`:CALC:MON:MARK2:MAX:NEXT` selects marker 2 and moves it to the peak that is next lower in amplitude than the current marker value
Notes	Sending this command selects the subopcoded marker
State Saved	Not part of saved state

Marker Delta

Pressing this control has exactly the same effect as selecting the **Delta** selection in "Marker Mode" on page 235 on the **Settings** tab. The selected marker becomes a Delta Marker. If the selected marker is already a Delta marker, the reference marker is moved to the current position of the selected marker, thus resetting the Delta to zero.

The control is duplicated here to allow you to conveniently perform a peak search and change the marker's control mode to Delta without having to access two separate menus.

3.2.7.4 Properties

The controls on this tab are used to set certain properties of the selected marker.

Marker Frequency

This is the fundamental control that you use to move a marker around on the trace. This is the same as "Marker Frequency" on page 233 on the **Settings** tab.

Relative To

Selects the marker to which the selected marker is relative (its reference marker).

Every marker has another marker to which it is relative. This marker is referred to as the “reference marker” for that marker. This attribute is set by the **Marker, Properties, Relative To** key. The marker must be a **Delta** marker to make this attribute relevant. If it is a **Delta** marker, the reference marker determines how the marker is controlled and how its value is displayed. A marker cannot be relative to itself.

Remote Command	`:CALCulate:MONitor:MARKer[1]|2|...|12:REFerence <integer>` `:CALCulate:MONitor:MARKer[1]|2|...|12:REFerence?`
Example	`:CALC:MON:MARK2:REF 1` `:CALC:MON:MARK2:REF?`
Notes	This command causes the marker specified with the subopcode to become selected Range (for SCPI command): 1 to 12. If the range is exceeded the value is clipped A marker cannot be relative to itself so that choice is not available, and if sent from SCPI generates error -221: “Settings conflict; marker cannot be relative to itself” When queried a single value is returned (the specified marker numbers relative marker)
Couplings	The act of specifying the selected marker’s reference marker makes the selected marker a Delta marker If the reference marker is off it is turned on in **Normal** mode at the delta marker location
Preset	The preset default “Relative To” marker (reference marker) is the next higher numbered marker (current marker +1). For example, if marker 2 is selected, then it’s default reference marker is marker 3. The exception is marker 12, which has a default reference of marker 1 Set to the defaults by using **Restore Mode Defaults**. This is not reset by **Marker Off**, **All Markers Off**, or **Preset**
State Saved	Saved in instrument state. Not affected by Marker Off and hence not affected by Preset or power cycle
Min	1
Max	12
Annunciation	Appears in the marker label of a **Delta** marker

Marker Trace

Selects the trace on which you want your marker placed. A marker is associated with one and only one trace. This trace is used to determine the placement, result, and X-Axis Scale of the marker. All markers have an associated trace; it is from that trace that they determine their attributes and behaviors, and it is to that trace that they go when they become Normal markers.

Specifying a Marker Trace manually or with this command associates the marker with the specified trace. If the marker is not OFF, it moves the marker from the trace it was on to the new trace. If the marker is OFF, it stays off but is now associated with the specified trace.

The query returns the number of the trace on which the marker is currently placed.

Remote Command	`:CALCulate:MONitor:MARKer[1]|2|...|12:TRACe 1 | 2 | 3` `:CALCulate:MONitor:MARKer[1]|2|...|12:TRACe?`
Example	`:CALC:MON:MARK:TRAC 1` `:CALC:MON:MARK:TRAC?`
Notes	A marker may be placed on a blanked and/or inactive trace, even though the trace is not visible and/or updating An application may register a trace name to be displayed on the control instead of a trace number
Couplings	The state of Marker Trace is not affected by the "Auto Couple" on page 1718 key Sending the remote command causes the addressed marker to become selected.
Preset	1
State Saved	Saved in instrument state.
Min	1
Max	3

Marker Settings Diagram

Lets you configure the Marker system using a visual utility. This is the same as the "Marker Settings Diagram" on page 236 control on the **Settings** tab.

3.2.7.5 Marker Function

The controls on this tab allow you to control the Marker Functions of the instrument. Marker Functions perform post-processing operations on marker data.

The **Marker Function** menu controls which marker functions are turned on and allows you to adjust the setup parameters for each function. These parameters include the following, but only one parameter can be assigned to a given marker:

- Marker Noise
- Band Power
- Band Density
- Off

Marker Frequency

This is the fundamental control that you use to move a marker around on the trace. This is the same as "Marker Frequency" on page 233 on the **Settings** tab.

Marker Function

Sets the marker control function type to one of the following:

NOISe	Marker Noise
BPOWer	Band Power
BDENsity	Band Density
OFF	Marker Function Off

Remote Command	:CALCulate:MONitor:MARKer[1]|2|...|12:FUNCtion NOISe | BPOWer | BDENsity | OFF :CALCulate:MONitor:MARKer[1]|2|...|12:FUNCtion?
Example	:CALC:MON:MARK:FUNC NOIS :CALC:MON:MARK:FUNC?
Preset	OFF
State Saved	Yes
Range	NOISe|BPOWer|BDENsity|OFF
Annotation	Mkr # <X value> and <Marker value> upper right on graph

Band Span

Sets the width of the frequency span for the selected marker.

Remote Command	:CALCulate:MONitor:MARKer[1]|2|...|12:FUNCtion:BAND:SPAN <freq> :CALCulate:MONitor:MARKer[1]|2|...|12:FUNCtion:BAND:SPAN?
Example	:CALC:MON:MARK12:FUNC:BAND:SPAN 20 MHz :CALC:MON:MARK12:FUNC:BAND:SPAN?
Couplings	Changing the Band Span necessarily changes the Band Left and Band Right values
Preset	Depends on X axis range of selected Trace 10% of Span
State Saved	Yes
Min	-9.9E+37 0
Max	9.9E+37

	26.5GHz

Band Left

Sets the left edge frequency or time value for the band of the selected marker.

Remote Command	:CALCulate:MONitor:MARKer[1]|2|...|12:FUNCtion:BAND:LEFT <freq> :CALCulate:MONitor:MARKer[1]|2|...|12:FUNCtion:BAND:LEFT?
Example	:CALC:MON:MARK12:FUNC:BAND:LEFT 20 GHz :CALC:MON:MARK12:FUNC:BAND:LEFT?
Couplings	Changing the Band Left necessarily changes the Band Span value
Preset	Depends on X axis range of selected Trace
State Saved	Yes
Min	-9.9E+37
Max	9.9E+37

Band Right

Sets the right edge frequency or time value for the band of the selected marker.

Remote Command	:CALCulate:MONitor:MARKer[1]|2|...|12:FUNCtion:BAND:RIGHt <freq> :CALCulate:MONitor:MARKer[1]|2|...|12:FUNCtion:BAND:RIGHt?
Example	:CALC:MON:MARK12:FUNC:BAND:RIGH 20 GHz :CALC:MON:MARK12:FUNC:BAND:RIGH?
Couplings	Changing the Band Right necessarily changes the Band Span value
Preset	Depends on X axis range of selected Trace
State Saved	Yes
Min	-9.9E+37
Max	9.9E+37

3.2.8 Meas Setup

This menu panel contains functions for setting up the measurement parameters and also contains functions for setting up parameters global to all measurements in the Mode.

3.2.8.1 Settings

Contains frequently used Meas Setup functions to which you will want the fastest access.

Avg|Hold Num

Specifies the number of measurement averages used when calculating the measurement result. The average is displayed at the end of each sweep.

After the specified number of average counts, the averaging mode (terminal control) setting determines the averaging action.

Remote Command	`[:SENSe]:MONitor:AVERage:COUNt <integer>` `[:SENSe]:MONitor:AVERage:COUNt?`
Example	`:MON:AVER:COUN 25` `:MON:AVER:COUN?`
Preset	10
State Saved	Yes
Min/Max	1/1000
Annotation	The average count is displayed in the measurement bar on the front panel display. The annotation appears in the format n/N where n is the current average and N is the average count

Averaging On/Off

Turns averaging on or off.

Remote Command	`[:SENSe]:MONitor:AVERage[:STATe] OFF | ON | 0 | 1` `[:SENSe]:MONitor:AVERage[:STATe]?`
Example	`:MON:AVER ON` `:MON:AVER?`
Preset	`OFF`
State Saved	Yes
Range	`OFF|ON`

Average Mode

Toggles the average mode between exponential (Exp) and Repeat.

– `EXPonential`- continues measurement averaging, using the specified number of averages to compute each averaged value. The average is displayed at the end of each sweep

– REPeat- causes the measurement to reset the average counter each time the specified number of averages is reached

Remote Command	[:SENSe]:MONitor:AVERage:TCONtrol EXPonential | REPeat [:SENSe]:MONitor:AVERage:TCONtrol?
Example	:MON:AVER:TCON EXP :MON:AVER:TCON?
Preset	EXPonential
State Saved	Yes
Range	EXPonential|REPeat

Spur Avoidance

Because the VXT models M9410A/11A/15A are direct-conversion (zero-IF) receivers, feedthrough leakage from the local oscillator appears as a spurious signal (spur) at the center frequency. The **Spur Avoidance** function is provided to eliminate this spur, at the expense of some measurement speed. For Spur Avoidance, the instrument uses a software algorithm to remove this spur from the displayed measurement data.

Some measurements allow you to turn off **Spur Avoidance**, but in this measurement it is always enabled. Therefore, in this measurement the Spur Avoidance switch is unavailable (grayed out) and set to Enabled.

Furthermore, if you press the grayed-out switch, this popup message appears:

`Always enabled in this measurement. See manual for details`

Remote Command	[:SENSe]:MONitor:SAVoid[:STATe]?
Example	:MON:SAV? Always returns ON
Dependencies	This control only appears in VXT models M9410A/11A/15A
Preset	ON
State Saved	Saved in instrument state
Range	ON

Meas Setup Summary Table

Lets you view and access many of the parameters in the Meas Setup menus on one screen.

Auto Couple

Immediately puts all Auto/Man functions into Auto. The **Auto Couple** action is confined to the current measurement only. It does not affect other measurements in the mode.

In the Auto state, Auto/Man functions are said to be “coupled”, meaning their values change as you make changes to other values in the measurement. This helps ensure accurate measurements and optimum dynamic range. Auto Couple is an immediate action function, and when it is executed, all the Auto/Man controls for the current measurement are set to Auto, and all measurement settings coupled to the Auto/Man parameters are automatically set to their optimal value.

For further details of measurement-specific settings (if any), see "Measurement-Specific Details" on page 246 below.

Remote Command	`:COUPle ALL`
Example	`:COUP ALL`
Backwards Compatibility SCPI	`:COUPLE ALL | NONE`
Backwards Compatibility Notes	`:COUP:NONE` puts all Auto/Man parameters in manual mode, decoupling all the coupled instrument parameters. It is retained for backwards compatibility and is *not* recommended for making measurements or new designs

All Auto/Man parameter couplings in the measurement are set to Auto. This includes couplings that may be unavailable or grayed-out due to the current state. For example, in the Swept SA measurement, there is no Auto/Man coupling for RBW while in Zero Span. Nonetheless, if **Auto Couple** were executed while in Zero Span it would set RBW to Auto "behind the scenes" so that, on exit from Zero Span, it would be in Auto.

Any Auto/Man selection specific (local) to the other measurements in the current Mode will not be affected by **Auto Couple**. Any functions that are *not* coupled with other instrument parameters, such as ranging or leveling variables, such as "AutoRange" or "AutoScale", will not be affected.

Executing the **Auto Couple** command generates the informational message, "All Auto/Man functions have been set to Auto".

Each parameter, upon being set to Auto, selects and sets the appropriate auto-coupled value based on that parameter’s coupling rules. The Dependency Resolver orchestrates the couplings for parameters that are dependent on one or more other parameters. The coupling and dependency rules for each parameter are defined in the chapter describing that parameter.

Executing the **Auto Couple** command *does not* affect markers, marker functions, trace or display attributes, or any other instrument setting other than those specifically mentioned above.

Measurement-Specific Details

TOI

Parameters affected by Auto Couple are:

- Center Frequency Step
- Resolution Bandwidth
- Span/RBW Ratio
- Sweep Time
- Video BandwidthVBW/RBW ratio
- Upper and Lower Tone (set to Sense
-)Zero span measurement Resolution Bandwidth
- Zero span measurement Dwell Time

Harmonics

For Harmonics, these parameters are:

- Resolution Bandwidth
- Fundamental Frequency
- Dwell Time
- Range Table Resolution Bandwidths
- Range Table Dwell Times

Meas Preset

Restores all the measurement parameters to their default values.

Remote Command	`:CONFigure:MONitor`
Example	`:CONF:MON`

3.2.8.2 Radio

The Radio tab contains controls to select the Radio Device, and enable or disable HSPA/HSPA+ options.

Radio Device

Allows you to specify the device to be used.

Remote Command	`[:SENSe]:RADio:STANdard:DEVice BTS | MS` `[:SENSe]:RADio:STANdard:DEVice?`
Example	`:RAD:STAN:DEV MS` `:RAD:STAN:DEV?`
Preset	BTS
State Saved	Saved in instrument state.
Range	BTS | MS
Backwards Compatibility SCPI	`[:SENSe]:RADio:DEVice`

HSPA Enable

Allows you to turn on or off the HSDPA/HSUPA option enable. This selection is necessary because some of the auto detection functions that expect an HSPA signal are less tolerant when the signal is noisy or distorted. When the HSPA signal is not expected, turn HSPA Enable off.

Remote Command	`[:SENSe]:RADio:CONFigure:HSDPa[:STATe] 0 | 1 | OFF | ON` `[:SENSe]:RADio:CONFigure:HSDPa[:STATe]?`
Example	`:RAD:CONF:HSDP 0` `:RAD:CONF:HSDP?`
Preset	ON
State Saved	Saved in instrument state.
Range	On|Off

HSPA+ Enable

Allows you to turn on or off the HSPA+ option enable. This selection is necessary because some of the auto detection functions that expect an HSPA+ signal are less tolerant when the signal is noisy or distorted. When the HSPA+ signal is not expected, turn HSPA+ Enable off.

Remote Command	`[:SENSe]:RADio:CONFigure:EHSPa[:STATe] OFF | ON | 0 | 1` `[:SENSe]:RADio:CONFigure:EHSPa[:STATe]?`

Example	`:RAD:CONF:EHSP 0` `:RAD:CONF:EHSP?`
Notes	When HSPA enable is OFF, HSPA+ function is disabled too.
Preset	ON
State Saved	Saved in instrument state.
Range	On|Off

3.2.8.3 Advanced

Contains controls for setting advanced function s of the instrument.

This tab does not appear in EXM or VXT.

Noise Floor Extension

When this function is `ON`, the expected noise power of the instrument (derived from a factory calibration) is subtracted from the trace data. This will usually reduce the apparent noise level by about 10 dB in low band, and 8 dB in high band (>~3.6 GHz).

Noise Floor Extension works with any RBW, VBW, detector, any setting of Average Type, any amount of trace averaging, and any signal type. It is ineffective when the trace is not smoothed (smoothing processes include narrow VBWs, trace averaging, and long sweep times with the detector set to Average or Peak). It works best with extreme amounts of smoothing, and with the average detector, with the Average Type set to Power.

NOTE **Noise Floor Extensions has no effect unless the RF Input is selected, therefore it does nothing when External Mixing is selected.**

In those cases where the cancellation is ineffective, it nonetheless has no undesirable side-effects. There is no significant speed impact to having Noise Floor Extension on.

The best accuracy is achieved when substantial smoothing occurs in each point before trace averaging. Thus, when using the average detector, results are better with long sweep times and fewer trace averages. When using the sample detector, the VBW filter should be set narrow with less trace averaging, instead of a wide VBW filter with more trace averaging.

See "More Information" on page 249.

Remote Command	`[:SENSe]:CORRection:NOISe:FLOor ON | OFF | 1 | 0` `[:SENSe]:CORRection:NOISe:FLOor?`
Example	`:CORR:NOIS:FLO ON`

Dependencies	This control only appears in instruments with the NFE or NF2 license installed. In all others, the control does not appear, however the SCPI command will be accepted without error (but will have no effect)
Couplings	When NFE is enabled in any mode manually, a prompt will be displayed reminding you to perform the Characterize Noise Floor operation if it is needed. If NFE is enabled through SCPI and a Characterize Noise Floor operation is needed, an error will be entered in the system error queue
Preset	Unaffected by Mode Preset. Turned off by Restore Mode Defaults
State Saved	No

More Information

The instrument is characterized in the factory (or during a field calibration) with a model of the noise, referred to the input mixer, versus frequency in each band and path combination. Bands are 0 (low band) and 1 through 4 (high band) in a 26.5 GHz instrument, for example. Paths include normal paths, preamp paths, the electronic attenuator, etc.

In most band/path combinations, the noise can be well characterized based on just two parameters and the instrument frequency response before compensation for frequency-dependent losses.

After the noise density at the input mixer is estimated, the effects of the input attenuator, RBW, detector, etc. are computed to get the estimated input-port-referred noise level.

In the simplest case, the measured power (signal plus analyzer noise) in each display point (bucket) is compensated by subtracting the estimated noise power, leaving just the signal power. This is the operation when the detector is Average and the Average Type is set to Power.

In other cases, operation is often not quite as good but still highly effective. With peak detection, the noise floor is estimated based on the RBW and the duration of the bucket using the same equations used in the noise marker function. The voltage of the noise is subtracted from the voltage of the observed signal-plus-noise measurement to compute the estimated signal voltage. The peak detector is one example of processing that varies with detector to give good estimates of the signal level without the analyzer noise.

For best operation, the average detector and the power scale are recommended, as already stated. Peak detection for pulsed-RF can still give excellent effectiveness. FFT analysis does not work well, and does not do NFE well, with pulsed-RF signals, so this combination is not recommended. Negative peak detection is not very useful, either. Sample detection works well, but is never better than the average detector because it doesn’t smooth as well. The Normal detector is a combination of peak and negative peak behaviors, and works about as well as these.

For best operation, extreme smoothing is desirable, as already stated. Using narrow VBWs works well, but using very long bucket durations and the average detector works best. Reducing the number of trace points will make the buckets longer.

For best operation, the power scale (Average Type = Power) is optimum. When making CW measurements in the presence of noise without NFE, averaging on the decibel scale has the advantage of reducing the effect of noise. When using NFE, the NFE does an even better job than using the log scale ever could. Using NFE with the log scale is not synergistic, though; NFE with the power scale works a little better than NFE with log averaging type.

The results from NFE with internal preamp can often be lower than the theoretical noise in a signal source at room temperature, a noise density of -174 dBm/Hz. This is expected and useful behavior, because NFE is designed to report the amount of input signal that is in excess of the thermal noise, not the amount that includes the thermal noise. This can be a useful behavior because thermal noise often interferes with what you want to measure, instead of being part of what you want to measure. Note that NFE is not adequately accurate to always be able to read below kTB.

On instruments with the NF2 license installed, the calibrated Noise Floor used by Noise Floor Extensions should be refreshed periodically. Keysight recommends that the **Characterize Noise Floor** operation be performed after the first 500 hours of operation, and once every calendar year. The key to perform this is located in the **System, Alignments, Advanced** menu. If you have not done this yourself at the recommended interval, then when you turn on Noise Floor Extensions, the instrument will prompt you to do so with a dialog that says:

This action will take several minutes to perform. Please disconnect all cables from the RF input and press Enter to proceed. Press ESC to cancel, or Postpone to postpone for a week

If you Cancel, you will be prompted again the next time you turn NFE on. If you postpone, you will be prompted again after a week passes and you then turn NFE on.

Conversion

Access a menu of functions that enable you to control the frequency conversion type for the current measurement. The following choices are available:

Auto	`AUTO`	Auto optimizes demodulation quality by selecting single conversion when available. Default value
Single High Side	`SHSide`	Single downconversion with the LO frequency above the receiver frequency. Not image protected, and available only above 400 MHz or at all frequencies under specific condition
Single Low Side	`SLSide`	Single downconversion with the LO frequency below the receiver frequency. Not image protected, and available only above 1.1 GHz
Image Protect	`IPRotect`	Double downconversion with pre-selection filtering. Available at all frequencies

Remote Command	`[:SENSe]:MONitor:CONversion:TYPE AUTO | SHSide | SLSide | IPRotect` `[:SENSe]:MONitor:CONversion:TYPE?`

Example	:MON:CON:TYPE AUTO :MON:CON:TYPE?
Dependencies	This control only appears in the M9391A
Couplings	The availabilities of SingleHighSide and SingleLowSide depend on the current Sweep Parameters such as Center Freq, Span, Res BW and Points
Preset	AUTO
State Saved	Yes
Range	AUTO|SHSide|SLSide|IPRotect

Phase Noise Optimization

Access a menu of functions that enable you to control the phase noise optimization for the current measurement. The following choices are available:

Normal	NORmal	Sets the Synthesizer's Phase Lock Loop to the Normal setting (Best Close-In)
Best Wide Offset	BWOffset	Sets the Synthesizer's Phase Lock Loop for narrow bandwidth to improve ORFS and EVM measurements for wide modulation

Remote Command	[:SENSe]:MONitor:PNOise:OPTion NORmal | BWOffset [:SENSe]:MONitor:PNOise:OPTion?
Example	:MON:PNO:OPT NOR :MON:PNO:OPT?
Dependencies	This control only appears in the M9391A
Preset	NORmal
State Saved	Yes
Range	NORmal|BWOffset

3.2.8.4 Global

The controls in this menu apply to all Modes in the instrument.

Some controls (for example, **Global Center Freq**) allow you to switch certain Meas Global parameters to a Mode Global state. These switches apply to all Modes that support global settings. For example, no matter what Mode you are in when you set **Global Center Freq** to ON, it applies to all Modes that support Global Settings.

Other controls (for example, **Extend Low Band**) are actually set in this menu, but apply to all Modes.

Global Center Freq

The software maintains a Mode Global value called **Global Center Freq**.

When **Global Center Freq** is switched ON, the current Mode’s center frequency is copied into the **Global Center Frequency**, and from then on all Modes that support global settings use the **Global Center Frequency**, so you can switch between any of these Modes and the Center Freq will remain unchanged.

Adjusting the Center Freq of any Mode that supports Global Settings, while **Global Center Freq** is ON, modifies the Global Center Frequency.

When **Global Center Freq** is switched OFF, the Center Freq of the current Mode is unchanged, but now the Center Freq of each Mode is once again independent.

When **Mode Preset** is pressed while **Global Center Freq** is ON, the Global Center Freq is preset to the preset Center Freq of the current Mode.

This function is reset to OFF when "Restore Defaults" on page 1737 (in this tab) is pressed, or when **System**, **Restore Defaults**, **All Modes** is pressed.

Remote Command	`:INSTrument:COUPle:FREQuency:CENTer ALL | NONE` `:INSTrument:COUPle:FREQuency:CENTer?`
Example	`:INST:COUP:FREQ:CENT ALL` `:INST:COUP:FREQ:CENT?`
Preset	Set to OFF on **Global** Settings, **Restore Defaults** and **System, Restore Defaults, All Modes**
Range	ALL|NONE

Preset	OFF
Backwards Compatibility SCPI	`:GLOBal:FREQuency:CENTer[:STATe] 1 | 0 | ON | OFF` `:GLOBal:FREQuency:CENTer[:STATe]?`

Global EMC Std

When this control is switched ON, the current Mode’s EMC Std is copied into the **Global EMC Std**, and from then on all Modes that support global settings use the Global EMC Std, so you can switch between any of these Modes and the EMC Std will remain unchanged.

Adjusting the EMC Std of any Mode that supports Global Settings, while Global EMC Std is ON, will modify the **Global EMC Std**.

When **Global EMC Std** is switched OFF, the EMC Std of the current Mode is unchanged, but now the EMC Std of each Mode is once again independent. When

Mode Preset is pressed while **Global EMC Std** is ON, the Global EMC Std is preset to the preset EMC Std of the current Mode.

This function is reset to OFF when "Restore Defaults" on page 1737 (in this tab) is pressed, or when **System, Restore Defaults, All Modes** is pressed.

Remote Command	`:INSTrument:COUPle:EMC:STANdard ALL | NONE` `:INSTrument:COUPle:EMC:STANdard?`
Example	`:INST:COUP:EMC:STAN ALL` `:INST:COUP:EMC:STAN?`
Dependencies	Only available if option EMC is installed
Preset	Set to OFF on **Global** Settings, **Restore Defaults** and **System, Restore Defaults, All Modes**
Range	ALL|NONE

Extend Low Band

The software maintains a Mode Global value called **Extend Low Band**.

Under the current sweep configuration crossing over two bands, when **Extend Low Band** is turned ON, the instrument checks whether one band can cover the whole sweep frequency range or not. If it can, then the instrument locks the band; otherwise, it does nothing (the band crossover occurs).

This function does *not* work when **Band Lock** under **System** > **Service** > **Lock Functions** is not -1 (no Band Lock). In that case, **Band Lock** takes priority over **Extend Low Band**.

This function is reset to OFF when "Restore Defaults" on page 1737 (in this tab) is pressed, or when **System**, **Restore Defaults**, **All Modes** is pressed.

This parameter is available for SA, RTSA, WCDMA, WIMAX OFDMA, LTEAFDD, LTEATDD Modes.

Remote Command	`:INSTrument:COUPle:FREQuency:BAND:EXTend 0 | 1 | ON | OFF` `:INSTrument:COUPle:FREQuency:BAND:EXTend?`
Example	`:INST:COUP:FREQ:BAND:EXT 1` `:INST:COUP:FREQ:BAND:EXT?`
Dependencies	Only applies to UXA, PXA, MXA and EXA
Preset	Set to OFF by **Global** Settings > **Restore Defaults** and **System** > **Restore Defaults** > **All Modes**
Range	ON|OFF

Restore Defaults

Resets all of the functions in the **Global** Settings menu to OFF. This also occurs when **System**, **Restore Defaults**, **All Modes** is pressed.

Remote Command	`:INSTrument:COUPle:DEFault`
Example	`:INST:COUP:DEF`
Backwards Compatibility SCPI	`:GLOBal:DEFault`

3.2.9 Sweep

Accesses controls that enable you configure and control the acquisition of data and the X-axis parameters of the instrument. These controls might include Sweep Time, Continuous/Single, Pause/Resume, X Scale, and number of Points.

3.2.9.1 Sweep/Control

Contains controls for the Sweep and Control functions of the instrument, such as Sweep Time and Continuous/Single.

Sweep Time

Controls the time the instrument takes to sweep the current frequency span in swept measurements, and displays the sweep time in swept measurements.

NOTE

In instruments without sweeping hardware, this control is grayed out. The value shown on this control is an estimate. It is the measurement's turnaround time, which is the sum of signal acquisition time, FFT time, and other overhead time, to complete the entire span of the measurement.

On non-sweeping hardware, the measurement does not provide a user-settable "Sweep Time" parameter, because such hardware does not sweep, so specifying "Sweep Time" is not straightforward.

Instead, we recommend using "Minimum Acquisition Time" on page 256, which provides better control.

If you need to specify the same "Sweep Time" as you would for sweeping hardware, you can send the SCPI command `[:SENSe]:MONitor:SWEep:TIME <time>`. The measurement emulates the "Sweep Time" effect, but again this emulation is not straightforward, and therefore the behavior is not specified.

When Sweep Time is in Auto, the instrument computes a time that will give accurate measurements based on other settings of the instrument, such as RBW and VBW.

You can choose a shorter sweep time to improve the measurement throughput (with some potential unspecified accuracy reduction), but the Meas Uncal indicator will come on if the sweep time you set is less than the calculated Auto Sweep time.

You can also select a longer sweep time, which can be useful (for example) for obtaining accurate insertion loss measurements on very narrowband filters.

NOTE Significantly faster sweep times are available with Option FS1.

NOTE The Meas Uncal (measurement uncalibrated) warning is given in the Status Bar at the bottom of the screen when the manual Sweep time entered is faster than the time computed by the instrument's Sweep time equations, that is, the Auto Sweep Time. The instrument's computed Sweep time will give accurate measurements; if you sweep faster than this, your measurements may be inaccurate. A Meas Uncal condition may be corrected by returning the Sweep Time to Auto; by entering a longer Sweep Time; or by choosing a wider RBW and/or VBW.

Remote Command	`[:SENSe]:MONitor:SWEep:TIME <time>`
	`[:SENSe]:MONitor:SWEep:TIME?`
	`[:SENSe]:MONitor:SWEep:TIME:AUTO OFF | ON | 0 | 1`
	`[:SENSe]:MONitor:SWEep:TIME:AUTO?`

Example	`:MON:SWE:TIME 100 ms`
	`:MON:SWE:TIME?`
	`:MON:SWE:TIME:AUTO OFF`
	`:MON:SWE:TIME:AUTO?`

Dependencies	In certain instruments without sweeping hardware, such as VXT models M9420A/21A, the Sweep Time control is grayed out, and the Auto/Man toggle disappears. The read-only control shows estimated sweep time. In those instruments, the "Minimum Acquisition Time" on page 256 control is available
Couplings	Sweep time is coupled to RBW when Sweep Time is set to Auto; in this case the sweep time is changed as the RBW changes, to maintain amplitude calibration Sweep Time is also coupled to the Video Bandwidth (VBW). As the VBW is changed, the sweep time (when set to Auto) is changed to maintain amplitude calibration. This occurs because of common hardware between the two circuits
Preset	Automatically Calculated ON
State Saved	Saved in instrument state
Min	Typically: 1 ms
Max	In swept spans: 4000 s
Annotation	The sweep time is displayed in the lower-right corner of the screen. The number of points is displayed parenthetically, as Sweep 13.3 ms (1001 points) A "#" mark appears before "Sweep" in the annotation when it is switched from Auto to Manual coupling
Status Bits/OPC dependencies	Meas Uncal is Bit 0 in the STATus:QUEStionable:INTegrity:UNCalibrated register

Minimum Acquisition Time

Minimum Acquisition Time is available on non-sweeping platforms.

This parameter specifies the minimum acquisition time for each "chunk" of the measurement result. The instrument automatically divides Span into multiple chunks if needed. Therefore, the total signal acquisition time for the entire Span is ~ (>~Minimum Acquisition Time) * (The number of chunks).

When in Auto, this parameter's value is determined by other parameters, such as Span, RBW and VBW.

You can manually increase this parameter value from this Auto value.

If increased, the instrument acquires signal for the specified time duration for each chunk. It performs additional FFTs, and averages or peak-holds the FFT results for a chunk, depending on Detector settings.

Note that the actual acquisition time for each chunk may exceed the Minimum Acquisition Time value, in order to satisfy FFT time required by other parameters, and to perform an integral number of FFTs.

Remote Command	`[:SENSe]:MONitor:SWEep:ACQuisition:TIME <time>`
	`[:SENSe]:MONitor:SWEep:ACQuisition:TIME?`
	`[:SENSe]:MONitor:SWEep:ACQuisition:TIME:AUTO OFF | ON | 0 | 1`
	`[:SENSe]:MONitor:SWEep:ACQuisition:TIME:AUTO?`

Example	`:MON:SWE:ACQ:TIME 500 ms`
	`:MON:SWE:ACQ:TIME?`
	`:MON:SWE:ACQ:TIME:AUTO OFF`

Dependencies	The "Minimum Acquisition Time" control is available only on non-sweeping hardware
Couplings	If Minimum Acquisition Time is set to Auto, it is coupled to Span, RBW, and VBW
Preset	Automatically calculated ON
State Saved	Saved in instrument state
Min	100 ns
Max	4.0 ks

Sweep Time Annotation (Remote Command Only)

Returns the Sweep Time Annotation value. This query is available only on non-sweeping hardware.

This value is also displayed in the result trace window.

The value returned is the turnaround time of each measurement cycle, in seconds. The turnaround time is the sum of the signal acquisition time, FFT time, and other overhead time, to complete the entire span of each measurement cycle.

Remote Command	`[:SENSe]:MONitor:SWEep:ETIMe?`
Example	`:MON:SWE:ETIMe?`
Dependencies	Available only on non-sweeping hardware
Preset	Automatically calculated

Sweep/Measure

Allows you to toggle between Continuous and Single sweep or measurement operation. The Single/Continuous state is Meas Global, so the setting affects *all* measurements.

The front-panel key **Single/Cont** performs exactly the same function

NOTE In the `WAVeform` measurement, this control only appears in the Meas Bar, and not in the **Sweep/Control** tab.

See "More Information" on page 257

Remote Command	`:INITiate:CONTinuous OFF | ON | 0 | 1` `:INITiate:CONTinuous?`

Example	`:INIT:CONT 0`
	`:INIT:CONT OFF`
	puts instrument into Single measurement operation
	`:INIT:CONT 1`
	`:INIT:CONT ON`
	puts instrument into Continuous measurement operation

Preset	ON Note that `:SYST:PRES` sets `:INIT:CONT` to `ON` but `*RST` sets `:INIT:CONT` to `OFF`
State Saved	Saved in instrument state
Annunciation	The **Single/Continuous** icon in the Meas Bar changes depending on the setting: – A line with an arrow is Single – A loop with an arrow is Continuous

More Information

With **Avg/Hold Num** (in the **Meas Setup** menu) set to **Off** or set to **On** with a value of 1, a sweep is taken after the trigger condition is met; and the instrument continues to take new sweeps after the current sweep has completed and the trigger condition is again met. However, with **Avg/Hold Num** set to On with a value >1, multiple sweeps (data acquisitions) are taken for the measurement. The trigger condition must be met prior to each sweep. The sweep is not stopped when the average count k equals the number N set for Avg/Hold Num is reached, but the number k stops incrementing. A measurement average usually applies to all traces, marker results, and numeric results, but sometimes only applies to the numeric results.

If the instrument is in Single measurement, pressing the **Cont/Single** toggle control does not change k and does not cause the sweep to be reset; the only action is to put the instrument into Continuous measurement operation.

If it is already in Continuous sweep:

– the `:INIT:CONT 1` command has no effect

– the `:INIT:CONT 0` command will place the instrument in Single Sweep but will have no effect on the current sequence until k = N, at which point the current sequence will stop and the instrument will go to the idle state.

See "Restart" on page 1738 control description for details on the `:INIT:IMM` (Restart) function.

If you are already in Single sweep, the `:INIT:CONT OFF` command has no effect.

If you are already in Single Sweep, then pressing the **Cont/Single** toggle control in the middle of a sweep does not restart the sweep or sequence. Similarly, pressing the **Cont/Single** toggle control does not restart the sweep or sequence if the sweep is not in the idle state (for example, if you are taking a very slow sweep, or the instrument is waiting for a trigger). Even though pressing the **Cont/Single** toggle control in the middle of a sweep does *not* restart the sweep, sending `:INIT:IMM` *does* reset it.

Restart

The **Restart** function restarts the current sweep, or measurement, or set of averaged/held sweeps or measurements. In measurements that support pausing, if you are Paused, pressing **Restart** performs a **Resume**.

The Restart function is accessed in several ways:

– Pressing the **Restart** key

– Sending the remote command `:INIT:IMM`

– Sending the remote command `:INIT:REST`

See "More Information" on page 259

Remote Command	`:INITiate[:IMMediate]` `:INITiate:RESTart`
Example	`:INIT:IMM`

	`:INIT:REST`
Notes	`:INIT:REST` and `:INIT:IMM` and the front-panel **Restart** key perform exactly the same function
Couplings	Resets average/hold count k For the first sweep, overwrites all active (update=on) traces with new current data For application modes, resets other parameters as required by the measurement
Status Bits/OPC dependencies	This is an Overlapped command The `:STATus:OPERation` register bits 0 through 8 are cleared The `:STATus:QUEStionable` register bit 9 (INTegrity sum) is cleared The `SWEEPING` bit is set The `MEASURING` bit is set
Backwards Compatibility Notes	For Spectrum Analysis mode in ESA and PSA, the **Restart** hardkey and the `:INIT:REST` command restart trace averages (displayed average count reset to 1) for a trace in **Clear Write**, but did not restart **Max Hold** and **Min Hold** In the X-Series, the **Restart** hardkey and the `:INIT:REST` command restart not only **Trace Average**, but **Max Hold** and **Min Hold** traces as well For wireless comms modes in ESA and PSA, the **Restart** hardkey and the `:INIT:REST` command restarted every measurement, including all traces and numeric results. There is no change to this operation

More Information

The **Restart** function first aborts the current sweep or measurement as quickly as possible. It then resets the sweep and trigger systems, sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is in the process of aligning when a Restart is executed, the alignment finishes before the restart function is performed.

Even when set for Single operation, multiple sweeps may be taken when **Restart** is pressed (for example, when averaging/holding is on). Thus when we say that Restart "restarts a measurement," depending on the current settings, we may mean:

- It restarts the current sweep
- It restarts the current measurement
- It restarts the current set of sweeps if any trace is in Trace Average, Max Hold or Min Hold
- It restarts the current set of measurements if Averaging, or Max Hold, or Min Hold is on for the measurement

With Average/Hold Number (in Meas Setup menu) set to 1, or Averaging off, or no trace in Trace Average or Hold, a single sweep is equivalent to a single measurement. A single sweep is taken after the trigger condition is met; and the instrument stops sweeping once that sweep has completed. However, with Average/Hold Number >1 and at least one trace set to Trace Average, Max Hold, or Min Hold (SA Measurement) or Averaging on (most other measurements), multiple sweeps/data acquisitions are taken for a single measurement. The trigger condition must be met prior to each sweep. The sweep is stopped when the average count k equals the number N set for Average/Hold Number. A measurement average usually applies to all traces, marker results, and numeric results, but sometimes only applies to the numeric results.

Once the full set of sweeps has been taken, the instrument will go to the idle state. To take one more sweep without resetting the average count, increment the average count by 1, by pressing the step up key while Average/Hold Number is the active function, or by sending the remote command `:CALC:AVER:TCON UP`.

Pause/Resume

Pauses a measurement after the current data acquisition is complete.

When a measurement is paused:

- The label on this control changes to **Resume**. Pressing **Resume** un-pauses the measurement.
- Pressing **Restart** also performs a **Resume**.

Remote Command	`:INITiate:PAUSe` `:INITiate:RESume`
Example	`:INIT:PAUS` `:INIT:RES`
Dependencies	Not displayed in Modes that do not support pausing
Couplings	When Averaging is On, if the measurement is paused no more updates will occur until either a Resume or Restart occurs If the measurement is resumed, the averaging continues to use the traces from before the Pause occurred and continues to use the traces from the point where the Resume occurred. This still provides real-time traces, but they will no longer be gap free In a view with a Waterfall window, when the measurement is paused, the Waterfall stops updating. When Resume is selected, the Waterfall will retain the existing traces and continue updating using traces from the point at which Resume was selected. The time stamp of the individual Waterfall traces will show the time from the beginning of the measurement the trace relates to, showing there was a gap in the Waterfall capture In Density view, when the measurement is paused, the Density Display stops updating. When the measurement is resumed, if Persistence is `ON`, the persistence fading will continue from the point when the measurement was paused If a Restart occurs, the average counter is reset and all results are discarded. The measurement begins again, using traces after the Restart occurred

Abort (Remote Command Only)

This command stops the current measurement. It aborts the current measurement as quickly as possible, resets the sweep and trigger systems, and puts the measurement into an "idle" state. If the instrument is in the process of aligning when `:ABORt` is sent, the alignment finishes before the abort function is performed, so `:ABORt` does *not* abort an alignment.

If the instrument is set for Continuous measurement, it sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is set for Single measurement, it remains in the "idle" state until an `:INIT:IMM` command is received.

Remote Command	`:ABORt`
Example	`:ABOR`
Notes	If `:INIT:CONT` is `ON`, then a new continuous measurement will start immediately, with sweep (data acquisition) occurring once the trigger condition has been met If `:INIT:CONT` is `OFF`, then `:INIT:IMM` is used to start a single measurement, with sweep (data acquisition) occurring once the trigger condition has been met
Dependencies	For continuous measurement, `:ABORt` is equivalent to the **Restart** key Not all measurements support the abort command
Status Bits/OPC dependencies	The `:STATus:OPERation` register bits 0 through 8 are cleared The `:STATus:QUEStionable` register bit 9 (INTegrity sum) is cleared Since all the bits that feed into OPC are cleared by `:ABORt`, the `:ABORt` will cause the *OPC query to return true

3.2.9.2 Sweep Config

Accesses controls that enable you to configure the Sweep and Control functions of the instrument, such as Sweep Rules.

Points

Sets the number of points taken per sweep, and displayed in the traces. The current value of points is displayed parenthetically, next to the sweep time in the lower-right corner of the display. Using more points provides greater resolution. Using fewer points compacts the data and decreases the time required to access a trace over the remote interface.

Increasing the number of points does not increase the sweep time. However, it can slightly impact the trace processing time and therefore the overall measurement speed. Decreasing the number of points does not decrease the sweep time, but it may speed up the measurement, depending on the other sweep settings (for example, in FFT sweeps). Fewer points will always speed up the I/O.

Due to minimum sweep rate limitations of the hardware, the minimum sweep time available to the user will increase above its normal value of 1 ms as the number of sweep points increases above 15001.

Changing the number of sweep points has several effects on the instrument.Since markers are read at the point location, the marker reading may change.The sweep time resolution will change. Trace data for all the traces will be cleared and, if Sweep is in Cont, a new trace taken. If any trace is in average or hold, the averaging starts over.

Because of sweep time quantization issues, the knob and up/down keys cannot be used to adjust the number of points.

When in a split screen display each window may have its own value for points.

When sweep points is changed, an informational message "Sweep points changed, all traces cleared" is displayed and in the 5G NR mode, Auto Sweep Points is set to OFF(0).

Remote Command	`[:SENSe]:MONitor:SWEep:POINts <integer>` `[:SENSe]:MONitor:SWEep:POINts?`
Example	`:MON:SWE:POIN 1000` `:MON:SWE:POIN?`
Dependencies	This function is not available when Signal ID is set to On in External Mixing Neither the knob nor the step keys can be used to change this value. If it is tried, a warning is given Not displayed in modes that do not support Swept
Couplings	Whenever the number of sweep points change: – All trace data is erased – Any traces with Update Off will also go to Display Off (like going from View to Blank in the older instruments) – Sweep time is re-quantized – Any limit lines that are on will be updated – If averaging/hold is on, averaging/hold starts over – Auto Sweep Points is OFF (Only 5GNR) The resolution of setting the sweep time depends on the number of points selected
Preset	1001 unless noted below 2001: 5GNR
State Saved	Saved in instrument state
Min	1
Max	20001
Annotation	On second line of annotations, in lower right corner in parenthesis behind the sweep annotation

3.2.10 Trace

Lets you control the acquisition, display, storage, detection, and manipulation of trace data for the available traces.

The "Trace Control" on page 263 tab in this menu contains radio-button selections for the trace type (**Clear/Write, Trace Average, Max Hold, Min Hold**) and **View/Blank** setting for the selected trace.

3.2.10.1 Select Trace

Specifies the selected trace. The term “selected trace” is used to specify which trace will be affected when you change trace settings.

The Select Trace control appears above the menu panel, indicating that it applies to all controls in the menu panel. Select Trace is blanked if you select a tab whose controls do *not* depend on the selected trace (e.g., Normalize).

Notes	The selected trace is remembered even when not in the trace menu
Preset	Trace 1
State Saved	The number of the selected trace is saved in instrument state

3.2.10.2 Trace Control

The controls on this tab allow you to set the type of the Trace and its update mode.

There are four trace Types: **Clear/Write, Trace Average, Max Hold** and **Min Hold.** Each type handles data in a different way.

Each trace also has two values that determine whether it is being written or not and whether it is being displayed or not. These values, **Update** and **Display,** are described more fully in the View/Blank control description, but suffice it to say that when **Update** is On a trace is updating and when **Update** is Off it is not; and when **Display** is On it is visible and when **Display** is Off it is not. These terms are used throughout the descriptions below.

When Trace Annotation (see Display menu) is On, each non-blanked trace is labeled on the trace with the detector used to take it.

For slower sweeps a visual indicator exists on the trace where the new data is being written, a green “caret” or ^ symbol, which moves across the bottom of the graticule showing the current trace point.

Trace Type

Allows you to select the type of trace you want to you use for the current measurement. There are four trace Types: Clear/Write, Trace Average, Max Hold and

Min Hold.

Besides the **Trace Type**, the **View/Blank** state must be set to **Active** (**Update** On, **Display** On) for a trace to be updating and visible. Selecting any **Trace Type** automatically makes the trace **Active**. See also the **View/Blank** menu description.

Remote Command	`:TRACe[1]|2|3:MONitor:TYPE WRITe | AVERage | MAXHold | MINHold` `:TRACe[1]|2|3:MONitor:TYPE?`
Example	`:TRAC:MON:TYPE WRIT` `:TRAC:MON:TYPE?`
Notes	`WRITe` = Clear Write. In **Clear/Write** type each trace update replaces the old data in the trace with new data `AVERage` = Average. In **Trace Average** type the instrument maintains and displays an average trace, which represents the cumulative average on a point-by-point basis of the new trace data and previous averaged trace data `MAXHold` = Maximum Hold. In **Max Hold** type the instrument maintains and displays a max hold trace, which represents the maximum data value on a point-by-point basis of the new trace data and previous trace data `MINHold` = Minimum Hold. In **Min Hold** type the instrument maintains and displays a min hold trace, which represents the minimum data value on a point-point basis of the new trace data and previous trace data
Preset	`WRITe`
State Saved	Saved in instrument state
Backwards Compatibility SCPI	`:DISPlay:MONitor:VIEW:WINDow:TRACe[1]|2|3:TYPE`

Clear and Write | Restart Averaging | Restart Max/Min Hold

Starts the trace writing as though the trace type had just been selected. Pressing this control has exactly the same effect as selecting the current trace type again – the control is provided because it may not be obvious that re-selecting the current selection from a radio button menu will take an action.

The label of this control depends on the Trace Type:

- Clear/Write: Clear and Write
- Trace Average: Restart Averaging
- Max Hold: Restart Max Hold
- Min Hold: Restart Min Hold

View/Blank

This radio button box lets you set the state of the two trace values, Update and Display. The four choices available are:

- Active: Update and Display both On
- View: Update Off and Display On
- Blank: Update Off and Display Off
- Background: Update On, Display Off (this allows a trace to be blanked and continue to update “in the background”, which was not possible in the past)

See tables below for detail onthe SCPI remote commands to control these two variables.

Preset	Trace On
State Saved	Saved in instrument state
Range	Trace On|Blank

Trace Update State On/Off

Toggles a trace Update state between On and Off. The Off selection makes the trace inactive. This does not affect whether the trace is visible or not. To change the trace visibility, see "Trace Display State On/Off" on page 265

Remote Command	`:TRACe[1]|2|3:MONitor:UPDate[:STATe] ON | OFF | 0 | 1` `:TRACe[1]|2|3:MONitor:UPDate[:STATe]?`
Example	`:TRAC3:MON:UPD OFF` `:TRAC3:MON:UPD?`
Couplings	Whenever you set **Update** to **On** for any trace, the **Display** is set to **On** for that trace
Preset	1|1|1 (**On** for Trace 1; **Off** for 2 &3)
State Saved	Saved in instrument state

Trace Display State On/Off

Toggles a trace Display state between On and Off. The Off selection makes the trace not visible. This does not affect whether the trace is updating or not.

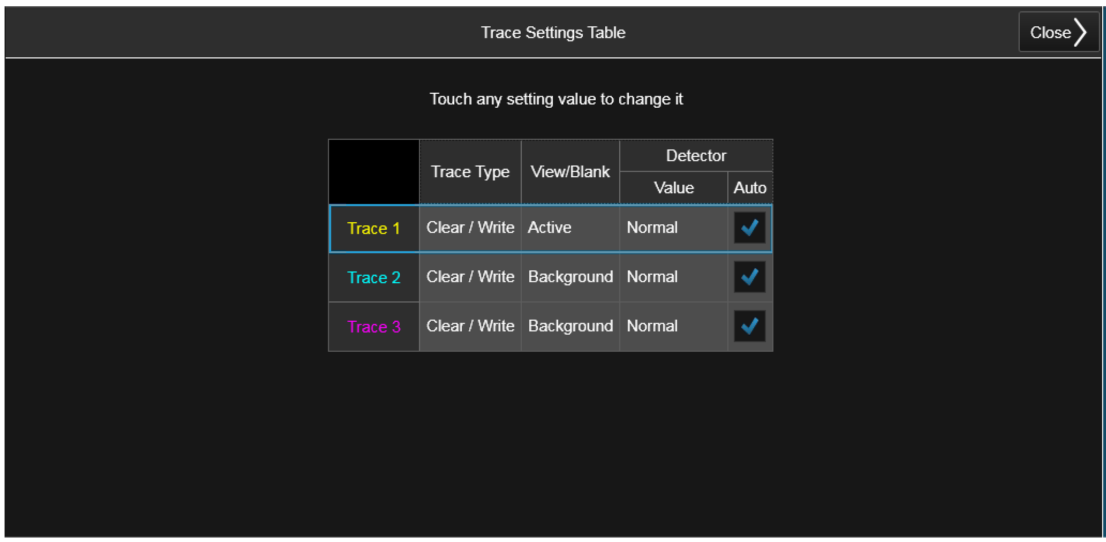
Even when not visible, traces may be queried and markers may be placed on them.

Remote Command	`:TRACe[1]|2|3:MONitor:DISPlay[:STATe] ON | OFF | 0 | 1` `:TRACe[1]|2|3:MONitor:DISPlay[:STATe]?`
Example	`:TRAC:MON:DISP ON` `:TRAC:MON:DISP?`

Couplings	Whenever you set **Update** to **On** for any trace, the **Display** is set to **On** for that trace
Preset	1|0|0 (**On** for Trace 1; **Off** for 2 &3)
State Saved	Saved in instrument state
Range	0 1

Trace Settings Table

Lets you configure the Trace system using a visual utility.



Clear All Traces

Clears all traces from the display.

Remote Command	`:TRACe:MONitor:CLEar:ALL`
Example	`:TRAC:MON:CLE:ALL`
Backwards Compatibility SCPI	`:DISPlay:MONitor:VIEW:WINDow:TRACe:CLEar:ALL`

3.2.10.3 Detector

Lets you choose and configure detectors for the selected trace.

Detector

Allows you to select a specific detector for the current measurement. When the detector choice is Auto, the instrument selects the detector. The selected detector depends on marker functions, trace functions, and trace averaging functions for the current measurement.

The following options are available:

AUTO	The detector selected depends on marker functions, trace functions, average type, and the trace averaging function In the ACP measurement, when in AUTO, the detector selected is set to AVERage, unless the Radio Standard defaults state otherwise e.g., it is set to Peak for Radio Standard = PDC when Device = both MS and BTS, and when Radio Standard = NADC and Device = MS
NORMal	The detector determines the peak of the CW-like signals, and it yields alternating maximums and minimums of noise-like signals. This is also referred to as Rosenfell detection
AVERage	The detector determines the average of the signal within the sweep points, using RMS averaging
POSitive Peak	The detector determines the maximum of the signal within the sweep points
SAMPle	The detector indicates the instantaneous level of the signal at the center of the sweep points represented by each display point
NEGative Peak	The detector determines the minimum of the signal within the sweep points

Because they may not find a spectral component's true peak, neither AVERage nor SAMPle detectors measure amplitudes of CW signals as accurately as Peak or NORMal, but they do measure noise without the biases of Peak detection.

Remote Command	[:SENSe]:MONitor:DETector:TRACe AVERage | NEGative | NORMal | POSitive | SAMPle | RMS [:SENSe]:MONitor:DETector:TRACe?
Example	:MON:DET:TRAC NORM :MON:DET:TRAC? :MON:DET RMS Sets the detector to AVERage. AVERage uses RMS averaging, so this is equivalent to selecting RMS
Notes	The query returns a string corresponding to the detector type as shown below

String Returned	Definition
NORM	Normal
AVER	Average (RMS)

	<table><tr><th>String Returned</th><th>Definition</th></tr><tr><td>POS</td><td>Peak</td></tr><tr><td>SAMP</td><td>Sample</td></tr><tr><td>NEG</td><td>Negative Peak</td></tr></table>The RMS selection sets the detector type to AVERage with RMS averaging. Therefore, if RMS has been selected, the query returns "AVER"
Couplings	When "Detector Select Auto/Man" on page 268 is ON, the detector selected depends on the Trace (Average) type
Preset	NORMal
State Saved	Yes
Range	AVERage|NEGative|NORMal|POSitive|SAMPle|RMS
Annotation	The four letter mnemonic for the detector appears in the trace window next to the trace it applies to
Backwards Compatibility SCPI	[:SENSe]:MONitor:DETector[:FUNCtion]

Detector Select Auto/Man

This toggle sets the Detector mode to Auto or Manual. In Auto, the proper detector is chosen based on rules that take into account the measurement settings and other instrument settings.

When any detector is selected by the user, this toggles automatically set to Man (manual).

Remote Command	[:SENSe]:MONitor:DETector:AUTO ON | OFF | 1 | 0 [:SENSe]:MONitor:DETector:AUTO?
Example	:MON:DET:AUTO ON :MON:DET:AUTO?
Couplings	When this function is ON, the "Detector" on page 267 and "Trace Type" on page 263 settings automatically align as follows: – "NORMal" with Clear Write – "AVERage" with AVERage – "POSitive (Peak)" with MAXHold – "NEGative (Peak)" with MINHold
Preset	ON
State Saved	Yes

3.3 Mod Accuracy

In addition to the QPSK EVM and Symbol EVM measurements, the Composite EVM measurement is made to qualify a transmitter. QPSK EVM is for single channel analysis and does not take into account spreading and scrambling. Symbol EVM is for measuring a single coded channel. The composite EVM measurement is the modulation accuracy against the multi coded reference chip power through the spreading and scrambling circuits.

Rho is one of the key modulation quality metrics, along with EVM and Modulation Accuracy (Rho) power. Rho is the ratio of the correlated power in a multi coded channel to the total signal power. This measurement takes into account all possible error mechanisms in the entire transmission chain including: baseband filtering, I/Q modulation anomalies, filter amplitude and phase non-linearities, and power amplifier distortions.

This provides an overall indication of the performance level of the transmitter of the Unit Under Test (UUT).

Modulation Accuracy Commands

The following commands and queries are used to retrieve the measurement results:

`:CONFigure:RHO`

`:CONFigure:RHO:NDEFault`

`:INITiate:RHO`

`:FETCh:RHO[n]?`

`:READ:RHO[n]?`

`:MEASure:RHO[n]?`

Remote Command Results for Modulation Accuracy

For the queries listed above, the results returned depend on the value of `n`, as follows.

Index: n	Results Returned
0	Returns unprocessed I/Q trace data of Capture Interval, as a series of trace point values. The I values are listed first in each pair, using the 0 through even-indexed values. The Q values are the odd-indexed values
1 (or not specified)	Returns the following 16 comma-separated scalar results:

#	Result Name (Average Mode*) <explanation>
1	RMS EVM (Average) A floating point number (in percent) of EVM over the entire measurement area
2	Peak EVM (Peak Hold) A floating point number (in percent) of the peak EVM in the measurement area
3	Magnitude error (Average)

Index: n	Results Returned

#	Result Name (Average Mode*) <explanation>
	A floating point number (in percent) of the average magnitude error over the entire measurement area
4	**Phase error (Average)** A floating point number (in degree) of the average phase error over the entire measurement area
5	**I/Q origin offset (Average)** A floating point number (in dB) of the I and Q error (magnitude squared) offset from the origin
6	**Frequency error (Average)** A floating point number (in Hz) of the frequency error in the measured signal
7	**Rho (Average)** A floating point number of Rho
8	**Peak Code Domain Error (Peak Hold)** A floating point number (in dB) of the Peak Code Domain Error relative to the mean power
9	**Peak Code Domain Error Channel Number (Peak Hold)** The channel number in which the peak code domain error is detected
10	**Number of active channels. (Average)**
11	**Time offset (Average)** A floating point number (in chips) of the pilot phase timing from the acquisition trigger point
12	**CPICH power over a slot (Average)** A floating point number (in dB) of the CPICH power over a measurement slot In the MS mode, the value returned is –999
13	**Total power over a slot (Average)** A floating point number (in dBm) of the total RF power over a measurement slot
14	**First Slot Number** An integer number of the first slot in Capture Interval. This is not averaged even if the averaging function is On. It is always the last cycle of the measurement

15	**DPCCH Slot Format**
	Floating point number
	– If Sync Type is DPCCH, the DPCCH slot format value used for synchronization is returned:
	  – 0.0: Slot Format 0
	  – 1.0: Slot Format 1
	  – 2.0: Slot Format 2
	  – 3.0: Slot Format 3
	  – 4.0: Slot Format 4
	  – 5.0: Slot Format 5
	– If Sync Type is PRACH, the value returned is -999.0
	In BTS mode, the value returned is 999.0

16	**Preamble Signature**
	Floating point number
	– BTS mode
	  – The returned value is always -999.0
	– MS mode
	  – In Preamble Signature auto-detection mode, the detected signature code number (from 0.0 to 15.0) is returned when the Sync Type is PRACH Message

Index: n	Results Returned
	# **Result Name (Average Mode*)** <explanation> – In Preamble Signature manual setting mode, the retuned value is the same as the parameter setting. When the Sync Type is not PRACH Message, the returned value is -999.0 *Average Mode is one of: – Average : Averaged value in average cycle – Peak Hold : Detected Peak/Maximum value in average cycle
2	**Chip EVM** EVM trace returns a series of floating point numbers (in percent) that represent each sample in the EVM trace of Capture Interval. The first number is the symbol 0 decision point. There are X points per symbol (X = points/chip). Therefore, the decision points are at 0, 1 * X, 2 * X, 3 * X, ...
3	**Chip Magnitude Error** Magnitude error trace returns a series of floating point numbers (in percent) that represent each sample in the magnitude error trace of Capture Interval. The first number is the symbol 0 decision point. There are X points per symbol (X = points/chip). Therefore, the decision points are at 0, 1 * X, 2 * X, 3 * X, ...
4	**Chip Phase Error** Phase error trace returns a series of floating point numbers (in degrees) that represent each sample in the phase error trace of Capture Interval. There are X points per symbol (X = points/ chip). Therefore, the decision points are at 0, 1 * X, 2 * X, 3 * X ...
5	**Corrected Measured Trace** Corrected measured trace of Single Slot specified by Meas Offset returns a series of floating point numbers that alternately represent I and Q pairs of the corrected measured trace. The magnitude of each I and Q pair are normalized to 1.0. The first number is the in-phase (I) sample of the symbol 0 decision point and the second is the quadrature-phase (Q) sample of the symbol 0 decision point. There are X points per symbol (X = points/chip), so the series of numbers is: – 1st number = I of the symbol 0 decision point – 2nd number = Q of the symbol 0 decision point – ... – (2 * X) + 1th number = I of the symbol 1 decision point – (2 * X) + 2th number = Q of the symbol 1 decision point – ... – (2 * X) * Nth + 1 number = I of the symbol N decision point – (2 * X) * Nth + 2 number = Q of the symbol N decision point
6	**PASS/FAIL** Returns 6 comma-separated scalar values of the pass/fail (0.0 = passed, or 1.0 = failed) results determined by testing the following items. The pass/fail is for the peak-hold value, because the test on the peak-hold value should be more severe than the average value 1. Test result of EVM 2. Test result of Peak EVM 3. Test result of Rho 4. Test result of Peak Code Domain Error 5. Test result of Frequency Error 6. Test result of CPICH over a slot (If MS is selected, this always returns 0.0)
7	**Active Channel List** In BTS Mode, returns a series of floating point numbers: symbol rate (ex. 7.5 ksps), OVSF code number, a dummy value, power level and code domain error for the active channels for Single Slot specified by Meas Offset

Index: n	Results Returned
	In MS Mode, returns a series of floating point numbers: symbol rate (ex. 15 ksps), OVSF code number, 1.0 (I) or -1.0 (Q), power level and code domain error for the active channels for Single Slot specified by Meas Offset The results would look like the following: – 1st number = Symbol Rate for 1st Active Channel – 2nd number = OVSF Code number for 1st Active Channel – 3rd number = (in BTS) -999, or (in MS) either +1 (I) or -1 (Q) for 1st Active Channel – 4th number = Power Level (in dB) for 1st Active Channel – 5th number = Code Domain Error for 1st Active Channel – ... – (N - 1) * 5 + 1th number = Symbol Rate for Nth Active Channel – (N - 1) * 5 + 2th number = OVSF Code number for Nth Active Channel – (N - 1) * 5 + 3th number = -999 (in BTS), or either +1 (I) or -1 (Q) (in MS) for Nth Active Channel – (N - 1) * 5 + 4th number = Power Level (in dB) for Nth Active Channel – (N * 5)th number = Code Domain Error for Nth Active Channel Number of active channel is given by 10th parameter of `:MEASure:RHO[1]`
8	**Code Domain Power** Returns a series of floating point numbers (in dB) that represents all the code domain powers of Single Slot specified by Meas Offset In BTS Mode, there are 512 numbers. If the active channel occupies more than the max spreading factor (7.5 ksps) the power is duplicated (active symbol rate/7.5 ksps) times – 1st number = 1st code power over the slot – 2nd number = 2nd code power over the slot – ... – Nth number = Nth code power over the slot In MS Mode, there are 256 I/Q pairs. If the active channel occupies more than the max spreading factor (15 ksps) the power is duplicated (active symbol rate / 15 ksps) times – 1st number = 1st in-phase code power over the slot – 2nd number = 1st quad-phase code power over the slot – ... – (2 * N - 1)th number = Nth in-phase code power over the slot – (2 * N)th number = Nth quad-phase code power over a slot N = the number of codes detected. The total number of codes varies because of the different symbol rates of each code
9	**Slot RMS EVM** Slot RMS EVM trace returns a series of floating point numbers (in percent) that represent each slot RMS EVM trace of Capture Interval. The first number is of the first slot in Capture Interval. Total length of trace is equivalent to Capture Interval in slot
10	**Peak CDE** Peak CDE trace of Capture Interval, returns a series of floating point numbers that represent the Peak CDE as follows:

Index: n	Results Returned

	– 1st number = Peak CDE Symbol Rate of 1st slot in Capture Interval
	– 2nd number = Peak CDE Code Index of 1st slot in Capture Interval
	– 3rd number = I/Q Phase of Peak CDE
	  – I-Phase = 1.0 (for MS)
	  – Q-Phase = -1.0 (for MS)
	  – IQ = -999.0 (for BTS)
	– 4th number = Peak CDE Value of 1st slot in Capture Interval
	– ...
	– (4 * N + 1)th number = Peak CDE Code Level of Nth slot in Capture Interval
	– (4 * N + 2)th number = Peak CDE Code Index of Nth slot in Capture Interval
	– (4 * N + 3)th number = I/Q Phase of Peak CDE
	  – I-Phase = 1.0 (for MS)
	  – Q-Phase = -1.0 (for MS)
	  – IQ = -999.0 (for BTS)
	– (4 * N + 4)th Number = Peak CDE value of Nth slot in Capture Interval
	N is equivalent to Capture Interval in slot, and total trace length 3 * N + 3

11	**Slot Frequency Error** Slot Frequency Error trace returns a series of floating point numbers (in Hz) that represents each slot frequency error. Total length of trace is equivalent to Capture Interval in slot
12	**Slot CPICH Power** – When Radio device is BTS, Slot CPICH Power trace returns the series of floating point numbers (in dB) of the code domain power of CPICH – When Radio device is MS, dummy data (= -999.0) is returned Total length of trace is equivalent to Capture Interval in slot
13	**Slot Average Total Power** Slot Average Total Power trace returns the series of floating point numbers (in dBm) of the total power. Total length of trace is equivalent to Capture Interval in slot
14	**Average Results** Average scalar results trace returns 13 comma-separated scalar results: 1. **RMS EVM** is a floating point number (in percent) of EVM over the entire measurement area 2. **Peak EVM** is a floating point number (in percent) of peak EVM in the measurement area 3. **Magnitude error** is a floating point number (in percent) of average magnitude error over the entire measurement area 4. **Phase error** is a floating point number (in degree) holding the result with absolute maximum value of average phase error over the entire measurement area 5. **I/Q origin offset** is a floating point number (in dB) of the I and Q error (magnitude squared) offset from the origin 6. **Frequency error** is a floating point number (in Hz) holding the result with absolute maximum value of the frequency error in the measured signal

Index: n	Results Returned
	7. **Rho** is a floating point number holding the minimum result of Rho 8. **Peak Code Domain Error** is a floating point number (in dB) of the Peak Code Domain Error relative to the mean power 9. **Peak Code Domain Error Channel Number** is the channel number in which the peak code domain error is detected at the max spreading factor 10. **Number of active channels** 11. **Time offset** is a floating point number (in chip) of the pilot phase timing from the acquisition trigger point 12. **CPICH power over a slot** is a floating point number in dB of CPICH power over a measurement slot. In the MS mode the value returned is –999 13. **Total power over a slot** is a floating point number in dBm of total RF power over a measurement slot
15	Peak Hold Results Peak Hold scalar results trace returns 13 comma-separated scalar results: 1. **RMS EVM** is a floating point number (in percent) of EVM over the entire measurement area 2. **Peak EVM** is a floating point number (in percent) of peak EVM in the measurement area 3. **Magnitude error** is a floating point number (in percent) of average magnitude error over the entire measurement area 4. **Phase error** is a floating point number (in degree) holding the result with absolute maximum value of average phase error over the entire measurement area 5. **I/Q origin offset** is a floating point number (in dB) of the I and Q error (magnitude squared) offset from the origin 6. **Frequency error** is a floating point number (in Hz) holding the result with absolute maximum value of the frequency error in the measured signal 7. **Rho** is a floating point number holding the minimum result of Rho 8. **Peak Code Domain Error** is a floating point number (in dB) of the Peak Code Domain Error relative to the mean power 9. **Peak Code Domain Error Channel Number** is the channel number in which the peak code domain error is detected at the max spreading factor 10. **Number of active channels** 11. **Time offset** is a floating point number (in chip) of the pilot phase timing from the acquisition trigger point 12. **CPICH power over a slot** is a floating point number in dB of CPICH power over a measurement slot. In the MS mode the value returned is –999 13. **Total power over a slot** is a floating point number in dBm of total RF power over a measurement slot
16	Active RCDE Channel List In BTS mode, returns a series of floating point numbers: symbol rate (ex. 7.5 ksps), OVSF code number, a dummy value and relative code domain power for the active channels for Single Slot specified by Meas Offset In MS mode, returns a series of floating point numbers: symbol rate (ex. 15 ksps), OVSF code number, 1.0 (I) or –1.0 (Q) and relative code domain power for the active channels for Single Slot specified by Meas Offset. The results look like the following: – 1st number = Symbol Rate for 1st Active Channel – 2nd number = OVSF Code number for 1st Active Channel – 3rd number = (in BTS) –999, or (in MS) either +1 (I) or –1 (Q) for 1st Active Channel – 4th number = Relative Code Domain Error for 1st Active Channel – 5th number = -999 (Reserved for Mod Format for 1st Active Channel)

Index: n	Results Returned
	– ... – (N - 1) * 5 + 1th number = Symbol Rate for Nth Active Channel – (N - 1) * 5 + 2th number = OVSF Code number for Nth Active Channel – (N - 1) * 5 + 3th number = -999 (in BTS), or either +1 (I) or –1 (Q) (in MS) for Nth Active Channel – (N - 1) * 5 + 4th number = Relative Code Domain Error for Nth Active Channel – (N * 5)th number = -999 (Reserved for Mod Format for Nth Active Channel) Number of active channel is given by 10th parameter of :MEASure:RHO[1]
17	Average Results 2 This trace returns 10 comma-separated scalar results: 1. **Averaged 64QAM RCDE** is a floating point number (in dB) of the Relative Code Domain Error averaged over 64QAM channels in capture interval. In the MS mode the value returned is –999 2. **Peak Relative Code Domain Error** is a floating point number (in dB) of the Peak Relative Code Domain Error relative to the mean power. In BTS mode, the value returned is -999 3. (Reserved) The value returned is -999 4. (Reserved) The value returned is -999 5. (Reserved) The value returned is -999 6. (Reserved) The value returned is -999 7. (Reserved) The value returned is -999 8. (Reserved) The value returned is -999 9. (Reserved) The value returned is -999 10. (Reserved) The value returned is -999
18	Peak Hold Results2 This trace returns 10 comma-separated scalar results: 1. **Averaged 64QAM RCDE** is a floating point number (in dB) of the Relative Code Domain Error averaged over 64QAM channels in capture interval. In the MS mode the value returned is –999 2. **Peak Relative Code Domain Error** is a floating point number (in dB) of the Peak Relative Code Domain Error relative to the mean power. In BTS mode, the value returned is -999 3. **Peak Relative Code Domain Error Channel Symbol Rate** is a floating point number (in Symbol Per Second) holding Symbol Rate of Peak Relative Code Domain Error channel. In BTS mode, the value returned is -999 4. **Peak Relative Code Domain Error Channel Code Number** is a floating point number holding OVSF Code Number of Peak Relative Code Domain Error channel. In BTS mode, the value returned is -999 5. **Peak Relative Code Domain Error Channel I or Q** is a floating point number that specifies whether the Peak Relative Code Domain Error channel is on I (+1) or Q (-1). In the BTS mode the value returned is –999 6. (Reserved) The value returned is -999 7. (Reserved) The value returned is -999 8. (Reserved) The value returned is -999

Index: n	Results Returned
	9. (Reserved) The value returned is -999
	10. (Reserved) The value returned is -999
19	1. Returns a detected scramble code. The value returned is 0~511. (Available only when Radio Device is set to BTS and P-Scramble Code is set to Autodetect. Otherwise NaN is returned)
	2. I/Q Gain Imbalance (Average) in dB
	3. I/Q Gain Imbalance (Peak Hold) in dB
	4. I/Q Quadrature Error (Average) in degree
	5. I/Q Quadrature Error (Peak Hold) in degree
	6. (Reserved) NaN returned
	7. (Reserved) NaN returned
	8. (Reserved) NaN returned
	9. (Reserved) NaN returned
	10. (Reserved) NaN returned
20	1. I Offset (Average) in Volts
	2. I Offset (PeakHold) in Volts
	3. Q Offset(Average) in Volts
	4. Q Offset(PeakHold) in Volts
	5. IQOffset(Average) in dB
	6. IQOffset(PeakHold) in dB
	7. I Offset(Average), I Offset (PeakHold), Q Offset(Average) and Q Offset(PeakHold) are available only when N9073C-EFP is available, otherwise NaN (9.91E+37) is returned

3.3.1 Views

The table below shows the Views and Windows used for this measurement.

Some of these Views are multiple-window Views. When in a multiple window View, you select a window by touching it. The menu controls may sometimes change depending on which window is selected.

Whenever the View changes, the default menu is Frequency, unless otherwise specified in the View description.

View	Result
"I/Q Measured Polar Graph" on page 344	I/Q Measured Polar Vector Graph
	Metrics
"I/Q Error" on page 345	EVM Graph
	Mag Error Graph
	Phase Error Graph
"Code Domain Power" on page 345	Code Domain Power Graph
	Metrics
"Peak/Avg Metrics" on page 345	Peak/Average Metrics
"Capture Time Summary" on page 345	Capture Time Summary
"Slot CDE/EVM" on page 346	EVM Graph
	Peak CDE Graph
	Frequency Error Graph

View Selection Remote Commands

Allows you to select the desired measurement view:

- The Enumerated ID is used with the SCPI Command `:DISP:RHO:VIEW[:SEL]` ("View Selection by Name" on page 277)
- The Numeric ID is used with the SCPI Command `:DISP:RHO:VIEW:NSEL` ("View Selection by Name" on page 277)

Enumerated ID	Numeric ID	View Name & Details
`POLar`	1	I/Q Measured Polar Graph - Provides a combination view of an I/Q measured polar vector graph and the summary data
`ERRor`	2	I/Q Error (Tri View) - Provides a combination view of the EVM, magnitude error, and phase error graphs
`PGRaph`	3	Code Domain Power - Provides a graph of Modulation Accuracy (Rho) channels individual power in dB. A table of summary data for the Modulation Accuracy (Rho) channels is provided in the text window
`TABLe`	4	Peak/Average Metrics - Provides a table of magnitude error, phase error, EVM, and the modulation accuracy summary data such as rho, peak and rms EVM, peak Modulation Accuracy (Rho) error, magnitude error, phase error, in a text window, in terms of averaged and detected peak/maximum value in the average cycle
`SUMMary`	5	Capture Time Summary – Provides a table that summarizes measurement results through the Capture Interval. Highlights the peak/worst result through the Capture Interval slot-by-slot
`CDError`	6	Slot CDE/EVM(Tri View) – Provides a combination view of Frequency Error, Peak CDE, and EVM graphs

View Selection by Name

Allows you to specify the view via its enumerated ID string.

Remote Command	`:DISPlay:RHO:VIEW[:SELect] POLar | ERRor | PGRaph | TABLe | SUMMary | CDError` `:DISPlay:RHO:VIEW[:SELect]?`
Example	`:DISP:RHO:VIEW:SEL CDE` `:DISP:RHO:VIEW:SEL?`
Preset	POLar

State Saved	Yes
Range	I/Q Measured Polar Graph|I/Q Error|Code Domain Power|Peak/Avg Metrics|Capture Time Summary|Slot CDE/EVM

View Selection by Number

Allows you to specify the view via its numeric ID value.

Remote Command	`:DISPlay:RHO:VIEW:NSELect <integer>` `:DISPlay:RHO:VIEW:NSELect?`
Example	`:DISP:RHO:VIEW:NSEL 1` `:DISP:RHO:VIEW:NSEL?`
Preset	1
State Saved	Yes
Min/Max	1/6

3.3.1.1 I/Q Measured Polar Graph

Windows: "I/Q Measured Polar Vector Graph" on page 280,"Result Summary" on page 281

The traces and results of this view are only for the slot specified by the measurement offset. The traces are not averaged, even if the average is on. The parameters displayed in these windows differ depending on the setting of Radio Device.

Example	`:DISP:RHO:VIEW POL`

3.3.1.2 I/Q Error

Windows:"EVM Graph" on page 283, "Mag Error Graph" on page 283, "Phase Error Graph" on page 283

The traces of this view are not averaged, even if the average function is on. The parameters displayed in these windows differ depending on the setting of Radio Device.

Example	`:DISP:RHO:VIEW ERR`

3.3.1.3 Code Domain Power

Windows: "Code Domain Power Graph" on page 283, "CDP Metrics" on page 284

The traces and results of this view are only for the slot specified by the measurement offset. The results are not averaged, even if the average function is on.

The parameters displayed in these windows differ depending on the setting of Radio Device.

Example	`:DISP:RHO:VIEW PGR`

3.3.1.4 Peak/Avg Metrics

Windows: "Peak/Average Metrics" on page 285

This view has one window, the Peak/Average Metrics window, which displays two sets of data as follows:

Average	The value averaged in average-cycle
Peak Hold	The value detected and held as the Peak/Maximum in the average cycle

NOTE

The average cycle is updated when restarted, and is equal to the average count. In each average cycle, through the capture interval, the data is also averaged and detects the peak/worst values. Therefore, the metrics of this view are actually averaged by the data, which is the value of:

Average Count x Capture Interval

The parameters displayed in these windows differ depending on the setting of Radio Device.

Example	`:DISP:RHO:VIEW TABL`

3.3.1.5 Capture Time Summary

Windows:"Capture Time Summary" on page 288

The summary table displays the measurement results for multiple slots (for example 15 slots). It shows data sets slot-by-slot through the Capture Interval, and highlights the peak (or worst) slot value, and average value through the Capture Interval at the bottom of the table.

The results in this view are not averaged when restarted, even if the average is on. The parameters displayed in this window differ depending on the setting of Radio Device.

Example	`:DISP:RHO:VIEW SUMM`

3.3.1.6 Slot CDE/EVM

Windows: "Slot EVM Graph" on page 290,"Slot EVM Graph" on page 290"Slot EVM Graph" on page 290"Slot EVM Graph" on page 290"Slot Peak CDE Graph" on page 290, "Slot Frequency Error Graph" on page 290

The trace of this view is not averaged when restarted, even if the average function is on.

The parameters displayed in the windows differ depending on the setting of Radio Device in the Mode Setup.

In the graph:

– Yellow lines are the slot-by-slot results

– Blue (Cyan) lines are the test limits

Example	`:DISP:RHO:VIEW CDE`

3.3.2 Windows

This section describes the windows that are available in the Modulation Accuracy Measurement.

3.3.2.1 Window Number List

Window	Number
Result Summary	1
I/Q Measured Polar	2
EVM	3
Mag Error	4
Phase Error	5
Code Domain Power	6
CDP Metrics	7
Peak/Average Metrics	8
Capture Time Summary	9
Slot EVM	10
Peak CDE	11
Freq Error	12

I/Q Measured Polar Vector Graph

This Graph window appears in the following View:

View	Size	Position
I/Q Measured Polar Graph	Full, two-thirds width	Right

These traces and scalar results are for the slot specified by Meas Offset.

Marker Operation	None
Corresponding Trace	Corrected measured trace (n=5)

Active Channels	n=1 10th a Number of Active Channels.
Slot Number	NA

Result Summary

The Metrics window appears in the following View:

View	Size	Position
I/Q Measured Polar Graph	Full, one-thirds width	Left

Radio Device: BTS

These traces and scalar results are for the slot specified by Meas Offset.

Name	Corresponding Results	Display Format
Rho	n=1 7th rho	9.99999
EVM (rms)	n=1 1st EVM over the entire measurement area	99.99 % rms
EVM (pk)	n=1 2nd peak EVM in the measurement area	99.99 % pk
Pk CDE (dB)	n=1 8th Peak Code Domain Error relative to the mean power	-99.99 dB
Pk CDE (Ch No.)	n=1 9th Channel number in which the peak code domain error is detected at the max spreading factor	CX(Y) x=8 for downlink Y: OVSF code number (0 ... 255)
Pk Active CDE (dB)	None	-99.99 dB
Pk Active CDE (Ch No.)	None	CX(Y) X: OVSF level (2 ... 9) 2: 960ksps ... 9:7.5ksps Y: OVSF code number (0 ... 2^x-1)
Magnitude Error	n=1 3rd Average magnitude error over the entire measurement area	99.99 % rms
Phase Error	n=1 4th Average phase error over the entire measurement area	99.99 °rms
Freq Error	n=1 6th Frequency error in the measured signal	99.99 Hz
I/Q Origin Offset	n=1 5th I and Q error (magnitude squared) offset from the	-99.99 dB

Name	Corresponding Results	Display Format
	origin.	
Time Offset	N=1 11th Pilot phase timing from the acquisition trigger point	9999.99 chip
Preamble Signature	N = 1 16th Detected PRACH Preamble Signature	99

Radio Device: MS

These traces and scalar results are for the slot specified by Meas Offset.

Name	Corresponding Results	Display Format

Name	Corresponding Results	Display Format
Preamble Signature	Pilot phase timing from the acquisition trigger point N = 1 16th Detected PRACH Preamble Signature	99

EVM Graph

The EVM window appears in the following View:

View	Size	Position
I/Q Error	One-thirds, full width	Top

Marker Operation	Yes
Corresponding Trace	EVM trace (n=2)

Mag Error Graph

The Mag Error Graph window appears in the following View:

View	Size	Position
I/Q Error	One-thirds, full width	Middle

Marker Operation	Yes
Corresponding Trace	Magnitude error trace (n=3)

Phase Error Graph

The Phase Error window appears in the following View:

View	Size	Position
I/Q Error	One-thirds, full width	Bottom

Marker Operation	Yes
Corresponding Trace	Phase error trace (n=4)

Code Domain Power Graph

The Graph window appears in the following View:

View	Size	Position
Code Domain Power	Half, full width	Top

These traces and scalar results are for the slot specified by the Meas Offset.

Marker Operation	Yes
Corresponding Trace	CDP (n=8)

CDP Metrics

The Metrics window appears in the following View:

View	Size	Position
Code Domain Power	Half, full width	Bottom

Radio Device: BTS

These traces and scalar results are for the slot specified by Meas Offset.

Name	Corresponding Results	Display Format
Total Power	None Absolute Total Power	99.99 dBm
PSCH	None	99.99 dBm
SSCH	None	99.99 dBm
Active Channels	n=1 10th Number of Active Channels.	99
Code	n=7 (N-1)*5+2 number OVSF Code number for N th Active Channel	CX(Y) X: OVSF level (2 … 9) 2:960 ksps … 9:7.5 ksps Y: OVSF code number (0 … 2^x-1)

Marker Operation	Yes
Corresponding Trace	Slot Peak CDE trace (n=10)

Slot Frequency Error Graph

This graph appears in the following View:

View	Size	Position
Slot CDE/EVM	One-thirds, full width	Bottom

Marker Operation	Yes
Corresponding Trace	Slot Frequency error trace (n=11)

3.3.3 Amplitude

Activates the **Amplitude** menu and selects **Reference Level** or **Reference Value** as the active function, depending on the measurement.

Some features in this menu apply to multiple measurements. Some other features apply only to specific measurements and their controls are blanked or grayed-out in measurements that do not support the feature.

3.3.3.1 Y Scale

The Y Scale Tab contains controls that pertain to the Y axis parameters of the measurement. These parameters control how data on the vertical (Y) axis is displayed and control instrument settings that affect the vertical axis.

Ref Value

Sets the value for the absolute power reference. The functionality depends on the selected window.

Remote Command

```
:DISPlay:RHO:WINDow3|4|5|6|10|11|12:TRACe:Y[:SCALe]:RLEVel <amptd>
:DISPlay:RHO:WINDow3|4|5|6|10|11|12:TRACe:Y[:SCALe]:RLEVel?
```

Window numbers are as follows:

- EVM : 3
- Mag Error: 4
- Phase Error: 5
- CDP: 6
- Slot EVM: 10
- Peak CDE: 11
- Freq Error: 12

Example

3-EVM window

```
:DISP:RHO:WIND3:TRAC:Y:RLEV 0.0
```

	4-Mag Error window
	`:DISP:RHO:WIND4:TRAC:Y:RLEV 0.0`
	5-Phase Error Window
	`:DISP:RHO:WIND5:TRAC:Y:RLEV 0.0`
	6-CDP window
	`:DISP:RHO:WIND6:TRAC:Y:RLEV 0.0`
	10-Slot EVM window
	`:DISP:RHO:WIND10:TRAC:Y:RLEV 0.0`
	11-Peak CDE window
	`:DISP:RHO:WIND11:TRAC:Y:RLEV 0.0`
	12-Freq Error window
	`:DISP:RHO:WIND12:TRAC:Y:RLEV 0.0`

Couplings	When Auto Scaling is On (default), this value is automatically determined by the measurement result. When you set a value manually, Auto Scaling changes to Off
Preset	0.00
State Saved	Yes
Min/Max	

11-Peak CDE | 6-CDP	-250.0/250.0
4-Mag Error | 3-EVM | 10- Slot EVM	-500/500
5-Phase Error	-36000/36000
12-Freq Error	-4.3214/4.3214 GHz

Backwards Compatibility SCPI

Window Numbers used to be a combination of View and Window, now only Window number is sent. For backwards compatibility the old View and Window numbers are honored as below:

Window	Old SCPI Command	New SCPI Command
EVM	`DISP:RHO:VIEW2:WIND:TRAC:Y:RLEV 0.0`	`DISP:RHO:WIND3:TRAC:Y:RLEV 0.0`

CDP	DISP:RHO:VIEW3:WIND:TRAC:Y:PDIV 10.0	DISP:RHO:WIND6:TRAC:Y:PDIV 10.0
Slot EVM	DISP:RHO:VIEW6:WIND:TRAC:Y:PDIV 10.0	DISP:RHO:WIND10:TRAC:Y:PDIV 10.0
Peak CDE	DISP:RHO:VIEW6:WIND2:TRAC:Y:PDIV 10.0	DISP:RHO:WIND11:TRAC:Y:PDIV 10.0
Freq Error	DISP:RHO:VIEW6:WIND3:TRAC:Y:PDIV 10.0	DISP:RHO:WIND12:TRAC:Y:PDIV 10.0

Ref Position

Positions the Y-axis scale reference level at the top, center or bottom of the display. Changing the reference position does not change the reference level value.

Remote Command	:DISPlay:RHO:WINDow3|4|5|10|11|12:TRACe:Y[:SCALe]:RPOSition TOP | CENTer | BOTTom :DISPlay:RHO:WINDow3|4|5|10|11|12:TRACe:Y[:SCALe]:RPOSition? Window numbers are as follows: – EVM : 3 – Mag Error: 4 – Phase Error: 5

	– Slot EVM: 10 – Peak CDE: 11 – Freq Error: 12

Example	3-EVM window
	`:DISP:RHO:WIND3:TRAC:Y:RPOS TOP`
	4-Mag Error window
	`:DISP:RHO:WIND4:TRAC:Y:RPOS TOP`
	5-Phase Error Window
	`:DISP:RHO:WIND5:TRAC:Y:RPOS TOP`
	10-Slot EVM window
	`:DISP:RHO:WIND10:TRAC:Y:RPOS TOP`
	11-Peak CDE window
	`:DISP:RHO:WIND11:TRAC:Y:RPOS TOP`
	12-Freq Error window
	`:DISP:RHO:WIND12:TRAC:Y:RPOS TOP`

Preset	11-Peak CDE: `TOP` 3-EVM | 10-Slot EVM: `BOTTom` 4-Mag Error | 5-Phase Error | 12-Freq Error: `CENTer`
State Saved	Yes

Backwards Compatibility SCPI

Window Numbers used to be a combination of View and Window, now only Window number is sent. For backwards compatibility the old View and Window numbers are honored as below:

Window	Old SCPI Command	New SCPI Command
EVM	`DISP:RHO:VIEW2:WIND:TRAC:Y:RPOS TOP`	`DISP:RHO:WIND3:TRAC:Y:RPOS TOP`
Mag Error	`DISP:RHO:VIEW2:WIND2:TRAC:Y:RPOS TOP`	`DISP:RHO:WIND4:TRAC:Y:RPOS TOP`
Phase Error	`DISP:RHO:VIEW2:WIND3:TRAC:Y:RPOS TOP`	`DISP:RHO:WIND5:TRAC:Y:RPOS TOP`
Slot EVM	`DISP:RHO:VIEW6:WIND:TRAC:Y:RPOS TOP`	`DISP:RHO:WIND10:TRAC:Y:RPOS TOP`
Peak CDE	`DISP:RHO:VIEW6:WIND2:TRAC:Y:RPOS TOP`	`DISP:RHO:WIND11:TRAC:Y:RPOS TOP`
Freq Error	`DISP:RHO:VIEW6:WIND3:TRAC:Y:RPOS TOP`	`DISP:RHO:WIND12:TRAC:Y:RPOS TOP`

Auto Scaling

Toggles the Auto Scaling function between On and Off. When Auto Scaling is On, pressing the Restart front-panel key results in automatically determining scale per division and reference values based on the measurement results.

When you set a value to either Scale/Div or Ref Value manually, Auto Scaling automatically changes to Off.

Remote Command	`:DISPlay:RHO:WINDow3|4|5|10|11|12:TRACe:Y[:SCALe]:COUPle 0 | 1 | OFF | ON`
	`:DISPlay:RHO:WINDow3|4|5|10|11|12:TRACe:Y[:SCALe]:COUPle?`
	Window numbers are as follows:
	– EVM : 3
	– Mag Error: 4
	– Phase Error: 5
	– Slot EVM: 10
	– Peak CDE: 11
	– Freq Error: 12

Example	3-EVM window
	`:DISP:RHO:WIND3:TRAC:Y:COUP ON`
	4-Mag Error window
	`:DISP:RHO:WIND4:TRAC:Y:COUP ON`
	5-Phase Error Window
	`:DISP:RHO:WIND5:TRAC:Y:COUP ON`
	10-Slot EVM window
	`:DISP:RHO:WIND10:TRAC:Y:COUP ON`
	11-Peak CDE window
	`:DISP:RHO:WIND11:TRAC:Y:COUP ON`
	12-Freq Error window
	`:DISP:RHO:WIND12:TRAC:Y:COUP ON`

Notes	When this parameter is set to On, pressing the front-panel Restart key activates the scale coupling function, that automatically determines scale per division and reference values based on the measurement results. When you set a value to either Scale/Div or Ref Value manually, Auto Scaling is automatically set to Off
Preset	`ON`
State Saved	Yes
Range	`OFF|ON`

Backwards Compatibility SCPI

Window Numbers used to be a combination of View and Window, now only Window number is sent. For backwards compatibility the old View and Window numbers are honored as below:

3.3.3.2 Attenuation

Controls the attenuator functions and interactions between the attenuation system components.

There are two attenuator configurations in the X-Series. One is a Dual-Attenuator configuration consisting of a mechanical attenuator and an optional electronic attenuator. The other configuration uses a single attenuator with combined mechanical and electronic sections thatcontrols all the attenuation functions. Different models in the X-Series come with different configurations.

– See "Dual-Attenuator Configurations" on page 298

– See "Single-Attenuator Configuration" on page 298

Most attenuation settings are the same for all measurements – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by Meas Preset.

This tab is only available when the hardware set includes an input attenuator, which is typically only the case when using Keysight’s box instruments. For example, this tab does not appear in:

– VXT models M9420A/21A/10A/11A

– E7760

– M9391A

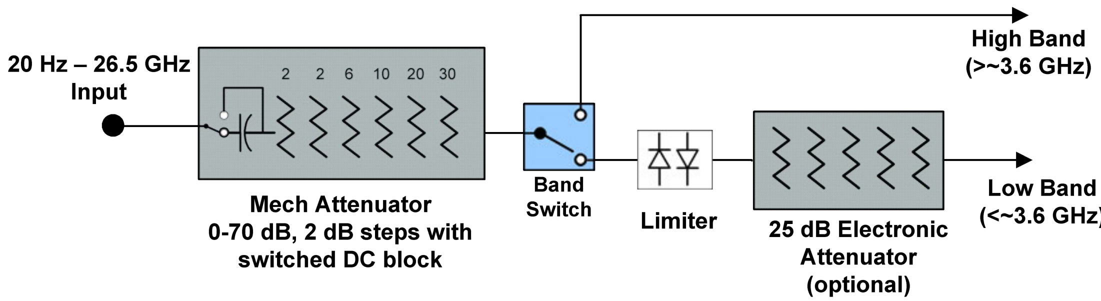
– M9393A

This tab also does not appear in UXM. In UXM all Attenuation and Range settings are disabled, as the expected input power level is handled by the Call Processing App that drives the DUT power control.

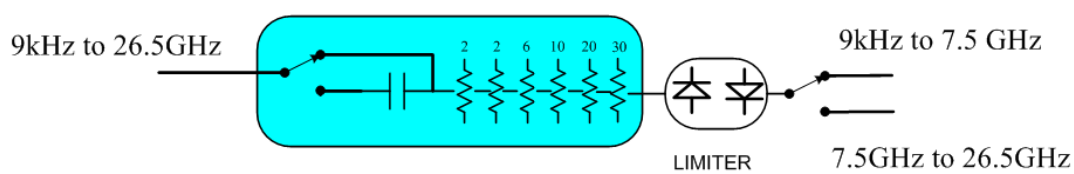
Dependencies	In measurements that support the I/Q inputs, this tab is unavailable when I/Q is the selected input, and is replaced by the Range tab in that case

Dual-Attenuator Configurations

Configuration 1: Mechanical attenuator + optional electronic attenuator

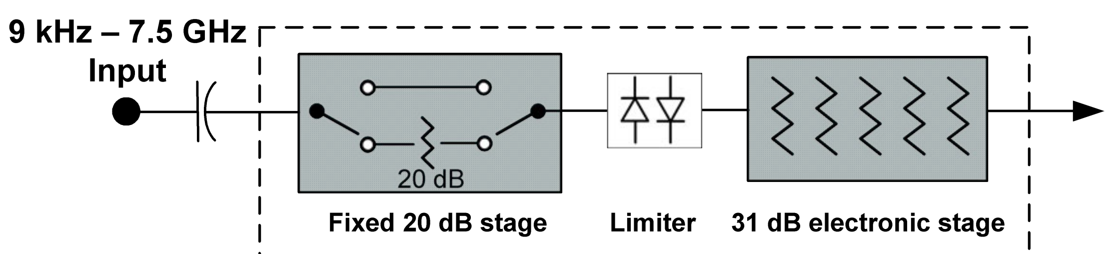


Configuration 2: Mechanical attenuator, no optional electronic attenuator

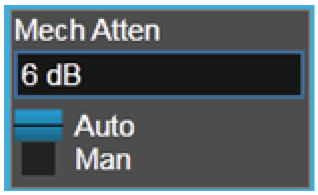


(note that Configuration 2 is not strictly speaking a dual-section attenuator, since there is no electronic section available. However, it behaves exactly like Configuration 1 without the Electronic Attenuator option EA3, therefore for the sake of this document it is grouped into the "Dual-Attenuator" configuration)

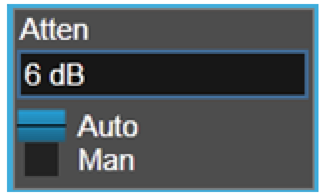
Single-Attenuator Configuration



You can tell which attenuator configuration you have by pressing the Attenuation tab, which (in most Modes) opensthe Attenuation menu. If the first control in the Attenuation menu says **Mech Atten** you have the Dual-Attenuator configuration. If the first control says **Atten** you have the Single-Attenuator configuration.



Dual Attenuator



Single Attenuator

(Note that depending on the measurement, there may be no Auto/Man functionality on the Mech Atten control).

In the Single-Attenuator configuration, youcontrol the attenuation with a single control, as the fixed stage has only two states. In the Dual-Attenuator configuration, both stages have significant range so you are given separate control of the mechanical and electronic attenuator stages.

When you have the Dual-Attenuator configuration, you may still have only a Single-Attenuator, because unless option EA3 (the Electronic Attenuator option) is available, and you purchase it, you will have only the mechanical attenuator.

Full Range Atten

The **Full Range Atten** control and **Attenuator Summary** only appear in N9041B, when the RF input is selected and the RF Input Port is set to RF Input 2, and the Full Range Attenuator is installed. The Full Range Attenuator adds a second input attenuator at the beginning of the RF Input 2, which enhances the protection and optimizes the performance of the extra internal mixers used by RF Input 2.

Remote Command	`[:SENSe]:POWer[:RF]:FRATten <rel_ampl>` `[:SENSe]:POWer[:RF]:FRATten?`
Example	`:POW:FRAT 14` `:POW:FRAT?`
Notes	When you enter an amplitude value that falls between valid values, the value will be incremented to the next smallest valid value
Dependencies	Only appears if input RF is selected, and RF Input Port 2 is selected, and the Full Range Attenuator exists
Couplings	This value is never changed by any coupling, however other couplings use this value. See the **Reference Level** and "Mech Atten" on page 1750 command descriptions
Preset	20 dB
State Saved	Saved in instrument state
Min	0 dB
Max	Only valid values are 0, 6, 14, 20 dB
Annotation	When the Input is RF, and the Input Port is RF Input 2, and the Full Range Attenuator is installed: On the Meas Bar, the field “Atten” displays as follows:

- If the sweep is entirely < 50 GHz, the value shown after “Atten:” is equal to Mech Atten + Elec Atten + Full Range Atten
- If the sweep is entirely > 50 GHz, the value shown after “Atten:” is equal to Full Range Atten
- If the sweep straddles 50 GHz, the value shown after “Atten:” is preceded by the symbol “>=” and is equal to Full Range Atten

In the **Amplitude**, "Attenuation" on page 1747 menu, and the Atten Meas Bar dropdown menu panel, a summary is displayed as follows:

“Total Atten below 50 GHz” followed by the value of Full Range Atten + Mech Atten + Elec Atten

“Total Atten above 50 GHz” followed by the value of Full Range Atten

For example, if Mech Atten = 6 dB, Elec Atten = 4 dB, and Full Range Atten = 20 dB, the summary below is shown:

- Attenuator summary:
- Total Atten below 50 GHz: 30 dB
- Total Atten above 50 GHz: 20 dB

Mech Atten

This control is labeled **Mech Atten** in Dual-Attenuator models and **Atten** in Single-Attenuator models. In the Dual-Attenuator configuration, this control only affects the mechanical attenuator.

This control lets you modify the attenuation applied to the RF input signal path. This value is normally auto coupled to the Ref Level, the Internal Preamp Gain, any External Gain that is entered, and the Max Mixer Level, as described in the table below.

See "Attenuator Configurations and Auto/Man" on page 302

Remote Command	`[:SENSe]:POWer[:RF]:ATTenuation <rel_ampl>`
	`[:SENSe]:POWer[:RF]:ATTenuation?`
	`[:SENSe]:POWer[:RF]:ATTenuation:AUTO OFF | ON | 0 | 1`
	`[:SENSe]:POWer[:RF]:ATTenuation:AUTO?`

Example	`:POW:ATT 20`
	Dual-Attenuator configuration: sets the mechanical attenuator to 20 dB
	Single-Attenuator mode: sets the main attenuation to 20 dB (see below for definition of “main” attenuation)
	In either case, if the attenuator was in Auto, it is set to Manual
	`:POW:ATT:AUTO ON`
	Turn Auto Mech Atten ON

Dependencies	Some measurements do not support the Auto setting of "Mech Atten" on page 300. In these measurements, the Auto/Man selection is not available, and the Auto/Man toggle function is not

	available In Dual-Attenuator configurations, when the electronic attenuator is enabled, the mechanical attenuator has no auto setting and the Auto/Man toggle function is not available. The state of Auto/Man is remembered and restored when the electronic attenuator is once again disabled. This is described in more detail in "Elec Atten" on page 1753 See "Attenuator Configurations and Auto/Man" on page 302 for more information on the Auto/Man functionality `:POW:ATT:AUTO` is only available in measurements that support Mech Atten Auto, such as Swept SA
Couplings	If the RF Input Port is the RF Input: – If the USB Preamp is connected to USB, use 0 dB for Mech Atten – Otherwise compute the auto-selected value of Mech Atten based on **Reference Level**, Int Preamp, External Gain, Ref Level Offset, Max Mixer Level, µW Path Control and IF Gain settings. Limit this value to be no less than 6 dB (total attenuation below 6 dB can never be chosen by Auto) – In the N9041B, if the RF Input Port is RF Input 2, use the formula above and subtract the Full Range Atten value from the result to determine the Mech Atten. Limit the value so that it is never lower than 0 dB and so that total attenuation, including Full Range Atten, is never less than 6 dB (total attenuation, including Full Range Atten below 6 dB, can never be chosen by Auto) In External Mixingand BBIQ, where the Attenuator is not in the signal path, the Attenuator setting changes as described above when "Mech Atten" on page 300 is in Auto, but no changes are made to the actual attenuator hardware setting until the input is changed back to the RF Input For CXA-m with option FSA (Fine-Step Attenuator or 2 dB steps), the FSA-like behavior is only available when the frequency setting is <= 7.5GHz. So, when the frequency is changed from below 7.5GHz to above 7.5GHz, the attenuation setting will be changed to a multiple of 10dB which will be no smaller than the previous setting. For example, 4dB attenuation will be changed to 10dB
Preset	The preset for Mech Attenuation is "Auto" The Auto value of attenuation is 10 dB ON
State Saved	Saved in instrument state
Min	0 dB The attenuation set by this control cannot be decreased below 6 dB with the knob or step keys. Values below 6 dB must be directly entered from the keypad or via SCPI. This protects against setting a dangerously small attenuation value, which can put the instrument at risk of damage to input circuitry. If the current mechanical attenuation is below 6 dB, it can be increased with the knob and step keys, but not decreased
Max	CXA Option 503 or 507: 50 dB EXA: 60 dB All other models: 70 dB Note that in the Single-Attenuator configuration, the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB.
Annotation	The current value for Total Atten is displayed in the Measurement Bar at the top of the display. A value appears for Electronic Attenuation only if the Electronic Attenuator is enabled. The annotation appears as Atten: <total> dB (e<elec>)

The e letter is in amber in Single-Attenuator configurations

For example:

Dual-Attenuator configuration:

Atten: 24 dB (e14)

Indicating the total attenuation is at 24 dB and the electronic attenuation is at 14 dB

Single-Attenuator configuration:

A: 24 dB (e14)

Indicating the total attenuation is at 24 dB and the “soft” attenuation is at 14 dB (see below for definition of “soft” attenuation)

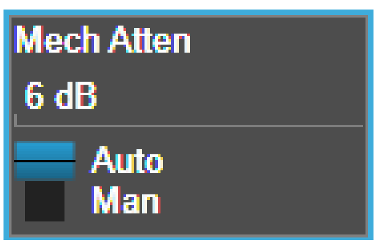
When in Manual, a # sign appears in front of Atten in the annotation

Attenuator Configurations and Auto/Man

As described in "Attenuation" on page 1747 , there are two distinct attenuator configurations available in the X-Series, the single attenuator and Dual-Attenuator configurations. In Dual-Attenuator configurations, we have the mechanical attenuation and the electronic attenuation, and the current total attenuation is the sum of the electronic + mechanical attenuation. In Single-Attenuator configurations, we refer to the attenuation set using "Mech Atten" on page 300 (or `:POW:ATT`) as the “main” attenuation; and the attenuation that is set by `:POW:EATT` as the “soft” attenuation (`:POW:EATT` is honored even in the Single-Attenuator configuration, for compatibility purposes). Then the current total attenuation is the sum of the main + soft attenuation. See "Elec Atten" on page 1753 for more on “soft” attenuation.

NOTE

In some measurements, the **Mech Atten** control has an Auto/Man function. In these measurements, an Auto/Man switch is shown on the **Mech Atten** control:



Note that in configurations that include an Electronic Attenuator, this switch is only shown when the Electronic Attenuator is disabled.

In other measurements, **Mech Atten** has no Auto/Man function. In these measurements, no switch is shown on the **Mech Atten** control:

Mech Atten also appears with no switch, as above, in configurations that include an Electronic Attenuator but when the Electronic Attenuator is enabled.

Elec Atten

Controls the Electronic Attenuator in Dual-Attenuator configurations. This control does not appear in Single-Attenuator configurations, as the control of both the mechanical and electronic stages of the Single-Attenuator is integrated into the single **Atten** control.

This control includes an Enable/Disable toggle switch; it is only possible to enter a value for the Electronic Attenuator when this switch is in the “Enable” position.

See "More Information" on page 304

Remote Command	`[:SENSe]:POWer[:RF]:EATTenuation <rel_ampl>`
	`[:SENSe]:POWer[:RF]:EATTenuation?`
	`[:SENSe]:POWer[:RF]:EATTenuation:STATe OFF | ON | 0 | 1`
	`[:SENSe]:POWer[:RF]:EATTenuation:STATe?`

Example	`:POW:EATT 10`
	`:POW:EATT?`
	`:POW:EATT:STAT ON`
	`:POW:EATT:STAT?`

Notes	Electronic Attenuation’s specification is defined only when Mechanical Attenuation is 6 dB
Dependencies	This control only appears in Dual-Attenuator models with an Electronic Attenuator installed and licensed. It does not appear in models with the Single-Attenuator configuration, as in the Single-Attenuator configuration there is no “electronic attenuator” there is only a single integrated attenuator (which has both a mechanical and electronic stage). However, in the Single-Attenuator configuration, EATT SCPI commands are accepted for compatibility with other X-series instruments and set a “soft” attenuation as described in . The “soft” attenuation is treated as an addition to the “main” attenuation value set by the Atten control or the POW:ATT SCPI command and affects the total attenuation displayed on the Atten control and the Meas Bar The electronic attenuator (and the “soft” attenuation function provided in Single-Attenuator configurations) is unavailable above the low band (0-3.6 GHz, 0-3.4 GHz 0-3GHz, depending on the model). If the low band ranges from 0-3.6GHz, and Stop Frequency of the instrument is > 3.6 GHz, then the **Enabled/Disabled** section of the **Elec Atten** control will be OFF and grayed out If the Internal Preamp is on, meaning it is set to Low Band or Full, the electronic attenuator (and the “soft” attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the **Enabled/Disabled** section of the **Elec Atten** control will be OFF and grayed out If either of the above is true, if the SCPI command is sent, an error indicating that the electronic attenuator is unavailable will be sent If both of the above are true, pressing the control will generate error message -221, in other words, the frequency range lockout takes precedence If the electronic/soft Attenuator is enabled, then the Stop Freq of the instrument is limited to 3.6 GHz and the Internal Preamp is unavailable The SCPI-only “soft” electronic attenuation for the single-attenuator configuration is not available in all measurements; in particular, it is not available in the Swept SA measurement

Couplings	Enabling and disabling the Electronic Attenuator affects the setting of the Mechanical Attenuator (in Dual-Attenuator configurations). This is described in more detail below and in the section "Attenuator Configurations and Auto/Man" on page 1752
Preset	OFF (Disabled) for Swept SA measurement ON (Enabled) for all other measurements that support the electronic attenuator
State Saved	Saved in instrument state
Min	0 dB
Max	Dual-Attenuator configuration: 24 dB Single-Attenuator configuration: the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB
Annotation	See Annotation under the **Mech Atten** control description

More Information

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear. These advantages primarily aid in remote operation and are negligible for front panel use. See "Using the Electronic Attenuator: Pros and Cons" on page 305 for a detailed discussion of the pros and cons of using the electronic attenuator.

For the Single-Attenuator configuration, for SCPI backwards compatibility, the “soft” attenuation feature replaces the Dual-Attenuator configuration’s electronic attenuator. All the same couplings and limitations apply. See "Attenuator Configurations and Auto/Man" on page 1752

Mechanical Attenuator Transition Rules

When the Electronic Attenuator is enabled, the Mechanical Attenuator transitions to a state that has no Auto function. Below are the rules for transitioning the Mechanical Attenuator. Note that the information below ONLY applies to the Dual-Attenuator configurations, and ONLY when the Electronic Attenuator is installed:

When the Electronic Attenuation is enabled from a disabled state:

The Mechanical Attenuator is initialized to 10 dB (this is its optimal performance setting). You can then set it as desired with SCPI, numeric keypad, step keys, or knob, and it behaves as it normally would in manual mode

The Auto/Man state of (Mech) Atten is saved

The Auto/Man toggle on the (Mech) Atten control disappears and the auto rules are disabled

The Electronic Attenuator is set to 10 dB less than the previous value of the Mechanical Attenuator, within the limitation that it must stay within the range of 0 to 24 dB of attenuation

Examples in the Dual-Attenuator configuration:

Mech Atten at 20 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 10 dB. New total attenuation equals the value before Elec Atten enabled

Mech Atten at 0 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 0 dB. New total attenuation does not equal the value before Elec Atten enabled

Mech Atten at 40 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 24 dB. New total attenuation does not equal the value before Elec Atten enabled

When the Electronic Attenuation is disabled from an enabled state:

The Elec Atten control is grayed out

- The Auto/Man state of (Mech) Atten is restored

If now in Auto, (Mech) Atten recouples

If now in Man, (Mech) Atten is set to the value of total attenuation that existed before the Elec Atten was disabled. The resulting value is rounded up to the smallest value possible given the (Mech) Atten Step setting - (That is, 57 dB changes to 58 dB when (Mech) Atten Step is 2 dB)

Using the Electronic Attenuator: Pros and Cons

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear.

The “finer steps” advantage of the electronic attenuator is beneficial in optimizing the alignment of the instrument dynamic range to the signal power in the front panel as well as remote use. Thus, you can achieve improved relative signal measurement accuracy. Compared to a mechanical attenuator with 2 dB steps, the 1 dB resolution of the electronic attenuator only gives better resolution when the odd-decibel steps are used. Those odd-decibel steps are less accurately calibrated than the even-decibel steps, so one tradeoff for this superior relative accuracy is reduced absolute amplitude accuracy.

Another disadvantage of the electronic attenuator is that the spectrum analyzer loses its “Auto” setting, making operation less convenient.

Also, the relationship between the dynamic range specifications (TOI, SHI, compression, and noise) and instrument performance are less well-known with the electrical attenuator. With the mechanical attenuator, TOI, SHI, and compression threshold levels increase dB-for-dB with increasing attenuation, and the noise floor does as well. With the electronic attenuator, there is an excess attenuation of about 1 to 3 dB between 0 and 3.6 GHz, making the effective TOI, SHI, and so forth, less well known. Excess attenuation is the actual attenuation relative to stated attenuation. Excess attenuation is accounted for in the instrument calibration

Adjust Atten for Min Clipping

Sets the combination of mechanical and electronic attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an "immediate action" function, that is, it executes once, when the control is pressed.

The algorithms that are used for the adjustment are documented under "Pre-Adjust for Min Clipping" on page 1757.

Remote Command	[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMediate
Example	:POW:RANG:OPT IMM
Notes	Executing Adjust Atten for Min Clipping initiates the measurement.
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements For the Waveform measurement, this control is available only in 5G NR Mode

Adjust Atten

Allows you to select;

- Electric attenuator only
- Combination of Electric attenuator and Mechanical attenuator

when the command [:SENSe]:POWer[:RF]:RANGe:OPTimize IMMediate is executed.

Remote Command	[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE EONLy | COMBined [:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE?
Example	:POW:RANG:OPT:TYPE EONL :POW:RANG:OPT:TYPE?
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements For the Waveform measurement, this control is available only in 5G NR Mode
Preset	COMBined
State Saved	Saved in instrument state

Pre-Adjust for Min Clipping

If this function is ON, it applies the adjustment described under "Adjust Atten for Min Clipping" on page 1756 each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

In Dual-Attenuator models, you can set **Elec+Mech Atten**, in which case both attenuators participate in the autoranging, or **Elec Atten Only**, in which case the mechanical attenuator does not participate in the autoranging. This latter case results in less wear on the mechanical attenuator and is usually faster.

See "Adjustment Algorithm" on page 308

Selection	Example	Note
Off	:POW:RANGe:OPT:ATT OFF	This is the default setting
Elec Atten Only	:POW:RANGe:OPT:ATT ELEC	Selects only the electric attenuator to participate in auto ranging. This offers less wear on the mechanical attenuator and is usually faster
Mech + Elec Atten	:POW:RANGe:OPT:ATT COMB	In Dual-Attenuator models, this selects both attenuators to participate in the autoranging

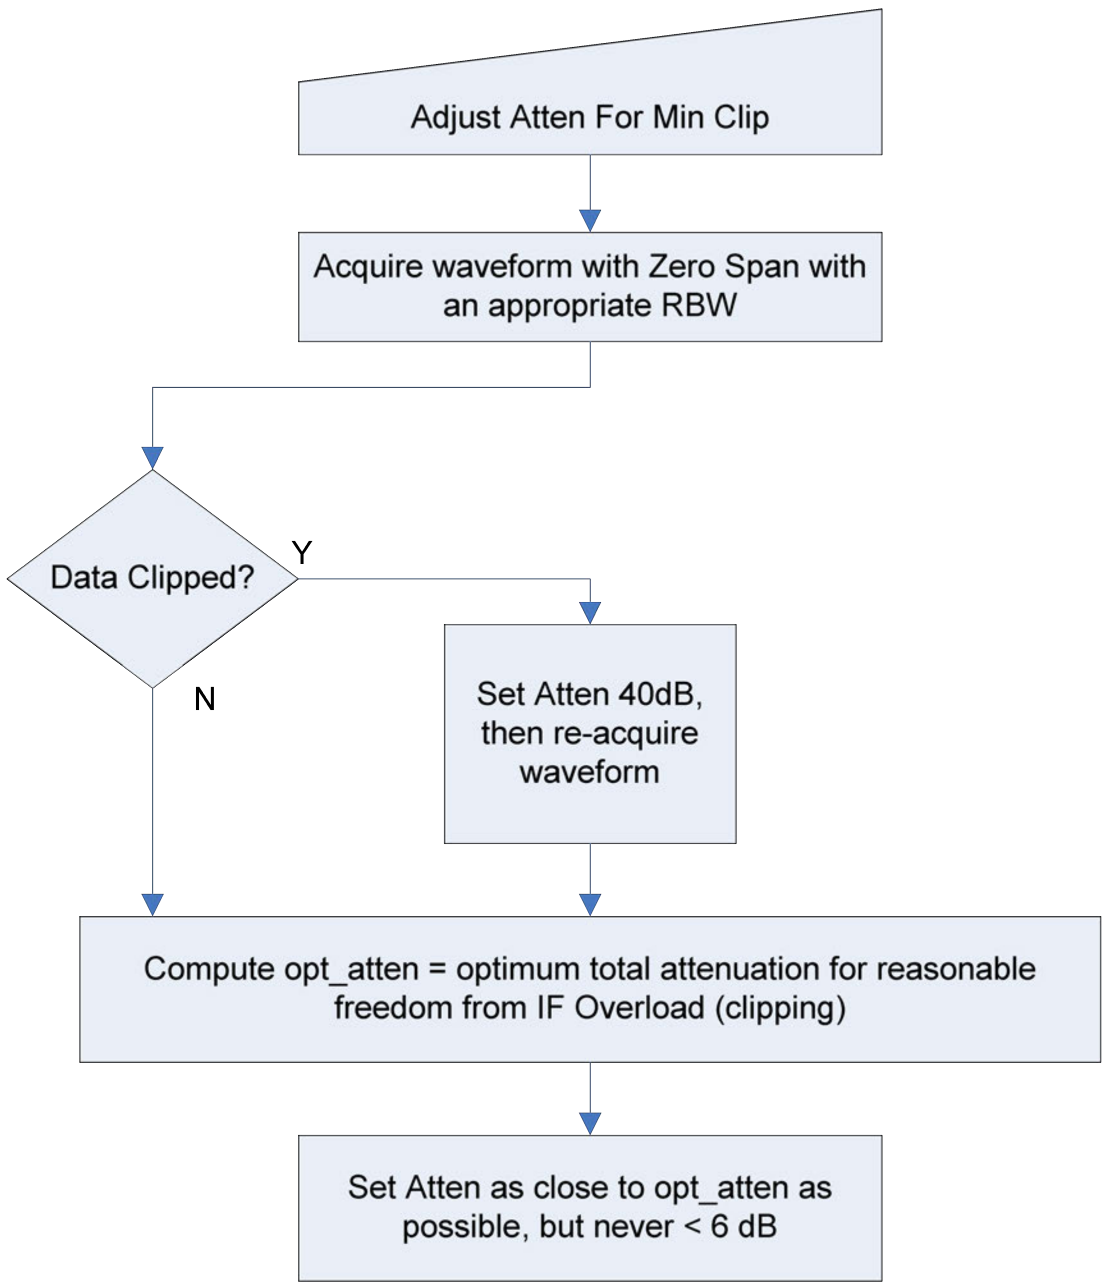
Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF | ON | ELECtrical | COMBined` `[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?`
Example	`:POW:RANG:OPT:ATT OFF` `:POW:RANG:OPT:ATT?`
Notes	The parameter option ELECtrical sets this function to ON in Single-Attenuator models The parameter option COMBined is mapped to ELECtrical in Single-Attenuator models. If you send COMBined, it sets the function to ON and returns ELEC to a query For SCPI compatibility with models that do not have an input attenuator, the ON parameter is honored and mapped to COMBined
Dependencies	This control only appears in Dual-Attenuator models with an Electronic Attenuator installed In instruments with Dual-Attenuator model, when **Enable** "Elec Atten" on page 1753 is OFF or grayed-out, "Pre-Adjust for Min Clipping" on page 306 is grayed-out This control does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements For the Waveform measurement, this control is available only in 5G NR Mode
Preset	OFF when Elec Atten is Disabled at preset, otherwise ELEC
State Saved	Saved in instrument state
Range	Dual-Attenuator models: Off | Elec Atten Only | Mech + Elec Atten Single-Attenuator models: Off | On

Notes	ON aliases to "Elec Atten Only" (`:POW:RANG:OPT:ATT ELEC`) OFF aliases to "Off" (`:POW:RANG:OPT:ATT OFF`) `:POW:RANG:AUTO?` returns true if `:POW:RANG:OPT:ATT` is not OFF
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:RANGe:AUTO ON | OFF | 1 | 0` `[:SENSe]:POWer[:RF]:RANGe:AUTO?`

Adjustment Algorithm

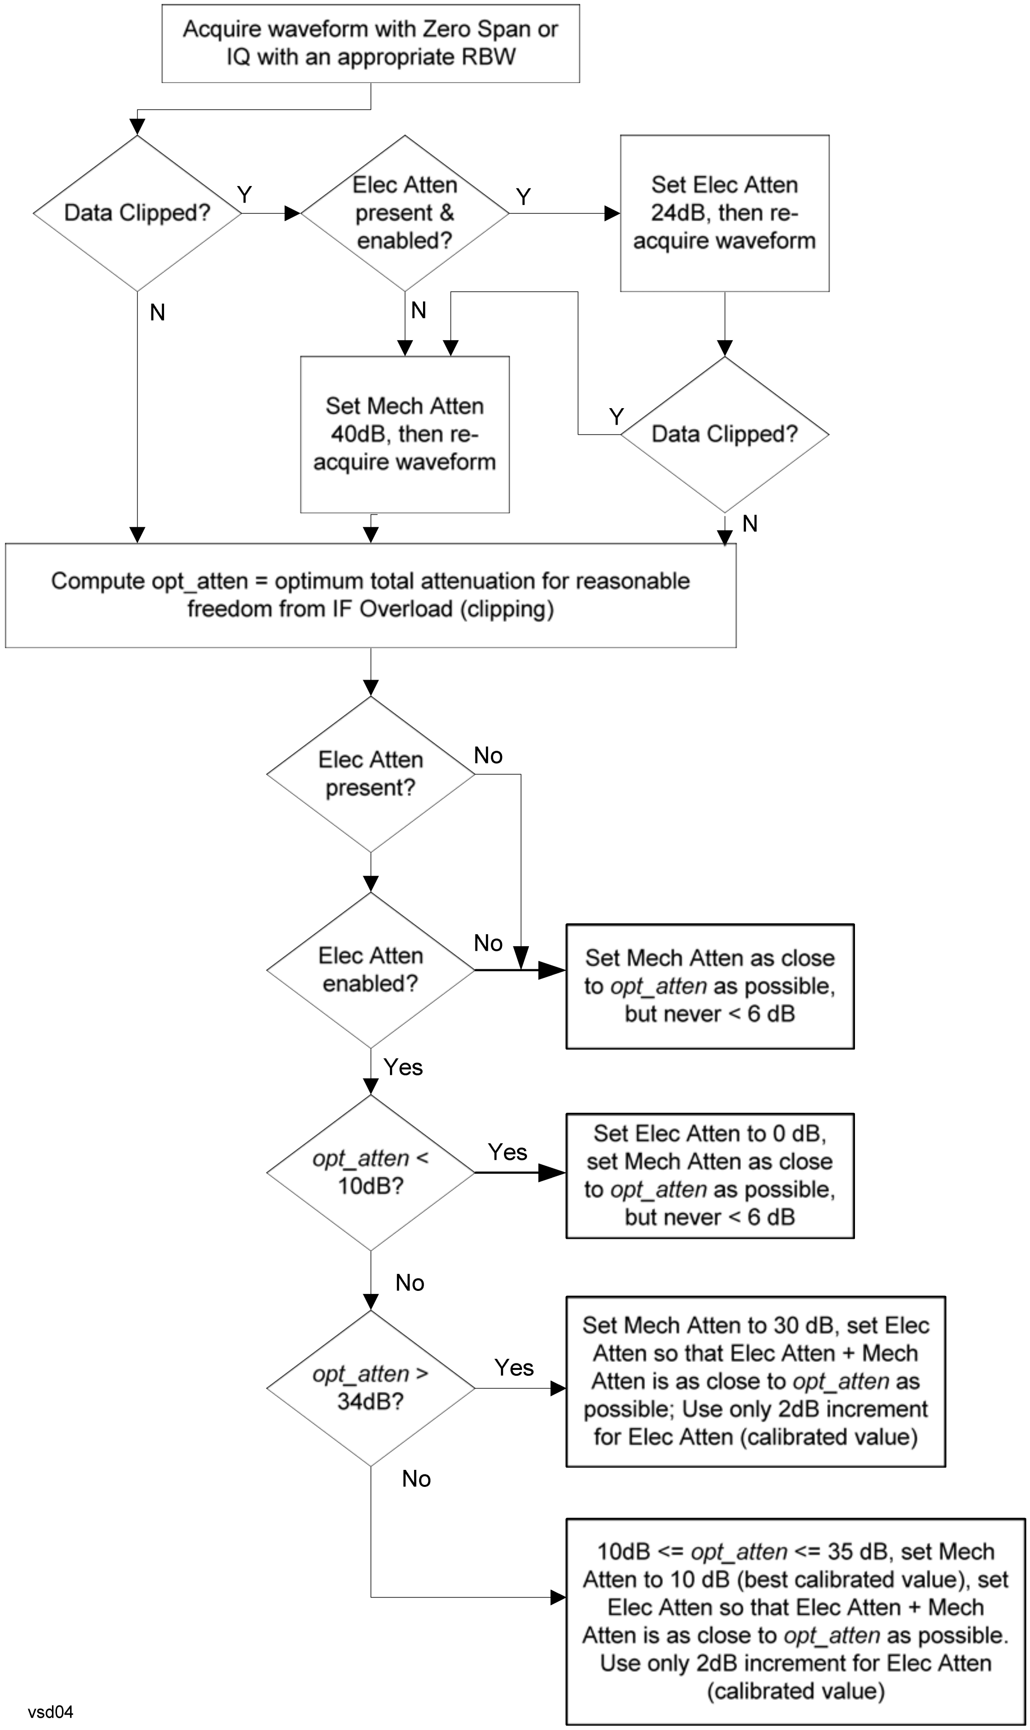
The algorithms for the adjustment are documented below:

Single-Attenuator Models



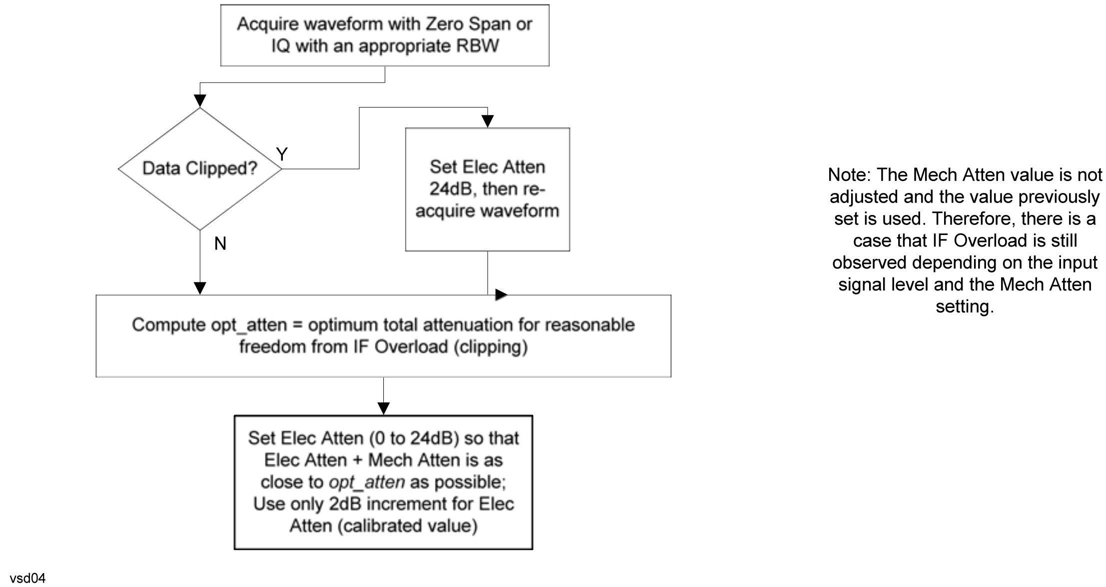
Dual-Attenuator models

"Adjust Atten for Min Clipping" on page 1756 or "Pre-Adjust for Min Clipping" on page 306 selection is Mech + Elec Atten:



Acquire waveform with Zero Span or IQ with an appropriate RBW
Data Clipped?
Y
N
Elec Atten present & enabled?
Y
N
Set Elec Atten 24dB, then re-acquire waveform
Set Mech Atten 40dB, then re-acquire waveform
Y
Data Clipped?
N
Compute opt_atten = optimum total attenuation for reasonable freedom from IF Overload (clipping)
Elec Atten present?
No
Elec Atten enabled?
No
Set Mech Atten as close to opt_atten as possible, but never < 6 dB
Yes
opt_atten < 10dB?
Yes
Set Elec Atten to 0 dB, set Mech Atten as close to opt_atten as possible, but never < 6 dB
No
opt_atten > 34dB?
Yes
Set Mech Atten to 30 dB, set Elec Atten so that Elec Atten + Mech Atten is as close to opt_atten as possible; Use only 2dB increment for Elec Atten (calibrated value)
No
10dB <= opt_atten <= 35 dB, set Mech Atten to 10 dB (best calibrated value), set Elec Atten so that Elec Atten + Mech Atten is as close to opt_atten as possible. Use only 2dB increment for Elec Atten (calibrated value)
vsd04

"Pre-Adjust for Min Clipping" on page 306 selection is Elec Only:



Mech Atten Step

Controls thestep size used when making adjustments to the input attenuation.

This control is labeled **Mech Atten Step** in Dual-Attenuator models and **Atten Step** in Single-Attenuator models. In the Dual-Attenuator configuration, this control only affects the step size of the mechanical attenuator.

Remote Command	`[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement] 10 dB | 2 dB` `[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement]?`
Example	`:POW:ATT:STEP 2` `:POW:ATT:STEP?`
Notes	This feature has a toggle choice from the front panel, but it takes a specific value (in dB) when used remotely. The only valid values are 2 and 10
Dependencies	Blanked in EXA, CXA and CXA-m if option FSA (2 dB steps) is not present. If blanked, attempts to set it via SCPI yield an error
Couplings	When the attenuation step size changes, the current mechanical attenuation value is adjusted (if necessary) to be quantized to the new step size. That is, if step is set to 10 dB, mech atten is increased if necessary so it is a multiple of 10 dB
Preset	EXA, CXA and CXA-m: 10 dB (2 dB with option FSA) All other models: 2 dB
State Saved	Saved in instrument state

Max Mixer Level

Allows you to set the maximum level to be applied to the mixer for a signal at the top of the screen. By setting this value up or down you can allow more or less signal through the system.

The major impact of changes to **Max Mixer Level** is seen in changes to the value to which **Reference Level** is limited. Max Ref Level depends on Max Mixer Level and Attenuation, and therefore a higher Max Mixer Level may let you set Ref Level higher. However, changing this value can impact your TOI, compression, or dynamic range. The preset value of this function is best for most measurements.

See also "Max Mixer Lvl Rules" on page 1762.

Remote Command	`[:SENSe]:POWer[:RF]:MIXer:RANGe[:UPPer] <real>` `[:SENSe]:POWer[:RF]:MIXer:RANGe[:UPPer]?`
Example	`:POW:MIX:RANG -15 dBm` `:POW:MIX:RANG?`
Dependencies	Only appears in Swept SA and RTSA measurements
Preset	-10 dBm
State Saved	Saved in instrument state
Min	-50 dBm
Max	0 dBm

Max Mixer Lvl Rules

Allows you to optimize the Max Mixer Level setting for certain kinds of measurements.

- `NORMal` – The historical, and thus backwards compatible, setting range (–50 to 0 dBm) and default setting (–10 dBm). The instrument has been designed so that, at the default setting, any signal below the **Reference Level** is extremely unlikely to create ADC overloads. At this mixer level the scale fidelity will be within specifications, thus compression with be negligible.
- `TOI` – Allows a range of settings of the "Max Mixer Level" on page 1762, –50 to –10 dBm, that can be optimum for measurements limited by the instrument third-order dynamic range. The default setting, –25 dBm, is commonly appropriate but RBW affects this. A good setting for Max Mixer Level would be higher than the optimum mixer level by half of the attenuator step size.
- `COMPression` – Allows a range of settings of the Max Mixer Level, –10 to +10 dBm or more, that can be optimum for measurements limited by the tradeoffs between instrument accuracy due to compression, and dynamic range due to the noise floor. The default setting, –3 dBm, is commonly appropriate, representing mixer drive levels that cause 1 dB or less compression at most carrier

frequencies. Typical measurements that would be optimized by this setting are the measurement of low sideband levels, including nulls, in angle-modulated signals (FM and PM). Also pulsed-RF measurements, including finding nulls to estimate pulse width, which are often best done with significant overdrive (compression) of the front end.

Setting Name (readback)	Setting Name (verbose)	Max Mixer Level Preset Value, dBm	Max Mixer Level minimum value, dBm	Max Mixer Level maximum value, dBm
NORMal	Normal – balance TOI, noise, and compression	–10	–50	0
TOI	TOI-limited dynamic range	–25	–50	–10
COMPression	Compression-limited dynamic range	–3	–10	+30

Remote Command	[:SENSe]:POWer[:RF]:MIXer:RULEs NORMal | TOI | COMPression [:SENSe]:POWer[:RF]:MIXer:RULEs?
Example	:POW:MIX:RULE:COMP
Dependencies	Only appears in Swept SA and RTSA
Preset	NORM

3.3.3.3 Range (Non-attenuator models)

This tab is only available for Keysight's modular signal analyzers and certain other Keysight products. Examples include:

– VXT

– E7760

– M9391A

– M9393A

This tab also does not appear in UXM. In UXM, all Attenuation and Range settings are disabled, as the expected input power level is handled by the Call Processing App that drives the DUT power control.

State Saved	No

Range

Represents the amplitude of the largest sinusoidal signal that could be present within the IF without being clipped by the ADC. For signals with high peak-to-average ratios, the range may need to exceed the rms signal power by a significant amount to avoid clipping.

This is a measurement global setting.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe <real>` `[:SENSe]:POWer[:RF]:RANGe?`
Example	`:POW:RANG 10 dBm` `:POW:RANG?`
Notes	The MIN and MAX values are affected by the External Gain parameters, and by the **Center Frequency** The hardware compensates for frequency response and alters the Range setting
Preset	0 dBm
State Saved	Yes
Min	-100
Max	100
Annotation	Meas Bar

Adjust Range for Min Clipping

Sets the combination of attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an "immediate action" function, that is, it executes once, when the key is pressed.

This key does not appear in measurements that do not support this functionality.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMediate`
Notes	Executing Adjust Range for Min Clipping initiates the measurement
Dependencies	This control does not appear in the Swept SA and Monitor Spectrum measurements This control appears in all measurements in E7760

Pre-Adjust for Min Clipping

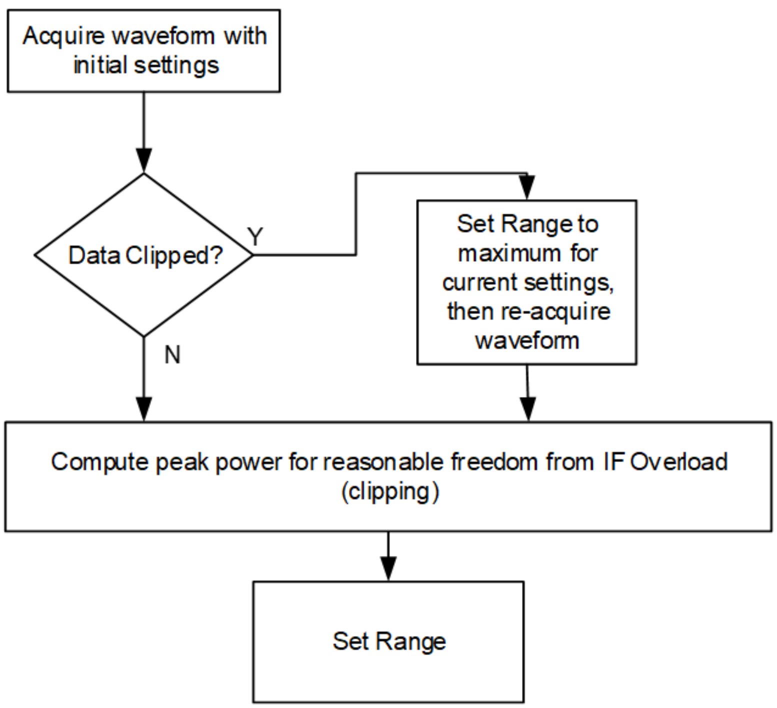
If this function is ON, it applies the adjustment described under Adjust Range For Min Clipping each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF | ON | ELECtrical`

	| COMBined [:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?
Notes	Because there is no attenuator control available in these models, the control displays only ON and OFF choices. However, for SCPI compatibility with other platforms, all three parameters (ELECtrical, COMBined, and ON) are honored and all are mapped to ELECtrical, so if any of these three parameters is sent, a subsequent query will return ELEC
Dependencies	This control does not appear in the Swept SA and Monitor Spectrum measurements This control appears in all measurements in E7760
Preset	OFF for Swept SA measurement; ON for all other measurements that support **Pre-Adjust for Min Clipping**
State Saved	Saved in instrument state

Adjustment Algorithm

The algorithm for the adjustment is documented below:



Peak-to-Average Ratio

Used with "Range (Non-attenuator models)" on page 1864 to optimize the level control in the instrument. The value is the ratio, in dB, of the peak power to the average power of the signal to be measured. A ratio of 0 should be used for sinusoidal signals; for 802.11g OFDM signals use 9 dB.

All Applications (Modes) show the current value of Peak-to-Average ratio on the control. However, some applications do not permit changing the value. In these situations, the control is grayed-out.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:PARatio <real>` `[:SENSe]:POWer[:RF]:RANGe:PARatio?`
Example	`:POW:RANG:PAR 12 dB`
Notes	In some Applications (Modes) this parameter is read-only; meaning the value will appear on the control and query via SCPI, but is not changeable. In such applications the control is grayed-out. Attempting to change the value via SCPI will be ignored but no error message will be generated
Dependencies	This control does not appear in Spectrum Analyzer Mode
Preset	10 dB VXT Models M9410A/11A: 0 dB
State Saved	Saved in instrument state
Min	0 dB
Max	20 dB VXT Models M9410A/11A: 50 dB

Mixer Lvl Offset

This is an advanced setting to adjust target Range at the input mixer, which in turn affects the signal level in the instrument's IF. This setting can be used when additional optimization is needed after setting "Peak-to-Average Ratio" on page 1866. Positive values of offset optimize noise performance over distortion, negative values optimize distortion performance over noise.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet <real>` `[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet?`
Example	`:POW:RANG:MIX:OFFS -5 dB`
Preset	0 dB
State Saved	Saved in instrument state
Min	-35 dB VXT Models M9410A/11A: -34 dB
Max	30 dB

3.3.3.4 Range (Baseband Input models)

This tab is only available when Option BBA is present (I/Q Baseband Inputs), the current measurement supports option BBA, and I/Q is the selected input. It replaces the Attenuation tab in that case.

Each input channel (I and Q) has four internal gain ranges. The maximum allowed voltage in each gain range is slightly more than the nominal value, so the break point between ranges is a few millivolts higher than the nominal (setting a peak voltage of 0.502 mV will still map to the 0.5 V Peak range).

Gain Setting	Volts RMS	Volts Peak	Volts Peak - Peak	dBm (50Ω)	Break Point
0 dB	0.7071	1.0	2.0	10	n/a
6 dB	0.3536	0.5	1.0	4	0.502 V Peak
12 dB	0.1768	0.25	0.5	-2	0.252 V Peak
18 dB	0.0884	0.125	0.25	-8	0.127 V Peak

Dependencies	Available only when the selected input is I/Q. If the current measurement does not support baseband inputs, an error will be displayed: "No result; Meas invalid with I/Q inputs"
State Saved	No

Range Auto/Man

The Auto setting for Range causes the range to be set based on the Y Scale settings. When Range is "Auto", the I & Q Range are set based on the top of the Y Scale when the Y scale is in dB units (for example, power), or to the max(abs(top), abs(bottom)) when the Y scale reference is not at the top of the screen.

Not all measurements support **Range Auto/Man**. If Auto is not supported in the current measurement, this control is grayed-out displaying "Man", and `MAN` is returned to a SCPI query, but this does *not* change the Auto/Man setting for Range. When you switch to a measurement that supports Auto, it goes back to Auto if it was previously in Auto mode.

Remote Command	`[:SENSe]:VOLTage:IQ:RANGe:AUTO OFF | ON | 0 | 1` `[:SENSe]:VOLTage:IQ:RANGe:AUTO?`

Example	Put the I Range and Q Range in manual.
	`:VOLT:IQ:RANG:AUTO OFF`
	`:VOLT:IQ:RANG:AUTO?`

Dependencies	If Auto is not supported, sending the SCPI command generates an error
Couplings	When in Auto, both I Range and Q Range are set to the same value, computed as follows: Maximum absolute value is computed for the Y Scale. The top and bottom of the graph are computed based on Ref Value, Scale/Div, and Ref Position. Formula: Y_{Max} = max(abs(top), abs(bottom)) The I Range and Q Range are then set to Y_{Max}
Preset	ON
State Saved	Saved in instrument state
Annotation	When in Man, the Range annotation is preceded by "#"

This is an alternate form of the command to match the `POWer` form of the I Range and Q Range SCPI.

Remote Command	`[:SENSe]:POWer:IQ:RANGe:AUTO OFF | ON | 0 | 1` `[:SENSe]:POWer:IQ:RANGe:AUTO?`

Example	Put the I Range and Q Range in manual
	`:POW:IQ:RANG:AUTO OFF`
	`:POW:IQ:RANG:AUTO?`

Notes	`:POW:IQ:RANG:AUTO` is an alternate form of `:VOLT:IQ:RANG:AUTO`, to maintain consistency with I Range and Q Range, which support both the `POWer` and `VOLTage` forms of the command
Preset	`ON`
Range	Auto | Man

I Range

The internal gain range for the I channel when the Input Path is I Only or I and I/Q. Used for both the I and Q channels when the Input Path is I+jQ.

Remote Command	`[:SENSe]:VOLTage:IQ[:I]:RANGe[:UPPer] <voltage>` `[:SENSe]:VOLTage:IQ[:I]:RANGe[:UPPer]?`

Example	Set the I Range to 0.5 V Peak
	`:VOLT:IQ:RANG 0.5 V`
	`:VOLT:IQ:RANG?`

Notes	The numeric entries are mapped to the smallest gain range whose break point is greater than or equal to the value, or 1 V Peak if the value is greater than 1 V
Couplings	When "Q Same as I" on page 1580 is On, the **I Range** value will be copied to "Q Range" on page 1578 Changing the value also sets Range = Man
Preset	1 V Peak
State Saved	Saved in instrument state
Range	1 V Peak (10 dBm @ 50 Ω) | 0.5 V Peak (4 dBm @ 50Ω) | 0.25 V Peak (-2 dBm @ 50Ω) | 0.125 V Peak (-8 dBm @ 50Ω)
Min	0.125 V
Max	1 V
Annotation	The Range annotation replaces the RF Input context's "Atten" annotation "Rng: <I Range>". When Range = Man the annotation is preceded by "#" The I Range is not annotated in Input Path Q Only. When I Range and Q Range are the same, the annotation is "Rng: <Range>". When I Range and Q Range are different and the Input Path is Ind I/Q, the annotation is "Rng: <I Range>, <Q Range>" and "Peak" is removed from the text. Examples: "Rng: 1 V Peak" the I Range is 1 V Peak "Rng: 1 V, 0.5 V " the I Range is 1 V Peak and the Q Range is 0.5 V Peak

This is an alternate form of the command to allow entry as a power.

Remote	`[:SENSe]:POWer:IQ[:I]:RANGe[:UPPer] <ampl>`

Command	`[:SENSe]:POWer:IQ[:I]:RANGe[:UPPer]?`

Example	Set the I Range to 0.5 V Peak when Reference Z is 50 Ω, and to 1.0 V Peak when Reference Z is 75 **Ω**
	`:POW:IQ:RANG 4 dBm`
	`:POW:IQ:RANG?`

Notes	The `POWer` form of the command is provided for convenience. It maps to the same underlying gain range parameter as the `VOLTage` form of the command The Reference Z (not the I channel Input Z) is used to convert the power to peak voltage, which is then used to set the I Range as with the `VOLTage` form of the command. The power values of the 4 range states (1V Peak, 0.5V Peak, 0.25V Peak, and 0.125V Peak) will vary with Reference Z. Here are some examples: 50 Ω: 10, 4, -2, -8 75 Ω: 8.2, 2.2, -3.8, -9.8 600 Ω: -0.8, -6.8, -12.8, -18.9
Preset	10.0 dBm
Range	-20 dBm to 10 dBm
Min	-20 dBm
Max	10 dBm

Q Range

The internal gain range for the Q channel.**Q Range** only applies to Input Path Q Only and Ind I/Q. For input I+jQ "I Range" on page 1577 determines both I and Q channel range settings.

Remote Command	`[:SENSe]:VOLTage:IQ:Q:RANGe[:UPPer] <voltage>` `[:SENSe]:VOLTage:IQ:Q:RANGe[:UPPer]?`

Example	Set the Q Range to 0.5 V Peak:
	`:VOLT:IQ:Q:RANG 0.5 V`
	`:VOLT:IQ:Q:RANG?`

Notes	The numeric entries are mapped to the smallest gain range whose break point is greater than or equal to the value, or 1 V Peak if the value is greater than 1 V **Q Range** is only used for Input Path Q Only and Ind I/Q. For input I+jQ, "I Range" on page 1577 determines both I and Q channel range settings
Couplings	When "Q Same as I" on page 1580 is On, the "I Range" on page 1577 value is copied to **Q Range** and the range value keys are disabled Changing the value also sets Range = Man
Preset	1 V Peak
State Saved	Saved in instrument state
Range	1 V Peak (10 dBm @ 50Ω) | 0.5 V Peak (4 dBm @ 50Ω) | 0.25 V Peak (-2 dBm @ 50Ω) | 0.125 V Peak (-8 dBm @ 50Ω)
Min	0.125 V

Max	1 V
Annotation	The Range annotation replaces the RF Input context's "Atten" annotation "Rng: <Q Range>". When Range = Man the annotation is preceded by "#" The Q Range is not annotated in Input Path I Only or I+jQ. When I Range and Q Range are the same, the annotation is "Rng: <Range>". When I Range and Q Range are different and the Input Path is Ind I/Q, the annotation is "Rng: <I Range>, <Q Range>" and "Peak" is removed from the text. Examples: "Rng: 1 V Peak" the Q Range is 1 V Peak "Rng: 1 V, 0.5 V " the I Range is 1 V Peak and the Q Range is 0.5 V Peak

This is an alternate form of the command to allow entry as a power.

Remote Command	`[:SENSe]:POWer:IQ:Q:RANGe[:UPPer] <ampl>` `[:SENSe]:POWer:IQ:Q:RANGe[:UPPer]?`

Example	Sets the Q Range to 0.5 V Peak when Reference Z is 50 Ω, and to 1.0 V Peak when Reference Z is 75 Ω:
	`:POW:IQ:Q:RANG 4 dBm`
	`:POW:IQ:Q:RANG?`

Notes	The `POWer` form of the command is provided for convenience. It maps to the same underlying gain range parameter as the `VOLTage` form of the command The Reference Z (not the Q channel Input Z) is used to convert the power to peak voltage, which is then used to set the Q Range as with the `VOLTage` form of the command. The power values of the 4 range states (1V Peak, 0.5V Peak, 0.25V Peak, and 0.125V Peak) will vary with Reference Z. Here are some examples: 50 Ω: 10, 4, -2, -8 75 Ω: 8.2, 2.2, -3.8, -9.8 600 Ω: -0.8, -6.8, -12.8, -18.9
Preset	10.0 dBm
Range	-20 dBm to 10 dBm
Min	-20 dBm
Max	10 dBm

Q Same as I

Many, but not all, usages require the I and Q channels to have an identical setup. To simplify channel setup, **Q Same as I** causes the Q channel range to be mirrored from the I channel. That way you only need to set up one channel (the I channel). The I channel values are copied to the Q channel, so at the time **Q Same as I** is Off, the I and Q channel setups will be identical.

Remote Command	`[:SENSe]:VOLTage|POWer:IQ:MIRRored OFF | ON | 0 | 1` `[:SENSe]:VOLTage|POWer:IQ:MIRRored?`
Example	Turn off the mirroring of I Range to Q Range. `:VOLT:IQ:MIRR OFF`

	:POW:IQ:MIRR OFF
Couplings	When ON, the "I Range" on page 1577 value is mirrored (copied) to the "Q Range" on page 1578
Preset	ON
State Saved	Saved in instrument state
Range	OFF|ON

3.3.3.5 Signal Path

Contains controls that pertain to the routing of the signal through the frontend of the instrument.

In general, this tab only appears in instruments whose hardware supports this signal routing. For example, this tab does not appear in many of the modular instrument products, including VXT Models M9420/21A. It also does not appear in UXM.

This tab *does* appear in VXT Models M9410A/11A because the Software Preselection control is in this tab, and VXT Models M9410A/11A implement a version of Software Preselection.

Presel Center

Pressing this control adjusts the centering of the preselector filter to optimize the amplitude accuracy at the frequency of the selected marker. If the selected marker is not on when **Presel Center** is pressed, the instrument turns on the selected marker, performs a peak search, and then performs centering on the marker's center frequency. If the selected marker is already on and between the start and stop frequencies of the instrument, the instrument performs the preselector calibration on that marker's frequency. If the selected marker is already on, but outside the frequency range between Start Freq and Stop Freq, the instrument first performs a peak search, and then performs centering on the marker's center frequency.

The value displayed on "Preselector Adjust" on page 1869 will change to reflect the new preselector tuning.

A number of considerations should be observed to ensure proper operation. See "Proper Preselector Operation" on page 322.

Remote Command	[:SENSe]:POWer[:RF]:PCENter
Example	:POW:PCEN
Notes	Note that the rules outlined above under the control description apply for the remote command as well as the key. The result of the command is dependent on marker position, etc. Any message shown by the control press is also shown in response to the remote command
Dependencies	Does not appear in CXA-m Does not appear in VXT Models M9410A/11A Grayed-out if the microwave preselector is off – If the selected marker's frequency is below Band 1, an advisory message is generated "Preselector

	not used in this frequency range" and no action is taken – Grayed-out if entirely in Band 0, that is, if Stop Freq is below about 3.6 GHz – Grayed-out if entirely above 50 GHz, that is, if Start Freq is above 50 GHz – Blank in models that do not include a preselector, such as option 503. If the remote command is sent in these instruments, it is accepted without error, and the query always returns 0 – Grayed-out in the Spectrogram View
Couplings	The active marker position determines where the centering will be attempted If the instrument is in a measurement such as averaging when centering is initiated, the act of centering the preselector restarts averaging, but the first average trace will not be taken until the centering is completed The offset applied to do the centering reads out on the "Preselector Adjust" on page 1869 control
Status Bits/OPC dependencies	When centering the preselector, `*OPC` will not return true until the process is complete and a subsequent measurement has completed, nor will results be returned to `:READ` or `:MEASure` queries The Measuring bit should remain set while this command is operating and should not go false until the subsequent sweep/measurement has completed

Proper Preselector Operation

A number of considerations should be observed to ensure proper operation:

1 If the selected marker is off, the instrument turns on a marker, performs a peak search, and adjusts the preselector using the selected marker's frequency. It uses the "highest peak" peak search method unqualified by threshold or excursion, so that there is no chance of a 'no peak found' error. It continues with that peak, even if it is the peak of just noise. Therefore, for this operation to work properly, there should be a signal on screen in a preselected range for the peak search to find

2 If the selected marker is already on, the instrument attempts the centering at that marker's frequency. There is no preselector for signals below about 3.6 GHz, so if the marker is on a signal below 3.6 GHz, no centering will be attempted and an advisory message generated

3 In some models, the preselector can be bypassed. If it is bypassed, no centering will be attempted in that range and a message will be generated

Preselector Adjust

Allows you to manually adjust the preselector filter frequency to optimize its response to the signal of interest. This function is only available when "Presel Center" on page 1868is available.

For general purpose signal analysis, using **Presel Center** is recommended. Centering the filter minimizes the impact of long-term preselector drift. **Preselector Adjust** can be used instead to manually optimize the preselector. One application of manual optimization would be to peak the preselector response, which both optimizes the signal-to-noise ratio and minimizes amplitude variations due to small (short-term) preselector drifting.

When **Presel Center** is performed, the offset applied to do the centering becomes the new value of **Preselector Adjust**.

Remote Command	`[:SENSe]:POWer[:RF]:PADJust <freq>` `[:SENSe]:POWer[:RF]:PADJust?`
Example	`:POW:PADJ 100KHz` `:POW:PADJ?`
Notes	The value on the control reads out to 0.1 MHz resolution
Dependencies	– Does not appear in CXA-m – Does not appear in VXT Models M9410A/11A – Grayed-out if microwave preselector is off – Grayed-out if entirely in Band 0, that is, if Stop Freq is below about 3.6 GHz – Grayed-out if entirely above 50 GHz, that is, if Start Freq is above 50 GHz – Blank in models that do not include a preselector, such as option 503. If the SCPI is sent in these instruments, it is accepted without error, and the query always returns 0 – Grayed-out in the Spectrogram View
Preset	0 MHz
State Saved	The **Preselector Adjust** value set by "Presel Center" on page 1868, or by manually adjusting **Preselector Adjust** It is not saved in instrument state, and does not survive a Preset or power cycle
Min	-500 MHz
Max	500 MHz
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:MW:PADJust` `[:SENSe]:POWer[:RF]:MMW:PADJust`

Notes	PSA had multiple preselectors, and you could select which preselector to adjust. Since the X-Series has only one mm/uW preselector, the preselector selection control is no longer available. However, to provide backward compatibility, we accept the legacy remote commands The command form has no effect, the query always returns `MWAVe`
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:PADJust:PRESelector MWAVe | MMWave | EXTernal` `[:SENSe]:POWer[:RF]:PADJust:PRESelector?`

Internal Preamp

Accesses a menu of controls for the internal preamps. Turning on the preamp gives a better noise figure, but a poorer inter-modulation distortion (TOI) to noise floor dynamic range. You can optimize this setting for your particular measurement.

The instrument takes the preamp gain into account as it sweeps. If you sweep outside of the range of the preamp, the instrument will also account for that. The displayed result always reflects the correct gain.

For some measurements, when the preamp is on and any part of the displayed frequency range is below the lowest frequency for which the preamp has specifications, a warning condition message appears in the status line. For example, for a preamp with a 9 kHz lowest specified frequency: "Preamp: Accy unspec'd below 9 kHz".

Selection	Example	Note
Off	`:POW:GAIN OFF`	
Low Band	`:POW:GAIN ON` `:POW:GAIN:BAND LOW`	Sets the internal preamp to use only the low band. The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Low Band selection in the dropdown
Full Range	`:POW:GAIN ON` `:POW:GAIN:BAND FULL`	Sets the internal preamp to use its full range. The low band (0-3.6 GHz, 0-3.4 GHz, 0-3GHz, depending on the model) is supplied by the low band preamp and the frequencies above low band are supplied by the high band preamp The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Full Range selection in the dropdown. If the high band option is not installed the Full Range selection does not appear

Remote Command	`[:SENSe]:POWer[:RF]:GAIN:BAND LOW | FULL`
	`[:SENSe]:POWer[:RF]:GAIN:BAND?`
	`[:SENSe]:POWer[:RF]:GAIN[:STATe] OFF | ON | 0 | 1`
	`[:SENSe]:POWer[:RF]:GAIN[:STATe]?`

Example	`:POW:GAIN:BAND LOW`
	`:POW:GAIN:BAND?`
	`:POW:GAIN OFF`
	`:POW:GAIN?`

Dependencies	Preamp is not available on all hardware platforms. If the preamp is not present or is unlicensed, the control is not shown

	Does not appear in VXT Models M9410A/11A/15A If `:POW:GAIN:BAND FULL` is sent when a low band preamp is available, the preamp band parameter is set to `LOW` instead of `FULL`, and an "Option not installed" message is generated The preamp is not available when the electronic/soft attenuator is enabled
Preset	`LOW` `OFF`
State Saved	Saved in instrument state
Annotation	When the USB Preamp is not connected to USB, the Preamp annotation in the Meas Bar says "Off" if the preamp is off and displays the frequency range of the low band or full range preamp depending on the setting. For example, if the Preamp is set to Low Band and the Low Band is 3.6 GHz the annotation says "3.6 GHz". If it is a 13.6 GHz preamp and it is set to Full Range the annotation says "13.6 GHz" When the USB Preamp is connected to USB, the Preamp annotation says "Preamp: USB" if the internal preamp is off or "Preamp: USB, Int" if the internal preamp is on (only for measurements that support the USB preamp)

LNA

Lets you turn the Low Noise Amplifier (**LNA**) on or off.

The LNA is an additional preamplifier that provides superior DANL and frequency range compared to the Internal Preamp. The LNA provides lower system noise figure, especially at frequencies above 100 MHz, and can be operated up to the full range of 50 GHz instruments.

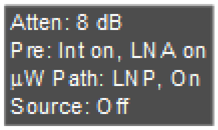
For best possible sensitivity, the LNA can be turned on together with the "Internal Preamp" on page 1870, although if you operate both preamps together, note that the TOI (distortion) specifications are impacted. The sensitivity improvement of this combination is substantial when operating in high band (frequencies above 3.6 GHz).

See "More Information" on page 326

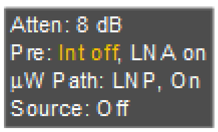
Remote Command	`[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe] OFF | ON | 0 | 1` `[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe]?`
Example	`:POW:GAIN:LNA ON`
Dependencies	Requires option LNA Option LNA is not required by VXT model M9415A Does not appear in VXT models M9420A/21A/10A/11A May not appear in some measurements
Preset	`OFF`
State Saved	Saved in State

More Information

When the LNA is installed, the preamp annotation changes to show the state of both the LNA and the Internal Preamp. Below is an example:



Note that when operating entirely in the low band (below about 3.6 GHz), if the LNA is on, the Internal Preamp is switched off (even if you have its switch set to ON). This is because the noise performance is actually degraded in low band if both preamps are on. In this case, the annotation reflects the actual state of the two preamps, but the Internal Preamp annotation displays in amber, to warn you that the actual state of the Internal Preamp does not match the **Internal Preamp** switch control display:



µW Path Control

Options for this control include **µW Preselector Bypass** (Option MPB), **Low Noise Path** (Option LNP) and **Full Bypass Enable** in the High Band path circuits.

When the µW Preselector is bypassed, flatness is improved, but will be subject to spurs from out of band interfering signals. When **Low Noise Path Enable** is selected, the instrument automatically bypasses certain circuitry in the high frequency bands that can contribute to noise, when it is appropriate based on other instrument settings.

For most applications, the preset state is **Standard Path**, which provides the best remote-control throughput, minimizes acoustic noise from switching and minimizes the risk of wear in the hardware switches, particularly in remote test scenarios where both low band and high band setups will follow in rapid succession. In this path, the bypass of the low band/high band switch and microwave preamp is never activated, which can cause some noise degradation but preserves the life of the bypass switch.

For applications that utilize the wideband IF paths, the preset state is **µW Preselector Bypas**s, if option MPB is present. This is because, when using a wideband IF such as the 140 MHz IF, the µW Preselector's bandwidth can be narrower than the available IF bandwidth, causing degraded amplitude flatness and phase linearity, so it is desirable to bypass the preselector in the default case.

You may choose **Low Noise Path Enable** for a lower noise floor, especially in the 21-26.5 GHz region, though without improving many measures of dynamic range, and without giving the best possible noise floor. The preamp, if purchased and used, gives better noise floor than does **Low Noise Path Enable**, but the preamp's compression threshold and third-order intercept are much poorer than that of **Low Noise Path Enable**.

A fourth choice is **Full Bypass Enable**, which combines **µW Preselector Bypass** and **Low Noise Path Enable**. Because this can bypass most of the circuitry between the input and the first mixer, care should be taken when using this setting to avoid damaging the mixer. **Full Bypass Enable** is only available if both options LNP and MPB are present, as well as option FBP.

Path	Example	Note
Standard Path	`:POW:MW:PATH STD`	Normal setting for most measurements. µW Preselector in circuit, Low Noise Path disabled
Low Noise Path Enable	`:POW:MW:PATH LNP`	See "Low Noise Path Enable" on page 330
µW Preselector Bypass	`:POW:MW:PATH MPB`	See "µW Preselector Bypass" on page 332
Full Bypass Enable	`:POW:MW:PATH FULL`	See "Full Bypass Enable" on page 333

Remote Command	`[:SENSe]:POWer[:RF]:MW:PATH STD | LNPath | MPBypass | FULL` `[:SENSe]:POWer[:RF]:MW:PATH?`

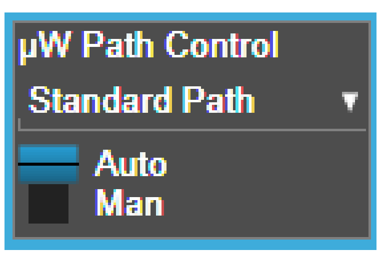
Example	`:POW:MW:PATH LNP`
	Enables the Low Noise path
	`:POW:MW:PATH?`

Notes	If "Presel Center" on page 1868 is performed, the instrument will momentarily switch to the Standard Path, regardless of the setting of **µW Path Control** The DC Block will always be switched in when the low noise path is switched in, to protect succeeding circuitry from DC. Note that this does not mean "when the low noise path is enabled" but when, based on the Low Noise Path rules, the path is actually switched in. This can happen when the selection is **Low Noise Path Enable** or **Full Bypass Enable**. In the case where the DC Block is switched in the instrument is now AC coupled. However, if you selected DC coupling, the UI would still behave as though it were DC coupled, including all annunciation, warnings, status bits, and responses to SCPI queries. This is because, based on other settings, the instrument could switch out the low noise path at any time and hence go back to being DC coupled Alignment switching ignores the settings in this menu, and restores them when finished
Dependencies	Does not appear in CXA-m Does not appear in VXT Models M9410A/11A Does not appear in BBIQ and External Mixing The **Low Noise Path Enable** selection does not appear unless Option LNP is present and licensed The **µW Preselector Bypass** selection does not appear unless Option MPB is present and licensed The **Full Bypass Enable** selection does not appear unless options LNP and MPB are both present as well as option FBP In any of these cases, if the required options are not present and the SCPI command is sent, error -241, "Hardware missing; Option not installed" is generated

	Low Noise Path Enable and **Full Bypass Enable** are grayed-out if the current measurement does not support them **Low Noise Path Enable** and **Full Bypass Enable** are not supported in Avionics and MMR Modes. In any of these cases (that is, the feature is not supported in either measurement or mode), if the SCPI command is sent, the following error is generated: -221, “Setting Conflict; Feature not supported for this measurement”
Preset	All except modes specified below: `STD` IQ Analyzer, VXA, Pulse and Avionics mode: – MPB option present and licensed: `MPB` – MPB option not present and licensed: `STD`
State Saved	Save in instrument state
Range	Standard Path|Low Noise Path Enable|µW Presel Bypass|Full Bypass Enable
Annotation	In the Meas Bar, if the Standard path is chosen, it says: µW Path: Standard If Low Noise Path is enabled but the LNP switch is not thrown, it shows: µW Path: LNP,Off If the Low Noise Path is enabled and the LNP switch IS thrown, it shows: µW Path: LNP,On If the preselctor is bypassed, it says: µW Path: Bypass If Full Bypass Enable is selected but the LNP switch is not thrown, it shows: µW Path: FByp,Off If Full Bypass Enable is selected and the LNP switch IS thrown, it shows: µW Path: FByp,On

µW Path Control Auto [Mode: VMA, WLAN, NR5G, CQM]

In VMA, WLAN, 5G NR, CQM modes, an Auto/Man switch is added to **µW Path Control**:



This allows the function to automatically switch based on certain Auto Rules as shown below:

VMA Mode

Measurement	When µW Path Control is in Auto:
Digital Demod	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Monitor Spectrum	Always Presel Bypass
IQ Waveform	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Custom OFDM	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Channel Power	Always Presel Bypass
Occupied BW	Always Presel Bypass
CCDF	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
ACP	Always Presel Bypass
SEM	Always Presel Bypass
Spurious Emissions	Always Standard Path

WLAN Mode

Measurement	When µW Path Control is in Auto:
Modulation Analysis	Always Presel Bypass
Spectral Flatness	Always Presel Bypasss
Power vs Time	Always Presel Bypass
Monitor Spectrum	Always Presel Bypass
IQ Waveform	Always Presel Bypass
Channel Power	Always Presel Bypass
Occupied BW	Always Presel Bypass
CCDF	Always Presel Bypass
SEM	1. For 11be 320M, when 'Enabled Wideband IF for FFT' is OFF or 'Sweep Type Rule' is Best Dynamic Range, auto µW path is standard. 2. For other cases, auto µW path is presel bypass if presel bypass is enabled, auto µW path is standard if presel bypass is not enabled.
Spurious Emissions	Always Standard Path

5G NR Mode

Measurement	When µW Path Control is in Auto:
Modulation Analysis	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Full Bypass if conditions warrant(FBP Option is available and "Allow Full Bypass in Auto" is On), otherwise choose Preselector Bypass
Monitor Spectrum	Always Standard Path
IQ Waveform	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in

Measurement	When µW Path Control is in Auto:
	which case choose Full Bypass if conditions warrant(FBP Option is available and "Allow Full Bypass in Auto" is On), otherwise choose Preselector Bypass
Channel Power	Always Standard Path
Occupied BW	Always Standard Path
CCDF	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
ACP	Always Standard Path
SEM	Always Standard Path
Spurious Emissions	Always Standard Path
Transmit On|Off Power	Use Standard Path unless tuned frequency > 3.6 GHz and Info BW > 15 MHz, in which case choose Preselector Bypass

Channel Quality Mode

Measurement	When µW Path Control is in Auto:
Group Delay	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Full Bypass if conditions warrant(FBP Option is available and "Allow Full Bypass in Auto" is On), otherwise choose Preselector Bypass
Monitor Spectrum	Always Standard Path
IQ Waveform	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
CCDF	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass

Remote Command	`[:SENSe]:POWer[:RF]:MW:PATH:AUTO ON | OFF | 1 | 0` `[:SENSe]:POWer[:RF]:MW:PATH:AUTO?`
Example	`:POW:MW:PATH:AUTO ON` `:POW:MW:PATH:AUTO?`
Dependencies	Only appears in VMA, WLAN, 5G NR and CQM modes
Couplings	See the tables above
Preset	ON
Range	ON|OFF

Low Noise Path Enable

You may select **Low Noise Path Enable**, which gives a lower noise floor under some circumstances, particularly when operating in the 21–26.5 GHz region. With the Low Noise Path enabled, the low band/high band switch and microwave preamp are bypassed whenever all of the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz
- the internal preamp is not installed or (if installed) is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Low Noise Path Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the **Low Noise Path Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Low Noise Path Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

For measurements that use IQ acquisition, the low noise path is used when **Center Frequency** is in High Band (> 3.6 GHz) and no preamp is in use. In other words, the rules above are modified to use only the center frequency to qualify which path to switch in. This is not the case for FFTs in the Swept SA measurement; they use the same rules as swept measurements.

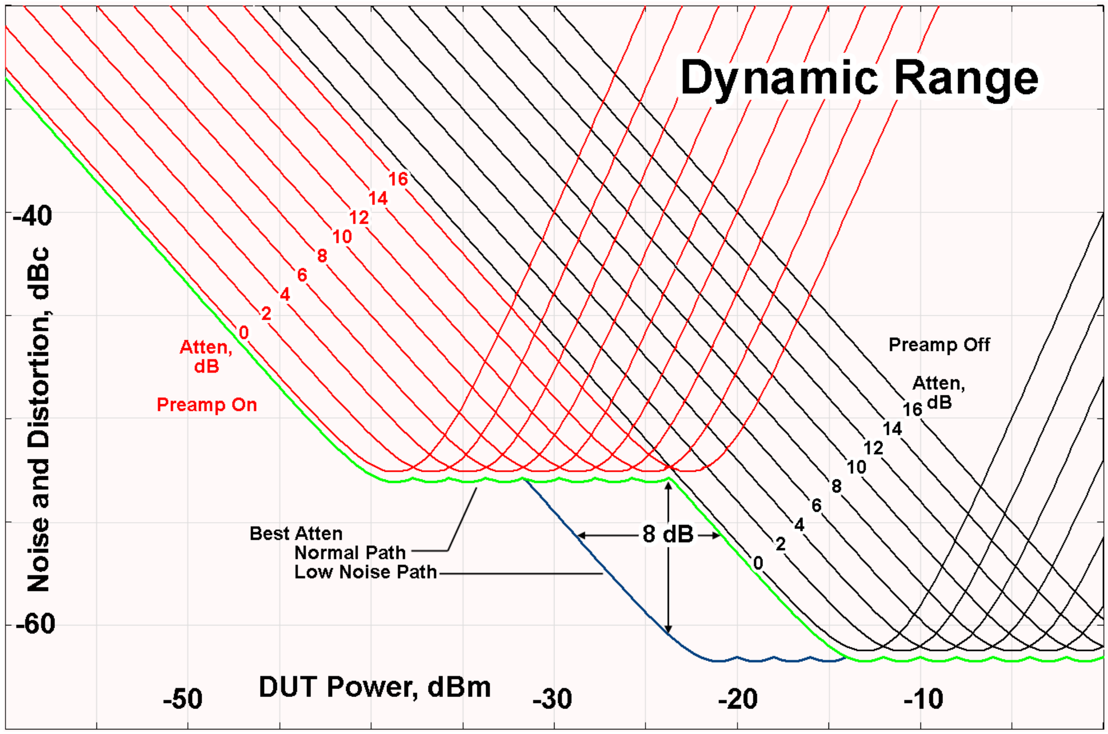
Note that the Low Noise Path, while giving improved DANL, has the disadvantage of decreased TOI performance and decreased gain compression performance relative to the standard path.

Note also that the bypass switch is a mechanical switch and has finite life, so if the **Low Noise Path Enable** is selected, it is possible to cause frequent cycling of this switch by frequently changing instrument settings such that the above conditions hold true only some of the time. A user making tests of this nature should consider opting for the **Standard Path**, which will never throw the bypass switch, at the expense of some degraded noise performance.

The low noise path is useful for situations where the signal level is so low that the instrument performance is dominated by noise even with 0 dB attenuation, but still high enough that the preamp option would have excessive third-order intermodulation or compression. The preamp, if purchased and used, gives better noise floor than does the “Low Noise Path.” However, its compression threshold and third-order intercept are much poorer than that of the non-preamp path.

There are some applications, typically for signals around –30 dBm, for which the third-order dynamic range of the standard path is good enough, but the noise floor is not low enough even with 0 dB input attenuation. When the third-order dynamic range of the preamp path is too little and the noise floor of the standard path is too high, the Low Noise Path can provide the best dynamic range

The graph below illustrates the concept. It shows, in red, the performance of an instrument at different attenuation settings, both with the preamp on and off, in a measurement that is affected by both instrument noise and instrument TOI. The green shows the best available dynamic range, offset by 0.5 dB for clarity. The blue shows how the best available dynamic range improves for moderate signal levels with the low noise path switched in. In this illustration, the preamp improves the noise floor by 15 dB while degrading the third-order intercept by 30 dB, and the low noise path reduces loss by 8 dB. The attenuator step size is 2 dB.



There are other times where selecting the low noise path improves performance, too. Compression-limited measurements such as finding the nulls in a pulsed-RF spectrum can profit from the low noise path in a way similar to the TOI-limited measurement illustrated. Accuracy can be improved when the low noise path allows the optimum attenuation to increase from a small amount like 0, 2 or 4 dB to a larger amount, giving better return loss at the instrument input. Harmonic measurements, such as second and third harmonic levels, are much improved using the low noise path because of the superiority of that path for harmonic (though not intermodulation) distortion performance.

µW Preselector Bypass

Toggles the preselector bypass switch for band 1 and higher. When the microwave presel is on, the signal path is preselected. When the microwave preselector is off, the signal path is not preselected. The preselected path is the normal path for the instrument.

The preselector is a tunable bandpass filter which prevents signals away from the frequency of interest from combining in the mixer to generate in-band spurious signals (images). The consequences of using a preselector filter are its limited bandwidth, the amplitude and phase ripple in its passband, and any amplitude and phase instability due to center frequency drift.

Option MPB or pre-selector bypass provides an unpreselected input mixer path for certain X-Series signal analyzers with frequency ranges above 3.6 GHz. This signal path allows a wider bandwidth and less amplitude variability, which is an advantage when doing modulation analysis and broadband signal analysis. The disadvantage is that, without the preselector, image signals will be displayed. Another disadvantage of bypassing the preselector is increased LO emission levels at the front panel input port.

Image responses are separated from the real signal by twice the 1st IF. For IF Paths of 10 MHz and 25 MHz, the 1st IF is 322.5 MHz, so the image response and the real signal will be separated by 645 MHz. The 1st IF will be different for other IF Path settings. When viewing a real signal and its corresponding image response in internal mixing, the image response will be to the left of the real signal.

Also, the image response and the real signal typically have the same amplitude and exhibit the same shape factor.

However, if Option FS1, Fast Sweep Capability, is enabled, the image response in the Swept SA measurement appears lower in amplitude and has a much wider shape factor compared to the real signal.

Full Bypass Enable

With **Full Bypass Enable** selected, the microwave preselector is bypassed. In addition, the low band/high band switch and microwave preamp are bypassed whenever all of the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz.
- the internal preamp is not installed or (if installed) is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Full Bypass Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

CAUTION

When **Full Bypass Enable** is selected, and "Attenuation" on page 1747 is set to 0 dB, there will be a direct AC connection between the input and the first converter when the Low Noise Path switches in (when Start Freq >3.6 GHz and the Preamp is either not licensed, set to Low Band, or Off). This puts the first converter at high risk to be damaged by high AC power. Consequently, whenever **Full Bypass Enable** is selected, a warning message appears in the status bar:

Full Bypass Enabled, maximum safe input power reduced

Microwave Preselector Bypass Backwards Compatibility

Example	:POW:MW:PRES OFF Bypasses the microwave preselector
Notes	Included for Microwave Preselector Bypass backwards compatibility The ON parameter sets the STD path (:POW:MW:PATH STD) The OFF parameter sets path MPB (:POW:MW:PATH MPB)
Preset	ON
Backwards Compatibility SCPI	[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe] ON | OFF | 0 | 1 [:SENSe]:POWer[:RF]:MW:PRESelector[:STATe]?

Frequency Extender Preselection Bypass

Frequency Extender Preselection Bypass only applies to the high frequency path of the Frequency Extender and only if the Frequency Extender allows it. For example, the V3050A high frequency path is 50 – 110 GHz and does allow control of the preselector bypass.

When the Frequency Extender's preselection is bypassed, flatness is improved, but will be subject to spurs from out of band interfering signals. For bandwidths greater than 2.5 [GHz], it is recommended that the signal bypass the Frequency Extender Preselector since the max bandwidth of the Preselector can be as narrow as 2.5 [GHz].

For most applications, the preset state is OFF, which gives the best remote-control throughput, minimizes acoustic noise from switching, minimizes out of band spurs, and minimizes the risk of wear in the hardware switches.

Coupling with Microwave Preselector Control

The control of whether to apply or bypass the Frequency Extender's preselection is dependent on the Microwave Path Control setting.

The coupling between the Microwave Path Control and Frequency Extender Preselector Bypass is described below.

UW PATH CTRL	UW PRESELECTOR	VIKING PRESELECTOR
Standard Path	On	**On**
Low Noise Path Enable	On	**On**
uW Presel Bypass	Off	**Off**
Full Bypass Enable	Off	**Off**

In other words…

uW Path Ctrl == Standard
uW Path Ctrl == Low Noise
Viking PreselBypass == Off

uW Path Ctrl == Bypass
uW Path Ctrl == Full Bypass
Viking PreselBypass == On

For the Frequency Extender Preselector Bypass to take effect, it requires a Frequency Extender device (such as V3050A) be connected and External RF (ERFIN) selected as the input.

The Frequency Extender Preselector is applied or bypassed depending on the Microwave Path Control setting only when the acquisition is above 50 [GHz]. Hence, it will be bypassed only when the acquisition is above 50 [GHz].

Preselector and Bandwidth Conflict

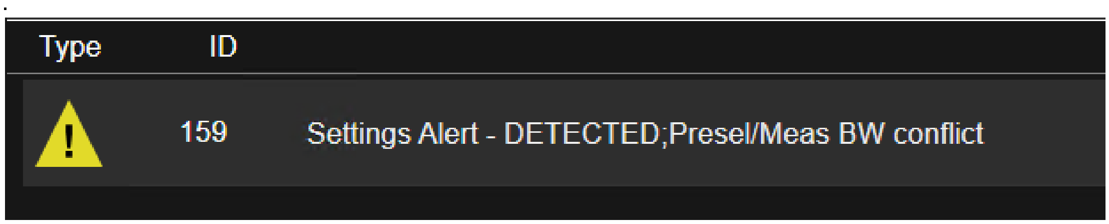
When the Frequency Extender Preselector is applied and the signal bandwidth is greater than 2.5 [GHz], then a settings alert message will show to warn the user that the signal may be distorted due to the limitation of the Frequency Extender Preselector bandwidth.

An example of the settings alert message is shown below.

Settings Alert message in the Status Bar at the bottom of the display.

Settings Alert message in the error queue

.



Software Preselection

Software Preselection is provided in some instruments, either to compensate for issues with provided hardware preselection or to provide the preselection function when there is no hardware preselector.

N9041B

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

In the N9041B, Software Preselection only applies for frequencies above 50 GHz, therefore it is only used for RF Input 2. Even if it is turned on, it will not be used for other inputs and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that in the N9041B, in Swept SA, Software Preselection will work even if the measurement is using an FFT sweep type. In measurements other than Swept SA, Software Preselection will not be used if the measurement is using an FFT sweep type.

N9042B+V3050A

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 88 GHz, software preselection must be used to suppress and separate images above 88 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

For N9042B+V3050A, Software Preselection only applies for frequencies above 88 GHz, therefore it is only used for External RF. Even if it is turned on, it will not be used for other inputs and never for frequencies below 88 GHz. This is why the label of this control contains the parenthetical note “(>~88 GHz)”.

Note that for N9042B+V3050A, in Swept SA, Software Preselection will work even if the measurement is using an FFT sweep type. In measurements other than Swept SA, Software Preselection will not be used if the measurement is using an FFT sweep type.

VXT models M9410A/11A

Software Preselection is used to provide the preselection function, as there is no hardware preselector in these models. Two background traces are taken and compared point by point, and the point with the lowest amplitude from the two traces is used. This provides a method to reduce spurs that are internally generated within the VXT, but the user should note the following when using Software

Preselection:

– There is some speed cost due to the need to take multiple captures

– Taking the point with the lowest amplitude in each trace will make the average noise level lower at all points that do not have a spur. This can reduce the accuracy of the measurement of noise and noise-like signals.

Because of the difficulty in identifying spurs manually, you are encouraged to leave Software Preselection ON at all times in VXT models M9410A/11A. If you turn it off in order to speed up your measurement or improve noise accuracy, be aware of unwanted onscreen spurs.

Remote Command	`[:SENSe]:POWer[:RF]:SWPResel:STATe 0 | 1 | ON | OFF` `[:SENSe]:POWer[:RF]:SWPresel:STAT?`
Example	`:POW:SWPR:STAT 1` `:POW:SWPR:STAT?`
Dependencies	Only appears in N9041B, N9042B+V2050A, and VXT models M9410A/11A. Does not appear in all measurements
Couplings	Sweep Time is affected by SW Preselection. Also Auto Tune supports SW Preselection, so set SW Preselection state and then do Auto Tune
Preset	N9041B: OFF N9042B+V3050A: ON M9410A/11A: ON
State Saved	Saved in instrument state

SW Preselection Type

Specifies the algorithm used for software preselection.

Two hidden sweeps are taken in succession. The second sweep is offset in LO frequency by 2*IF/N. For each point in each trace, the smaller amplitude from the two traces is taken and placed in that point in the selected trace. The Peak detector is auto-selected to improve the image suppression effectiveness. Responses of each trace that lie on top of one another will remain and are valid signals. Other signals are images and are suppressed. The action of taking the smaller of the two traces will make the average noise level lower in all points that do not have an image, thus reducing the accuracy of the measurement of noise and noise-like signals.

– `NORMal` - mathematically removes all image and multiple responses of signals present at the input

– `ADVanced` - any trace processing (such as “max hold” or trace averaging) is performed on the points of both candidate traces before the “select minimum” operation occurs. This form of processing works better for non-stationary signals, such as pulsed-RF signals

Remote Command	[:SENSe]:POWer[:RF]:SWPResel NORMal | ADVanced [:SENSe]:POWer[:RF]:SWPResel?
Example	:POW:SWPR NORM :POW:SWPR?
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method When "Software Preselection" on page 1883 is Disabled, this control is grayed-out. Its grayout message is “Unavailable unless SW Presel enabled”
Preset	N9041B: ADVanced N9042B+V3050A: NORMal
State Saved	Saved in instrument state

SW Preselection BW

Specifies the effective bandwidth to be used for Software Preselection.

The choices are:

– NORMal – when making Swept measurements, a software preselection algorithm is used which takes up to 4 background acquisitions, then post-processes the result. This algorithm can remove images from signals with an occupied bandwidth up to around 3 GHz. (Default/Preset setting). When making FFT measurements, this algorithm is not used, instead the same algorithm is used as for NARRow (below)

– NARRow– a software preselection algorithm is used which takes two background acquisitions, then post-processes the result to detect and remove images from wideband signals with occupied bandwidths up to 2 GHz. This increases the risk of images failing to be rejected, but improves the measurement speed

Remote Command	[:SENSe]:POWer[:RF]:SWPResel:BW NORMal | NARRow [:SENSe]:POWer[:RF]:SWPResel:BW?
Example	:POW:SWPR:BW NARR
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method When "Software Preselection" on page 1883 is Disabled, this control is grayed out. Its grayout message is “Unavailable unless SW Presel enabled” For N9042B+V3050A the parameter is SCPI only and always set to NARRow when Software Preselection is enabled
Preset	N9041B: NORMal N9042B+V3050A: NARRow
State Saved	Saved in instrument state

High Freq Prefilter

Lets you set the state of Prefilter for Center Frequencies above 1310 MHz.

In VXT Models M9410A/11A, the Receiver RF path has a bank of filters that come after the RF Attenuator in the signal path. Since this bank of filters precedes the mixer they are known as the “Prefilter” bank. Their purpose is to eliminate unwanted in-band mixing products by filtering out all but the desired frequencies before the signals get to the mixer. There are 13 prefilter bands to cover the frequencies between 9 kHz and 6000 MHz. The Prefilter provides the necessary rejection of the unwanted signal.

Remote Command	`[:SENSe]:<measurement>:PFILter[:STATe] ON | OFF | 1 | 0` `[:SENSe]:<measurement>:PFILter[:STATe]?`

Example	For example, to enable High Freq Prefilter in IQ Analyzer Mode:
	For the Complex Spectrum Measurement:
	`:SPEC:PFIL ON`
	For the IQ Waveform Measurement:
	`:WAV:PFIL ON`
	`:`

Dependencies	This control only appears in VXT models M9410A/11A with center frequency above 1310 MHz
Preset	See “Prefilter Presets” below
State Saved	Saved in instrument state

Prefilter Presets

Meas	Mode	Preset
SPEC	BASIC	OFF
WAV	BASIC, WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA	OFF
MON	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA	OFF
RHO	WCDMA	OFF
CDP	WCDMA	OFF
PCON	WCDMA	OFF
EVMQ	WCDMA	OFF
CHP	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
OBW	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
ACP	WCDMA, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
SEM	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
PST	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
PVT	WLAN, LTEAFDD, LTEATDD, 5GNR	OFF
EVM	WLAN, LTEAFDD, LTEATDD, 5GNR	OFF

Meas	Mode	Preset
FLAT	WLAN	OFF
EVMM	WLAN	OFF
CEVM	LTEAFDD, LTEATDD	OFF
PAVT	5GNR, VMA	OFF
DDEM	VMA	OFF
OFDM	VMA	OFF
SAN	SA	ON
HARM	SA	ON

3.3.4 BW

BW is not supported in the WCDMA Mod Accuracy Measurement.

3.3.5 Display

The Display key opens the Display Menu, which lets you configure display items for the current Mode, Measurement View or Window.

3.3.5.1 Meas Display

The Meas Display tab contains controls for setting up the display for the current Measurement, View or Window.

I/Q Polar Vec/Constln

Selects the format of the Polar Vector graph display as one of the following:

- Vec Constln (Vector and Constellation)
- Vector (Vector only)
- Constellation (Constellation only)

Remote Command	`:DISPlay:RHO:WINDow2:TRACe:POLar VC | VECTor | CONStln` `:DISPlay:RHO:WINDow2:TRACe:POLar?`
Example	`:DISP:RHO:WIND2:TRAC:POL CONS` `:DISP:RHO:WIND2:TRAC:POL?`
Preset	VC
State Saved	Yes
Range	Vec & Constln|Vector|Constellation

Backwards Compatibility SCPI	`:DISPlay:RHO:VIEW[1]:WINDow2:TRACe:POLar`

Chip Offset

Specifies the number of chips offset from the first chip in a captured slot.

Remote Command	`:DISPlay:RHO:WINDow2:TRACe:COFFset <integer>` `:DISPlay:RHO:WINDow2:TRACe:COFFset?`
Example	`:DISP:RHO:WIND2:TRAC:COFF 100` `:DISP:RHO:WIND2:TRAC:COFF?`
Preset	0
State Saved	Yes
Min/Max	0/2560 – I/Q chips
Backwards Compatibility SCPI	`:DISPlay:RHO:VIEW[1]:WINDow2:TRACe:COFFset`

I/Q Chips

Specifies the number of I/Q chips displayed for the I/Q waveforms.

Remote Command	`:DISPlay:RHO:WINDow2:TRACe:IQCHips <integer>` `:DISPlay:RHO:WINDow2:TRACe:IQCHips?`
Example	`:DISP:RHO:WIND2:TRAC:IQCH 10` `:DISP:RHO:WIND2:TRAC:IQCH?`
Preset	2560
State Saved	Yes
Min/Max	1/2560
Backwards Compatibility SCPI	`:DISPlay:RHO:VIEW[1]:WINDow2:TRACe:IQCHips`

+45° Rotation

Toggles the display rotation function between On and Off. When set to On, the I/Q polar vector or I/Q polar constellation graph is rotated by +45 degrees to provide a rectangular display.

Remote Command	`:DISPlay:RHO:WINDow2:TRACe:ROTQpi[:STATe] 0 | 1 | OFF | ON` `:DISPlay:RHO:WINDow2:TRACe:ROTQpi[:STATe]?`
Example	`:DISP:RHO:WIND2:TRAC:ROTQ ON`

	:DISP:RHO:WIND2:TRAC:ROTQ?
Preset	OFF
State Saved	Yes
Range	On|Off
Backwards Compatibility SCPI	:DISPlay:RHO:VIEW[1]:WINDow2:TRACe:ROTQpi[:STATe]

Full Vector

Toggles the full vector display function between On and Off. When set to On, the full vector traces in gray are displayed in the background of the polar vector solid traces in yellow.

Remote Command	:DISPlay:RHO:WINDow2:TRACe:FVECtor[:STATe] 0 | 1 | OFF | ON :DISPlay:RHO:WINDow2:TRACe:FVECtor[:STATe]?
Example	:DISP:RHO:WIND2:TRAC:FVEC ON :DISP:RHO:WIND2:TRAC:FVEC?
Dependencies	This parameter is not available when the selected view is I/Q Measured Polar Graph and the selected I/Q Polar Vec/Constln is Constellation
Preset	OFF
State Saved	Yes
Range	OFF|ON
Backwards Compatibility SCPI	:DISPlay:RHO:VIEW[1]:WINDow2:TRACe:FVECtor[:STATe]

Time Offset Unit

Toggles the unit of Time Offset result between Chip and Second.

Remote Command	:DISPlay:RHO:TEXT:TFUNit CHIP | SECond :DISPlay:RHO:TEXT:TFUNit?
Example	:DISP:RHO:TEXT:TFUN SEC :DISP:RHO:TEXT:TFUN?
Notes	This command only affects the display result. Results returned by remote commands are always expressed in units of "CHIPs"
Preset	CHIP
State Saved	Yes
Range	CHIP|SECond
Backwards	:DISPlay:RHO:VIEW[1]:WINDow[1]:TEXT:TFUNit

Compatibility	
SCPI	

3.3.5.2 View

Contains controls for selecting the current **View**, and for editing User Views.

Views

The table below shows the Views and Windows used for this measurement.

Some of these Views are multiple-window Views. When in a multiple window View, you select a window by touching it. The menu controls may sometimes change depending on which window is selected.

Whenever the View changes, the default menu is Frequency, unless otherwise specified in the View description.

View	Result
"I/Q Measured Polar Graph" on page 344	I/Q Measured Polar Vector Graph
	Metrics
"I/Q Error" on page 345	EVM Graph
	Mag Error Graph
	Phase Error Graph
"Code Domain Power" on page 345	Code Domain Power Graph
	Metrics
"Peak/Avg Metrics" on page 345	Peak/Average Metrics
"Capture Time Summary" on page 345	Capture Time Summary
"Slot CDE/EVM" on page 346	EVM Graph
	Peak CDE Graph
	Frequency Error Graph

View Selection Remote Commands

Allows you to select the desired measurement view:

- The Enumerated ID is used with the SCPI Command `:DISP:RHO:VIEW[:SEL]` ("View Selection by Name" on page 344)
- The Numeric ID is used with the SCPI Command `:DISP:RHO:VIEW:NSEL` ("View Selection by Name" on page 344)

Enumerated ID	Numeric ID	View Name & Details
`POLar`	1	I/Q Measured Polar Graph - Provides a combination view of an I/Q measured polar vector graph and the summary data
`ERRor`	2	I/Q Error (Tri View) - Provides a combination view of the EVM, magnitude error, and phase error graphs
`PGRaph`	3	Code Domain Power - Provides a graph of Modulation Accuracy (Rho) channels individual power in dB. A table of summary data for the Modulation Accuracy (Rho) channels is provided in the text window

Enumerated ID	Numeric ID	View Name & Details
TABLe	4	Peak/Average Metrics - Provides a table of magnitude error, phase error, EVM, and the modulation accuracy summary data such as rho, peak and rms EVM, peak Modulation Accuracy (Rho) error, magnitude error, phase error, in a text window, in terms of averaged and detected peak/maximum value in the average cycle
SUMMary	5	Capture Time Summary – Provides a table that summarizes measurement results through the Capture Interval. Highlights the peak/worst result through the Capture Interval slot-by-slot
CDError	6	Slot CDE/EVM(Tri View) – Provides a combination view of Frequency Error, Peak CDE, and EVM graphs

View Selection by Name

Allows you to specify the view via its enumerated ID string.

Remote Command	`:DISPlay:RHO:VIEW[:SELect] POLar | ERRor | PGRaph | TABLe | SUMMary | CDError` `:DISPlay:RHO:VIEW[:SELect]?`
Example	`:DISP:RHO:VIEW:SEL CDE` `:DISP:RHO:VIEW:SEL?`
Preset	POLar
State Saved	Yes
Range	I/Q Measured Polar Graph|I/Q Error|Code Domain Power|Peak/Avg Metrics|Capture Time Summary|Slot CDE/EVM

View Selection by Number

Allows you to specify the view via its numeric ID value.

Remote Command	`:DISPlay:RHO:VIEW:NSELect <integer>` `:DISPlay:RHO:VIEW:NSELect?`
Example	`:DISP:RHO:VIEW:NSEL 1` `:DISP:RHO:VIEW:NSEL?`
Preset	1
State Saved	Yes
Min/Max	1/6

I/Q Measured Polar Graph

Windows: "I/Q Measured Polar Vector Graph" on page 280,"Result Summary" on page 281

The traces and results of this view are only for the slot specified by the measurement offset. The traces are not averaged, even if the average is on. The parameters displayed in these windows differ depending on the setting of Radio Device.

Example	`:DISP:RHO:VIEW POL`

I/Q Error

Windows:"EVM Graph" on page 283, "Mag Error Graph" on page 283, "Phase Error Graph" on page 283

The traces of this view are not averaged, even if the average function is on. The parameters displayed in these windows differ depending on the setting of Radio Device.

Example	`:DISP:RHO:VIEW ERR`

Code Domain Power

Windows: "Code Domain Power Graph" on page 283, "CDP Metrics" on page 284

The traces and results of this view are only for the slot specified by the measurement offset. The results are not averaged, even if the average function is on.

The parameters displayed in these windows differ depending on the setting of Radio Device.

Example	`:DISP:RHO:VIEW PGR`

Peak/Avg Metrics

Windows: "Peak/Average Metrics" on page 285

This view has one window, the Peak/Average Metrics window, which displays two sets of data as follows:

Average	The value averaged in average-cycle
Peak Hold	The value detected and held as the Peak/Maximum in the average cycle

NOTE **The average cycle is updated when restarted, and is equal to the average count. In each average cycle, through the capture interval, the data is also averaged and detects the peak/worst values. Therefore, the metrics of this view are actually averaged by the data, which is the value of:**

Average Count x Capture Interval

The parameters displayed in these windows differ depending on the setting of Radio Device.

Example	`:DISP:RHO:VIEW TABL`

Capture Time Summary

Windows:"Capture Time Summary" on page 288

The summary table displays the measurement results for multiple slots (for example 15 slots). It shows data sets slot-by-slot through the Capture Interval, and highlights the peak (or worst) slot value, and average value through the Capture Interval at the bottom of the table.

The results in this view are not averaged when restarted, even if the average is on. The parameters displayed in this window differ depending on the setting of Radio Device.

Example	`:DISP:RHO:VIEW SUMM`

Slot CDE/EVM

Windows: "Slot EVM Graph" on page 290,"Slot EVM Graph" on page 290"Slot EVM Graph" on page 290"Slot EVM Graph" on page 290"Slot Peak CDE Graph" on page 290, "Slot Frequency Error Graph" on page 290

The trace of this view is not averaged when restarted, even if the average function is on.

The parameters displayed in the windows differ depending on the setting of Radio Device in the Mode Setup.

In the graph:

- Yellow lines are the slot-by-slot results
- Blue (Cyan) lines are the test limits

Example	`:DISP:RHO:VIEW CDE`

User View

Lets you choose a View from the saved User Views for the current measurement. This panel only appears if a User View exists for the current measurement.

Remote Command	`:DISPlay:VIEW:ADVanced:SELect <alphanumeric>` `:DISPlay:VIEW:ADVanced:SELect?`
Example	Select Baseband as the current View `:DISP:VIEW:ADV:SEL “Baseband”`
Notes	You must be in the measurement whose View you are trying to set to send the command. You can only set Views for the current measurement using this command For predefined views, the parameter is derived from the view name that is shown in the View list in the user interface. For example, if you are trying to select the Trace Zoom view in the Swept SA measurement, you send: `:DISP:VIEW:ADV:SEL "Trace Zoom"` because “Trace Zoom” is the name of the View as seen in the Mode/Meas dialog or in the Display, View menu

	You *cannot* use the legacy View parameter (which in this case would be `TZOom`) with `:DISP:VIEW:ADV:SEL`
	`<alphanumeric>` is case insensitive; you can specify mixed case, however the name will be evaluated on a single case. Thus, both of the following forms work:
	`:DISP:VIEW:ADV:SEL "Trace Zoom"`
	`:DISP:VIEW:ADV:SEL "TRACE ZOOM"`
	If the specified view is not a valid View, the query returns the error message "-224, Illegal parameter value; View with the name <alphanumeric> does not exist"
	If the display is disabled (via `:DISP:ENAB OFF`) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated

Backwards Compatibility SCPI	The legacy node `:DISPlay:VIEW[:SELect]` is retained for backwards compatibility, but it only supports predefined views

Restore Layout to Default

Restores the Layout to the default for Basic.

Modified Views are very temporary; if you exit the current measurement they are discarded, and they are not saved in State. To retain this View for later use, and to be able to return easily to your original Basic View, you can save your edited View as a "User View".

Save Layout as New View

Saves your new View as a User View. An alpha keyboard appears, which lets you name your new View; the default is the old View name plus a number.

Remote Command	`:DISPlay:VIEW:ADVanced:NAME <alphanumeric>`
Example	`:DISP:VIEW:ADV:NAME "Baseband"` Creates a new View named `Baseband` from the current View, and selects it as the current View
Notes	`<alphanumeric>` is case insensitive; you can specify mixed case, however the name will be evaluated on a single case If `<alphanumeric>` name already exists as a View, the error message "-224, Illegal parameter value; View <alphanumeric> already exists" is generated If the display is disabled (via `:DISP:ENAB OFF`) then the error message "-221, Settings conflict; User View SCPI cannot be used while Display is disabled" is generated

Re-Save User View

You can re-edit a User View; if you make changes, then an asterisk will appear next to the User View's name. You can then tap **Re-Save User View** to save it back to its existing name, or **Save Layout as New View** to add another, new User View.

This is a front panel function only, there is no remote command available to perform this function. To do this remotely, you must first perform **Save Layout as New View**, then delete the old User View and rename the new one with the name of the View you just deleted.

Rename User View

You can rename the current View by giving it a new unique name. Only User Views can be renamed, if the current View is a Predefined View, an error occurs.

Remote Command	`:DISPlay:VIEW:ADVanced:REName <alphanumeric>`
Example	`:DISP:VIEW:ADV:REN "Baseband"`
Notes	`<alphanumeric>` is case insensitive; you can specify mixed case, however the name will be evaluated on a single case If the `<alphanumeric>` specifying the new name is already present in the list of View names, the error message "-224, Illegal parameter value; View <alphanumeric> already exists" is generated If the current View is a Predefined View, the error message "-224, Illegal parameter value; Cannot rename a Predefined View" is generated If the display is disabled (via `:DISP:ENAB OFF`) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated

Delete User View

You can delete the current View if it is a User View. The default view becomes the current view for the Measurement.

Remote Command	`:DISPlay:VIEW:ADVanced:DELete`
Example	`:DISP:VIEW:ADV:DEL`
Notes	`<alphanumeric>` is case insensitive; you can specify mixed case, however the name will be evaluated on a single case If the `<alphanumeric>` is not present in the list of View names, the error message "-224, Illegal parameter value; View <alphanumeric> does not exist" is generated If the current View is a Predefined View, the error message "-224, Illegal parameter value; Cannot delete a Predefined View" is generated If the display is disabled (via `:DISP:ENAB OFF`) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated

Delete All User Views

Deletes all previously saved User Views. The default view becomes the current view for the Measurement if a User View was the current view when this command was executed.

Remote Command	`:DISPlay:VIEW:ADVanced:DELete:ALL`
Example	`:DISP:VIEW:ADV:DEL:ALL`
Notes	Disabled if there are no User Views

View Editor Remote Commands

The following remote commands help you manage Views and User Views. Note that the SCPI node for User Views handles both Predefined and User Views. The legacy nodes, `:DISPlay:VIEW[:SELect]` and `:DISPlay:VIEW:NSEL`, are retained for backwards compatibility, but they only support predefined views.

View Listing Query

Returns a string containing a comma-separated list of names for *all* the Views, including User Views, available for the current Measurement.

Remote Command	`:DISPlay:VIEW:ADVanced:CATalog?`
Example	`:DISP:VIEW:ADV:CAT?`
Notes	Returns a quoted string of the available Views for the current measurement, separated by commas. The list includes names for *all* the Views, including User Views, available for the current Measurement Example: `"Normal,Trace Zoom,Spectrogram,Baseband,myView1,yourView1"` No distinction is made between Predefined and User Views If you switch measurements with the display disabled (via `:DISP:ENAB OFF`), then query the list of available Views, the result is undefined

User View Listing Query

Returns a string containing a comma-separated list of names for *only* the User Views available for the current Measurement.

Remote Command	`:DISPlay:VIEW:ADVanced:USER:CATalog?`
Example	`:DISP:VIEW:ADV:USER:CAT?`
Notes	Returns a quoted string of the available User Views for the current measurement, separated by commas. Example: `"Baseband,myView1,yourView1"` If you switch measurements with the display disabled (see "Display Enable (Remote Command Only)" on page 1894), then query the list of available Views, the result is undefined

3.3.5.3 Annotation

Contains controls for setting up the annotation for the current Mode or Measurement.

Graticule

Turns the display graticule On or Off for all windows with graticules in all measurements in the current Mode. Also turns the graticule Y-Axis annotation on and off.

Remote Command	:DISPlay:GRATicule[:STATe] OFF | ON | 0 | 1 :DISPlay:GRATicule[:STATe]?
Example	:DISP:GRAT OFF
Notes	The graticule is the set of horizontal and vertical lines that make up the grid/divisions for the X-Axis and Y-Axis
Preset	ON
State Saved	Saved in instrument state
Backwards Compatibility SCPI	:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe] OFF | ON | 0 | 1 :DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe]? This command is accepted for backwards compatibility with older instruments, but the WINDow, TRACe and GRID parameters are ignored

Screen Annotation

Controls the display of the annunciation and annotation around the graticule, including any annotation on lines (such as the display line, the threshold line, etc.) and the Y-Axis annotation, for all windows with screen annotation in all measurements in the current Mode.

This does *not* include marker annotation (or the N dB result). When OFF, the graticule expands to fill the entire graticule area, leaving only the 1.5% gap above the graticule, as described in the **Trace** section.

Remote Command	:DISPlay:ANNotation:SCReen[:STATe] OFF | ON | 0 | 1 :DISPlay:ANNotation:SCReen[:STATe]?
Example	:DISP:ANN:SCR OFF
Dependencies	Grayed-out and forced to OFF when **System Display Settings**, **Annotation** is OFF
Preset	ON This remains OFF through a Preset when **System Display Settings**, **Annotation** is set to OFF
State Saved	Saved in instrument state

Trace Annotation

Turns on and off the labels on the traces, showing their detector (or their Math Mode) as described in the **Trace** section, for all windows in all measurements in the current Mode for which Trace Annotation on/off is supported.

If Trace Math is being performed on a trace, then the Trace Math annotation replaces the detector annotation.

For measurements that support limit lines, this key also turns on and off the labels on the Limit Lines. The label is the Limit number annotation and Limit Comment displayed on the graph. If the length of the comment is greater than 20 characters, the first 8 characters and the last 8 characters are displayed, joined with ….

Remote Command	`:DISPlay:ANNotation:TRACe[:STATe] ON | OFF | 1 | 0` `:DISPlay:ANNotation:TRACe[:STATe]?`
Example	`:DISP:ANN:TRAC OFF`
Preset	`OFF`
State Saved	Saved in instrument state

Control Annotation

Turns on and off the display of values on the Active Function controls for all measurements in the current Mode. This is a security feature.

Remote Command	`:DISPlay:ACTivefunc[:STATe] ON | OFF | 1 | 0` `:DISPlay:ACTivefunc[:STATe]?`
Example	`:DISP:ACT OFF`
Dependencies	Grayed out and forced to `OFF` when **System Display Settings**, **Annotation** is `OFF`
Preset	`ON` This remains `OFF` through a Preset when **System Display Settings**, **Annotation** is set to `OFF`
State Saved	Saved in instrument state

Meas Bar

Turns the Measurement Bar at the top of the screen on and off for all measurements in the current Mode. When `OFF`, the graticule area expands to fill the area formerly occupied by the Measurement Bar.

Remote Command	`:DISPlay:ANNotation:MBAR[:STATe] OFF | ON | 0 | 1` `:DISPlay:ANNotation:MBAR[:STATe]?`
Example	`:DISP:ANN:MBAR OFF`
Dependencies	Grayed out and forced to `OFF` when **System Display Settings**, **Annotation** is `OFF`

Preset	ON This remains OFF through a Preset when **System Display Settings**, **Annotation** is set to OFF
State Saved	Saved in instrument state

Display Enable (Remote Command Only)

Turns the display on/off, including the display drive circuitry. The backlight stays lit to confirm that the instrument is on. The display enable setting is mode global. Theare three reasons for turning the display off:

1. To increase speed as much as possible by freeing the instrument from having to update the display
2. To reduce emissions from the display, drive circuitry
3. For security purposes

If you have turned off the display:

– and you are in local operation, the display can be turned back on by pressing any key or by sending `:SYSTem:DEFaults MISC` or `:DISPlay:ENABle ON` (neither `*RST` nor :SYSTem:PRESet enable the display)

– and you are in remote operation, the display can be turned back on by pressing the **Local** or **Esc** keys, or by sending `:SYSTem:DEFaults MISC` or `:DISPlay:ENABle ON` (neither `*RST` nor `:SYSTem:PRESet` enable the display)

– and you are using either the `:SYSTem:KLOCk` command or GPIB local lockout, then *no* front-panel key press will turn the display back on. You must turn it back on remotely.

If the display is `OFF`, many SCPI commands related to User Views and Multiscreen functionality do not work, and return the error messages “-221, Settings conflict; Screen SCPI cannot be used when Display is disabled” or “221, Settings conflict; View SCPI cannot be used while Display is disabled”. These commands include:

Name	Command
Select User View	:DISPlay:VIEW:ADVanced:SELect
Rename User View	:DISPlay:VIEW:ADVanced:REName
Delete User View	:DISPlay:VIEW:ADVanced:DELete
Create User View	:DISPlay:VIEW:ADVanced:NAME
Select Screen	:INSTrument:SCReen:SELect
Delete Screen	:INSTrument:SCReen:DELete
Delete All But This Screen	:INSTrument:SCReen:DELete:ALL
Add Screen	:INSTrument:SCReen:CREate
Rename Screen	:INSTrument:SCReen:REName
Sequencer On/Off	:SYSTem:SEQuencer

Remote Command	`:DISPlay:ENABle OFF | ON | 0 | 1` `:DISPlay:ENABle?`
Example	`:DISP:ENAB OFF`
Couplings	`:DISP:ENAB OFF` turns Backlight `OFF` and `:DISP:ENAB ON` turns Backlight `ON`, but changing Backlight settings does *not* change the state of `:DISP:ENAB`
Preset	`ON` Set by `:SYST:DEF MISC`, but not affected by `*RST` or `:SYSTem:PRESet`
State Saved	Not saved in instrument state
Backwards Compatibility Notes	`:SYST:PRES` no longer turns on `:DISPlay:ENABle` as it did in legacy analyzers

3.3.6 Freq

The Freq key opens the Frequency menu, which contains controls that allow you to control the Frequency and Channel parameters of the instrument.

Some features in the Frequency menu are the same for all measurements in the current Mode – they do not change as you change measurements. Settings like these are called "Meas Global" and are unaffected by Meas Preset. For example, the Center Freq setting is the same for all measurements - it does not change as you change measurements.

3.3.6.1 Settings

The Settings Tab contains controls that pertain to the X axis parameters of the measurement. These parameters control how data on the vertical (X) axis is displayed and control instrument settings that affect the horizontal axis.

Center Frequency

Sets the frequency that corresponds to the horizontal center of the graticule. While adjusting the Center Frequency the Span is held constant.

The center frequency setting is the same for all measurements within a mode, that is, it is Meas Global. Some modes are also able to share a Mode Global center frequency value. If this is the case, the Mode will have a **Global** tab in its **Meas Setup** menu.

The **Center Freq** function sets (and queries) the Center Frequency for the currently selected input. If your instrument has multiple inputs, and you select another input, the Center Freq changes to the value for that input. SCPI commands are available to directly set the Center Freq for a specific input.

Center Freq is remembered as you go from input to input. Thus you can set a Center Freq of 10 GHz with the RF Input selected, change to BBIQ and set a Center Freq of

20 MHz, then switch to External Mixing and set a Center Freq of 60 GHz, and when you go back to the RF Input the Center Freq will go back to 10 GHz; back to BBIQ and it is 20 MHz; back to External Mixing and it is 60 GHz.

– See "RF Center Freq" on page 356

– See "Ext Mix Center Freq" on page 357

– See "I/Q Center Freq" on page 358

– See "Center Frequency Presets" on page 354

Remote Command	`[:SENSe]:FREQuency:CENTer <freq>` `[:SENSe]:FREQuency:CENTer?`

Example	Sets the Center Frequency to 50 MHz
	`:FREQ:CENT 50 MHz`
	Increments the Center Frequency by the value of CF Step
	`:FREQ:CENT UP`
	Returns the current value of Center Frequency
	`:FREQ:CENT?`

Notes	This command sets the RF, External Mixing or I/Q Center Frequency depending on the selected input For RF input it is equivalent to `:FREQ:RF:CENT` For I/Q input it is equivalent to `:FREQ:IQ:CENT` For External Mixer it is equivalent to `:FREQ:EMIX:CENT` Preset and Max values are dependent on Hardware Options (5xx) If no terminator (e.g. MHz) is sent the terminator Hz is used. If a terminator with unit other than Frequency is used, an invalid suffix error message is generated
Preset	Depends on instrument maximum frequency, mode, measurement, and selected input See "Center Frequency Presets" on page 354 and "RF Center Freq" on page 356 and "Ext Mix Center Freq" on page 357 and "I/Q Center Freq" on page 358
State Saved	Saved in instrument state
Min	Depends on instrument maximum frequency, mode, measurement, and selected input See "Center Frequency Presets" on page 354 and "RF Center Freq" on page 356 and "Ext Mix Center Freq" on page 357 and "I/Q Center Freq" on page 358
Max	Depends on instrument maximum frequency, mode, measurement, and selected input See "Center Frequency Presets" on page 354 and "RF Center Freq" on page 356 and "Ext Mix Center Freq" on page 357 and "I/Q Center Freq" on page 358
Status Bits/OPC dependencies	Non-overlapped

Center Frequency Presets

The following table provides the Center Frequency Presets for the Spectrum Analyzer mode, and the Max Freq, for the various frequency options:

Freq Option	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
503 (all but CXA)	1.805 GHz	3.6 GHz	3.7 GHz
503 (CXA)	1.505 GHz	3.0 GHz	3.08 GHz
507 (all but CXA)	3.505 GHz	7.0 GHz	7.1 GHz
507 (CXA)	3.755 GHz	7.5 GHz	7.58 GHz
508 (all but MXE)	1.805 GHz	3.6 GHz	8.5 GHz
508 (MXE)	4.205 GHz	8.4 GHz	8.5 GHz
513	6.805 GHz	13.6 GHz	13.8 GHz
526 (except CXA and MXE)	13.255 GHz	26.5 GHz	27.0 GHz*
526 (CXA)	13.255 GHz	26.5 GHz	26.55 GHz
526 (MXE)	1.805 GHz	3.6 GHz	27.0 GHz
532	16.005 GHz	32.0 GHz	32.5 GHz
540	20.005 GHz	40.0 GHz	40.5 GHz
543	21.505 GHz	43.0 GHz	43.0 GHz
544	22.005 GHz	44.0 GHz	45.0 GHz
550	25.005 GHz	50.0 GHz	52 GHz
F03 (CXA-m)	1.505 GHz	3.0 GHz	3.08 GHz
F07 (CXA-m)	3.755 GHz	7.5 GHz	7.575 GHz
F13 (CXA-m)	6.805 GHz	13.6 GHz	13.8 GHz
F26 (CXA-m)	13.255 GHz	26.5 GHz	26.55 GHz
504 (M9420A/21A, M8920A)	2.145 GHz	3.88GHz	3.88 GHz
506 (M9420A/21A, M8920A)	3.245 GHz	6.08GHz	6.08 GHz
F06 (M9410A/11A)	1.0 GHz	6.08 GHz	6.08 GHz
F06 (M9415A)	1 GHz	1.08 GHz	6.6 GHz
F08 (M9415A)	1 GHz	1.08 GHz	8.6 GHz
F12 (M9415A)	1 GHz	1.08 GHz	12.9 GHz

*For option 526, the Max CF in RTSA is 26.999999995 GHz.

N9041B Center Freq Presets

Input	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
Input 1, all models	25.005 GHz	50.0 GHz	52 GHz
Input 2, opt 585	42.505 GHz	85.0 GHz	86 GHz
Input 2, opt 590	45.005 GHz	90.0 GHz	92 GHz
Input 2, opt 5CX	55.005 GHz	110.0 GHz	110 GHz

Input 2, CXA and MXE

Model	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
CXA opt C75	0.7505 GHz	1.5 GHz	1.58 GHz
MXE	505 MHz	1 GHz	1.000025 GHz

Tracking Generator Frequency Limits (CXA only)

Tracking Generator Option	Min Freq (clips to this freq when turn TG on and can't tune below while TG on)	If above this Freq, Stop Freq clipped to this Freq when TG turned on	Max Freq (can't tune above) while TG on
T03	9 kHz	3.0 GHz	3.08 GHz
T06	9 kHz	6.0 GHz	6.05 GHz

Tracking Generator Frequency Limits(CXA-m only)

Tracking Generator Option	Min Freq (clips to this freq when turn TG on and can't tune below while TG on)	If above this Freq, Stop Freq clipped to this Freq when TG turned on	Max Freq (can't tune above) while TG on
T03	2 MHz	3.08 GHz	3.08 GHz
T07	2 MHz	7.575 GHz	7.575 GHz
T13	2 MHz	13.8 GHz	13.8 GHz
T26	2 MHz	26.55 GHz	26.55 GHz

RF Center Freq

SCPI command for specifying the RF Center Frequency. This command will set the Center Frequency to be used when the RF input is selected, even if the RF input is not the input that is selected at the time the command is sent. Note that the **Center Freq** function in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command	`[:SENSe]:FREQuency:RF:CENTer <freq>` `[:SENSe]:FREQuency:RF:CENTer?`
Example	`:FREQ:RF:CENT 30 MHz` `:FREQ:RF:CENT?`
Notes	This command is the same in all modes, but the parameter is Measurement Global. So the value is independent in each mode and common across all the measurements in the mode
Dependencies	If the electronic/soft attenuator is enabled, any attempt to set Center Frequency such that the Stop Frequency would be >3.6 GHz fails and results in an advisory message. If the equivalent SCPI command is sent, this same message is generated as part of a "-221, Settings conflict" warning
Preset	See the table above

State Saved	Saved in instrument state
Min	-79.999995 MHz
Max	See the table above. Basically instrument maximum frequency - 5 Hz

Ext Mix Center Freq

SCPI command for specifying the External Mixer Center Frequency. This command will set the Center Frequency to be used when the External Mixer is selected, even if the External Mixer input is not the input which is selected at the time the command is sent. Note that the **Center Freq** function in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command	`[:SENSe]:FREQuency:EMIXer:CENTer <freq>` `[:SENSe]:FREQuency:EMIXer:CENTer?`
Example	`:FREQ:EMIX:CENT 60 GHz` `:FREQ:EMIX:CENT?`
Notes	This command is the same in all modes, but the parameter is Measurement Global. So the value is independent in each mode and common across all the measurements in the mode
Couplings	When returning to External Mixing after having been switched to one of the other inputs (e.g., RF), you will come back into the settings that you had when you left External Mixing. So you will come back to the band you were in with the Center Frequency that you had. However, Span is not an input-dependent parameter, therefore you will bring the span over from the other input. Therefore, the instrument comes back with the span from the previous input, limited as necessary by the current mixer setup
Preset	When a Mode Preset is performed while in External Mixing, the Start frequency of the current Mode is set to the nominal Min Freq of the lowest harmonic range in the Harmonic Table for the current mixer setup. Similarly, the Stop frequency of the current Mode is set to the nominal Max Freq of the highest harmonic range in the Harmonic Table. The Center Freq thus presets to the point arithmetically equidistant from these two frequencies Note that if the current measurement has a limited Span available to it, and cannot achieve the Span shown in the table (Span=Stop Freq – Start Freq), the instrument uses the maximum Span the measurement allows, and still sets the Center Freq to the midpoint of the Start and Stop Freq values in the Harmonic Table When Restore Input/Output Defaults is performed, the mixer presets to the 11970A, whose Start and Stop frequencies are 26.5 and 40 GHz respectively. The center of these two frequencies is 33.25 GHz Therefore, after a Restore Input/Output Defaults, if you go into External Mixing and do a Mode Preset while in the Spectrum Analyzer Mode, the resulting Center Freq is 33.25 GHz
State Saved	Yes
Min	The minimum frequency in the currently selected mixer band + 5 Hz
Max	The maximum frequency in the currently selected mixer band - 5 Hz

I/Q Center Freq

SCPI command for specifying the I/Q Center Frequency. This command will set the Center Frequency to be used when the I/Q input is selected, even if the I/Q input is not the input which is selected at the time the command is sent. Note that the **Center Freq** function in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command	`[:SENSe]:FREQuency:IQ:CENTer <freq>` `[:SENSe]:FREQuency:IQ:CENTer?`
Example	`:FREQ:IQ:CENT 30 MHz`
Notes	This command is the same in all modes, but the parameter is Measurement Global. So the value is independent in each mode and common across all the measurements in the mode
Preset	0 Hz
State Saved	Saved in instrument state
Min	-40.049995 MHz
Max	40.049995 MHz

CF Step

Changes the step size for the center frequency and start and stop frequency functions. Once a step size has been selected and the center frequency function is active, the step keys (and the UP|DOWN parameters for Center Frequency from remote commands) change the center frequency by the step-size value. The step size function is useful for finding harmonics and sidebands beyond the current frequency span of the instrument.

Note that the start and stop frequencies also step by the CF Step value.

Remote Command	`[:SENSe]:FREQuency:CENTer:STEP[:INCRement] <freq>`
	`[:SENSe]:FREQuency:CENTer:STEP[:INCRement]?`
	`[:SENSe]:FREQuency:CENTer:STEP:AUTO OFF | ON | 0 | 1`
	`[:SENSe]:FREQuency:CENTer:STEP:AUTO?`

Example	`:FREQ:CENT:STEP 500 MHz`
	Increase the current center frequency value by 500 MHz
	`:FREQ:CENT UP`
	`:FREQ:CENT:STEP?`
	`:FREQ:CENT:STEP:AUTO ON`
	`:FREQ:CENT:STEP:AUTO?`

Notes	Preset and Max values are dependent on Hardware Options (5xx)

Dependencies	Span, RBW, Center frequency If the electronic/soft attenuator is enabled, any attempt to change the value of the center frequency >3.6 GHz by pressing the Up-arrow key, fails and results in an advisory message. If the equivalent SCPI command is sent, this same message is generated as part of a "-221, Settings conflict" warning
Couplings	When auto-coupled in a non-zero span, the center frequency step size is set to 10% of the span. When auto-coupled in zero span, the center frequency step size is set to the equivalent -3 dB RBW value
Preset	Auto ON
State Saved	Saved in instrument state
Min	– (the maximum frequency of the instrument). That is, 27 GHz max freq instrument has a CF step range of +/- 27 GHz. Note that this is the maximum frequency given the current settings of the instrument, so in External Mixing, for example, it is the maximum frequency of the current mixer band
Max	The maximum frequency of the instrument. That is, 27 GHz max freq instrument has a CF step range of +/- 27 GHz. Note that this is the maximum frequency given the current settings of the instrument, so in External Mixing, for example, it is the maximum frequency of the current mixer band
Status Bits/OPC dependencies	non-overlapped

3.3.7 Marker

Accesses a menu that enables you to select, set up and control the markers for the current measurement. If there are no active markers, Marker selects marker 1, sets it to Normal and places it at the center of the display. If the selected marker is Off, it is set to Normal and placed it at the center of the screen on the trace determined by the Marker Trace rules.

3.3.7.1 Select Marker

Specifies the selected marker. The term "selected marker" is used throughout this document to specify which marker will be affected when you change marker settings, perform a Peak Search, etc.

The Select Marker control appears above the menu panel, indicating that it applies to all controls in the Marker menu panels. Select Marker is blanked if you select a tab whose controls do NOT depend on the selected marker (e.g., Counter).

On any menu tab for which **Select Marker** displays, the first control is always **Marker Frequency|Time**.

Notes	The selected marker is remembered even when not in the Marker menu and is used if a Search is done or a Band Function is turned on or for Signal Track or Continuous Peak
Preset	Marker 1
State Saved	The number of the selected marker is saved in instrument state
Annunciation	Appears in the marker results block label for **Normal** and **Delta** markers

3.3.7.2 Settings

The controls on the Settings tab include the Marker active function and a radio button selection of the marker control mode (Normal, Delta, or Off) for the selected marker, as well as additional functions that help you use markers.

Marker Chip Time

Sets the marker Chip value in the current marker for the I/Q Polar trace. It has no effect if the control mode is **Off**, but if the control mode is Normal, this is the SCPI equivalent of entering a Chip value.

This command is valid only when Marker Trace 'POLar'(I/Q Polar) is active. For any other Marker Trace, the command is ignored.

Remote Command	`:CALCulate:RHO:MARKer[1]|2|...|12:CHIP <real>` `:CALCulate:RHO:MARKer[1]|2|...|12:CHIP?`
Example	`:CALC:RHO:MARK:CHIP 0` `:CALC:RHO:MARK:CHIP?`
Notes	If no suffix is sent, 'chips' is used. If a suffix is sent that does not match 'chips', an error "Invalid suffix" is generated The query returns the marker's 'chips' value in the trace if the control mode is Normal. The query is returned in 'chips'. If the marker is Off the response is not a number (NAN)
Preset	Start point of the trace in the display window
State Saved	No
Min	-9.9E+37
Max	9.9E+37
Annotation	Mkr # <Chip Value>, <X value> and <Y value> upper right on graph

Marker X Axis Value

Sets the marker X Axis value in the current marker X Axis Scale unit. It has no effect if the control mode is **Off,** but is the SCPI equivalent of entering an X value if the control mode is **Normal** or **Delta**.

NOTE	This command is not valid when Marker Trace is `POLar` and ignored. Marker Chip Time is supported instead.

Remote Command	`:CALCulate:RHO:MARKer[1]|2|...|12:X <real>` `:CALCulate:RHO:MARKer[1]|2|...|12:X?`
Example	`:CALC:RHO:MARK3:X 0.0`

	`:CALC:RHO:MARK3:X?`
Notes	If no suffix is sent, uses the fundamental units for the current marker X Axis Scale. If a suffix is sent that does not match the current marker X Axis Scale unit, an error "Invalid suffix" is generated The query returns the marker's absolute X Axis value if the control mode is Normal, or the offset from the marker's reference marker if the control mode is Delta. The query is returned in the fundamental units for the current marker X Axis scale: Hz for Frequency and Inverse Time, seconds for Period and Time. If the marker is Off the response is not a number
Preset	After a preset, all Markers are turned OFF, so Marker X Axis Value query returns a Not A Number (NAN)
State Saved	No
Min	–9.9E+37
Max	9.9E+37
Annotation	Mkr # <X value> and <Marker value> upper right on graph

Marker X Axis Position (Remote Command only)

Sets the marker X position in trace points. It has no effect if the control mode is **Off,** but is the SCPI equivalent of entering a value if the control mode is **Normal** or **Delta** – except in trace points rather than X Axis Scale units. The entered value is immediately translated into the current X Axis Scale units for setting the value of the marker.

Remote Command	`:CALCulate:RHO:MARKer[1]|2|...|12:X:POSition <real>` `:CALCulate:RHO:MARKer[1]|2|...|12:X:POSition?`
Example	`:CALC:RHO:MARK10:X:POS 0.0` `:CALC:RHO:MARK10:X:POS?`
Notes	The query returns the marker's absolute X Axis value in trace points if the control mode is Normal, or the offset from the marker's reference marker in trace points if the control mode is Delta. The value is returned as a real number, not an integer, corresponding to the translation from X Axis Scale units to trace points. If the marker is Off the response is *Not A Number (NAN)* This command is not available when Marker Trace of the selected marker (`:CALCulate:RHO:MARKer[1]|2|3|4|5|6|7|8|9|10|11|12:TRACe?`) is set to `POLar`. In this case, this command is ignored
Preset	After a preset, all Markers are turned OFF, so Marker X Axis Value query returns a Not A Number (NAN)
State Saved	No
Min	-9.9E+37
Max	9.9E+37

Marker Y Axis Value (Remote Command only)

Queries the marker Y Axis value in the current marker Y Axis unit.

Remote	`:CALCulate:RHO:MARKer[1]|2|...|12:Y?`

Command	
Example	:CALC:RHO:MARK11:Y?
Notes	The query returns the marker Y-axis result if the control mode is Normal or Delta. If the marker is Off, the response is not a number (NAN)
Preset	Result dependent on markers setup and signal source
State Saved	No
Backwards Compatibility SCPI	:CALCulate:RHO:MARKer[1]|2|...|12:FUNCtion:RESult?

Marker Mode

Sets the marker control mode to Normal, Delta, or Off. All interactions and dependencies detailed under the control description are enforced when the remote command is sent. If the selected marker is Off, pressing Marker sets it to Normal and places it at the center of the screen on the trace determined by the Marker Trace rules. At the same time, Marker X Axis Value appears on the Active Function area.

The default active function is the active function for the currently selected marker control mode. If the current control mode is Off, there is no active function and the active function is turned off.

Remote Command	:CALCulate:RHO:MARKer[1]|2|...|12:MODE POSition | DELTa | OFF :CALCulate:RHO:MARKer[1]|2|...|12:MODE?
Example	:CALC:RHO:MARK3:MODE POS :CALC:RHO:MARK3:MODE?
Preset	OFF
State Saved	Saved in instrument state
Range	POSition|DELTa|OFF
Annotation	Mkr # <X value> and <Marker value> upper right on graph When Marker Trace is Polar in WCDMA mode: Mkr # <Chip Value (RHO & QPSKEVM)/Symbol Value (CDP)>, <X value> and <Y value> upper right on graph

Backward Compatibility SCPI Commands

Sets or queries the state of a marker. Setting a marker which is OFF to state ON or 1 puts it in Normal mode and places it at the center of the screen.

Remote Command	:CALCulate:RHO:MARKer[1]|2|...|12:STATe OFF | ON | 0 | 1 :CALCulate:RHO:MARKer[1]|2|...|12:STATe?
Example	:CALC:RHO:MARK3:STAT ON

	:CALC:RHO:MARK3:STAT?
Preset	OFF
State Saved	Saved in instrument state
Range	OFF|ON

Delta Marker (Reset Delta)

Pressing this button is exactly the same as pressing the “Delta” selection on the Marker Mode radio button. The selected marker becomes a Delta Marker. If the selected marker is already a Delta marker, the reference marker is moved to the current position of the selected marker, thus resetting the Delta to zero.

Marker Settings Diagram

The Marker Settings Diagram lets you configure the Marker system using a visual utility.

All Markers Off

Turns off all markers.

Remote Command	:CALCulate:RHO:MARKer:AOFF
Example	:CALC:RHO:MARK:AOFF

Couple Markers

When this function is On, moving any marker causes an equal X Axis movement of every other marker which is not Fixed or Off. By “equal X Axis movement” we mean that we preserve the difference between each marker’s X Axis value (in the fundamental x-axis units of the trace that marker is on) and the X Axis value of the marker being moved (in the same fundamental x-axis units).

When the marker is assigned to the Polar graph, a chip value is coupled instead of an X axis value.

This may result in markers going off screen.

Remote Command	:CALCulate:RHO:MARKer:COUPle[:STATe] ON | OFF | 1 | 0 :CALCulate:RHO:MARKer:COUPle[:STATe]?
Example	:CALC:RHO:MARK:COUP ON :CALC:RHO:MARK:COUP?
Preset	OFF Presets on Mode Preset and All Markers Off

State Saved	Saved in instrument state

3.3.7.3 Peak Search

The controls on the Peak Search tab allow you to move the marker to selected peaks of the signal, giving you enormous analysis capabilities, particularly when combined with the Delta Marker function.

NOTE

Pressing the **Peak Search** hardkey automatically moves you to the **Peak Search** page of the **Marker** menu *and* performs a Peak Search.

Pressing the **Peak Search** tab once you are already *in* the **Marker** menu does *not* perform a Peak Search.

Marker Chip Time

Sets the marker Chip value in the current marker for the I/Q Polar trace. It has no effect if the control mode is Off, but if the control mode is Normal, this is the SCPI equivalent of entering a Chip value.

This command is valid only when Marker Trace 'POLar'(I/Q Polar) is active. For any other Marker Trace, the command is ignored.

Remote Command	`:CALCulate:RHO:MARKer[1]|2|...|12:CHIP <real>` `:CALCulate:RHO:MARKer[1]|2|...|12:CHIP?`
Example	`:CALC:RHO:MARK:CHIP 0` `:CALC:RHO:MARK:CHIP?`
Notes	If no suffix is sent, 'chips' is used. If a suffix is sent that does not match 'chips', an error "Invalid suffix" is generated The query returns the marker's 'chips' value in the trace if the control mode is Normal. The query is returned in 'chips'. If the marker is Off the response is not a number (NAN)
Preset	Start point of the trace in the display window
State Saved	No
Min	-9.9E+37
Max	9.9E+37
Annotation	Mkr # <Chip Value>, <X value> and <Y value> upper right on graph

Marker X Axis Value

Sets the marker X Axis value in the current marker X Axis Scale unit. It has no effect if the control mode is Off, but is the SCPI equivalent of entering an X value if the control mode is Normal or Delta.

NOTE This command is not valid when Marker Trace is `POLar` and ignored. Marker Chip Time is supported instead.

Remote Command	`:CALCulate:RHO:MARKer[1]|2|...|12:X <real>` `:CALCulate:RHO:MARKer[1]|2|...|12:X?`
Example	`:CALC:RHO:MARK3:X 0.0` `:CALC:RHO:MARK3:X?`
Notes	If no suffix is sent, uses the fundamental units for the current marker X Axis Scale. If a suffix is sent that does not match the current marker X Axis Scale unit, an error “Invalid suffix” is generated The query returns the marker’s absolute X Axis value if the control mode is Normal, or the offset from the marker’s reference marker if the control mode is Delta. The query is returned in the fundamental units for the current marker X Axis scale: Hz for Frequency and Inverse Time, seconds for Period and Time. If the marker is Off the response is not a number
Preset	After a preset, all Markers are turned OFF, so Marker X Axis Value query returns a Not A Number (NAN)
State Saved	No
Min	–9.9E+37
Max	9.9E+37
Annotation	Mkr # <X value> and <Marker value> upper right on graph

Marker X Axis Position (Remote Command only)

Sets the marker X position in trace points. It has no effect if the control mode is **Off**, but is the SCPI equivalent of entering a value if the control mode is **Normal** or **Delta** - except in trace points rather than X Axis Scale units. The entered value is immediately translated into the current X Axis Scale units for setting the value of the marker.

Remote Command	`:CALCulate:RHO:MARKer[1]|2|...|12:X:POSition <real>` `:CALCulate:RHO:MARKer[1]|2|...|12:X:POSition?`
Example	`:CALC:RHO:MARK10:X:POS 0.0` `:CALC:RHO:MARK10:X:POS?`
Notes	The query returns the marker’s absolute X Axis value in trace points if the control mode is Normal, or the offset from the marker’s reference marker in trace points if the control mode is Delta. The value is returned as a real number, not an integer, corresponding to the translation from X Axis Scale units to trace points. If the marker is Off the response is *Not A Number (NAN)* This command is not available when Marker Trace of the selected marker (`:CALCulate:RHO:MARKer[1]|2|3|4|5|6|7|8|9|10|11|12:TRACe?`) is set to `POLar`. In this case, this command is ignored
Preset	After a preset, all Markers are turned OFF, so Marker X Axis Value query returns a Not A Number (NAN)
State Saved	No
Min	-9.9E+37
Max	9.9E+37

Marker Y Axis Value (Remote Command only)

Queries the marker Y Axis value in the current marker Y Axis unit.

Remote Command	`:CALCulate:RHO:MARKer[1]|2|...|12:Y?`
Example	`:CALC:RHO:MARK11:Y?`
Notes	The query returns the marker Y-axis result if the control mode is Normal or Delta. If the marker is Off, the response is not a number (NAN)
Preset	Result dependent on markers setup and signal source
State Saved	No
Backwards Compatibility SCPI	`:CALCulate:RHO:MARKer[1]|2|...|12:FUNCtion:RESult?`

Peak Search

Pressing the Peak Search control moves the selected marker to the trace point which has the maximum y-axis value for that marker's trace.

NOTE: Pressing the **Peak Search** hardkey automatically moves you to the **Peak Search** page of the **Marker** menu *and* performs a Peak Search.

Remote Command	`:CALCulate:RHO:MARKer[1]|2|...|12:MAXimum`

Example	`:CALC:RHO:MARK2:MAX`
	`:SYST:ERR?`
	can be used to query the errors to determine if a peak is found. The message "No peak found" will be returned after an unsuccessful search

Notes	Sending this command selects the subopcoded marker This command does not work when the selected marker is located on the polar trace. In this case, the command is ignored

Next Peak

Pressing Next Peak moves the selected marker to the peak that is next lower in amplitude than the current marker value. Only peaks which meet all enabled peak criteria are considered. If there is no valid peak lower than the current marker position, a "No peak found" message is generated and the marker is not moved.

If the selected marker was off, then it is turned on as a normal marker and a peak search is performed.

Remote Command	`:CALCulate:RHO:MARKer[1]|2|...|12:MAXimum:NEXT`
Example	`:CALC:RHO:MARK2:MAX:NEXT`
Notes	Sending this command selects the subopcoded marker
State Saved	Not part of saved state

Next Peak Right

Pressing Next Pk Right moves the selected marker to the nearest peak right of the current marker that meets all enabled peak criteria. If there is no valid peak to the right of the current marker position, a “No peak found” message is generated and the marker is not moved.

If the selected marker was off, then it is turned on as a normal marker and a peak search is performed.

Pressing this control moves the selected marker to the nearest active channel right of the current marker when Marker Trace is Code Domain Power. In other cases, pressing this control moves the selected marker to the highest peak right of the current marker.

Remote Command	`:CALCulate:RHO:MARKer[1]|2|...|12:MAXimum:RIGHt`
Example	`:CALC:RHO:MARK2:MAX:RIGH`
Notes	Sending this command selects the subopcoded marker
State Saved	Not part of saved state

Next Peak Left

Pressing Next Pk Left moves the selected marker to the nearest peak left of the current marker that meets all enabled peak criteria. If there is no valid peak to the left of the current marker position, a “No peak found” message is generated and the marker is not moved.

If the selected marker was off, then it is turned on as a normal marker and a peak search is performed.

Pressing this control moves the selected marker to the nearest active channel left of the current marker when Marker Trace is Code Domain Power. In other cases, moves the selected marker to the highest peak left of the current marker.

Remote Command	`:CALCulate:RHO:MARKer[1]|2|...|12:MAXimum:LEFT`
Example	`:CALC:RHO:MARK2:MAX:LEFT`
State Saved	Not part of saved state

Minimum Peak

Moves the selected marker to the minimum y-axis value on the current trace. Minimum (negative) peak searches do not have to meet the peak search criteria. It just looks for the lowest y-axis value. If the selected marker is Off, it is turned on before the minimum search is performed.

Remote Command	`:CALCulate:RHO:MARKer[1]|2|...|12:MINimum`
Example	`:CALC:RHO:MARK:MIN`
Notes	Sending this command selects the subopcoded marker
State Saved	Not part of saved state

Pk-Pk Search

Finds and displays the amplitude and frequency (or time, if in zero span) differences between the highest and lowest y-axis value. It places the selected marker on the minimum value on its selected trace. And it places that marker's reference marker on the peak of its selected trace.

This function turns on the reference marker and sets its mode to Normal if it is not already on. (These markers may be on two different traces.)

The rules for finding the maximum peak are exactly the same as for Peak Search, including the use of the peak criteria rules. However, the minimum trace value is not required to meet any criteria other than being the minimum y-axis value in the trace.

If the selected marker is off, a delta type marker is turned on and the peak-to-peak search is done. If the selected marker is on, but it is not a delta marker, then it is changed to delta which turns on the reference marker if needed, and then it performs the peak-to-peak function.

Remote Command	`:CALCulate:RHO:MARKer[1]|2|...|12:PTPeak`
Example	`:CALC:RHO:MARK:PTP`
Notes	Turns on the Marker D active function Sending this command selects the subopcoded marker
Dependencies	Pk-Pk Search is not available when Coupled Markers is on
Couplings	The selected marker becomes a delta marker if not already in delta mode
State Saved	Not part of saved state

Marker Delta

Pressing this button is exactly the same as pressing the “Delta” selection on the Marker Mode radio button on the Settings tab. The selected marker becomes a Delta Marker. If the selected marker is already a Delta marker, the reference marker is moved to the current position of the selected marker, thus resetting the Delta to zero.

The control is duplicated here in the Peak Search Menu to allow you to conveniently perform a peak search and change the marker's control mode to Delta without having to access two separate menus.

3.3.7.4 Properties

The controls on the Properties tab are used to set certain properties of the selected marker.

Marker Chip Time

Sets the marker Chip value in the current marker for the I/Q Polar trace. It has no effect if the control mode is **Off**, but if the control mode is Normal, this is the SCPI equivalent of entering a Chip value.

This command is valid only when Marker Trace 'POLar'(I/Q Polar) is active. For any other Marker Trace, the command is ignored.

Remote Command	`:CALCulate:RHO:MARKer[1]|2|...|12:CHIP <real>` `:CALCulate:RHO:MARKer[1]|2|...|12:CHIP?`
Example	`:CALC:RHO:MARK:CHIP 0` `:CALC:RHO:MARK:CHIP?`
Notes	If no suffix is sent, 'chips' is used. If a suffix is sent that does not match 'chips', an error "Invalid suffix" is generated The query returns the marker's 'chips' value in the trace if the control mode is Normal. The query is returned in 'chips'. If the marker is Off the response is not a number (NAN)
Preset	Start point of the trace in the display window
State Saved	No
Min	-9.9E+37
Max	9.9E+37
Annotation	Mkr # <Chip Value>, <X value> and <Y value> upper right on graph

Marker X Axis Value

Sets the marker X Axis value in the current marker X Axis Scale unit. It has no effect if the control mode is **Off,** but is the SCPI equivalent of entering an X value if the control mode is **Normal** or **Delta**.

NOTE **This command is not valid when Marker Trace is `POLar` and ignored. Marker Chip Time is supported instead.**

Remote Command	`:CALCulate:RHO:MARKer[1]|2|...|12:X <real>` `:CALCulate:RHO:MARKer[1]|2|...|12:X?`
Example	`:CALC:RHO:MARK3:X 0.0` `:CALC:RHO:MARK3:X?`
Notes	If no suffix is sent, uses the fundamental units for the current marker X Axis Scale. If a suffix is sent that does not match the current marker X Axis Scale unit, an error “Invalid suffix” is generated The query returns the marker’s absolute X Axis value if the control mode is Normal, or the offset from the marker’s reference marker if the control mode is Delta. The query is returned in the fundamental units for the current marker X Axis scale: Hz for Frequency and Inverse Time, seconds for Period and Time. If the marker is Off the response is not a number
Preset	After a preset, all Markers are turned OFF, so Marker X Axis Value query returns a Not A Number (NAN)
State Saved	No
Min	–9.9E+37
Max	9.9E+37
Annotation	Mkr # <X value> and <Marker value> upper right on graph

Marker X Axis Position (Remote Command only)

Sets the marker X position in trace points. It has no effect if the control mode is **Off,** but is the SCPI equivalent of entering a value if the control mode is **Normal** or **Delta** - except in trace points rather than X Axis Scale units. The entered value is immediately translated into the current X Axis Scale units for setting the value of the marker.

Remote Command	`:CALCulate:RHO:MARKer[1]|2|...|12:X:POSition <real>` `:CALCulate:RHO:MARKer[1]|2|...|12:X:POSition?`
Example	`:CALC:RHO:MARK10:X:POS 0.0` `:CALC:RHO:MARK10:X:POS?`
Notes	The query returns the marker’s absolute X Axis value in trace points if the control mode is Normal, or the offset from the marker’s reference marker in trace points if the control mode is Delta. The value is returned as a real number, not an integer, corresponding to the translation from X Axis Scale units to trace points. If the marker is Off the response is *Not A Number (NAN)* This command is not available when Marker Trace of the selected marker (`:CALCulate:RHO:MARKer[1]|2|3|4|5|6|7|8|9|10|11|12:TRACe?`) is set to `POLar`. In this case, this command is ignored
Preset	After a preset, all Markers are turned OFF, so Marker X Axis Value query returns a Not A Number (NAN)
State Saved	No
Min	-9.9E+37
Max	9.9E+37

Marker Y Axis Value (Remote Command only)

Queries the marker Y Axis value in the current marker Y Axis unit.

Remote Command	`:CALCulate:RHO:MARKer[1]|2|...|12:Y?`
Example	`:CALC:RHO:MARK11:Y?`
Notes	The query returns the marker Y-axis result if the control mode is Normal or Delta. If the marker is Off, the response is not a number (NAN)
Preset	Result dependent on markers setup and signal source
State Saved	No
Backwards Compatibility SCPI	`:CALCulate:RHO:MARKer[1]|2|...|12:FUNCtion:RESult?`

Relative To

Selects the marker to which the selected marker is relative (its reference marker).

Every marker has another marker to which it is relative. This marker is referred to as the “reference marker” for that marker. This attribute is set by the **Marker, Properties, Relative To** key. The marker must be a **Delta** marker to make this attribute relevant. If it is a **Delta** marker, the reference marker determines how the marker is controlled and how its value is displayed. A marker cannot be relative to itself.

Remote Command	`:CALCulate:RHO:MARKer[1]|2|...|12:REFerence <integer>` `:CALCulate:RHO:MARKer[1]|2|...|12:REFerence?`
Example	`:CALC:RHO:MARK:REF 5` `:CALC:RHO:MARK:REF?`
Notes	This command causes the marker specified with the subopcode to become selected Range (for SCPI command): 1 to 12. If the range is exceeded, the value is clipped A marker cannot be relative to itself so that choice is not available, and if sent from SCPI generates error -221: “Settings conflict; marker cannot be relative to itself” When queried a single value is returned (the specified marker numbers relative marker)
Couplings	The act of specifying the selected marker’s reference marker makes the selected marker a Delta marker If the reference marker is off it is turned on in Normal mode at the delta marker location
Preset	The preset default “Relative To” marker (reference marker) is the next higher numbered marker (current marker +1). For example, if marker 2 is selected, then it’s default reference marker is marker 3. The exception is marker 12, which has a default reference of marker 1 Set to the defaults by using Restore Mode Defaults. This is not reset by Marker Off, All Markers Off, or Preset
State Saved	Saved in instrument state. Not affected by Marker Off and hence not affected by Preset or power cycle
Min	1

Max	12
Annunciation	Appears in the marker label of a Delta marker

Marker Trace

Assigns the specified marker to the designated trace.

Remote Command	`:CALCulate:RHO:MARKer[1]|2|...|12:TRACe CDPower | EVM | MERRor | PERRor | FERRor | EVMSlot | PCDE | POLar` `:CALCulate:RHO:MARKer[1]|2|...|12:TRACe?`
Example	`:CALC:RHO:MARK2:TRAC EVM` `:CALC:RHO:MARK:TRACE?`
Preset	`EVM`
State Saved	Yes
Range	`CDPower|EVM|MERRor|PERRor|FERRor|EVMSlot|PCDE|POLar`

Marker Settings Diagram

The Marker Settings Diagram lets you configure the Marker system using a visual utility. This is the same as the "Marker Settings Diagram" on page 363control on the Settings tab.

3.3.8 Meas Setup

The Meas Setup menu panel contains functions for setting up the measurement parameters and also contains functions for setting up parameters global to all measurements in the mode.

3.3.8.1 Settings

This tab enables you to set measurement parameters.

Avg|Hold Number

Sets the number of data acquisitions that are averaged. After the specified number of average counts is reached, the averaging mode (termination control) setting determines the averaging action.

Remote Command	`[:SENSe]:RHO:AVERage:COUNt <integer>` `[:SENSe]:RHO:AVERage:COUNt?`
Example	`:RHO:AVER:COUN 100`

	:RHO:AVER:COUN?
Preset	10
State Saved	Yes
Min/Max	1/10000

Averaging On/Off

Turns averaging on or off.

Remote Command	[:SENSe]:RHO:AVERage[:STATe] OFF | ON | 0 | 1 [:SENSe]:RHO:AVERage[:STATe]?
Example	:RHO:AVER OFF :RHO:AVER?
Preset	ON
State Saved	Yes
Range	OFF|ON

Averaging Mode

Selects the type of termination control used for the averaging function. This determines the averaging action after the specified number of data acquisitions (average count) is reached. You can select between the Exp (exponential) and Repeat averaging modes. This selection only affects the averaging result after the number of N averages is reached. You can use the Avg|Hold Number to set N.

Key	SCPI	Description
Exponential averaging	EXPonential	When Measure is set at Cont, data acquisitions continue indefinitely. After N averages, exponential averaging is used with a weighting factor of N (the displayed average count stops at N). Exponential averaging weights new data more than old data, which allows tracking of slow-changing signals
Repeat averaging	REPeat	When Measure is set at Cont, data acquisitions continue indefinitely. After N averages is reached, all previous result data is cleared and the average count is set back to 1. This is equivalent to being in Measure Single and pressing the Restart key when the Single measurement finishes

Remote Command	[:SENSe]:RHO:AVERage:TCONtrol EXPonential | REPeat [:SENSe]:RHO:AVERage:TCONtrol?
Example	:RHO:AVER:TCON EXP

	:RHO:AVER:TCON?
Preset	REPeat
State Saved	Yes
Range	EXPonential|REPeat

IF Gain

Enables you to control an internally switched IF amplifier with approximately 10 dB of gain. This amplifier takes full advantage of the RF dynamic range of the instrument. When it can be turned on without an overload, the dynamic range is always better when the amplifier is set to On, than when it is set to Off. The control “IF Gain” can be used to set the IF Gain function to Auto, or to On (the extra 10 dB) or Off. These settings affect sensitivity and IF overloads.

Remote Command	[:SENSe]:RHO:IF:GAIN[:STATe] ON | OFF | 1 | 0 [:SENSe]:RHO:IF:GAIN[:STATe]? [:SENSe]:RHO:IF:GAIN:AUTO[:STATe] OFF | ON | 0 | 1 [:SENSe]:RHO:IF:GAIN:AUTO[:STATe]?
Example	:RHO:IF:GAIN OFF :RHO:IF:GAIN? :RHO:IF:GAIN:AUTO OFF :RHO:IF:GAIN:AUTO?
Notes	Where: – ON = high gain – OFF = low gain This only applies to the RF input. It does not apply to baseband I/Q input
Dependencies	This control does not appear in VXT, M9393A, M9391A, or UXM
Couplings	Auto sets IF Gain to High Gain under any of the following conditions: the input attenuator is set to 0 dB, the preamp is turned on, or the Max Mixer Level is –20 dBm or lower. For other settings, Auto sets IF Gain to Low Gain
Preset	OFF OFF
State Saved	Yes
Range	Low Gain | High Gain

Spur Avoidance

Because the VXT models M9410A/11A/15A are direct-conversion (zero-IF) receivers, feedthrough leakage from the local oscillator appears as a spurious signal (spur) at the center frequency. The Spur Avoidance function is provided to eliminate this spur, at the expense of some measurement speed.

When Spur Avoidance is enabled (the default), the instrument uses a software algorithm to remove this spur from the displayed measurement data.

You can disable this function to speed up your measurement by setting Spur Avoidance to “Disabled.” When Spur Avoidance is disabled, the following warning message will appear in the status bar: “Settings Alert; Spur Avoidance Off”. This is to alert you that measurement accuracy might be impacted by the fact that Spur Avoidance is not in effect.

Remote Command	`[:SENSe]:RHO:SAVoid[:STATe] ON | OFF | 0 | 1` `[:SENSe]:RHO:SAVoid[:STATe]?`
Example	`:RHO:SAVoid ON` `:RHO:SAVoid?`
Dependencies	This control only appears in VXT models M9410A/11A/15A
Preset	ON
State Saved	Saved in instrument state
Range	ON|OFF

Auto Couple

Immediately puts all Auto/Man functions into Auto. The **Auto Couple** action is confined to the current measurement only. It does not affect other measurements in the mode.

In the Auto state, Auto/Man functions are said to be “coupled”, meaning their values change as you make changes to other values in the measurement. This helps ensure accurate measurements and optimum dynamic range. Auto Couple is an immediate action function, and when it is executed, all the Auto/Man controls for the current measurement are set to Auto, and all measurement settings coupled to the Auto/Man parameters are automatically set to their optimal value.

For further details of measurement-specific settings (if any), see "Measurement-Specific Details" on page 376 below.

Remote Command	`:COUPle ALL`
Example	`:COUP ALL`
Backwards Compatibility SCPI	`:COUPLE ALL | NONE`
Backwards Compatibility Notes	`:COUP:NONE` puts all Auto/Man parameters in manual mode, decoupling all the coupled instrument parameters. It is retained for backwards compatibility and is *not* recommended for making measurements or new designs

All Auto/Man parameter couplings in the measurement are set to Auto. This includes couplings that may be unavailable or grayed-out due to the current state. For example, in the Swept SA measurement, there is no Auto/Man coupling for RBW while in Zero Span. Nonetheless, if **Auto Couple** were executed while in Zero Span it would set RBW to Auto "behind the scenes" so that, on exit from Zero Span, it would be in Auto.

Any Auto/Man selection specific (local) to the other measurements in the current Mode will not be affected by **Auto Couple**. Any functions that are *not* coupled with other instrument parameters, such as ranging or leveling variables, such as "AutoRange" or "AutoScale", will not be affected.

Executing the **Auto Couple** command generates the informational message, "All Auto/Man functions have been set to Auto".

Each parameter, upon being set to Auto, selects and sets the appropriate auto-coupled value based on that parameter's coupling rules. The Dependency Resolver orchestrates the couplings for parameters that are dependent on one or more other parameters. The coupling and dependency rules for each parameter are defined in the chapter describing that parameter.

Executing the **Auto Couple** command *does not* affect markers, marker functions, trace or display attributes, or any other instrument setting other than those specifically mentioned above.

Measurement-Specific Details

TOI

Parameters affected by Auto Couple are:

- Center Frequency Step
- Resolution Bandwidth
- Span/RBW Ratio
- Sweep Time
- Video BandwidthVBW/RBW ratio
- Upper and Lower Tone (set to Sense
-)Zero span measurement Resolution Bandwidth
- Zero span measurement Dwell Time

Harmonics

For Harmonics, these parameters are:

- Resolution Bandwidth
- Fundamental Frequency
- Dwell Time
- Range Table Resolution Bandwidths
- Range Table Dwell Times

Meas Preset

Restores all the measurement parameters to their default values.

Remote Command	:CONFigure:RHO
Example	:CONF:RHO
Couplings	Selecting Meas Preset restores all measurement parameters to these default values

3.3.8.2 Radio

The Radio tab contains controls to select the Radio Device, and enable or disable HSPA/HSPA+ options.

Radio Device

Allows you to specify the device to be used.

Remote Command	[:SENSe]:RADio:STANdard:DEVice BTS | MS [:SENSe]:RADio:STANdard:DEVice?
Example	:RAD:STAN:DEV MS :RAD:STAN:DEV?
Preset	BTS
State Saved	Saved in instrument state.
Range	BTS | MS
Backwards Compatibility SCPI	[:SENSe]:RADio:DEVice

HSPA Enable

Allows you to turn on or off the HSDPA/HSUPA option enable. This selection is necessary because some of the auto detection functions that expect an HSPA signal are less tolerant when the signal is noisy or distorted. When the HSPA signal is not expected, turn HSPA Enable off.

Remote Command	`[:SENSe]:RADio:CONFigure:HSDPa[:STATe] 0 | 1 | OFF | ON` `[:SENSe]:RADio:CONFigure:HSDPa[:STATe]?`
Example	`:RAD:CONF:HSDP 0` `:RAD:CONF:HSDP?`
Preset	ON
State Saved	Saved in instrument state.
Range	On|Off

HSPA+ Enable

Allows you to turn on or off the HSPA+ option enable. This selection is necessary because some of the auto detection functions that expect an HSPA+ signal are less tolerant when the signal is noisy or distorted. When the HSPA+ signal is not expected, turn HSPA+ Enable off.

Remote Command	`[:SENSe]:RADio:CONFigure:EHSPa[:STATe] OFF | ON | 0 | 1` `[:SENSe]:RADio:CONFigure:EHSPa[:STATe]?`
Example	`:RAD:CONF:EHSP 0` `:RAD:CONF:EHSP?`
Notes	When HSPA enable is OFF, HSPA+ function is disabled too.
Preset	ON
State Saved	Saved in instrument state.
Range	On|Off

3.3.8.3 Sync

This tab enables you to set sync parameters.

Sync Type (BTS)

Accesses the menu that enables you to select the channel to synchronize with, and to set features, such as Symbol Rate, that may affect synchronization. You can select from the following types of channels and features listed in the menu:

- **CPICH** - Synchronize with the common pilot channel (CPICH)
- **Pilot-aided Timing Est(imator)** - Enables additional symbol timing estimation to each detected code channel through the demod calculation process by referring to the pilot channel (CPICH) timing correlation
- **SCH** - Synchronize with the synchronization channel (SCH)
- **Symbol Based** - Allows you to access the menu that allows you to select the code symbol to synchronize with
- **Symbol Rate** - Allows you to set the symbol rate, ranging from 7.5 to 960 ksps. The parameter automatically sets the maximum value for Code Number when appropriate
- **Code Number** - Allows you to set the code number. The range is 0 to 511, depending on the Symbol Rate setting

Antenna-2 CPICH - Allows you to synchronize with the STTD Antenna-2 common pilot channel

- **Pilot-aided Timing Est(imator)** - Enables additional symbol timing estimation to each detected code channel through the demod calculation process by referring to the pilot channel (Antenna-2 CPICH) timing correlation

STTD Diff - Allows you to synchronize to the common pilot channel at STTD antenna-1 and antenna-2 to make Diversity Time Error measurements

TSTD SCH Antenna1 – Allows you to synchronize the antenna1 of TSTD SCH

TSTD SCH Antenna2 – Allows you to synchronize the antenna2 of TSTD SCH

Remote Command	`[:SENSe]:RHO:SYNC[:BTS] CPICh | SCH | SYMBol | STTD | A2Cpich | A1SCh | A2SCh` `[:SENSe]:RHO:SYNC[:BTS]?`
Example	`:RHO:SYNC SCH` `:RHO:SYNC?`
Notes	This command is effective when `[:SENSe]:RADio:DEVice` is set to BTS
Couplings	SYMBol synchronizes to the code symbol specified by `[:SENSe]:RHO:SYNC:SYMBol:SRATe` and the `[:SENSe]:RHO:SYNC:SYMBol:SPRead` commands
Preset	`CPICh`
State Saved	Yes
Range	CPICH | SCH | Symbol Based | STTD Diff | Antenna-2 CPICH | Antenna-1 TSTD SCH | Antenna-2 TSTD SCH

Sync Type (MS)

Selects the channel to synchronize with. You can select from the following types:

- DPCCh - Synchronizes to DPCCH and the Slot Format, which is specified by [:SENSe]:RHO:SFORmat:MS
- PMESsage - Synchronizes to PRACH Message and the Slot Format, which is specified by [:SENSe]:RHO:PRACh:SIGNature and [:SENSe]:RHO:SFORmat:MS
- EDPCch - Synchronizes to E-DPCCH(C8(1):I, the spreading factor is 256, and the code index is 1 on I-branch)
- PRACh Preamble - Synchronizes to PRACH Preamble and the Signature, which is specified by [:SENSe]:RHO:PRACh:SIGNature

Remote Command	[:SENSe]:RHO:SYNC:MS DPCCh | EDPCch | PMESsage | PPReamble [:SENSe]:RHO:SYNC:MS?
Example	:RHO:SYNC:MS DPCC :RHO:SYNC:MS?
Notes	This command is effective when [:SENSe]:RADio:DEVice is set to MS
Preset	DPCCh
State Saved	Saved in instrument state
Range	DPCCH|E-DPCCH C8(1):I|PRACH Message|PRACH Preamble

Pilot-aided Timing Estimator

Enables additional symbol timing estimation to each detected code channel through the demod calculation process by referring to the pilot channel (i.e. CPICH or Ant2 CPICH, accordingly) timing correlation. It is expected to improve symbol reference vector estimation robustness for some specific impairment conditions: for example, the signal under test is assumed to have asymmetric filter response. Note that this function would not always be effective to any signal condition; on the contrary, turning the control “on” may decrease the estimation robustness and measurement speed for some different cases. A typical example it is worth to try this out is when you find that the peak EVM result is unexpectedly high compared to the RMS EVM result.

Remote Command	[:SENSe]:RHO:SYNC:CPICh:ESTimator OFF | ON | 0 | 1 [:SENSe]:RHO:SYNC:CPICh:ESTimator?
Example	:RHO:SYNC:CPIC:EST 0 :RHO:SYNC:CPIC:EST?
Dependencies	This command is effective when [:SENSe]:RADio:DEVice is set to BTS and [:SENSe]:RHO:SYNC[:BTS] is set to CPICh or A2CPich
Preset	OFF
State Saved	Saved in instrument state
Range	ON|OFF

Synchronization Symbol Rate (BTS only)

Sets the symbol rate of the code symbol to synchronize with. The parameter automatically sets the maximum value for the Code Number when appropriate. This command is currently available only for BTS.

Remote Command	`[:SENSe]:RHO:SYNC:SYMBol:SRATe <integer>` `[:SENSe]:RHO:SYNC:SYMBol:SRATe?`
Example	`:RHO:SYNC:SYMB:SRAT 15000` `:RHO:SYNC:SYMB:SRAT?`
Notes	This command is effective when `[:SENSe]:RADio:DEVice` is set to BTS, and `[:SENSe]:RHO:SYNC[:BTS]` is set to SYMBol
Preset	7500
State Saved	Saved in instrument state
Range	7500|15000|30000|60000|120000|240000|480000|960000

Synchronization Code Number (BTS only)

Sets the spread code number of the code symbol to synchronize with. The range depends on the Symbol Rate setting. This command is available only for BTS.

Remote Command	`[:SENSe]:RHO:SYNC:SYMBol:SPRead <integer>` `[:SENSe]:RHO:SYNC:SYMBol:SPRead?`
Example	`:RHO:SYNC:SYMB:SPR 3` `:RHO:SYNC:SYMB:SPR?`
Notes	This command is effective when `[:SENSe]:RADio:DEVice` is set to BTS, and `[:SENSe]:RHO:SYNC[:BTS]` is set to SYMBol
Preset	1
State Saved	Saved in instrument state
Min/Max	Min: 0 Max: Dependent on Synchronization Symbol Rate

[:SENSe]:RHO:SYNC:SYMBol:SRATe	Value
7500	511
15000	255
30000	127
60000	63
120000	31
240000	15

[:SENSe]:RHO:SYNC:SYMBol:SRATe	Value
480000	7
960000	3

Slot Format (MS only)

Defines the uplink DPCCH pilot pattern to synchronize with. This control is available when **DPCCH** is selected under **Sync Type**. The command is effective when the [:SENSe]:RHO:SYNC:MS command is set to DPCCh.

Formats 0A, 0B, 2A, 2B, 5A and 5B are not supported, because the compressed mode is not supported. For details of the fields for each available slot format, see "DPCCH fields information (TS25.211 V.3.9.0)" on page 382.

Remote Command	`[:SENSe]:RHO:SFORmat:MS SF0 | SF1 | SF2 | SF3 | SF4 | SF5 | AUTO` `[:SENSe]:RHO:SFORmat:MS?`
Example	`:RHO:SFOR:MS SF0` `:RHO:SFOR:MS?`
Dependencies	This command is effective when `[:SENSe]:RADio:DEVice` is set to MS, and `[:SENSe]:RHO:SYNC:MS` is set to DPCCh
Preset	`SF0`
State Saved	Yes
Range	`SF0|SF1|SF2|SF3|SF4|SF5|AUTO`

DPCCH fields information (TS25.211 V.3.9.0)

Slot Format #i	Channel Bit Rate (kbps)	Channel Symbol Rate (ksps)	SF	Bits/Frame	Bits/Slot	Npilot	NTPC	NTFCI	NFBI	Transmitted slots per radio frame
0	15	15	256	150	10	6	2	2	0	15
0A	15	15	256	150	10	5	2	3	0	10-14
0B	15	15	256	150	10	4	2	4	0	8-9
1	15	15	256	150	10	8	2	0	0	8-15
2	15	15	256	150	10	5	2	2	1	15

Slot Format #i	Channel Bit Rate (kbps)	Channel Symbol Rate (ksps)	SF	Bits/Frame	Bits/Slot	Npilot	NTPC	NTFCI	NFBI	Transmitted slots per radio frame
2A	15	15	256	150	10	4	2	3	1	10-14
2B	15	15	256	150	10	3	2	4	1	8-9
3	15	15	256	150	10	7	2	0	1	8-15
4	15	15	256	150	10	6	2	0	2	8-15
5	15	15	256	150	10	5	1	2	2	15
5A	15	15	256	150	10	4	1	3	2	10-14
5B	15	15	256	150	10	3	1	4	2	8-9

Preamble Signature (MS only)

Sets the PRACH Preamble Signature number for PRACH Message detection. Based on this value, the code allocation of the PRACH message control part is calculated. This command is effective when the [:SENSe]:RHO:SYNC:MS command is set to PMESsage (PRACH Message) or PPReamble (PRACH Preamble).

PRACH message (Control) has only Slot Format #0. The field lengths are defined in the table below. Demod attribute information is colored according to the given Slot Format parameter. Using input parameter Slot Format #i, bit data is colored accordingly (for example, Npilot and NTFCI).

PRACH message Control field Information (TS25.211 V.3.9.0)

Slot Format #i	Channel Bit Rate (kbps)	Channel Symbol Rate (ksps)	SF	Bits/Frame	Bits/Slot	Npilot	NTFCI
0	15	15	256	150	10	8	2

Select Auto or Man (Manual). Auto corresponds to “ON” for the `[:SENSe]:RHO:PRACh:SIGNature:AUTO` command. When Auto is selected, it searches and synchronizes the PRACH Message control part automatically. The code for the control part is assigned according to the PRACH Preamble Signature number. It can find the code number for the control part from 16 possible cases. But it takes more time than manual setting. “---“ is shown initially. When Man is selected, it synchronizes with the code specified by the Preamble Signature.

The value is set at its auto number and "---" is replaced with the detected number, if PRACH Search is set to Auto and PRACH Preamble or Message sync is done successfully. Otherwise the value is not changed.

NOTE: When PRACH Message is selected for Sync Type, this function does not check the Preamble Signature itself. Instead, it identifies the code location for the PRACH Message control part. The relationship between "Preamble Signature" and "code location for PRACH Message control part" is a one-to-one correspondence.

Remote Command	`[:SENSe]:RHO:PRACh:SIGNature <integer>`
	`[:SENSe]:RHO:PRACh:SIGNature?`
	`[:SENSe]:RHO:PRACh:SIGNature:AUTO OFF | ON | 0 | 1`
	`[:SENSe]:RHO:PRACh:SIGNature:AUTO?`

Example	`:RHO:PRAC:SIGN 3`
	`:RHO:PRAC:SIGN?`
	`:RHO:PRAC:SIGN:AUTO OFF`
	`:RHO:PRAC:SIGN:AUTO?`

Notes	This command is effective when `[:SENSe]:RADio:DEVice` is set to MS, and `[:SENSe]:RHO:SYNC:MS` is set to PMESsage or PPReamble (PRACH Preamble) Set Signature Auto mode ON for PRACH Preamble detection
Preset	0 ON
State Saved	Yes Yes
Range	Auto|Man
Min/Max	0/15

Sync Start Slt

Specifies the slot number to measure as the first slot. You can then use any trigger, even **Free Run**, to get the measurement result beginning with the specified slot number. For example, if the Sync Start Slot state is set to On and the start slot number is 0, then the synchronization always starts from slot number 0 regardless of the trigger type and its delay.

If Sync Start Slot state is set to Off, the measurement performs synchronization at any slot found immediately after the trigger timing.

Remote Command	`[:SENSe]:RHO:SSLot:NUMBer <integer>`
	`[:SENSe]:RHO:SSLot:NUMBer?`
	`[:SENSe]:RHO:SSLot[:STATe] OFF | ON | 0 | 1`

	[:SENSe]:RHO:SSLot[:STATe]?
Example	:RHO:SSL:NUMB 5 :RHO:SSL:NUMB? :RHO:SSL:STAT ON :RHO:SSL:STAT?
Notes	Turn first slot number detection mode on or off
Dependencies	This command has no effect when Device is MS and Sync Type is PRACH Preamble
Preset	0 OFF
State Saved	Yes Yes
Range	0 to 14 OFF|ON
Min/Max	0/14

Freq Error Tol Range

Selects the frequency error tolerance range from either Normal or Wide.

- NORMal- provides a more stringent range of frequency tolerance, which is useful when you want to accurately demodulate signals of higher complexity. For example, when composite channels are modulated on the same signal, the modulation is complex, and frequency error is critical to correct demodulate. In the case of demodulating complex signals, set to 'Normal'
- WIDE- provides a wider, and less stringent range of frequency error tolerance

This parameter is valid only when the device type is MS (Uplink). When BTS (Downlink), the menu is disabled.

Remote Command	[:SENSe]:RHO:FERRor:TRANge WIDE | NORMal [:SENSe]:RHO:FERRor:TRANge?
Example	:RHO:FERR:TRAN WIDE :RHO:FERR:TRAN?
Preset	NORMal
State Saved	Yes
Range	WIDE|NORMal

P-Scramble Code (BTS only)

Sets a numeric value for the primary scramble code for synchronization:

– **Autodetect** - The instrument autodetects the primary scramble code. The result is also available using SCPI command, READ/FETCh:RHO19? Available only when Sync Type for BTS is set to SCH or CPICH and Capture Interval is set to 1 frame

  When Autodetect is not available, the result as detected primary scramble code is not valid

– **Manual** – You can specify the value for the primary scramble code. The range is 0 to 511

If the Device is set to MS, this label changes to Slot Format to define the DPCCH pilot pattern to synchronize with. It allows you to enter either 0 or 2 slot formats

The BTS scramble code number (Downlink) is determined by the “Primary Scramble Code”, “Scramble Code Offset” and “Scramble Code Type”.

The following information is an excerpt from TS25.213 Section 5.2.2 Scramble Code.

A total of 2^{18}-1 = 262,143 scrambling codes, numbered 0...262,142, can be generated. However, not all the scrambling codes are used. The scrambling codes are divided into 512 sets, each consisting of a primary scrambling code and 15 secondary scrambling codes.

The primary scrambling codes consist of scrambling codes n = 16*i where i = 0...511. The i:th set of secondary scrambling codes consists of scrambling codes 16*i + k, where k = 1...15.

There is a one-to-one mapping between each primary scrambling code and the 15 secondary scrambling codes in a set such that i:th primary scrambling code corresponds to i:th set of secondary scrambling codes.

Hence, according to the above, scrambling codes k = 0, 1, ..., 8191 are used. Each of these codes is associated with a left alternative scrambling code and a right alternative scrambling code that may be used for compressed frames. The left alternative scrambling code corresponding to scrambling code k is scrambling code number k + 8192, while the right alternative scrambling code corresponding to scrambling code k is scrambling code number k + 16384. The alternative scrambling codes can be used for compressed frames. In this case, the left alternative scrambling code is used if n < SF/2, and the right alternative scrambling code is used if n ¤ SF/2, where cch,SF,n is the channelization code used for non-compressed frames. The usage of an alternative scrambling code for compressed frames is signaled by higher layers for each physical channel respectively.

The Primary Scramble Code corresponds to i (i = 0 ... 511), the Scramble Code Offset corresponds to k (k = 1 ... 15: Secondary Scramble Code, 0: Primary Scramble Code) and the Scramble Code Type Left and Right correspond to+8192 and +16384 offsets respectively.

Remote Command

```
[:SENSe]:RHO:SYNC:SCRamble[:BTS] <integer>
[:SENSe]:RHO:SYNC:SCRamble[:BTS]?
[:SENSe]:RHO:SYNC:SCRamble[:BTS]:AUTO OFF | ON | 0 | 1
```

	[:SENSe]:RHO:SYNC:SCRamble[:BTS]:AUTO?
Example	:RHO:SYNC:SCR 100 :RHO:SYNC:SCR? :RHO:SYNC:SCR:AUTO 1 :RHO:SYNC:SCR:AUTO?
Notes	This command is effective when [:SENSe]:RADio:DEVice is set to BTS Autodetect is available when the following conditions are met – Option N/W9073A-AFP (auto scramble code detection) is installed – [:SENSe]:RADio:DEVice is set to BTS – Sync Type for BTS is set to SCH or CPICH – Capture Interval is set to 1 Frame
Preset	0 OFF
State Saved	Yes
Range	Auto Detect|Manual
Min/Max	0/511

Scramble Code (MS only)

Sets the MS scramble code for synchronization. When this control is selected, the “Hex Input” menu appears.

Remote Command	[:SENSe]:RHO:SYNC:SCRamble:MS <integer> [:SENSe]:RHO:SYNC:SCRamble:MS?
Example	:RHO:SYNC:SCR:MS 10000000 :RHO:SYNC:SCR:MS?
Notes	This command is effective when [:SENSe]:RADio:DEVice is set to MS
Preset	0 (0x0
State Saved	Yes
Range	0 to 16777215 (0x0 to 0xFFFFFF; 24 bits)
Min/Max	0/16777215

Scramble Code Offset (BTS only)

Sets the number of scramble code offsets needed to make the modulation accuracy measurement. This control is not available if Device is set to MS.

Remote	[:SENSe]:RHO:SYNC:SCRamble[:BTS]:OFFSet <integer>

Command	[:SENSe]:RHO:SYNC:SCRamble[:BTS]:OFFSet?
Example	:RHO:SYNC:SCR:OFFS 5 :RHO:SYNC:SCR:OFFS?
Notes	This command is effective when [:SENSe]:RADio:DEVice is set to BTS This command is not effective when [:SENSe]:RHO:SYNC:SCRamble[:BTS]:AUTO is set to ON
Preset	0
State Saved	Yes
Range	0 to 15 (0 for the primary scramble code; 1 to 15 for the secondary scramble code)
Min/Max	0/15

Scramble Code Type (BTS only)

Sets the BTS primary scramble code type for synchronization.

Enables you to set the scramble code type to Std (standard), Left, or Right to make the modulation accuracy measurement. This control is not available if Device is set to MS.

- LEFT – the left alternative scrambling code, whose number is the primary scramble code number + 8192, is used
- RIGHt – the right alternative scrambling code, whose number is the primary scrambling code number + 16384, is used
- STANdard – the standard scrambling code, whose number is the primary scrambling code number, is used

Remote Command	[:SENSe]:RHO:SYNC:SCRamble[:BTS]:TYPE LEFT | RIGHt | STANdard [:SENSe]:RHO:SYNC:SCRamble[:BTS]:TYPE?
Example	:RHO:SYNC:SCR:TYPE LEFT :RHO:SYNC:SCR:TYPE?
Notes	This command is effective when [:SENSe]:RADio:DEVice is set to BTS. This command is not effective when [:SENSe]:RHO:SYNC:SCRamble[:BTS]:AUTO is set to ON
Preset	STANdard
State Saved	Yes
Range	LEFT|RIGHt|STANdard

Advanced Sync Setup

The Advanced Sync Setup enables you to access advanced sync parameters in the Meas Setup menus on one screen.

Chip Rate

Sets the chip rate.

Remote Command	`[:SENSe]:RHO:CRATe <freq>` `[:SENSe]:RHO:CRATe?`
Example	`:RHO:CRAT 3900000` `:RHO:CRAT?`
Preset	3.84 MHz
State Saved	Yes
Min/Max	3.456 MHz/4.224 MHz

RRC Filter Control

Specifies the alpha value of the Root Raised Cosine (RRC) filter and changes its status (ON/OFF). This ON/OFF state change involves measurement restart.

Remote Command	`[:SENSe]:RHO:FILTer[:RRC]:ALPHa <real>`
	`[:SENSe]:RHO:FILTer[:RRC]:ALPHa?`
	`[:SENSe]:RHO:FILTer[:RRC][:STATe] OFF | ON | 0 | 1`
	`[:SENSe]:RHO:FILTer[:RRC][:STATe]?`

Example	`:RHO:FILT:ALPH 0.3`
	`:RHO:FILT:ALPH?`
	`:RHO:FILT ON`
	`:RHO:FILT?`

Preset	0.22 ON
State Saved	Yes
Min/Max	0.01/0.50
Backwards Compatibility SCPI	`[:SENSe]:RHO:ALPHa`

Spectrum

Sets a spectrum to either normal or inverted for demodulation related measurements. If set to INVert, the upper and lower spectrums are swapped.

The Invert function conjugates the spectrum, which is equivalent to taking the negative of the quadrature component in demodulation. The correct setting (Normal or Invert) depends on whether the signal at the input of the instrument has a high or low side mix.

Remote Command	`[:SENSe]:RHO:SPECtrum INVert | NORMal` `[:SENSe]:RHO:SPECtrum?`
Example	`:RHO:SPEC INV` `:RHO:SPEC?`
Preset	`NORMal`
State Saved	Yes
Range	`INVert|NORMal`

EVM Result I/Q Offset

Toggles the I/Q origin offset function between Std (standard) and Exclude.

- Std (ON): The measurement results for EVM, Rho, and Modulation Accuracy (Rho) error take into account the I/Q origin offset
- Exclude (OFF): The measurement results for EVM, Rho, and Modulation Accuracy (Rho) error do not take into account the I/Q origin offset

Remote Command	`:CALCulate:RHO:IQOFfset:INCLude OFF | ON | 0 | 1` `:CALCulate:RHO:IQOFfset:INCLude?`
Example	`:CALC:RHO:IQOF:INCL ON` `:CALC:RHO:IQOF:INCL?`
Preset	`ON`
State Saved	Yes
Range	Standard|Exclude

EVM Minimization by IQ Imbalance

Toggles the I/Q Imbalance Compensation between ON and OFF.

- ON: The measurement results for EVM, Rho, and Modulation Accuracy (Rho) error are compensated for I/Q imbalance
- OFF: The measurement results for EVM, Rho, and Modulation Accuracy (Rho) error are not compensated for I/Q imbalance

Remote Command	`[:SENSe]:RHO:EVMMinimize:IQIMbalance OFF | ON | 0 | 1` `[:SENSe]:RHO:EVMMinimize:IQIMbalance?`
Example	`:RHO:EVMM:IQIM ON` `:RHO:EVMM:IQIM?`

Notes	This parameter is available only when N/W9073A-CFP license is installed
Preset	OFF
State Saved	Yes
Range	OFF|ON

IQ Imbalance Frequency Compensation

Toggles Frequency Compensation for IQ Imbalance measurement results (IQ Gain Imbalance, IQ Quadrature Error) for Receiver Device Under Test (DUT) between on and off. The Compensation is not valid for Transmitter DUT.

- ON: IQ Imbalance measurement results are compensated by taking account of Frequency Offset which is added before IQ Imbalance addition on DUT
- OFF: IQ Imbalance measurement results are not compensated for the Frequency Offset

Remote Command	[:SENSe]:RHO:IQIMbalance:FCOMpen ON | OFF [:SENSe]:RHO:IQIMbalance:FCOMpen?
Example	:RHO:IQIM:FCOM ON :RHO:IQIM:FCOM?
Notes	This parameter is available only when N/W9073A-DFP license is installed
Preset	OFF
State Saved	Yes
Range	ON|OFF

MEQ (Equalizer Mode)

Sets the Equalizer mode as follows.

- OFF: Equalizer is not active
- NORMal: Equalizer is active (Mirror Frequency Spectrum is Off)
- INVert: Equalizer is active (Mirror Frequency Spectrum is On)

Remote Command	[:SENSe]:RHO:MEQ OFF | NORMal | INVert [:SENSe]:RHO:MEQ?
Example	:RHO:MEQ OFF :RHO:MEQ?
Dependencies	Available when Option BBA or N9073C-DP2 (or both), and N9073C-DFP are installed
Preset	OFF

State Saved	Yes
Range	OFF|NORMal|INVert

3.3.8.4 Time

This tab enables you to set time parameters.

Capture Interval

Sets the data capture length in frames (1 frame equals 10 ms)that is used in the acquisition.

For details of the functionality, see "Capture Interval Enum" on page 392.

Frame Capture Interval (Remote Command only)

Sets the frame capture interval time.

Remote Command	[:SENSe]:RHO:CAPTure:TIME[:FRAMe] <real> [:SENSe]:RHO:CAPTure:TIME[:FRAMe]?
Example	:RHO:CAPT:TIME 1.0 :RHO:CAPT:TIME?
Preset	1.0
State Saved	Yes
Range	0.067, 0.2, 1.0 frame (0.67 to 80 ms; 1/15 frame equals 1 slot)
Min/Max	0.067/1.0

Capture Interval Enum

Sets the data capture length in frames to be used in the acquisition. Please note that 1 frame equals 10 ms.

Couplings	Changing this parameter forces a change to :RHO:CAPT:TIME – 1 slot: 0.067 – 3 slots: 0.2 – 1 frame: 1.0
Preset	1 frame
State Saved	Yes
Range	1 Slot|3 Slots|1 Frame

Meas Offset

Sets the timing offset of the capture interval in slots, where 1 slot = 666.6 us. If the Capture Interval is set to 1 slot (Fast Mode), the Meas Offset is fixed at “0”.

Remote Command	`:CALCulate:RHO:SWEep:OFFSet <integer>` `:CALCulate:RHO:SWEep:OFFSet?`
Example	`:CALC:RHO:SWE:OFFS 0` `:CALC:RHO:SWE:OFFS?`
Couplings	Max value is limited by Capture Interval in slot
Preset	0
State Saved	Yes
Min/Max	0/Capture Interval in Slot - 1

Transient Period Exclude (MS only)

Selects either to include or to exclude the transient period. The transient period is specified in the 3GPP standard TS 34.121, as 25 µs before each slot boundary and 25 µs after each slot boundary. The 3GPP standard requires that the transient period is not included for the power measurement.

This command is available only when the device is MS.

Remote Command	`[:SENSe]:RHO:SWEep:TIME:TRANsient INCLude | EXCLude` `[:SENSe]:RHO:SWEep:TIME:TRANsient?`
Example	`:RHO:SWE:TIME:TRAN INCL` `:RHO:SWE:TIME:TRAN?`
Notes	This command is available only when the device is MS
Preset	`INCLude`
State Saved	Yes
Range	`INCLude|EXCLude`

Capture Time Diagram

Accesses a menu that enables you to set up time parameters.

Capture Buffer Offset

Sets the timing offset in Capture Buffer, and the unit is slot, where 1 slot = 666.6 µs.

Remote	`[:SENSe]:RHO:CBUFfer:OFFSet <integer>`

Command	`[:SENSe]:RHO:CBUFfer:OFFSet?`
Example	`:RHO:CBUF:OFFS 25` `:RHO:CBUF:OFFS?`
Notes	This parameter is valid only when Data Source is Capture Buffer
Preset	0
State Saved	Yes
Min/Max	0/239

3.3.8.5 Channel/Layer

This tab enables you to set channel/layer parameters.

The Advanced Can Setup dialog contains the following parameters:

– "Active Set Threshold" on page 420
– "Multi Channel Estimator" on page 421
– "Timing Estimation" on page 422
– "PICH Code Number (BTS only)" on page 422
– "MICH Code Number (BTS only)" on page 422
– "S-CCPCH Symbol Rate (BTS only)" on page 423
– "S-CCPCH Code Number (BTS only)" on page 424

Symbol Boundary (BTS only)

Accesses the menu for the symbol boundary detection modes that are used to make the modulation accuracy measurement.

Available selections are as follows:

Auto Detect

Auto Detect [SCPI Enum: AUTO] - Sets symbol boundary detection to the automatic mode. Various code channels are measured and the most appropriate code channel is selected as the reference channel.

Lower level menus enable further selection of various numbers of DPCH channels to make the Modulation Accuracy Measurement.

Test Model 1

Test Model 1 – Accesses a menu with further selections of Test Model 1 with 4, 8, 16, 32 or 64 DPCH channels and with S-CCPCH.

- Test Model 1 w/4DPCH w/ S-CCPCH [SCPI Enum: TM1D4] – Select this to set the Modulation Accuracy Measurement to the Test Model 1 with 4 DPCH channels and 1 S-CCPCH channel
- Test Model 1 w/8DPCH w/ S-CCPCH [SCPI Enum: TM1D8] – Select this to set the Modulation Accuracy Measurement to Test Model 1 with 8 DPCH channels and 1 S-CCPCH channel
- Test Model 1 w/16 DPCH w/ S-CCPCH [SCPI Enum: TM1D16] – Select this to set the Modulation Accuracy Measurement to the Test Model 1 with 16 DPCH channels and 1 S-CCPCH channel
- Test Model 1 w/32 DPCH w/ S-CCPCH [SCPI Enum: TM1D32] – Select this to set the Modulation Accuracy Measurement to Test Model 1 with 32 DPCH channels and 1 S-CCPCH channel
- Test Model 1 w/64 DPCH w/ S-CCPCH [SCPI Enum: TM1D64] – Select this to set the Modulation Accuracy Measurement to Test Model 1 with 64 DPCH channels and 1 S-CCPCH channel

3GPP TS25.141 Table 6.1: Test Model 1 (2009-12 version) (S-CCPCH included)

Type	Number of Channels	Fraction of Power (%)	Level setting (dB)	Channelization Code	Timing offset (x256Tchip)
P-CCPCH+SCH	1	10	-10	1	0
Primary CPICH	1	10	-10	0	0
PICH	1	1.6	-18	16	120
S-CCPCH containing PCH (SF=256)	1	1.6	-18	3	0
DPCH (SF=128)	4*/8*/16/32/64	76.8 in total	See 3GPP TS25.141 table 6.2	See 3GPP TS25.141 table 6.2	See 3GPP TS25.141 table 6.2

Table Note *: Only applicable to Home BS

Test Model 2

Test Model 2 – Accesses a menu with selections of Test Model 2 with S-CCPCH.

- Test Model 2 w/S-CCPCH [SCPI Enum: TM2SC] – Select this to set the Modulation Accuracy Measurement to Test Model 2 with 1 S-CCPCH channel

3GPP TS25.141 Table 6.3: Test Model 2 (2002-09 version) (S-CCPCH included)

Type	Number of Channels	Fraction of Power (%)	Level setting (dB)	Channelization Code	Timing offset (x256Tchip)
P-CCPCH+SCH	1	10	-10	1	0
Primary CPICH	1	10	-10	0	0
PICH	1	5	-13	16	120
S-CCPCH containing PCH (SF=256)	1	5	-13	3	0
DPCH (SF=128)	3	2 x 10, 1 x 50	2 x –10, 1 x –3	24, 72, 120	1, 7, 2

Test Model 3

Test Model 3 - Accesses a menu with further selections from Test Model 3 with 4, 8, 16 or 32 DPCH channels and with S-CCPCH.

- Test Model 3 w/4 DPCH w/ S-CCPCH [SCPI Enum: TM3D4SC] - Select this to set the Modulation Accuracy Measurement to Test Model 3 with 4 DPCH channels and 1 S-CCPCH channel
- Test Model 3 w/8 DPCH w/ S-CCPCH [SCPI Enum: TM3D8SC] - Select this to set the Modulation Accuracy Measurement to Test Model 3 with 8 DPCH channels and 1 S-CCPCH channel
- Test Model 3 w/16 DPCH w/ S-CCPCH [SCPI Enum: TM3D16SC] - Select this to set the Modulation Accuracy Measurement to Test Model 3 with 16 DPCH channels and 1 S-CCPCH channel
- Test Model 3 w/32 DPCH w/ S-CCPCH [SCPI Enum: TM3D32SC] - Select this to set the Modulation Accuracy Measurement to Test Model 3 with 32 DPCH channels and 1 S-CCPCH channel

3GPP TS25.141 Table 6.4: Test Model 3 (2009-12 version)

Type	Number of Channels	Fraction of Power (%) 16/32	Level settings (dB) 16/32	Channelization Code	Timing offset (x256Tchip)
P-CCPCH+SCH	1	15,8/15,8/12,6/7,9	-8/ -8 / -9 / -11	1	0
Primary CPICH	1	15.8/15.8/12,6/7,9	-8/ -8 / -9 / -11	0	0
PICH	1	2.5/2.5/5/1.6	-16/ -16/ -13/ -18	16	120
S-CCPCH	1	2.5/2.5/5/1.6	-16/ -16/	3	0

Type	Number of Channels	Fraction of Power (%) 16/32	Level settings (dB) 16/32	Channelization Code	Timing offset (x256Tchip)
containing PCH (SF=256)			-13/ -18		
DPCH (SF=256)	4*/8*/16/32	63,4/63,4/63,7/80,4 in total	See 3GPP TS25.141 table 6.5	See 3GPP TS25.141 table 6.5	See 3GPP TS25.141 table 6.5

Table Note *: Only applicable to Home BS

Test Model 4

Test Model 4 – Accesses a menu with further selections of Test Model 4.

– Test Model 4 w/P-CPICH [SCPI Enum: TM4CP] – Select this to set the Modulation Accuracy Measurement to Test Model 4 with 1 CPICH channel

– Test Model 4 [SCPI Enum: TM4] – Select this to set the Modulation Accuracy Measurement to Test Model 4 (no CPICH channel)

3GPP TS25.141, Table 6.6: Test Model 4 Active Channels (2001-09 version)

Type	Number of Channels	Fraction of Power (%)	Level setting (dB)	Channelization Code	Timing offset	Type
PCCPCH+SCH	1	50 to 1.6	-3 to -18	1	0	PCCPCH+SCH
Primary CPICH1	1	10	-10	0	0	Primary CPICH1

Note 1: The CPICH channel is optional

Test Model 5

Test Model 5 – Accesses a menu with further selections of Test Model 5. This feature is available when 'HSPA Enable' is on.

– Test Model 5 w/2 HS-PDSCH w/6 DPCH [SCPI Enum: TM5H2] – Select this to set the Modulation Accuracy Measurement to Test Model 5 with 2 HS-PDSCH channels and 6 DPCH channels

– Test Model 5 w/4 HS-PDSCH w/14 DPCH [SCPI Enum: TM5H4] – Select this to set the Modulation Accuracy Measurement to Test Model 5 with 4 HS-PDSCH channels and 14 DPCH channels

- **Test Model 5 w/8 HS-PDSCH w/30 DPCH** [SCPI Enum: TM5H8] - Select this to set the Modulation Accuracy Measurement to Test Model 5 with 8 HS-PDSCH channels and 30 DPCH channels
- **Test Model 5 w/4 HS-PDSCH w/4 DPCH** [SCPI Enum: TM5D4] - Select this to set the Modulation Accuracy Measurement to Test Model 5 with 4 HS-PDSCH channels and 4 DPCH channels

3GPP TS25.141 Table 6.6A: Test Model 5 Active Channels (2009-12 version)

Type	Number of Channels	Fraction of Power (%)	Level setting (dB)	Channelization Code	Timing offset (x256Tchip)
P-CCPCH+SCH	1	7.9	-11	1	0
Primary CPICH	1	7.9	-11	0	0
PICH	1	1.3	-19	16	120
S-CCPCH containing PCH (SF=256)	1	1.3	-19	3	0
DPCH (SF=128)	30/14/6/4*	14/14.2/14.4/14.2 in total	See 3GPP TS25.141 table 6.6.B	See 3GPP TS25.141 table 6.6B	See 3GPP TS25.141 table 6.6.B
HS-SCCH	2	4 in total	See 3GPP TS25.141 table 6.6C	See 3GPP TS25.141 table 6.6C	See 3GPP TS25.141 table 6.6C
HS-PDSCH (16QAM)	8/4/2*	63.6/63.4/63.2 in total	See 3GPP TS25.141 table 6.6D	See 3GPP TS25.141 table 6.6D	See 3GPP TS25.141 table 6.6D

Table Note *: 2 HS-PDSCH shall be taken together with 6 DPCH, 4 HS-PDSCH shall be taken with 14 DPCH or (for Home BS only) 4 DPCH, and 8 HS-PDSCH shall be taken together with 30 DPCH

Test Model 6

Test Model 6 - Accesses a menu to allow further selections of Test Model 6. This feature is available when both ‘HSPA Enable’ and ‘HSPA+ Enable’ are on.

- **Test Model 6 w/8 HS-PDSCH w/30 DPCH** [SCPI Enum: TM6H8] - Select this to set the Modulation Accuracy Measurement to Test Model 6 with 8 HS-PDSCH channels and 30 DPCH channels
- **Test Model 6 w/4 HS-PDSCH w/4 DPCH** [SCPI Enum: TM6D4] - Select this to set the Modulation Accuracy Measurement to Test Model 6 with 4HS-PDSCH channels and 4 DPCH channels

3GPP TS25.141 Table 6.6E: Test Model 6 Active Channels

This feature is available when both ‘HSPA Enable’ and ‘HSPA+ Enable’ are on

Type	Number of Channels	Fraction of Power (%)	Level setting (dB)	Channelization Code	Timing offset (x256Tchip)
P-CCPCH+SCH	1	7.9	-11	1	0
Primary CPICH	1	7.9	-11	0	0
PICH	1	1.3	-19	16	120
S-CCPCH containing PCH (SF=256)	1	1.3	-19	3	0
DPCH (SF=128)	30/4*	27.1 in total	See 3GPP TS25.141 table 6.6F	See 3GPP TS25.141 table 6.6F	See 3GPP TS25.141 table 6.6F
HS-SCCH	2	4 in total	See 3GPP TS25.141 table 6.6G	See 3GPP TS25.141 table 6.6G	See 3GPP TS25.141 table 6.6G
HS-PDSCH (64QAM)	8/4*	50.5 in total	See 3GPP TS25.141 table 6.6H	See 3GPP TS25.141 table 6.6H	See 3GPP TS25.141 table 6.6H

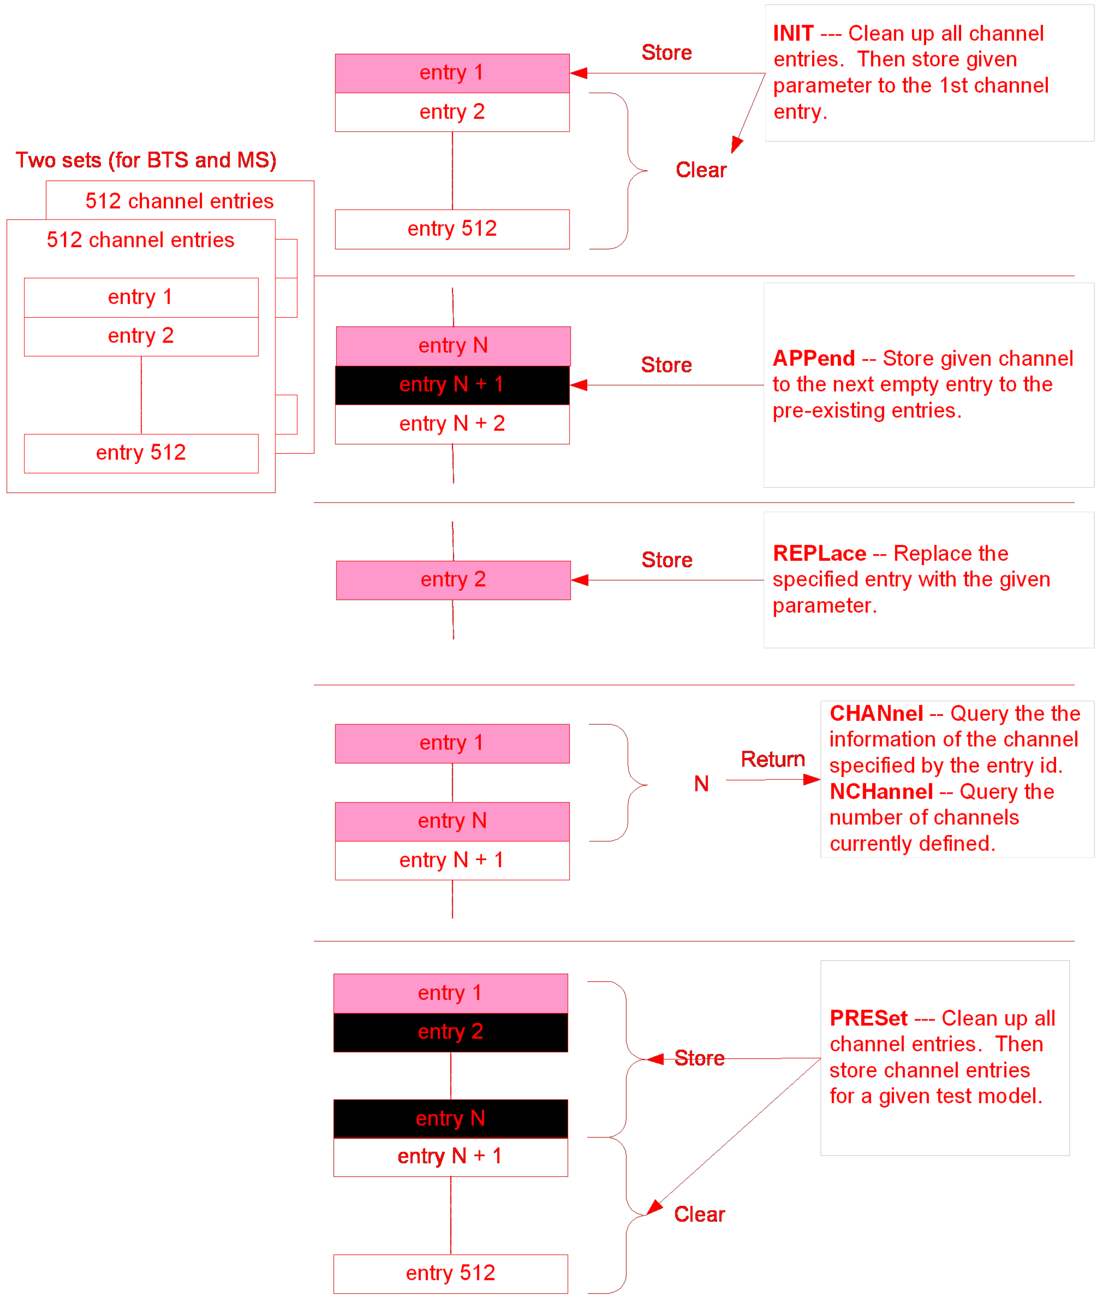
Table Note *: 8 HS-PDSCH shall be taken together with 30 DPCH, and (for Home BS only) 4 HS-PDSCH shall be taken with 4 DPCH

Custom

Custom [SCPI Enum: CUSTom] – Provides a flexible way to specify predefined active channels. By choosing it, you can specify a customized list of active channels using the following remote commands: Initialize List, Append List, Replace List, Query List.

The following commands handle the list of custom active channel list for BTS.

Mnemonic	Function	See Section
`INIT`	Cleans up all channel entries. Then stores given parameter to the 1st channel entry	"Initialize List (Remote Command only)" on page 400
`APPend`	Stores given channel to the next empty entry to the pre-existing entries	"Append List (Remote Command only)" on page 403
`REPLace`	Replaces the specified entry with the given parameter	"Replace List (Remote Command only)" on page 405
`CHANnel`	Queries the information of the channel specified by the entry id	"Query List (Remote Command only)" on page 408
`NCHannel`	Queries the number of channels currently defined	"Query List (Remote Command only)" on page 408
`PRESet`	Cleans up all channel entries. Then stores channel entries for a given test model	"Load Preset Setting BTS (Remote Command Only) (BTS only)" on page 410



Initialize List (Remote Command only)

Initializes the current custom active channel list. This creates a new entry with the specified parameters.

Parameter	Name/Value	Description
1	`<symbol_rate>`	Specifies symbol rate of the channel

Parameter	Name/Value	Description
2	<code_num>	Specifies code number of the channel
3	`QPSK`	Specifies the channel's modulation scheme is QPSK
	`QAM16`	Specifies the channel's modulation scheme is QAM16 This choice is available only for channels with a symbol rate of 240000 Only when 'HSPA' functionality is operative, 'QAM16' parameter is allowed
	`QAM64`	Specifies the channel's modulation scheme is QAM64 This choice is available only for channels with symbol rate 240000 Only when both 'HSPA' functionality and 'HSPA+' functionality are operative, 'QAM64' parameter is allowed

Remote Command	[:SENSe]:RHO:SBOundary:LIST[:BTS]:INIT <symbol_rate>, <code_num>, QPSK | QAM16 | QAM64

Example

In order to predefine the following channels:

- CPICH (C8(0))
- P-CCPCH (C8(1))
- S-CCPCH(C8(3))
- PICH(C8(16))
- HS-DPCCH (C4(15)) 16QAM modulated

```
:RHO:SBO:LIST:INIT 15000,0, QPSK
:RHO:SBO:LIST:APP 15000,1, QPSK
:RHO:SBO:LIST:APP 15000,3, QPSK
:RHO:SBO:LIST:APP 15000,16, QPSK
:RHO:SBO:LIST:APP 240000,15, QAM16
:RHO:SBO:LIST:BTS:NCH?
```

5

```
:RHO:SBO:LIST:CHAN? 1
```

15000,0, QPSK

```
:RHO:SBO:LIST:CHAN? 2
```

15000,1, QPSK

```
:RHO:SBO:LIST:CHAN? 3
```

15000,3, QPSK

```
:RHO:SBO:LIST:CHAN? 4
```

415000,16, QPSK

```
:RHO:SBO:LIST:CHAN? 5
```

	240000,15, QAM16
Notes	This command is effective when `[:SENSe]:RADio:DEVice` is set to BTS and `[:SENSe]:RHO:SBOundary[:BTS]` is set to `CUSTom` QAM16 for the 3rd parameter is available only when HSPA Enable is On QAM64 for the 3rd parameter is available only when both HSPA Enable and HSPA+ Enable are on See also "Initialize List Error Messages" on page 402 below
State Saved	Yes
Range	Dependent on Symbol Rate; see "Range & Symbol Rate" on page 407 below QAM16 and QAM64 for the 3rd parameter available only for channels with a symbol rate of 240000. For other channels, specify QPSK

Initialize List Error Messages

One of the following error messages is logged if the given parameter is invalid. If an error is reported, the SCPI command is rejected and the instrument's settings do not change.

#	Message	Details
1	Missing Parameter	This error is reported if the number of parameters is less than 3 For example, `:SENSe:RHO:SBOundary:LIST:BTS:INIT, 15000, 0` 3rd parameter is missing.

2	Illegal parameter value	This error is reported if parameter type is invalid or if enum value is invalid
		For example,
		`:SENSe:RHO:SBOundary:LIST:BTS:INIT, 15000, ON, QPSK`
		2nd parameter must be integer
		`:SENSe:RHO:SBOundary:LIST:BTS:INIT 15001, 8, QPSK`
		1st parameter value (Symbol Rate) is not allowed
		Only the values given in the Range field are valid for the Symbol Rate. You may specify these in numeric form, but they are interpreted as an enumeration and the error results if the value does not translate to one in the list

3	Data out of range	This error is reported if parameter value is out of range For example, `:SENSe:RHO:SBOundary:LIST:BTS:INIT 15000, 256, QPSK` 2nd parameter is out of range
4	Setting Conflict	This error is reported if the given code channel overlaps another code channel in modulation accuracy For example, if a user sends the following two commands, the second command causes the error message because C7(0) overlaps C8(0) `:SENSe:RHO:SBOundary:LIST:BTS:INIT 15000, 0, QPSK` OK

`:SENSe:RHO:SBOundary:LIST:BTS:APPend 30000, 0, QPSK`

C7(0) overlaps C8(0)

Append List (Remote Command only)

Appends the entry on the list of custom active channel list for BTS.

Parameter	Name/Value	Description
1	`<symbol_rate>`	Specifies symbol rate of the channel
2	`<code_num>`	Specifies code number of the channel
3	`QPSK`	Specifies the channel's modulation scheme is QPSK
	`QAM16`	Specifies the channel's modulation scheme is QAM16 This choice is available only for channels with a symbol rate of 240000 Only when 'HSPA' functionality is operative, 'QAM16' parameter is allowed
	`QAM64`	Specifies the channel's modulation scheme is QAM64 This choice is available only for channels with symbol rate 240000. Only when both 'HSPA' functionality and 'HSPA+' functionality are operative, 'QAM64' is valid to select

Remote Command	`[:SENSe]:RHO:SBOundary:LIST[:BTS]:APPend <symbol_rate>, <code_num>, QPSK | QAM16 | QAM64`

Example	In order to predefine the following channels:
	- CPICH (C8(0))
	P-CCPCH (C8(1))
	- S-CCPCH(C8(3))
	- PICH(C8(16))
	- HS-DPCCH (C4(15)) 16QAM modulated
	`:RHO:SBO:LIST:INIT 15000,0, QPSK`
	`:RHO:SBO:LIST:APP 15000,1, QPSK`
	`:RHO:SBO:LIST:APP 15000,3, QPSK`
	`:RHO:SBO:LIST:APP 15000,16, QPSK`
	`:RHO:SBO:LIST:APP 240000,15, QAM16`
	`:RHO:SBO:LIST:BTS:NCH?`
	5
	`:RHO:SBO:LIST:BTS:CHAN? 1`
	15000,0, QPSK
	`:RHO:SBO:LIST:BTS:CHAN? 2`

	15000,1, QPSK
	`:RHO:SBO:LIST:BTS:CHAN? 3`
	15000,3, QPSK
	`:RHO:SBO:LIST:BTS:CHAN? 4`
	15000,16, QPSK
	`:RHO:SBO:LIST:BTS:CHAN? 5`
	240000,15, QAM16

Notes	This command is effective when [:SENSe]:RADio:DEVice is set to BTS and [:SENSe]:RHO:SBOundary [:BTS] is set to CUSTom QAM16 for the 3rd parameter is available only when HSPA Enable is On QAM64 for the 3rd parameter is available only when both HSPA Enable and HSPA+ Enable are on The maximum number of entries is 512 See also "Append List Error Messages" on page 404 below
State Saved	Yes
Range	Dependent on Symbol Rate; see "Range & Symbol Rate" on page 407 below QAM16 and QAM64 for the 3rd parameter available only for channels with a symbol rate of 240000. For other channels, specify QPSK

Append List Error Messages

One of the following error messages is logged if the given parameter is invalid. If an error is reported, the SCPI command is rejected and the instrument's settings do not change.

#	Message	Details
1	Missing Parameter	This error is reported if the number of parameters is less than 4 For example, `:SENSe:RHO:SBOundary:LIST:BTS:APPend, 15000, 0` 3rd parameter is missing.

2	Illegal parameter value	This error is reported if parameter type is invalid or if enum value is invalid
		For example,
		`:SENSe:RHO:SBOundary:LIST:BTS:APPend 15000, ON, QPSK`
		2nd parameter must be integer
		`:SENSe:RHO:SBOundary:LIST:BTS:APPend, 15001, 8, QPSK`
		1st parameter value (Symbol Rate) is not allowed
		Only the values given in the Range field are valid for the Symbol Rate. You may specify these in numeric form, but they are interpreted as an enumeration and the error results if the value does not translate to one in the list

3	Data out of range	This error is reported if parameter value is out of range For example,

#	Message	Details
		`:SENSe:RHO:SBOundary:LIST:BTS:APPend 15000, 256, QPSK`
		2nd parameter is out of range
4	Setting Conflict	This error is reported if the given code channel overlaps another code channel in Modulation Accuracy (Rho)
		For example, if a user sends the following two commands, the second command causes the error message because C7(0) overlaps C8(0)
		`:SENSe:RHO:SBOundary:LIST:BTS:INIT, 15000, 0, QPSK`
		OK
		`:SENSe:RHO:SBOundary:LIST:BTS:APPend 30000, 0, QPSK`
		C7(0) overlaps C8(0)

Replace List (Remote Command only)

Replaces the entry of the custom active channel list for BTS.

Parameter	Name/Value	Description
1	`<entry_id>`	Specifies entry ID of the channel to replace
2	`<symbol_rate>`	Specifies symbol rate of the channel
3	`<code_num>`	Specifies code number of the channel
4	`QPSK`	Specifies the channel's modulation scheme is QPSK
	`QAM16`	Specifies the channel's modulation scheme is QAM16
		This choice is available only for channels with a symbol rate of 240000
		Only when 'HSPA' functionality is operative, 'QAM16' parameter is allowed
	`QAM64`	Specifies the channel's modulation scheme is QAM64
		This choice is available only for channels with symbol rate 240000
		Only when both 'HSPA' and 'HSPA+' functionalities are operative, 'QAM64' is valid to select

Remote Command	`[:SENSe]:RHO:SBOundary:LIST[:BTS]:REPLace <entry_id>, <symbol_rate>, <code_num>, QPSK | QAM16 | QAM64`
Example	In order to predefine the following channels: - CPICH (C8(0)) - P-CCPCH (C8(1)) - S-CCPCH(C8(3)) - PICH(C8(16)) - HS-DPCCH (C4(15)) 16QAM modulated `:RHO:SBO:LIST:INIT 15000,0, QPSK`

	`:RHO:SBO:LIST:APP 15000,1, QPSK`
	`:RHO:SBO:LIST:APP 15000,3, QPSK`
	`:RHO:SBO:LIST:APP 15000,16, QPSK`
	`:RHO:SBO:LIST:APP 240000,15, QAM16`
	And, P-CCPCH(C8(3)) is replaced as follows:
	`:RHO:SBO:LIST:REPL 3,15000,5,QPSK`
	`:RHO:SBO:LIST:BTS:NCH?`
	5
	`:RHO:SBO:LIST:CHAN? 1`
	15000,0, QPSK
	`:RHO:SBO:LIST:CHAN? 2`
	15000,1, QPSK
	`:RHO:SBO:LIST:CHAN? 3`
	15000,5, QPSK
	`:RHO:SBO:LIST:CHAN? 4`
	15000,16, QPSK
	`:RHO:SBO:LIST:CHAN? 5`
	240000,15, QAM16

Notes	This command is effective when [:SENSe]:RADio:DEVice is set to BTS and [:SENSe]:RHO:SBOundary [:BTS] is set to CUSTom QAM16 for the 4th parameter is available only when HSPA Enable is On. QAM64 for the 4th parameter is available only when both HSPA Enable and HSPA+ Enable are on The maximum number of entries is 512 See also "Replace List Error Messages" on page 406 below
State Saved	Yes
Range	The entry ID must be: 1 <= entry_id <= The number of entries that are currently appended Dependent on Symbol Rate; see "Range & Symbol Rate" on page 407 below QAM16 and QAM64 for the 4th parameter available only for channels with a symbol rate of 240000. For other channels, specify QPSK

Replace List Error Messages

One of the following error messages is logged if the given parameter is invalid. If an error is reported, the SCPI command is rejected and the instrument's settings do not change.

#	Message	Details
1	Missing	This error is reported if the number of parameters is less than 4

#	Message	Details
	Parameter	For example, `:SENSe:RHO:SBOundary:LIST:BTS:REPLace 1,15000, 0` 4th parameter is missing.

2	Illegal parameter value	This error is reported if parameter type is invalid or if enum value is invalid
		For example,
		`:SENSe:RHO:SBOundary:LIST:BTS:REPLace 1,15000, ON, QPSK`
		3rd parameter must be integer
		`:SENSe:RHO:SBOundary:LIST:BTS:REPLace 1,15001, 8, QPSK`
		2nd parameter value (Symbol Rate) is not allowed
		Only the values given in the Range field are valid for the Symbol Rate. You may specify these in numeric form, but they are interpreted as an enumeration and the error results if the value does not translate to one in the list

3	Data out of range	This error is reported if parameter value is out of range For example, `:SENSe:RHO:SBOundary:LIST:BTS:REPLace 1,15000, 256, QPSK` 3rd parameter is out of range

4	Setting Conflict	This error is reported if the given code channel overlaps another code channel in Modulation Accuracy (Rho)
		For example, if a user sends the following two commands, the second command causes the error message because C7(0) overlaps C8(0)
		`:SENSe:RHO:SBOundary:LIST:BTS:INIT 15000, 0, QPSK`
		OK
		`:SENSe:RHO:SBOundary:LIST:BTS:REPLace 1,30000, 0, QPSK`
		C7(0) overlaps C8(0)

5	The entry ID is out of range	1 <= entry_id <= The number of entries that are currently appended See Symbol Boundary Custom Active Channel List – The Number Of Entries BTS (BTS only)

Range & Symbol Rate

Symbol Rate	Range
7500	0<= code_num <= 511
15000	0<= code_num <= 255
30000	0<= code_num <= 127
60000	0<= code_num <= 63
120000	0<= code_num <= 31
240000	0<= code_num <= 15
480000	0<= code_num <= 7
960000	0<= code_num <= 3

Query List (Remote Command only)

This command returns the entry of the custom active channel list for BTS.

See also "Number of Entries (Remote Command only) (BTS only)" on page 409 below.

Parameter	Name/Value	Description
1	<entry_id>	Specifies entry ID of the channel to query

Remote Command	`[:SENSe]:RHO:SBOundary:LIST[:BTS]:CHANnel? <entry_id>`

Example	In order to predefine the following channels:
	- CPICH (C8(0))
	- P-CCPCH (C8(1))
	- S-CCPCH(C8(3))
	- PICH(C8(16))
	- HS-DPCCH (C4(15)) 16QAM modulated
	`:RHO:SBO:LIST:INIT 15000,0, QPSK`
	`:RHO:SBO:LIST:APP 15000,1, QPSK`
	`:RHO:SBO:LIST:APP 15000,3, QPSK`
	`:RHO:SBO:LIST:APP 15000,16, QPSK`
	`:RHO:SBO:LIST:APP 240000,15, QAM16`
	`:RHO:SBO:LIST:BTS:NCH?`
	5
	`:RHO:SBO:LIST:CHAN? 1`
	15000,0, QPSK
	`:RHO:SBO:LIST:CHAN? 2`
	15000,1, QPSK
	`:RHO:SBO:LIST:CHAN? 3`
	15000,3, QPSK
	`:RHO:SBO:LIST:CHAN? 4`
	15000,16, QPSK
	`:RHO:SBO:LIST:CHAN? 5`
	240000,15, QAM16

Notes	This command is effective when `[:SENSe]:RADio:DEVice` is set to BTS and [:SENSe]:RHO:SBOundary[:BTS] is set to CUSTom QAM16 for the 4th parameter is available only when HSPA Enable is On. QAM64 for the 4th parameter is available only when both HSPA Enable and HSPA+ Enable are on

	The maximum number of entries is 512
	Default value of the parameter
	By default, one channel is defined. (CPICH C8(0))
	In order to query the default entry, specify 1 for <entry_id>:
	`:SENSe:RHO:SBOundary:LIST:BTS:CHANnel? 1`
	The instrument returns an array of three values:
	`15000, 0, QPSK`
	Query command needs <entry_id> parameter
	The <entry_id> parameter is always required for a query command.
	The range of the parameter is from 1 to the total number of channels you have defined
	For example, if you have defined two channels, you can query them as follows:
	`:SENSe:RHO:SBOundary:LIST:BTS:CHANnel? 1`
	`:SENSe:RHO:SBOundary:LIST:BTS:CHANnel? 2`
	If you want to know the number of channels you have defined, send the following query command:
	`:SENSe:RHO:SBOundary:LIST:BTS:NCHannels?`
	Error messages associated with this parameter. The following error message is logged if the given parameter is invalid. If an error is reported, the SCPI command is rejected and the instrument's settings do not change:
	<entry_id> out of range
	The entry ID must be:
	1 <= entry_id <= The number of entries that are currently appended

Preset	15000, 0, QPSK
State Saved	Yes
Range	1 <= entry_id <= the number of channels defined <= 512 (<entry_id> is an integer ranging from 1 to 512)

Number of Entries (Remote Command only) (BTS only)

Returns the number of entries in the custom predefined active channel list BTS. This is a query only command.

Remote Command	`[:SENSe]:RHO:SBOundary:LIST[:BTS]:NCHannels?`
Example	`:SENS:RHO:SBO:LIST:BTS:NCH?`
Notes	This command is effective when `[:SENSe]:RADio:DEVice` is set to BTS and `[:SENSe]:RHO:SBOundary[:BTS]` is set to `CUSTom` This is a query-only command
Preset	1
Force Restart	No
State Saved	No

Load Preset Setting BTS (Remote Command Only) (BTS only)

Loads preset setting to the custom active channel list BTS. This is a command-only command; it does not support a query.

Remote Command	[:SENSe]:RHO:SBOundary:LIST[:BTS]:PRESet TM1D16 | TM1D32 | TM1D64 | TM1D16SC | TM1D32SC | TM1D64SC | TM2 | TM2SC | TM3D16 | TM3D32 | TM3D16SC | TM3D32SC | TM4 | TM4CP | TM5H2 | TM5H4 | TM5H8 | TM6H8
Example	:SENSe:RHO:SBOundary:LIST:BTS:PRESet TM1D64
Notes	(1) This command is effective when [:SENSe]:RADio:DEVice is set to BTS and [:SENSe]:RHO:SBOundary[:BTS] is set to CUSTom (2) TM5H2, TM5H4, TM5H8 parameters are allowed if HSPA Enable is On This is a command only; it does not support a query (3)TM6H8 parameter is allowed when HSPA+Enable is On
Force Restart	No
State Saved	No
Range	TM1D16|TM1D32|TM1D64|TM1D16SC|TM1D32SC|TM1D64SC| TM2 | TM2SC | TM3D16 | TM3D32 | TM3D16SC | TM3D32SC | TM4 | TM4CP | TM5H2 | TM5H4 | TM5H8 | TM6H8

Remote Command	[:SENSe]:RHO:SBOundary[:BTS] AUTO | TM1D4SC | TM1D8SC | TM1D16SC | TM1D32SC | TM1D64SC | TM2 | TM2SC | TM3D4SC | TM3D8SC | TM3D16SC | TM3D32SC | TM4 | TM4CP | TM5H2 | TM5H4 | TM5H8 | TM5D4 | TM6H8 | TM6D4 | CUSTom [:SENSe]:RHO:SBOundary[:BTS]?
Example	:RHO:SBO:BTS TM1D16 :RHO:SBO:BTS?

Notes	The reason that TM5H2, TM5H4 and TM5H8 have been selected is to align the enumerations with those of ESG
	For Test Model 5, W-CDMA HSPA option (N9073C-2FP) license needs to be installed and enabled. Otherwise, Test Model 5 menu is inactive (grayed out) and SCPI commands for Test Model 5 do not have effect
	For Test Model 6, both W-CDMA HSPA+ option (N9073C-3FP) license and W-CDMA HSPA option (N9073C-2FP) license need to be installed and enabled. Otherwise Test Model 6 is inactive (grayed out) and SCPI command for Test Model 6 do not have effect
	For the following selections of Home BS settings of Test Model 1 and Test Model 3, W-CDMA HSPA option license needs to be installed and enabled:
	– <TM1>
	  – Test Model 1 w/4DPCH w/ S-CCPCH
	  – Test Model 1 w/8DPCH w/ S-CCPCH
	– <TM3>
	  – Test Model 3 w/4 DPCH w/ S-CCPCH

– Test Model 3 w/8 DPCH w/ S-CCPCH

	Otherwise these are unavailable and the SCPI commands have no effect
Couplings	This command is effective when `[:SENSe]:RADio:DEVice` is set to `BTS`
Preset	`AUTO`
Force Restart	Yes
State Saved	Yes
Range	Auto Detect| Test Model 1 w/ 4 DPCH w/ S-CCPCH | Test Model 1 w/ 8 DPCH w/ S-CCPCH | Test Model 1 w/ 16 DPCH w/ S-CCPCH | Test Model 1 w/ 32 DPCH w/ S-CCPCH | Test Model 1 w/ 64 DPCH w/ S-CCPCH | Test Model 2 w/ S_CCPCH | Test Model 3 w/ 4 DPCH w/ S-CCPCH | Test Model 3 w/ 8 DPCH w/ S-CCPCH | Test Model 3 w/ 16 DPCH w/ S-CCPCH | Test Model 3 w/ 32 DPCH w/ S-CCPCH | Test Model 4 w/ P-CPICH | Test Model 4 | Test Model 5 w/ 2 HS-PDSCH w/ 6 DPCH | Test Model 5 w/ 4 HS-PDSCH w/ 14 DPCH | Test Model 5 w/ 8 HS-PDSCH w/ 30 DPCH | Test Model 5 w/ 4 HS-PDSCH w/ 4 DPCH | Test Model 6 w/ 8 HS-PDSCH w/ 30 DPCH | Test Model 6 w/ 4 HS-PDSCH w/ 4 DPCH | Custom

Symbol Boundary (MS only)

Selects the symbol boundary detection mode for MS and allows you to access the selection menu for the symbol boundary detection modes that allow you to specify the active channel detection scheme for the uplink.

Auto Detect

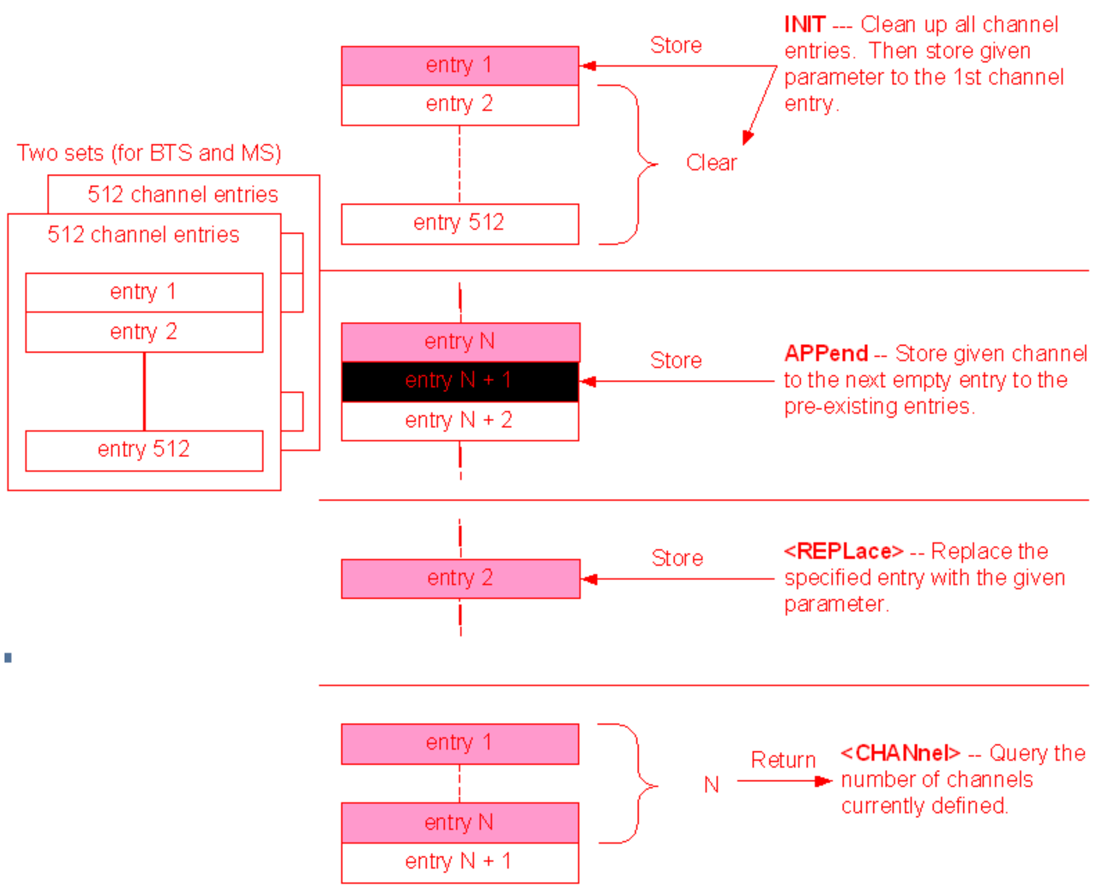
Auto Detect [SCPI Enum: `AUTO`] – Select this feature to set the symbol boundary detection to the automatic mode. Various code channels are measured and the most appropriate code channel is selected as the reference channel.

Custom

Custom [SCPI Enum: `CUSTom`] – Select this feature to specify a customized list of active channels using remote commands. All specified channels are considered as active. (There is no corresponding control.)

The following commands handle the list of custom predefined channels for MS.

Mnemonic	Function	See Section
`INIT`	Cleans up all channel entries. Then stores given parameter to the 1st channel entry	"Initialize List (Remote Command only)" on page 413
`APPend`	Stores given channel to the next empty entry to the pre-existing entries	"Append List (Remote Command only)" on page 414
`REPLace`	Replaces the specified entry with the given parameter	"Replace List (Remote Command only)" on page 416
`CHANnel`	Queries the information of the channel specified by the entry id	"Query List (Remote Command only)" on page 418
`NCHannel`	Queries the number of channels currently defined	"Query List (Remote Command only)" on page 418



Initialize List (Remote Command only)

Initializes the current custom active channel list. This creates a new entry with the given parameter.

Parameter	Name/Value	Description
1	<symbol_rate>	Specifies symbol rate of the channel
2	<code_num>	Specifies spreading code of the channel
3	IPH	Specifies the channel is on the I-axis
	QPH	Specifies the channel Is on the Q-axis

Remote Command	`[:SENSe]:RHO:SBOundary:LIST:MS:INIT <symbol_rate>, <code_num>, IPH | QPH`

Example	In order to predefine the following channels:
	- DPCCH (C8(0):Q)
	- DPDCH (C6(16):I)
	`:RHO:SBO:LIST:MS:INIT 15000, 0, QPH`
	`:RHO:SBO:LIST:MS:APP 60000, 16, IPH`
	`:RHO:SBO:LIST:MS:NCH?`
	2
	`:RHO:SBO:LIST:MS:CHAN? 1`
	15000, 0, QPH
	`:RHO:SBO:LIST:MS:CHAN? 2`
	60000, 16, IPH

Notes	This command is effective when `[:SENSe]:RADio:DEVice` is set to MS and `[:SENSe]:RHO:SBOundary:MS` is set to CUSTom symbol_rate = 1920000 is available if HSPA Enable is On The maximum number of entries is 512 See also "Initialize List Error Messages" on page 413 below
State Saved	Yes
Range	Dependent on Symbol Rate; see "Range & Symbol Rate" on page 418 below

Initialize List Error Messages

One of the following error messages is logged if the given parameter is invalid. If an error is reported, the SCPI command is rejected and the instrument’s settings do not change

#	Message	Details
1	Missing Parameter	This error is reported if the number of parameters is less than 3 For example, `:SENSe:RHO:SBOundary:LIST:MS:INIT 15000, 0`

#	Message	Details
		3rd parameter is missing.

2	Illegal parameter value	This error is reported if parameter type is invalid or if enum value is invalid
		For example,
		`:SENSe:RHO:SBOundary:LIST:MS:INIT 15000, ON, QPH`
		2nd parameter must be integer
		`:SENSe:RHO:SBOundary:LIST:MS:INIT 15001, 0, QPH`
		1st parameter value (Symbol Rate) is not allowed
		Only the values given in the Range field are valid for the Symbol Rate. You may specify these in numeric form, but they are interpreted as an enumeration and the error results if the value does not translate to one in the list

3	Data out of range	This error is reported if parameter value is out of range For example, `:SENSe:RHO:SBOundary:LIST:MS:INIT 15000, 256, QPH` 2nd parameter is out of range

4	Setting Conflict	This error is reported if the given code channel overlaps another code channel in modulation Accuracy
		For example, if a user sends the following two commands, the second command causes the error message because C7(0):Q overlaps C8(0):Q
		`:SENSe:RHO:SBOundary:LIST:MS:INIT 15000, 0, QPH`
		OK
		`:SENSe:RHO:SBOundary:LIST:MS:APPend 30000, 0, QPH`
		C7(0):Q overlaps C8(0):Q

Append List (Remote Command only)

Appends the entry to the custom active channel list.

Parameter	Name/Value	Description
1	`<symbol_rate>`	Specifies symbol rate of the channel
2	`<code_num>`	Specifies spreading code of the channel
3	`IPH`	Specifies the channel is on the I-axis
	`QPH`	Specifies the channel Is on the Q-axis

Remote Command	`[:SENSe]:RHO:SBOundary:LIST:MS:APPend <symbol_rate>, <code_num>, IPH | QPH`
Example	In order to predefine the following channels: - DPCCH (C8(0):Q) - DPDCH (C6(16):I)

	`:RHO:SBO:LIST:MS:INIT 15000, 0, QPH`
	`:RHO:SBO:LIST:MS:APP 60000, 16, IPH`
	`:RHO:SBO:LIST:MS:NCH?`
	2
	`:RHO:SBO:LIST:MS:CHAN? 1`
	15000, 0, QPH
	`:RHO:SBO:LIST:MS:CHAN? 2`
	60000, 16, IPH

Notes	This command is effective when `[:SENSe]:RADio:DEVice` is set to MS and `[:SENSe]:RHO:SBOundary:MS` is set to CUSTom symbol_rate = 1920000 is available if HSPA Enable is On The maximum number of entries is 512 See also "Append List Error Messages" on page 415 below
State Saved	Yes
Range	Dependent on Symbol Rate; see "Range & Symbol Rate" on page 418 below

Append List Error Messages

One of the following error messages is logged if the given parameter is invalid. If an error is reported, the SCPI command is rejected and the instrument's settings do not change.

#	Message	Details
1	Missing Parameter	This error is reported if the number of parameters is less than 3 For example, `:SENSe:RHO:SBOundary:LIST:MS:APPend 15000, 0` 3rd parameter is missing.

2	Illegal parameter value	This error is reported if parameter type is invalid or if enum value is invalid
		For example,
		`:SENSe:RHO:SBOundary:LIST:MS:APPend 15000, ON, QPH`
		2nd parameter must be integer
		`:SENSe:RHO:SBOundary:LIST:MS:APPend 15001, 0, QPH`
		1st parameter value (Symbol Rate) is not allowed
		Only the values given in the Range field are valid for the Symbol Rate. You may specify these in numeric form, but they are interpreted as an enumeration and the error results if the value does not translate to one in the list

3	Data out of range	This error is reported if parameter value is out of range For example, `:SENSe:RHO:SBOundary:LIST:MS:APPend 15000, 256, QPH` 2nd parameter is out of range

#	Message	Details

4	Setting Conflict	This error is reported if the given code channel overlaps another code channel in modulation accuracy
		For example, if a user sends the following two commands, the second command causes the error message because C7(0):Q overlaps C8(0):Q
		`:SENSe:RHO:SBOundary:LIST:MS:INIT 15000, 0, QPH`
		OK
		`:SENSe:RHO:SBOundary:LIST:MS:APPend 30000, 0, QPH`
		C7(0):Q overlaps C8(0):Q

Replace List (Remote Command only)

Replaces an entry in the custom active channel list.

Parameter	Name/Value	Description
1	`<entry_id>`	Specifies entry ID of the channel to replace
2	`<symbol_rate>`	Specifies symbol rate of the channel
3	`<code_num>`	Specifies spreading code of the channel
4	IPH	Specifies the channel is on the I-axis
	QPH	Specifies the channel Is on the Q-axis

Remote Command	`[:SENSe]:RHO:SBOundary:LIST:MS:REPLace <entry_id>,<symbol_rate>, <code_num>, IPH | QPH`

Example	In order to predefine the following channels:
	- DPCCH (C8(0):Q)
	- DPDCH (C6(16):I)
	`:RHO:SBO:LIST:MS:INIT 15000, 0, QPH`
	`:RHO:SBO:LIST:MS:APP 60000, 16, IPH`
	`:RHO:SBO:LIST:MS:NCH?`
	2
	And, replace 2nd entry:
	`:RHO:SBO:LIST:MS:REPL 2, 60000,17,QPH`
	`:RHO:SBO:LIST:MS:CHAN? 1`
	15000, 0, QPH
	`:RHO:SBO:LIST:MS:CHAN? 2`
	60000, 17, IPH

Notes	This command is effective when `[:SENSe]:RADio:DEVice` is set to MS and `[:SENSe]:RHO:SBOundary:MS` is set to CUSTom symbol_rate = 1920000 is available if HSPA Enable is On

	The maximum number of entries is 512 See also "Replace List Error Messages" on page 417 below
State Saved	Yes
Range	The entry ID must be: 1 <= entry_id <= The number of entries that are currently appended. Dependent on Symbol Rate; see "Range & Symbol Rate" on page 418 below

Replace List Error Messages

One of the following error messages is logged if the given parameter is invalid. If an error is reported, the SCPI command is rejected and the instrument's settings do not change

#	Message	Details
1	Missing Parameter	This error is reported if the number of parameters is less than 4 For example, `:SENSe:RHO:SBOundary:LIST:MS:REPLace 1,15000, 0` 4th parameter is missing.

2	Illegal parameter value	This error is reported if parameter type is invalid or if enum value is invalid
		For example,
		`:SENSe:RHO:SBOundary:LIST:MS: REPLace 1,15000, ON, QPH`
		3rd parameter must be integer
		`:SENSe:RHO:SBOundary:LIST:MS:REPLace 1,15001, 0, QPH`
		2nd parameter value (Symbol Rate) is not allowed
		Only the values given in the Range field are valid for the Symbol Rate. You may specify these in numeric form, but they are interpreted as an enumeration and the error results if the value does not translate to one in the list

3	Data out of range	This error is reported if parameter value is out of range For example, `:SENSe:RHO:SBOundary:LIST:MS:APPend 15000, 256, QPH` 3rd parameter is out of range

4	Setting Conflict	This error is reported if the given code channel overlaps another code channel in modulation accuracy
		For example, if a user sends the following two commands, the second command causes the error message because C7(0):Q overlaps C8(0):Q
		`:SENSe:RHO:SBOundary:LIST:MS:INIT 15000, 0, QPH`
		OK
		`:SENSe:RHO:SBOundary:LIST:MS: REPLace 1,30000, 0, QPH`
		C7(0):Q overlaps C8(0):Q

5	The entry ID out of range	1 <= entry_id <= The number of entries that are currently appended

Range & Symbol Rate

Symbol Rate	Range
15000	0<= code_num <= 255
30000	0<= code_num <= 127
60000	0<= code_num <= 63
120000	0<= code_num <= 31
240000	0<= code_num <= 15
480000	0<= code_num <= 7
960000	0<= code_num <= 3
1920000	0<= code_num <= 1

Query List (Remote Command only)

This command returns the entry of the custom active channel list.

See also "Number of Entries (Remote Command only) (MS only)" on page 419 below.

Parameter	Name/Value	Description
1	<entry_id>	Specifies entry ID of the channel to query

Remote Command	`[:SENSe]:RHO:SBOundary:LIST:MS:CHANnel? <entry_id>`

Example	In order to predefine the following channels:
	- DPCCH (C8(0):Q)
	- DPDCH (C6(16):I)
	`:RHO:SBO:LIST:MS:INIT 15000, 0, QPH`
	`:RHO:SBO:LIST:MS:APP 60000, 16, IPH`
	`:RHO:SBO:LIST:MS:NCH?`
	2
	`:RHO:SBO:LIST:MS:CHAN? 1`
	15000, 0, QPH
	`:RHO:SBO:LIST:MS:CHAN? 2`
	60000, 16, IPH

Notes	This command is effective when `[:SENSe]:RADio:DEVice` is set to MS and `[:SENSe]:RHO:SBOundary:MS` is set to `CUSTom` symbol_rate = 1920000 is available if HSPA Enable is On The maximum number of entries is 512 Default value of the parameter By default, one channel is defined. (DPCCH C8(0):Q) In order to query the default entry, specify 1 for <entry_id>:

	`:SENSe:RHO:SBOundary:LIST:MS:CHANnel? 1`
	The instrument returns an array of three values:
	`15000, 0, QPH`
	Query command needs <entry_id> parameter
	The <entry_id> parameter is always required for the query command
	The range of the parameter is from 1 to the total number of channels you have defined. For example, if you have defined two channels, you can query them as follows:
	`:SENSe:RHO:SBOundary:LIST:MS:CHANnel? 1`
	`:SENSe:RHO:SBOundary:LIST:MS:CHANnel? 2`
	If you want to know the number of channels you have defined, send the following query command:
	`:SENSe:RHO:SBOundary:LIST:NCHannels:MS?`
	Error Messages. The following error message is logged if the given parameter is invalid. If an error is reported, the SCPI command is rejected and the instrument's settings do not change

<entry_id> out of range
The entry ID must be: 1 <= entry_id <= The number of entries that are currently appended

Preset	15000, 0, QPH
State Saved	Yes
Range	The entry ID must be: 1 <= entry_id <= The number of entries that are currently appended

Number of Entries (Remote Command only) (MS only)

Returns the number of entries in the custom predefined active channel list MS. This command is query only.

Remote Command	`[:SENSe]:RHO:SBOundary:LIST:MS:NCHannels?`
Example	`:RHO:SBO:LIST:MS:NCH?`
Notes	This command is effective when `[:SENSe]:RADio:DEVice` is set to MS and `[:SENSe]:RHO:SBOundary:MS` is set to `CUSTom` This command is a query-only command
Preset	1
Force Restart	No
State Saved	No

Remote Command	`[:SENSe]:RHO:SBOundary:MS AUTO | CUSTom`

	[:SENSe]:RHO:SBOundary:MS?
Example	:SENS:RHO:SBO:MS CUST :SENS:RHO:SBO:MS?
Notes	This parameter is effective when [:SENSe]:RADio:DEVice is set to MS
Couplings	If the "Radio Device" selection is "BTS", a different control (Symbol Boundary BTS) appears instead of this control
Preset	AUTO
Force Restart	No
State Saved	Yes
Range	AUTO|CUSTom

DTX/Burst Detect

For downlink signals, detects the power burst for either "CM" (Compressed Mode) or "DTX". In the case of "Compressed Mode," both I and Q symbol power are set to Off. In the case of "DTX", either I or Q symbol power, or both, can be set to Off.

For uplink signals, this function detects the HS-DPCCH burst, the subframe of which does not align with the DPCCH slot boundary.

Remote Command	:CALCulate:RHO:DTXBurst 0 | 1 | OFF | ON :CALCulate:RHO:DTXBurst?
Example	:CALC:RHO:DTXB ON :CALC:RHO:DTXB?
Notes	When the HSPA option is enabled, this parameter is active and effective for both uplink and downlink. When disabled, this parameter is active and effective only for downlink
Preset	OFF
State Saved	Yes

Advanced Chan Setup

The Advanced Chan Setup enables you to access advanced channel/layer parameters in the Meas Setup menus on one screen.

Active Set Threshold

Toggles the active channel identification function between Auto and Man. If set to Auto, the active channels are determined automatically by the internal algorithm. If set to Man, the active channel identification is determined by a user definable threshold ranging from 0.00 to -100.00 dB.

Remote Command	`:CALCulate:RHO:ASET:THReshold <rel_ampl>`
	`:CALCulate:RHO:ASET:THReshold?`
	`:CALCulate:RHO:ASET:THReshold:AUTO OFF | ON | 0 | 1`
	`:CALCulate:RHO:ASET:THReshold:AUTO?`

Example	`:CALC:RHO:ASET:THR -20.0`
	`:CALC:RHO:ASET:THR?`
	`:CALC:RHO:ASET:THR:AUTO ON`
	`:CALC:RHO:ASET:THR:AUTO?`

Notes	This command is effective when `[:SENSe]:RHO:SBOundary[:BTS]` is set to `AUTO` For MS, this command is always effective Turn the automatic mode On or Off, for the active channel identification function – OFF – The active channel identification for each code channel is determined by a value set by `:CALCulate:RHO:ASET:THReshold` – ON – The active channels are determined automatically by the internal algorithm
Preset	0.0 `ON`
State Saved	Yes Yes
Min/Max	-100.0/0.0

Multi Channel Estimator

Allows you to toggle the multi-channel estimator function for MMSE between On and Off.

- `ON` (1): The individual code channels are aligned to the pilot channel to improve the phase error (whether each code phase is aligned or not). This requires a longer time
- `OFF` (0): The phase information is computed from one coded signal only. (The phase of each code channel needs to be aligned to the pilot channel.) This requires less time

Remote Command	`[:SENSe]:RHO:MCEStimator OFF | ON | 0 | 1` `[:SENSe]:RHO:MCEStimator?`
Example	`:RHO:MCES ON` `:RHO:MCES?`
Preset	`OFF`
State Saved	Yes
Range	`OFF|ON`

Timing Estimation

Selects between channel-by-channel and global timing estimation functions for MMSE.

- CHANnel-by-Channel: The code channels are estimated using individual timing. This requires longer time
- GLOBal: The individual code channels are estimated using global timing. This requires less time

Remote Command	[:SENSe]:RHO:MCEStimator:TIMing CHANnel | GLOBal [:SENSe]:RHO:MCEStimator:TIMing?
Example	:RHO:MCES:TIM CHAN :RHO:MCES:TIM?
Preset	GLOBal
State Saved	Yes
Range	Channel by Channel|Global

PICH Code Number (BTS only)

Specifies the code number for PICH, which contains the DTX (no transmission) part. PICH has 300 bits in 1 radio frame, but the last 12 bits are not transmitted. Then, PICH needs special handling to measure code domain power. The PICH Code Number enables you to specify which code channel should be set as PICH.

Remote Command	[:SENSe]:RHO:PICH:SPRead <integer> [:SENSe]:RHO:PICH:SPRead?
Example	:RHO:PICH:SPR 16 :RHO:PICH:SPR?
Notes	If PICH Code Number and MICH Code Number are the same, the channel is considered as PICH This parameter is meaningful only when the Symbol Boundary setting is Auto
Dependencies	This parameter is available only when Direction is BTS
Preset	16
State Saved	Yes
Min/Max	0/255

MICH Code Number (BTS only)

Specifies the code number for MICH (MBMS Indicator channel), which contains the DTX (no transmission) part. MICH has 300 bits in 1 radio frame, but the last 6 symbols (12 bits) are not transmitted. Therefore, MICH needs special handling to measure code domain power. The MICH Code Number specifies which code channel should be considered as MICH.

Since MICH is an optional channel, the parameter has a BAF setting (On|Off).

Active ID auto-detection is performed. However, the result can be 7.5ksps channel if MICH's two consecutive demod bits are the same. If this occurs, these 7.5ksps channels are automatically set to be 15ksps channels.

Remote Command	`[:SENSe]:RHO:MICH:SPRead <integer>`
	`[:SENSe]:RHO:MICH:SPRead?`
	`[:SENSe]:RHO:MICH:STATe OFF | ON | 0 | 1`
	`[:SENSe]:RHO:MICH:STATe?`

Example	`:RHO:MICH:SPR 4`
	`:RHO:MICH:SPR?`
	`:RHO:MICH:STAT ON`
	`:RHO:MICH:STAT?`

Notes	If the PICH Code Number and MICH Code Number are the same, the channel is considered as PICH This parameter is meaningful only when Symbol Boundary setting is Auto This parameter enables or disables MICH code number setting.
Dependencies	This parameter is available only when Direction is BTS
Preset	2 `OFF`
State Saved	Yes Yes
Min/Max	2/255

S-CCPCH Symbol Rate (BTS only)

To calculate the EVM value correctly, specifies the symbol rate for S-CCPCH (Secondary Common Control Physical Channel), which might be modulated with 64QAM, and is hard to detect as correct channelization code.

Remote Command	`[:SENSe]:RHO:SCCPch:SRATe <integer>` `[:SENSe]:RHO:SCCPch:SRATe?`
Example	`:RHO:SCCP:SRAT 15000` `:RHO:SCCP:SRAT?`
Notes	This command is effective when `[:SENSe]:RADio:DEVice` is set to `BTS` This parameter is available only when both W-CDMA HSPA+ option (N9073C-3FP) and HSPA option (N9073C-2FP) licenses are installed, and HSPA+ option is enabled. Otherwise this control and the SCPI command are unavailable

Preset	15000
State Saved	Yes
Range	15000|30000|60000|120000|240000|480000|960000

S-CCPCH Code Number (BTS only)

To calculate the EVM value correctly, specifies the code number for S-CCPCH (Secondary Common Control Physical Channel), which might be modulated with 64QAM, and is hard to detect as correct channelization code.

Remote Command	`[:SENSe]:RHO:SCCPch:SPRead <integer>` `[:SENSe]:RHO:SCCPch:SPRead?`
Example	`:RHO:SCCP:SPR 255` `:RHO:SCCP:SPR?`
Notes	This command is effective when [:SENSe]:RADio:DEVice is set to BTS This parameter is available only when both W-CDMA HSPA+ option (N9073C-3FP) and HSPA option (N9073C-2FP) licenses are installed, and HSPA+ option is enabled. Otherwise this control and the SCPI command are unavailable
Preset	3
State Saved	Yes
Min/Max	Min: 0 Max: Dependent on S-CCPCH Symbol Rate:

`[:SENSe]:RHO:SCCPch:SRATe`	Value
15000	255
30000	127
60000	63
120000	31
240000	15
480000	7
960000	3

3.3.8.6 Limits

Accesses a menu that allows you to set the following limits:

1. RMS EVM (Composite)
2. Peak EVM (Composite)
3. Rho (Composite)

4. Peak Code Domain
5. Frequency Error
6. CPICH Reference
7. CPICH Tolerance

RMS EVM (Composite)

Sets the limit for the composite RMS EVM measurement pass/fail test.

Remote Command	`:CALCulate:RHO:LIMit:RMS <real>` `:CALCulate:RHO:LIMit:RMS?`
Example	`:CALC:RHO:LIM:RMS 10.0` `:CALC:RHO:LIM:RMS?`
Preset	17.5
State Saved	Yes
Min/Max	0.00/100.00

Peak EVM (Composite)

Sets the limit for the composite peak EVM measurement pass/fail test.

Remote Command	`:CALCulate:RHO:LIMit:PEAK <real>` `:CALCulate:RHO:LIMit:PEAK?`
Example	`:CALC:RHO:LIM:PEAK 50.0` `:CALC:RHO:LIM:PEAK?`
Preset	200.0
State Saved	Yes
Min/Max	0.0/200.0

Rho (Composite)

Sets the limit for the composite Rho measurement pass/fail test.

Remote Command	`:CALCulate:RHO:LIMit:RHO <real>` `:CALCulate:RHO:LIMit:RHO?`
Example	`:CALC:RHO:LIM:RHO 0.9` `:CALC:RHO:LIM:RHO?`
Preset	0.50000

State Saved	Yes
Min/Max	0/1

Peak Code Domain Error

Sets the limit in dB for the composite Peak Code Domain Error measurement pass/fail test.

Remote Command	`:CALCulate:RHO:LIMit:CDERror <real>` `:CALCulate:RHO:LIMit:CDERror?`
Example	`:CALC:RHO:LIM:CDER -50.0` `:CALC:RHO:LIM:CDER?`
Preset	-32.0
State Saved	Yes
Min/Max	-100/0

Frequency Error

Sets the limit for the frequency error measurement pass/fail test.

Remote Command	`:CALCulate:RHO:LIMit:FERRor <freq>` `:CALCulate:RHO:LIMit:FERRor?`
Example	`:CALC:RHO:LIM:FERR 200` `:CALC:RHO:LIM:FERR?`
Preset	100.0 Hz
State Saved	Yes
Min/Max	0 Hz/500 Hz

CPICH Reference

Sets the limit for CPICH Reference Power (relative power to total carrier power) in dB.

Remote Command	`:CALCulate:RHO:LIMit:CPICh[:BTS]:POWer <real>` `:CALCulate:RHO:LIMit:CPICh[:BTS]:POWer?`
Example	`:CALC:RHO:LIM:CPIC:POW -30.0` `:CALC:RHO:LIM:CPIC:POW?`
Dependencies	The limit value set by this command is used only when `[:SENSe]:RADio:DEVice` is set to BTS
Preset	-10.0

State Saved	Yes
Min/Max	-100/0

CPICH Tolerance

Sets the limit, in dB, for the CPICH Tolerance measurement pass/fail test.

Remote Command	`:CALCulate:RHO:LIMit:CPICh[:BTS] <real>` `:CALCulate:RHO:LIMit:CPICh[:BTS]?`
Example	`:CALC:RHO:LIM:CPIC 30.0` `:CALC:RHO:LIM:CPIC?`
Dependencies	The limit value set by this command is used only when `[:SENSe]:RADio:DEVice` is set to `BTS`
Preset	100.0
State Saved	Yes
Range	0.0 to 100.0
Min/Max	0/100

3.3.9 Sweep

The Sweep key contains controls that allow you to control the sweep and measurement functions of the instrument, such as the sweep or measurement time and whether in Single sweep/measure or Continuous sweep/measure mode.

3.3.9.1 Sweep/Control

Contains controls for the Sweep and Control functions of the instrument, such as Sweep Time and Continuous/Single.

Sweep/Measure

Allows you to toggle between Continuous and Single sweep or measurement operation. The Single/Continuous state is Meas Global, so the setting affects *all* measurements.

The front-panel key **Single/Cont** performs exactly the same function

NOTE In the `WAVeform` measurement, this control only appears in the Meas Bar, and not in the **Sweep/Control** tab.

See "More Information" on page 428

Remote	`:INITiate:CONTinuous OFF | ON | 0 | 1`

Command	`:INITiate:CONTinuous?`

Example	`:INIT:CONT 0`
	`:INIT:CONT OFF`
	puts instrument into Single measurement operation
	`:INIT:CONT 1`
	`:INIT:CONT ON`
	puts instrument into Continuous measurement operation

Preset	ON Note that `:SYST:PRES` sets `:INIT:CONT` to `ON` but `*RST` sets `:INIT:CONT` to `OFF`
State Saved	Saved in instrument state
Annunciation	The **Single/Continuous** icon in the Meas Bar changes depending on the setting: – A line with an arrow is Single – A loop with an arrow is Continuous

More Information

With **Avg/Hold Num** (in the **Meas Setup** menu) set to **Off** or set to **On** with a value of 1, a sweep is taken after the trigger condition is met; and the instrument continues to take new sweeps after the current sweep has completed and the trigger condition is again met. However, with **Avg/Hold Num** set to On with a value >1, multiple sweeps (data acquisitions) are taken for the measurement. The trigger condition must be met prior to each sweep. The sweep is not stopped when the average count k equals the number N set for Avg/Hold Num is reached, but the number k stops incrementing. A measurement average usually applies to all traces, marker results, and numeric results, but sometimes only applies to the numeric results.

If the instrument is in Single measurement, pressing the **Cont/Single** toggle control does not change k and does not cause the sweep to be reset; the only action is to put the instrument into Continuous measurement operation.

If it is already in Continuous sweep:

- the `:INIT:CONT 1` command has no effect
- the `:INIT:CONT 0` command will place the instrument in Single Sweep but will have no effect on the current sequence until k = N, at which point the current sequence will stop and the instrument will go to the idle state.

See "Restart" on page 1738 control description for details on the `:INIT:IMM` (Restart) function.

If you are already in Single sweep, the `:INIT:CONT OFF` command has no effect.

If you are already in Single Sweep, then pressing the **Cont/Single** toggle control in the middle of a sweep does not restart the sweep or sequence. Similarly, pressing the **Cont/Single** toggle control does not restart the sweep or sequence if the sweep is not in the idle state (for example, if you are taking a very slow sweep, or the instrument is waiting for a trigger). Even though pressing the **Cont/Single** toggle control in the middle of a sweep does *not* restart the sweep, sending `:INIT:IMM` *does* reset it.

Restart

The **Restart** function restarts the current sweep, or measurement, or set of averaged/held sweeps or measurements. In measurements that support pausing, if you are Paused, pressing **Restart** performs a **Resume**.

The Restart function is accessed in several ways:

– Pressing the **Restart** key

– Sending the remote command `:INIT:IMM`

– Sending the remote command `:INIT:REST`

See "More Information" on page 430

Remote Command	`:INITiate[:IMMediate]` `:INITiate:RESTart`
Example	`:INIT:IMM` `:INIT:REST`
Notes	`:INIT:REST` and `:INIT:IMM` and the front-panel **Restart** key perform exactly the same function
Couplings	Resets average/hold count k For the first sweep, overwrites all active (update=on) traces with new current data For application modes, resets other parameters as required by the measurement
Status Bits/OPC dependencies	This is an Overlapped command The `:STATus:OPERation` register bits 0 through 8 are cleared The `:STATus:QUEStionable` register bit 9 (INTegrity sum) is cleared The `SWEEPING` bit is set The `MEASURING` bit is set
Backwards Compatibility Notes	For Spectrum Analysis mode in ESA and PSA, the **Restart** hardkey and the `:INIT:REST` command restart trace averages (displayed average count reset to 1) for a trace in **Clear Write**, but did not restart **Max Hold** and **Min Hold** In the X-Series, the **Restart** hardkey and the `:INIT:REST` command restart not only **Trace Average**, but **Max Hold** and **Min Hold** traces as well For wireless comms modes in ESA and PSA, the **Restart** hardkey and the `:INIT:REST` command restarted every measurement, including all traces and numeric results. There is no change to this operation

More Information

The **Restart** function first aborts the current sweep or measurement as quickly as possible. It then resets the sweep and trigger systems, sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is in the process of aligning when a Restart is executed, the alignment finishes before the restart function is performed.

Even when set for Single operation, multiple sweeps may be taken when **Restart** is pressed (for example, when averaging/holding is on). Thus when we say that Restart "restarts a measurement," depending on the current settings, we may mean:

- It restarts the current sweep
- It restarts the current measurement
- It restarts the current set of sweeps if any trace is in Trace Average, Max Hold or Min Hold
- It restarts the current set of measurements if Averaging, or Max Hold, or Min Hold is on for the measurement

With Average/Hold Number (in Meas Setup menu) set to 1, or Averaging off, or no trace in Trace Average or Hold, a single sweep is equivalent to a single measurement. A single sweep is taken after the trigger condition is met; and the instrument stops sweeping once that sweep has completed. However, with Average/Hold Number >1 and at least one trace set to Trace Average, Max Hold, or Min Hold (SA Measurement) or Averaging on (most other measurements), multiple sweeps/data acquisitions are taken for a single measurement. The trigger condition must be met prior to each sweep. The sweep is stopped when the average count k equals the number N set for Average/Hold Number. A measurement average usually applies to all traces, marker results, and numeric results, but sometimes only applies to the numeric results.

Once the full set of sweeps has been taken, the instrument will go to the idle state. To take one more sweep without resetting the average count, increment the average count by 1, by pressing the step up key while Average/Hold Number is the active function, or by sending the remote command `:CALC:AVER:TCON UP`.

Pause/Resume

Pauses a measurement after the current data acquisition is complete.

When a measurement is paused:

– The label on this control changes to **Resume**. Pressing **Resume** un-pauses the measurement.

– Pressing **Restart** also performs a **Resume**.

Remote Command	:INITiate:PAUSe :INITiate:RESume
Example	:INIT:PAUS :INIT:RES
Dependencies	Not displayed in Modes that do not support pausing
Couplings	When Averaging is On, if the measurement is paused no more updates will occur until either a Resume or Restart occurs If the measurement is resumed, the averaging continues to use the traces from before the Pause occurred and continues to use the traces from the point where the Resume occurred. This still provides real-time traces, but they will no longer be gap free In a view with a Waterfall window, when the measurement is paused, the Waterfall stops updating. When Resume is selected, the Waterfall will retain the existing traces and continue updating using traces from the point at which Resume was selected. The time stamp of the individual Waterfall traces will show the time from the beginning of the measurement the trace relates to, showing there was a gap in the Waterfall capture In Density view, when the measurement is paused, the Density Display stops updating. When the measurement is resumed, if Persistence is ON, the persistence fading will continue from the point when the measurement was paused If a Restart occurs, the average counter is reset and all results are discarded. The measurement begins again, using traces after the Restart occurred

Abort (Remote Command Only)

This command stops the current measurement. It aborts the current measurement as quickly as possible, resets the sweep and trigger systems, and puts the measurement into an "idle" state. If the instrument is in the process of aligning when :ABORt is sent, the alignment finishes before the abort function is performed, so :ABORt does *not* abort an alignment.

If the instrument is set for Continuous measurement, it sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is set for Single measurement, it remains in the "idle" state until an :INIT:IMM command is received.

Remote Command	:ABORt
Example	:ABOR
Notes	If :INIT:CONT is ON, then a new continuous measurement will start immediately, with sweep (data acquisition) occurring once the trigger condition has been met If :INIT:CONT is OFF, then :INIT:IMM is used to start a single measurement, with sweep (data

	acquisition) occurring once the trigger condition has been met
Dependencies	For continuous measurement, `:ABORt` is equivalent to the **Restart** key Not all measurements support the abort command
Status Bits/OPC dependencies	The `:STATus:OPERation` register bits 0 through 8 are cleared The `:STATus:QUEStionable` register bit 9 (INTegrity sum) is cleared Since all the bits that feed into OPC are cleared by `:ABORt`, the `:ABORt` will cause the *OPC query to return true

3.3.9.2 X Scale

This tab accesses controls that enable you to set the horizontal scale parameters.

Ref Value

Sets the chip reference value on the horizontal axis. The default setting is 0.000 chips. When Auto Scaling is set to On, the displayed graphs use a Scale/Div value determined by the instrument, based on the measurement result.

Remote Command	`:DISPlay:RHO:WINDow3|4|5:TRACe:X[:SCALe]:RLEVel <amptd>`
	`:DISPlay:RHO:WINDow3|4|5:TRACe:X[:SCALe]:RLEVel?`
	Window numbers are as follows:
	– EVM : 3
	– Mag Error: 4
	– Phase Error: 5

Example	3-EVM window
	`:DISP:RHO:WIND3:TRAC:X:RLEV 0.0`
	4-Mag Error window
	`:DISP:RHO:WIND4:TRAC:X:RLEV 0.0`
	5-Phase Error Window
	`:DISP:RHO:WIND5:TRAC:X:RLEV 0.0`

Couplings	When Auto Scaling is On (default), this value is automatically determined by the measurement result. When you set a value manually, Auto Scaling changes to Off
Preset	0.0
State Saved	Yes
Min/Max	0.0/5000000.0

Backwards Compatibility SCPI

Window Numbers used to be a combination of View and Window, now only Window number is sent. For backwards compatibility the old View and Window numbers are honored as below:

Window	Old SCPI Command	New SCPI Command
EVM	DISP:RHO:VIEW2:WIND:TRAC:X:RLEV 0.0	DISP:RHO:WIND3:TRAC:X:RLEV 0.0
Mag Error	DISP:RHO:VIEW2:WIND2:TRAC:X:RLEV 0.0	DISP:RHO:WIND4:TRAC:X:RLEV 0.0
Phase Error	DISP:RHO:VIEW2:WIND3:TRAC:X:RLEV 0.0	DISP:RHO:WIND5:TRAC:X:RLEV 0.0

Scale/Div

Sets the horizontal scale by changing a chip value per division. When the Scale Coupling default setting On is active, the displayed plots use a Scale/Div value determined by the instrument, which is based on the measurement result.

Remote Command	`:DISPlay:RHO:WINDow3|4|5:TRACe:X[:SCALe]:PDIVision <real>`
	`:DISPlay:RHO:WINDow3|4|5:TRACe:X[:SCALe]:PDIVision?`
	Window numbers are as follows:
	– EVM : 3
	– Mag Error: 4
	– Phase Error: 5

Example	3-EVM window
	`:DISP:RHO:WIND3:TRAC:X:PDIV 100.0`
	4-Mag Error window
	`:DISP:RHO:WIND4:TRAC:X:PDIV 100.0`
	5-Phase Error Window
	`:DISP:RHO:WIND5:TRAC:X:PDIV 100.0`

Couplings	If Auto Scaling is set to On, this value is automatically determined by the measurement result. When you set this value manually, Auto Scaling is automatically set to Off
Preset	3840.0
State Saved	Yes
Min/Max	64/38400.0

Backwards Compatibility SCPI

Window Numbers used to be a combination of View and Window, now only Window number is sent. For backwards compatibility the old View and Window numbers are honored as below:

Window	Old SCPI Command	New SCPI Command
EVM	DISP:RHO:VIEW2:WIND:TRAC:X:PDIV 100.0	DISP:RHO:WIND3:TRAC:X:PDIV 100.0
Mag Error	DISP:RHO:VIEW2:WIND2:TRAC:X:PDIV 100.0	DISP:RHO:WIND4:TRAC:X:PDIV 100.0
Phase Error	DISP:RHO:VIEW2:WIND3:TRAC:X:PDIV 100.0	DISP:RHO:WIND5:TRAC:X:PDIV 100.0

Ref Position

Sets the reference position for the X axis to the left, center, or right of the display.

Remote Command	:DISPlay:RHO:WINDow3|4|5:TRACe:X[:SCALe]:RPOSition LEFT | CENTer | RIGHt :DISPlay:RHO:WINDow3|4|5:TRACe:X[:SCALe]:RPOSition? Window numbers are as follows: – EVM: 3 – Mag Error: 4 – Phase Error: 5
Example	3-EVM window :DISP:RHO:WIND3:TRAC:X:RPOS LEFT 4-Mag Error window :DISP:RHO:WIND4:TRAC:X:RPOS LEFT 5-Phase Error Window :DISP:RHO:WIND5:TRAC:X:RPOS LEFT
Preset	LEFT
State Saved	Yes
Range	LEFT|CENTer|RIGHt

Backwards Compatibility SCPI

Window Numbers used to be a combination of View and Window, now only Window number is sent. For backwards compatibility the old View and Window numbers are honored as below:

Window	Old SCPI Command	New SCPI Command
EVM	DISP:RHO:VIEW2:WIND:TRAC:X:RPOS	DISP:RHO:WIND3:TRAC:X:RPOS

Window	Old SCPI Command	New SCPI Command
	LEFT	LEFT
Mag Error	DISP:RHO:VIEW2:WIND2:TRAC:X:RPOS LEFT	DISP:RHO:WIND4:TRAC:X:RPOS LEFT
Phase Error	DISP:RHO:VIEW2:WIND3:TRAC:X:RPOS LEFT	DISP:RHO:WIND5:TRAC:X:RPOS LEFT

Auto Scaling

Toggles the Auto Scaling function between On and Off. When Auto Scaling is On, and the Restart front-panel key is pressed, this function automatically determines the scale per division and reference values based on the measurement results.

Remote Command	`:DISPlay:RHO:WINDow3|4|5:TRACe:X[:SCALe]:COUPle 0	1	OFF	ON` `:DISPlay:RHO:WINDow3|4|5:TRACe:X[:SCALe]:COUPle?` Window numbers are as follows: – EVM: 3 – Mag Error: 4 – Phase Error: 5

Example	3-EVM window
	`:DISP:RHO:WIND3:TRAC:X:COUP ON`
	4-Mag Error window
	`:DISP:RHO:WIND4:TRAC:X:COUP ON`
	5-Phase Error Window
	`:DISP:RHO:WIND5:TRAC:X:COUP ON`

Couplings	When this parameter is set to On, pressing the front-panel Restart key activates the scale coupling function, that automatically determines scale per division and reference values based on the measurement results. When you set a value to either Scale/Div or Ref Value manually, Auto Scaling is automatically set to Off
Preset	ON
State Saved	Yes
Range	OFF|ON

Backwards Compatibility SCPI

Window Numbers used to be a combination of View and Window, now only Window number is sent. For backwards compatibility the old View and Window numbers are honored as below:

Window	Old SCPI Command	New SCPI Command
EVM	DISP:RHO:VIEW2:WIND:TRAC:X:COUP ON	DISP:RHO:WIND3:TRAC:X:COUP ON

Window	Old SCPI Command	New SCPI Command
Mag Error	DISP:RHO:VIEW2:WIND2:TRAC:X:COUP ON	DISP:RHO:WIND4:TRAC:X:COUP ON
Phase Error	DISP:RHO:VIEW2:WIND3:TRAC:X:COUP ON	DISP:RHO:WIND5:TRAC:X:COUP ON

Start Code Number

Sets the start value of the code range for the code domain power graph (CDP).

Remote Command	:DISPlay:RHO:CDOMain:SPAN:STARt <integer> :DISPlay:RHO:CDOMain:SPAN:STARt?
Example	:DISP:RHO:CDOM:SPAN:STAR 10 :DISP:RHO:CDOM:SPAN:STAR?
Notes	The max value is device sensitive: BTS: 448 MS: 192
Couplings	Start Code Number and Stop Code Number are coupled to each other, according to the following condition: Stop Code Number > Start Code Number If changing Start Code Number does not satisfy this condition, Stop Code Number is changed to satisfy the following condition Stop Code Number – Start Code Number = 63
Preset	0
State Saved	Yes
Min	0
Max	448

Stop Code Number

Sets the stop value of the code range for the code domain power graph (CDP).

Remote Command	:DISPlay:RHO:CDOMain:SPAN:STOP <integer> :DISPlay:RHO:CDOMain:SPAN:STOP?
Example	:DISP:RHO:CDOM:SPAN:STOP 200 :DISP:RHO:CDOM:SPAN:STOP?
Notes	The max value is device sensitive: BTS: 511 MS: 255
Couplings	Start CodeNumber and Stop Code Number are coupled to each other, according to:

	Stop Code Number > Start Code Number If changing Stop Code Number does not satisfy this condition, Start Code Number is changed to satisfy the following condition Stop Code Number – Start Code Number = 63
Preset	511
State Saved	Yes
Min	63
Max	511

Expand

Toggles the expanding function of the code domain power graph between On and Off. If set to On, the CDP graph is expanded horizontally to show 64 spread codes centered at the scale or the marker position. If toggled back to Off, the spread code range returns to the previous setting.

Notes	This control is valid only for Power Bar Graph window
Preset	Off
State Saved	Yes
Range	On|Off

3.3.10 Trace

Trace is not supported in the WCDMA Mod Accuracy Measurement.

3.4 Code Domain

The Code Domain Measurement provides the code domain analysis functions. It is an analysis-oriented measurement rather than a conformance test. Therefore, it doesn't provide pass/fail type of results.

The modulation schemes for downlink and uplink are quite different. Even though some key parameters and mnemonics are shared by downlink and uplink, the measurement functions are context sensitive depending on the Radio Device selection.

Code Domain Measurement Commands

The following commands and queries are used to retrieve the measurement results:

`:CONFigure:CDPower`

`:CONFigure:CDPower:NDEFault`

`:INITiate:CDPower`

`:FETCh:CDPower[n]?`

`:READ:CDPower[n]?`

`:MEASure:CDPower[n]?`

Remote Command Results for Code Domain

The following table describes the results returned by the queries listed above, according to the index value `n`.

Some results in the table are limited by an option license.

When both W-CDMA HSPA and HSPA+ option licenses are enabled,

– 64QAM

– 16QAM

– QPSK

– 4PAM

– BPSK

are returned.

When W-CDMA HSPA option license is enabled, but HSPA+ option is not enabled,

- 16QAM
- QPSK
- BPSK

are returned, but

- 64QAM
- 4PAM

are not returned. Therefore 64QAM channel is measured and returned as either 16QAM or QPSK, and 4PAM channel is measured and returned as BPSK.

When W-CDMA HSPA option license is not enabled,

- QPSK
- BPSK

are returned, but

- 64QAM
- 16QAM
- 4PAM

are not returned. Therefore either 64QAM or 16QAM channel is measured and returned as QPSK, and 4PAM channel is measured and returned as BPSK.

Index: n <Mnemonic>	Results Returned
0	Returns unprocessed I/Q trace data, as a series of comma-separated trace points, in volts. The I values are listed first in each pair, using the 0 through even-indexed values. The Q values are the odd-indexed values
not specified, or 1	Returns 44 comma-separated scalar results. For details, see "Results Data Format (n = 1)" on page 449 below
2 <CDPower>	**Code Domain Power** Returns a series of floating point numbers (in either dB or dBm, depending on Meas Type) that represents all the code domain powers In BTS mode, there are 512 numbers. If the active channel occupies more than the max spreading factor (7.5 ksps) the power is duplicated (active symbol rate / 7.5 ksps) times (N=512) – 1st number = 1st code power over one slot specified by Meas Offset including SCH period. – 2nd number = 2nd code power over one slot specified by Meas Offset including SCH period – ... – Nth number = Nth code power over one slot specified by Meas Offset including SCH period In MS mode, there are 256 I/Q pairs. If the active channel occupies more than the max spreading factor (15 ksps) the power is duplicated (active symbol rate / 15 ksps) times (N=256) – 1st number = 1st in-phase code power over one slot specified by Meas Offset – 2nd number = 1st quad-phase code power over one slot specified by Meas Offset

Index: n <Mnemonic>	Results Returned
	– ... – (2N – 1)th number = N th in-phase code power over one slot specified by Meas Offset – (2N)th number = N th quad-phase code power over one slot specified by Meas Offset
3	**Symbol Rate** Returns a series of floating point numbers (in sps) that represents all the code domain symbol rate In BTS mode, there are 512 numbers. If the active channel occupies more than the max spreading factor (7.5 ksps) the symbol rate is duplicated (active symbol rate / 7.5 ksps) times (N=512) – 1st number = 1st code symbol rate over one slot specified by Meas Offset including SCH period – 2nd number = 2nd code symbol rate over one slot specified by Meas Offset including SCH period – ... – N th number = N th code symbol rate over one slot specified by Meas Offset including SCH period In MS mode, there are 256 I/Q pairs. If the active channel occupies more than the max spreading factor (15 ksps) the symbol rate is duplicated (active symbol rate / 15 ksps) times (N=256) – 1st number = 1st in-phase code symbol rate over one slot specified by Meas Offset including SCH period – 2nd number = 1st quad-phase code symbol rate over one slot specified by Meas Offset including SCH period – ... – (2N – 1)th number = Nth in-phase code symbol rate over one slot specified by Meas Offset including SCH period – (2N)th number = Nth quad-phase code symbol rate over one slot specified by Meas Offset including SCH period
4	**Active Status** Returns series of floating point numbers that show either active or inactive of each code returned in n=2 and 3. When the code is inactive, the result is 0.0, otherwise more than 0.0 In BTS mode, there are 512 numbers (N=512) – 1st number = Active or inactive flag of the 1st code – 2nd number = Active or inactive flag of the 2nd code – ... – Nth number = Active or inactive flag of the N th code In MS mode, there are 256 I/Q pairs (N=256) – 1st number = 1st In Phase code active flag – 2nd number = 1st Quad Phase code active flag – ... – (2N – 1)th number = Nth In Phase code active flag – (2N)th number = Nth Quad Phase code active flag
5 <EVM>	**Symbol EVM** Returns series of floating point numbers (in percent) that represent EVM of symbols of the selected code channel

Index: n <Mnemonic>	Results Returned
	The length of the trace depends on the measurement period specified by Meas Offset, Meas Interval and tDPCH[BTS] / tHS-DPCCH[MS]
6 <MERRor>	**Symbol Magnitude Error** Returns series of floating point numbers (in percent) that represent magnitude error of symbols of the selected code channel The length of the trace depends on the measurement period specified by Meas Offset, Meas Interval and tDPCH[BTS] / tHS-DPCCH[MS]
7 <PERRor>	**Symbol Phase Error** Returns series of floating point numbers (in degrees) that represent phase error of symbols of the selected code channel The length of the trace depends on the measurement period specified by Meas Offset, Meas Interval and tDPCH[BTS] / tHS-DPCCH[MS]
8	**I/Q Corrected Measured Trace** Returns series of floating point numbers that alternately represent I and Q pairs of the corrected measured trace of the selected code channel The magnitude of each I and Q pair is normalized to 1.0 The length of the trace depends on the measurement period specified by Meas Offset, Meas Interval and tDPCH[BTS] / tHS-DPCCH[MS] – 1st number = I of the 1st symbol decision point – 2nd number = Q of the 1st symbol decision point – 3rd number = I of the 2nd symbol decision point – 4th number = Q of the 2nd symbol decision point – ... – (2N – 1)th number = I of the Nth symbol decision point – (2N)th number = Q of the Nth symbol decision point IQ Corrected Measured Trace is scaled as follows: [QPSK] The values of "I" and "Q" in the measured trace are normalized by the maximum value of the magnitude (= SQRT(I*I + Q*Q)) of the reference trace, which is scaled to SQRT(2.0) [16QAM] The values of "I" and "Q" in the measured trace are normalized as the maximum value of the magnitude (= SQRT(I*I + Q*Q)) of the reference trace, which is scaled to SQRT(1.3416*1.3416 + 1.3416*1.3416) In the 3GPP standard "TS 25.213 v6.4.0 (2005-09)", symbol values for each modulation format (QPSK, 16QAM) and DTX in the section "5.1.1 Modulation mapper" are specified
9 <SPOWer>	**Symbol Power vs. Time** Returns series of floating point numbers (in dBm) that represent the entire trace data of Symbol Power vs. Time of the selected code channel
10 <CPOWer>	**Chip Power vs. Time** Returns series of floating point numbers (in dBm) that represent the entire trace data of Chip Power vs. Time
11	**Demod Bits** Returns a series of floating point numbers of symbol values for the selected code channel for the entire capture length – If :CALCulate:CDPower:DBITs[:FORMat] is set to BINary, each value in the trace is either 0.0 or 1.0 – If :CALCulate:CDPower:DBITs[:FORMat] is set to TRIState, each value in the trace is one of 0.0, 1.0 and –1.0 where "–1.0" represents DTX (Discontinuous Transmission) bit or burst-off bit If a channel's spreading has been done on only I or Q branch, queried data represents the sequence of corresponding I or Q data If a channel's spreading has been done on both I and Q branch and its modulation scheme is QPSK, queried data represents alternating I and Q sequences as follows: – 1st number = in-phase bit of the 1st I/Q pair – 2nd number = quad-phase bit of the 1st I/Q pair – 3rd number = in-phase bit of the 2nd I/Q pair

Index: n <Mnemonic>	Results Returned
	– 4th number = quad-phase bit of the 2nd I/Q pair – ... – (2N – 1)th number = in-phase bit of the Nth I/Q pair – (2N)th number = quad-phase bit of the Nth I/Q pair where N is the number of the symbols in the entire capture length If a channel's modulation scheme is 16QAM, queried data represents alternating i1, q1, i2 and q2 sequences as follows: – 1st number = i1 bit of the 1st symbol – 2nd number = q1 bit of the 1st symbol – 3rd number = i2 bit of the 1st symbol – 4th number = q2 bit of the 1st symbol – 5th number = i1 bit of the 2nd symbol – 6th number = q1 bit of the 2nd symbol – 7th number = i2 bit of the 2nd symbol – 8th number = q2 bit of the 2nd symbol – ... – (4N – 3)th number = i1 bit of the Nth symbol – (4N – 2)th number = q1 bit of the Nth symbol – (4N – 1)th number = i2 bit of the Nth symbol – (4N)th number = q2 bit of the Nth symbol If a channel's modulation scheme is 64QAM, queried data represents alternating i1, q1, i2, q2, i3 and q3 sequences as follows: – 1st number = i1 bit of the 1st symbol – 2nd number = q1 bit of the 1st symbol – 3rd number = i2 bit of the 1st symbol – 4th number = q2 bit of the 1st symbol – 5th number = i3 bit of the 1st symbol – 6th number = q3 bit of the 1st symbol – ...... – (6N – 5) th number = i1 bit of the Nth symbol – (6N – 4) th number = q1 bit of the Nth symbol

Index: n <Mnemonic>	Results Returned
	– (6N – 3) th number = i2 bit of the Nth symbol – (6N –2) th number = q2 bit of the Nth symbol – (6N –1) th number = i3 bit of the Nth symbol – (6N) th number = q3 bit of the Nth symbol If a channel's modulation scheme is 4PAM for only either I or Q branch, queried data represents alternating x1 and x2 sequences as follows: – 1st number = x_1 bit of the 1st symbol – 2nd number = x_2 bit of the 1st symbol – 3rd number = x_1 bit of the 2nd symbol – 4th number = x_2 bit of the 2nd symbol – ... – (2N – 1)th number = x_1 bit of the Nth symbol – (2N)th number = x_2 bit of the Nth symbol Where, – x1: Either i_1 or q_1 – x2: Either i_2 or q_2 If a channel's modulation scheme is 4PAM for I branch and BPSK for Q branch, queried data represents alternating i1,i2 and q(quad-phase bit) sequences as follows: – 1st number = i1 bit of the 1st symbol for 4PAM on I branch – 2nd number = i2 bit of the 1st symbol for 4PAM on I branch – 3rd number = q bit of the 1st symbol for BPSK on Q branch – 4th number = i1 bit of the 2nd symbol for 4PAM on I branch – 5th number = i2 bit of the 2nd symbol for 4PAM on I branch – 6th number = q bit of the 2nd symbol for BPSK on Q branch – ... – (3N – 2)th number = i1 bit of the Nth symbol for 4PAM on I branch – (3N – 1)th number = i2 bit of the Nth symbol for 4PAM on I branch – (3N)th number = q bit of the Nth symbol for BPSK on Q branch If a channel's modulation scheme is BPSK for I branch and 4PAM for Q branch, queried data represents alternating i(in-phase bit) and q1,q2 sequences as follows: – 1st number = i bit of the 1st symbol for BPSK on I branch

Index: n <Mnemonic>	Results Returned
	– 2nd number = q1 bit of the 1st symbol for 4PAM on Q branch – 3rd number = q2 bit of the 1st symbol for 4PAM on Q branch – 4th number = i bit of the 2nd symbol for BPSK on I branch – 5th number = q1 bit of the 2nd symbol for 4PAM on Q branch – 6th number = q2 bit of the 2nd symbol for 4PAM on Q branch – ... – (3N – 2)th number = i bit of the Nth symbol for BPSK on I branch – (3N – 1)th number = q_1 bit of the Nth symbol for 4PAM on Q branch – (3N)th number = q_2 bit of the Nth symbol for 4PAM on Q branch If a channel's modulation scheme is 4PAM for both I and Q branches, queried data represents alternating i1, i2 and q1, q2 sequences as follows: – 1st number = i_1 bit of the 1st symbol for 4PAM on I branch – 2nd number = i_2 bit of the 1st symbol for 4PAM on I branch – 3rd number = q_1 bit of the 1st symbol for 4PAM on Q branch – 4th number = q_2 bit of the 1st symbol for 4PAM on Q branch – 5th number = i_1 bit of the 2nd symbol for 4PAM on I branch – 6th number = i_2 bit of the 2nd symbol for 4PAM on I branch – 7th number = q_1 bit of the 2nd symbol for 4PAM on Q branch – 8th number = q_2 bit of the 2nd symbol for 4PAM on Q branch – ... – (4N – 3)th number = i_1 bit of the Nth symbol for 4PAM on I branch – (4N – 2)th number = i_2 bit of the Nth symbol for 4PAM on I branch – (4N – 1)th number = q_1 bit of the Nth symbol for 4PAM on Q branch – (4N)th number = q_2 bit of the Nth symbol for 4PAM on Q branch where N is the number of the symbols in the entire capture length
12	**Demod Bits For Selected Measurement Period** Returns series of floating point numbers of symbol values for the selected code channel for the measurement period selected by Meas Offset, Meas Interval and tDPCH[BTS] / tHS-DPCCH[MS] – If `:CALCulate:CDPower:DBITs[:FORMat]` is set to BINary and `:CALCulate:CDPower:PCKM` is set to OFF, each value in the trace is either 0.0 or 1.0 – If `:CALCulate:CDPower:DBITs[:FORMat]` is set to TRIState and `:CALCulate:CDPower:PCKM` is set to OFF, each value in the trace is one of 0.0, 1.0 and –1.0 where "–1.0" represents DTX (Discontinuous Transmission) bit or burst-off bit

Index: n <Mnemonic>	Results Returned
	If a channel's spreading has been done on only I or Q branch, queried data represents the sequence of corresponding I or Q data If a channel's spreading has been done on both I and Q branch and its modulation scheme is QPSK, queried data represents alternating I and Q sequences as follows: – 1st number = in-phase bit of the 1st I/Q pair – 2nd number = quad-phase bit of the 1st I/Q pair – 3rd number = in-phase bit of the 2nd I/Q pair – 4th number = quad-phase bit of the 2nd I/Q pair – ... – (2N – 1)th number = in-phase bit of the Nth I/Q pair – (2N)th number = quad-phase bit of the Nth I/Q pair where N is the number of the symbols in the measurement period selected by Meas Offset, Meas Interval and tDPCH[BTS] / tHS-DPCCH[MS] If a channel's modulation scheme is 16QAM, queried data represents alternating i1, q1, i2 and q2 sequences as follows: – 1st number = i1 bit of the 1st symbol – 2nd number = q1 bit of the 1st symbol – 3rd number = i2 bit of the 1st symbol – 4th number = q2 bit of the 1st symbol – 5th number = i1 bit of the 2nd symbol – 6th number = q1 bit of the 2nd symbol – 7th number = i2 bit of the 2nd symbol – 8th number = q2 bit of the 2nd symbol – ... – (4N – 3)th number = i1 bit of the Nth symbol – (4N – 2)th number = q1 bit of the Nth symbol – (4N – 1)th number = i2 bit of the Nth symbol – (4N)th number = q2 bit of the Nth symbol If a channel's modulation scheme is 64QAM, queried data represents alternating i1, q1, i2, q2, i3 and q3 sequences as follows: – 1st number = i1 bit of the 1st symbol – 2nd number = q1 bit of the 1st symbol – 3rd number = i2 bit of the 1st symbol – 4th number = q2 bit of the 1st symbol – 5th number = i3 bit of the 1st symbol

Index: n <Mnemonic>	Results Returned

Index: n <Mnemonic>	Results Returned
	– (3N – 1)th number = i_2 bit of the Nth symbol for 4PAM on I branch – (3N)th number = q bit of the Nth symbol for BPSK on Q branch If a channel's modulation scheme is BPSK for I branch and 4PAM for Q branch, queried data represents alternating i(in-phase bit) and q1,q2 sequences as follows: – 1st number = i bit of the 1st symbol for BPSK on I branch – 2nd number = q1 bit of the 1st symbol for 4PAM on Q branch – 3rd number = q2 bit of the 1st symbol for 4PAM on Q branch – 4th number = i bit of the 2nd symbol for BPSK on I branch – 5th number = q1 bit of the 2nd symbol for 4PAM on Q branch – 6th number = q_2 bit of the 2nd symbol for 4PAM on Q branch – ... – (3N – 2)th number = i bit of the Nth symbol for BPSK on I branch – (3N – 1)th number = q_1 bit of the Nth symbol for 4PAM on Q branch – (3N)th number = q_2 bit of the Nth symbol for 4PAM on Q branch If a channel's modulation scheme is 4PAM for both I and Q branches, queried data represents alternating i1, i2 and q1, q2 sequences as follows: – 1st number = i_1 bit of the 1st symbol for 4PAM on I branch – 2nd number = i_2 bit of the 1st symbol for 4PAM on I branch – 3rd number = q_1 bit of the 1st symbol for 4PAM on Q branch – 4th number = q_2 bit of the 1st symbol for 4PAM on Q branch – 5th number = i_1 bit of the 2nd symbol for 4PAM on I branch – 6th number = i_2 bit of the 2nd symbol for 4PAM on I branch – 7th number = q_1 bit of the 2nd symbol for 4PAM on Q branch – 8th number = q_2 bit of the 2nd symbol for 4PAM on Q branch – ... – (4N – 3)th number = i_1 bit of the Nth symbol for 4PAM on I branch – (4N – 2)th number = i_2 bit of the Nth symbol for 4PAM on I branch – (4N – 1)th number = q_1 bit of the Nth symbol for 4PAM on Q branch – (4N)th number = q2 bit of the Nth symbol for 4PAM on Q branch where N is the number of the symbols in the measurement period selected by Meas Offset, Meas Interval and tDPCH[BTS] / tHS-DPCCH[MS] If `:CALCulate:CDPower:PCKM` is set to PKM1(=Mode1), demod bits per symbol are packed into one float value in bit-slice manner as follows:

Index: n <Mnemonic>	Results Returned
	- For 64QAM channels: 64QAM (No DTX):Float value 00……0X5X4X3X2X1X0, where: X5:I1, X4:Q1, X3:I2, X2:Q2, X1:I3, X0:Q3 - For 16QAM channels: 16QAM (No DTX):Float value 00……0X3X2X1X0, where: X3:I1, X2:Q1, X1:I2, X0:Q2 - For QPSK channels: QPSK (With DTX): Float value 00……0M1M0B1B0, where: M1: Mask for B1 (1:DTX, 0:Normal), M0: Mask for B0 (1:DTX, 0:Normal), B1:I, B0:Q - For 4PAM channels: 4PAM (No DTX):Float value 00……0 I1 I2 Q1 Q2 - For 4PAM on I branch channels and BPSK on Q branch channels: 4PAM (No DTX):Float value 00……0 I1 I2 0 Q - For BPSK on I branch channels and 4PAM on Q branch channels: 4PAM (No DTX):Float value 00……0 0 I Q1 Q2 The returned data is a sequence of float numbers as follows: – 1st number = Packed Demod bits of 1st symbol – 2nd number = Packed Demod bits of 2nd symbol – 3rd number = Packed Demod bits of 3rd symbol – … – Nth number = Packed Demod bits of Nth symbol where N is the number of the symbols in the measurement period selected by Meas Offset, Meas Interval and tDPCH[BTS] / tHS-DPCCH[MS] To identify whether the Demod bits of each symbol is either QPSK or 16QAM, query the Modulation Scheme returned by 14th trace (Modulation Scheme)
13 <CDError>	**Code Domain Error** Returns a series of floating point numbers (in dB or dBm) that represents all the code domain errors In BTS mode, there are 512 numbers. If the active channel occupies more than the max spreading factor (7.5 ksps) the error is duplicated (active symbol rate / 7.5 ksps) times (N=512) – 1st number = 1st code domain error over one slot specified by Meas Offset including SCH period – 2nd number = 2nd code domain error over one slot specified by Meas Offset including SCH period – … – Nth number = Nth code domain error over one slot specified by Meas Offset including SCH period In MS mode, there are 256 I/Q pairs. If the active channel occupies more than the max spreading factor (15 ksps) the power is duplicated (active symbol rate / 15 ksps) times (N=256) – 1st number = 1st in-phase code domain error over one slot specified by Meas Offset including SCH period – 2nd number = 1st quad-phase code domain error over one slot specified by Meas Offset including SCH period – … – (2N – 1)th number = Nth in-phase code domain error over one slot specified by Meas Offset including SCH period – (2N)th number = Nth quad-phase code domain error over one slot specified by Meas Offset including SCH period
14	**Modulation Scheme**

Index: n <Mnemonic>	Results Returned
Modulation Scheme	Returns a series of floating point numbers that represents the modulation scheme slot-by-slot for measurement period selected by Meas Offset, Meas Interval and tDPCH[BTS] / tHS-DPCCH[MS] The meaning of the number is : 0.0 QPSK (Quadrature Phase Shift Keying) 2.0 16QAM (16Quadrature Amplified Modulation) 4.0 64QAM (64Quadrature Amplified Modulation) 10.0 BPSK (Binary Phase Shift Keying) on I branch only 11.0 BPSK (Binary Phase Shift Keying) on Q branch only 12.0 4PAM(Pulse Amplitude Modulation) on I branch only 13.0 4PAM(Pulse Amplitude Modulation) on Q branch only 14.0 BPSK on I branch and BPSK on Q branch 15.0 4PAM on I branch and BPSK on Q branch 16.0 BPSK on I branch and 4PAM on Q branch 17.0 4PAM on I branch and 4PAM on Q branch – 1st number = Modulation Scheme of the slot specified by Meas Offset – 2nd number = Modulation Scheme of the slot specified by Meas Offset + 1 – 3rd number = Modulation Scheme of the slot specified by Meas Offset + 2 – ... – Nth number = Modulation Scheme of the slot specified by Meas Offset + N, where N is Meas Interval
15	1. Returns a detected scramble code. The value returned is 0~511 Available only when Radio Device is set to BTS and P-Scramble Code is set to Autodetect. Otherwise NaN is returned 2. (Reserved) NaN returned 3. (Reserved) NaN returned 4. (Reserved) NaN returned 5. (Reserved) NaN returned 6. (Reserved) NaN returned 7. (Reserved) NaN returned 8. (Reserved) NaN returned 9. (Reserved) NaN returned 10. (Reserved) NaN returned

Results Data Format (n = 1)

Queries using this parameter value return the following 44 comma-separated scalar results:

#	**Result Name: (type of number) [unit]** **<explanation>**
1	**RMS Symbol EVM**: (floating) [percent] The despreading (Symbol) RMS EVM of the selected code (OVSF level and number) over the selected measurement period by Meas Offset, Meas Interval and tDPCH [BTS] / tHS-DPCCH [MS]
2	**Peak Symbol EVM**: (floating) [percent] The despreading (Symbol) peak EVM of the selected code over the selected measurement period by Meas Offset, Meas Interval and tDPCH [BTS] / tHS-DPCCH[MS]
3	**RMS Symbol Magnitude Error**: (floating) [percent] The RMS-averaged magnitude error of Symbol I/Q Polar Vector of the selected code over the selected measurement period by Meas Offset, Meas Interval and tDPCH [BTS] / tHS-DPCCH[MS]
4	**RMS Symbol Phase Error**: (floating) [degrees] The RMS-averaged phase error of Symbol I/Q Polar Vector of the selected code over the selected measurement period by Meas Offset, Meas Interval and tDPCH [BTS] / tHS-DPCCH [MS]
5	**Total Power**: (floating) [dBm] – The total RF power over the selected measurement period by Meas Offset, Meas Interval and tDPCH[BTS] / tHS-DPCCH[MS] – (See item 8. for Total Power over one slot specified by Meas Offset)
6	**Channel Power**: (floating) [dBc or dBm] The absolute or relative (relative to Total Power) power of the selected code over the measurement period selected by Meas Offset, Meas Interval and tDPCH[BTS] / tHS-DPCCH [MS]
7	**tDPCH, tHS-DPCCH**: (floating) [x256 chips] BTS mode: – In tDPCH auto-detection mode, the offset delay time for the selected code (DPCH) from the reference (CPICH slot #0 start point) is returned for valid DPCH. It returns 0 for other channels – In tDPCH manual setting mode, the returned value is the same as “tDPCH” parameter setting MS mode: – There is no tHS-DPCCH auto-detection function – Returns the given “tHS-DPCCH” parameter setting
8	**Total Power**: (floating) [dBm] Total RF power over one slot specified by Meas Offset. SCH period is included in its calculation (See item 5 above for Total Power over the measurement period selected by Meas Offset and Meas Interval)
9	**Total Active Power**: (floating) [dBc or dBm]

#	Result Name: (type of number) [unit] <explanation>
	The sum of the active code channel powers over one slot specified by Meas Offset. SCH period is included in its calculation
10	**Common Pilot (CPICH) Power**: (floating) [dBc or dBm]
	The average power of the CPICH code (absolute or relative to the Total Power) over one slot specified by Meas Offset. SCH period is included in its calculation
	In MS mode, the value returned is –999.0
11	**Maximum Active Code Power**: (floating) [dBc or dBm]
	The maximum average power of active code channels (absolute or relative to the Total Power) over one slot specified by Meas Offset. SCH period is included in its calculation
	If no active code is detected, the value returned is –999.0
	In MS mode, the value returned is –999.0
12	**Average Active Code Power**: (floating) [dBc or dBm]
	The average power of active code channels (absolute or relative to the Total Power) over one slot specified by Meas Offset. SCH period is included in its calculation
	If no active code is detected the value returned is –999.0
	In MS mode, the value returned is –999.0
13	**Maximum Inactive Code Power**: (floating) [dBc or dBm]
	The maximum average power of inactive code channels (absolute or relative to the Total Power) over one slot specified by Meas Offset. SCH period is included in its calculation
	In MS mode, the value returned is –999.0
14	**Average Inactive Code Power**: (floating) [dBc or dBm]
	The average power of inactive code channels (absolute or relative to the Total Power) over one slot specified by Meas Offset. SCH period is included in its calculation
	In MS mode, the value returned is –999.0
15	**Number of active channel**: (floating) [no unit]
	The number of active channel for one slot specified by Meas Offset
16	**P-SCH (Primary SCH) Power**: (floating) [dBm]
	The P-SCH power over one slot specified by Meas Offset
	In MS mode, the value returned is –999.0
17	**S-SCH (Secondary SCH) Power**: (floating) [dBm]
	The S-SCH power over one slot specified by Meas Offset
	In MS mode, the value returned is –999.0
18	**DPCCH Power, PRACH Message Control Part Power**: (floating) [dBc or dBm]
	If Sync Type is DPCCH, dedicated physical control channel (DPCCH) power over one slot specified by Meas Offset
	If Sync Type is PRACH Message, PRACH message control part power over one slot specified by Meas Offset
	In BTS mode, the value returned is –999.0
19	**DPCCH Beta Nominal, PRACH Message Control Part Beta Nominal**: (floating) [no unit]
	If Sync Type is DPCCH, the nominal value of DPCCH beta factor over one slot specified by

#	Result Name: (type of number) [unit] <explanation>
	Meas Offset If Sync Type is PRACH Message, PRACH message control part beta nominal over one slot specified by Meas Offset The value is one of 0.0, 0.067 (=1/15), 0.133 (=2/15), ... or 1.0 (=15/15) In BTS mode, the value returned is –999.0
20	**DPCCH Beta Measured**: (floating) [no unit] If Sync Type is DPCCH, the measured value of DPCCH beta factor over one slot specified by Meas Offset If Sync Type is PRACH Message, the measured value of PRACH message control part beta factor over one slot specified by Meas Offset In BTS mode, the value returned is –999.0
21	**DPDCH 1 Beta Nominal**: (floating) [no unit] If Sync Type is DPCCH, the nominal value of DPDCH #1 beta factor over one slot specified by Meas Offset If Sync Type is PRACH Message, the nominal value of PRACH message data part beta factor over one slot specified by Meas Offset The value is one of 0.0, 0.067 (=1/15), 0.133 (=2/15), ... or 1.0 (=15/15) If DPCH/E-DPCH is Config 2 w/o DPDCH or Config 3, the value returned is –999.0 In BTS mode, the value returned is –999.0
22	**DPDCH 1 Beta Measured**: (floating) [no unit] If Sync Type is DPCCH, the measured value of the DPDCH #1 beta factor over one slot specified by Meas Offset If Sync Type is PRACH Message, the measured value of PRACH message data part beta factor over one slot specified by Meas Offset If DPCH/E-DPCH is Config 2 w/o DPDCH or Config 3, the value returned is –999.0 In BTS mode, the value returned is –999.0
23	**DPDCH 2 Beta Measured**: (floating) [no unit] If Sync Type is DPCCH, the measured value of the DPDCH #2 beta factor over one slot specified by Meas Offset If DPCH/E-DPCH not Config 1, the value returned is –999.0 If Sync Type is PRACH Message, the value returned is –999.0 In BTS mode, the value returned is –999.0
24	**DPDCH 3 Beta Measured**: (floating) [no unit] If Sync Type is DPCCH, the measured value of the DPDCH #3 beta factor over one slot specified by Meas Offset If DPCH/E-DPCH not Config 1, the value returned is –999.0 If Sync Type is PRACH Message, the value returned is –999.0 In BTS mode, the value returned is –999.0
25	**DPDCH 4 Beta Measured**: (floating) [no unit] If Sync Type is DPCCH, the measured value of the DPDCH #4 beta factor over one slot

#	Result Name: (type of number) [unit] <explanation>
	specified by Meas Offset If DPCH/E-DPCH not Config 1, the value returned is –999.0 If Sync Type is PRACH Message, the value returned is –999.0 In BTS mode, the value returned is –999.0
26	**DPDCH 5 Beta Measured**: (floating) [no unit] If Sync Type is DPCCH, the measured value of the DPDCH #5 beta factor over one slot specified by Meas Offset If DPCH/E-DPCH not Config 1, the value returned is –999.0 If Sync Type is PRACH Message, the value returned is –999.0 In BTS mode, the value returned is –999.0
27	**DPDCH 6 Beta Measured**: (floating) [no unit] If Sync Type is DPCCH, the measured value of the DPDCH #6 beta factor over one slot specified by Meas Offset If DPCH/E-DPCH not Config 1, the value returned is –999.0 If Sync Type is PRACH Message, the value returned is –999.0 In BTS mode, the value returned is –999.0
28	**I Channel Average Active Power**: (floating) [dBc or dBm] The average power of active I channels over one slot specified by Meas Offset In BTS mode, the value returned is –999.0
29	**I Channel Maximum Inactive Power**: (floating) [dBc or dBm] The maximum average power of inactive I channels over one slot specified by Meas Offset In BTS mode, the value returned is –999.0
30	**Q Channel Average Active Power**: (floating) [dBc or dBm] The average power of active Q channels over one slot specified by Meas Offset In BTS mode, the value returned is –999.0
31	**Q Channel Maximum Inactive Power**: (floating) [dBc or dBm] The maximum average power of inactive Q channels over one slot specified by Meas Offset In BTS mode, the value returned is –999.0
32	**Nominal Ratio Between HS-DPCCH And DPCCH**: (floating) If Sync Type is DPCCH, amplitude ratio of the nominal value based on the measured value of HS-DPCCH beta factor and the DPCCH beta factor If Sync Type is PRACH Message, the value returned is –999.0 In BTS mode, the value returned is –999.0
33	**HS-DPCCH Beta Measured**: (floating) If Sync Type is DPCCH, the measured value of HS-DPCCH beta factor If Sync Type is PRACH Message, the value returned is –999.0 In BTS mode, the value returned is –999.0
34	**Modulation scheme**: (floating) Modulation scheme for the specified code channel

#	Result Name: (type of number) [unit] <explanation>
	– 0.0: QPSK – +2.0: 16QAM – +4.0: 64QAM – 10.0 = BPSK (Binary Phase Shift Keying) on I branch only – 11.0 = BPSK (Binary Phase Shift Keying) on Q branch only – 12.0 = 4PAM(Pulse Amplitude Modulation) on I branch only – 13.0 = 4PAM(Pulse Amplitude Modulation) on Q branch only – 14.0 = BPSK on I branch and BPSK on Q branch – 15.0 = 4PAM on I branch and BPSK on Q branch – 16.0 = BPSK on I branch and 4PAM on Q branch – 17.0 = 4PAM on I branch and 4PAM on Q branch (+1 and other values are reserved for different modulation types) – If Mod Scheme is Auto, the modulation scheme is detected based on the measurement time period specified by Meas Offset, Meas Interval and tDPCH[BTS] / tHS-DPCCH[MS] – If Mod Scheme is either QPSK or 16QAM, the given setting is returned. This result has meaning only for downlink SF16 (240ksps) channels
35	**First Slot Number**: (floating) The first slot number of the specified channel by Symbol Rate and Code Number in Capture Interval
36	**Channel CDE**: (floating) [dBc or dBm] The absolute or relative (relative to Total Power) CDE of the selected code over one slot specified by Meas Offset SCH period is included in its calculation [BTS]
37	**DPCCH Slot Format**: (floating) If Sync Type is DPCCH , the DPCCH slot format value used for synchronization is returned – 0.0: Slot Format 0 – 1.0: Slot Format 1 – 2.0: Slot Format 2 – 3.0: Slot Format 3 – 4.0: Slot Format 4 – 5.0: Slot Format

#	Result Name: (type of number) [unit] <explanation>
	If Sync Type is PRACH, the value returned is –999.0 In BTS mode, the value returned is –999.0
38	**Preamble Signature**: (floating) BTS mode: – Always the returned value is –999.0 MS mode: – In Preamble Signature auto-detection mode, the detected signature code number(from 0.0 to 15.0) is returned when Sync Type is PRACH Message – In Preamble Signature manual setting mode, the returned value is the same as the parameter setting. When Sync Type is not PRACH Message, the returned value is –999.0
39	**E-DPCCH Beta Nominal**: (floating) If Sync Type is DPCCH and DPCH/E-DPCH Config is one of Config 2 w/ DPCH, Config 2 w/o DPCH and Config 3, the nominal value of E-DPCCH beta factor The value is one of 0.333 (=5/15), 0.4 (=6/15), 0.533 (=8/15), ... or 2.0 (=30/15) If DPCH/E-DPCH Config is Config 1, the value returned is –999.0 If Sync Type is PRACH Message, the value returned is –999.0 In BTS mode, the value returned is –999.0
40	**E-DPCCH Beta Measured**: (floating) If Sync Type is DPCCH and DPCH/E-DPCH Config is one of Config 2 w/ DPCH, Config 2 w/o DPCH and Config 3, the measured value of E-DPCCH beta factor If DPCH/E-DPCH Config is Config 1, the value returned is –999.0 If Sync Type is PRACH Message, the value returned is –999.0 In BTS mode, the value returned is –999.0
41	**E-DPDCH 1st on I-axis Beta Measured**: (floating) If Sync Type is DPCCH and DPCH/E-DPCH Config is either Config 2 w/o DPCH or Config 3, the measured value of E-DPDCH on I-axis (C8(64), C7(32), C6(16), C5(8), C4(4), C3(2) or C2(1)) beta factor If DPCH/E-DPCH Config is either Config 1 or Config 2 w/ DPCH, the value returned is –999.0 If Sync Type is PRACH Message, the value returned is –999.0 In BTS mode, the value returned is –999.0
42	**E-DPDCH 1st on Q-axis Beta Measured**: (floating) If Sync Type is DPCCH and DPCH/E-DPCH Config is either Config 2 w/o DPCH or Config 3, the measured value of E-DPDCH on Q-axis (C8(64), C7(32), C6(16), C5(8), C4(4), C3(2) or C2(1)) beta factor If DPCH/E-DPCH Config is either Config 1 or Config 2 w/ DPCH, the value returned is –999.0 If Sync Type is PRACH Message, the value returned is –999.0 In BTS mode, the value returned is –999.0

#	Result Name: (type of number) [unit] <explanation>
43	**E-DPDCH 2nd on I-axis Beta Measured**: (floating) If Sync Type is DPCCH and DPCH/E-DPCH Config is one of Config 2 w/ DPCH, Config 2 w/o DPCH and Config 3, the measured value of E-DPDCH on I-axis (C8(128), C7(64), C6(32), C5 (16), C4(8), C3(4), C2(2) or C1(1)) beta factor If DPCH/E-DPCH Config is Config 1, the value returned is –999.0 If Sync Type is PRACH Message, the value returned is –999.0 In BTS mode, the value returned is –999.0
44	**E-DPDCH 2nd on Q-axis Beta Measured**: (floating) If Sync Type is DPCCH and DPCH/E-DPCH Config is one of Config 2 w/ DPCH, Config 2 w/o DPCH and Config 3, the measured value of E-DPDCH on Q-axis (C8(128), C7(64), C6(32), C5 (16), C4(8), C3(4), C2(2) or C1(1)) beta factor If DPCH/E-DPCH Config is Config 1, the value returned is –999.0 If Sync Type is PRACH Message, the value returned is –999.0 In BTS mode, the value returned is –999.0

3.4.1 Views

The Code Domain Power measurement has five views as follows.

Some of these Views are multiple-window Views. When in a multiple window View, you select a window by touching it. The menu controls may sometimes change depending on which window is selected.

Whenever the View changes, the default menu is Frequency, unless otherwise specified in the View description.

View	Result
Power Graph & Metrics	Code Domain Power Graph
	CDP Metrics
CDP Graph & CDE Graph	Code Domain Power Graph
	Code Domain Error Graph
I/Q Error (Quad View)	Mag Error Graph
	Phase Error Graph
	EVM Graph
	Symbol Error Metrics
Code Domain (Quad View)	Code Domain Power Graph
	Symbol Power Graph
	I/Q Symbol Polar Vector Graph
	Symbol Error Metrics

View	Result
Demod Bits	Code Domain Power Graph Symbol Power Graph Demod Bits

View Selection

Selects the desired measurement view from the selections listed in the table below. There are two available commands, allowing you to select the view using either the ID string or a numeric ID value. For more details of the commands, see:

- "View Selection by Name" on page 458
- "View Selection by Number" on page 458

In the following table:

- The Enumerated ID is used with the SCPI Command `:DISP:CDP:VIEW[:SEL]`
- The Numeric ID is used with the SCPI Command `:DISP:CDP:VIEW:NSEL`

Enumerated ID	Numeric ID	View Name & Details
`PGRaph`	1	Power Graph & Metrics Provides a combination view of the code domain power graph and the summary data Not available if the [:SENSe]:CDPower:CAPTure:TIME (Capture Interval) is 4.0 or 8.0 (Long Mode)
`CDE`	2	Power Graph & CDE Graph Provides a combination view of the code domain power graph and the code domain error Not available if the [:SENSe]:CDPower:CAPTure:TIME (Capture Interval) is 4.0 or 8.0 or 16.0 (Long Mode)
`SEVM`	3	I/Q Error (Quad View) Symbol EVM provides a combination view of magnitude error, phase error, Symbol EVM, and the summary data Not available if the [:SENSe]:CDPower:CAPTure:TIME (Capture Interval) is set to 4.0 or 8.0 (Long Mode)
`QUAD`	4	Code Domain (Quad View) Provides a combination view for the code domain power symbol power, I/Q symbol polar vector and the summary data Not available if the [:SENSe]:CDPower:CAPTure:TIME (Capture Interval) is set to 4.0 or 8.0 (Long Mode)
`DBITs`	5	Demod Bits Provides a combination view of the graphs for the code domain power and symbol power, and the I/Q demodulated bit stream data for the symbol power slots selected by the measurement

Enumerated ID	Numeric ID	View Name & Details
		interval and measurement offset
LDEMod	6	Long Demodulation Provides a combination view of the symbol power and demodulation bits stream data for the symbol power slots selected by the measurement interval and measurement offset though long capture (capture interval > 3 frames)

View Selection by Name

Remote Command	:DISPlay:CDPower:VIEW[:SELect] PGRaph | CDE | SEVM | QUAD | DBITs | LDEMod :DISPlay:CDPower:VIEW[:SELect]?
Example	:DISP:CDP:VIEW PGR :DISP:CDP:VIEW?
Preset	PGRaph
State Saved	Yes
Range	Power Graph & Metrics|CDP Graph & CDE Graph|I/Q Error (Quad View)|Code Domain (Quad View)|Demod Bits|Long Demod

View Selection by Number

Displays the numeric values of the measurement results.

For a complete list of Numeric ID values for use with this command, see "View Selection" on page 457 above.

Remote Command	:DISPlay:CDPower:VIEW:NSELect <integer> :DISPlay:CDPower:VIEW:NSELect?
Example	:DISP:CDP:VIEW:NSEL 2 :DISP:CDP:VIEW:NSEL?
Preset	1
State Saved	Yes
Min/Max	1/6

3.4.1.1 Power Graph & Metrics

Windows: "Code Domain Power Graph" on page 461, "Metrics" on page 461

Dual window view of the graph and the metrics. The parameters displayed in these windows differ depending on the setting of Radio Device. When the parameter Capture Interval is set to Long Mode (4, 8 or 16 Frame), this view is not available, and only the "Demod Bits" on page 517 view is available.

Example	`:DISP:CDP:VIEW PGR`

3.4.1.2 CDP Graph & CDE Graph

Windows: "Code Domain Power Graph" on page 461, "Code Domain Error Graph" on page 464

Dual window view of the CDP graph and the CDE graph.

These two windows are coupled in terms of: X/Y Scaling, Composite Symbol Boundary, and Display Symbol Rate.

The parameters displayed in these windows differ depending on the setting of Radio Device. When the parameter Capture Interval is set to Long Mode (4, 8 or 16 Frame), this view is not available, and only the "Demod Bits" on page 517 view is available.

Example	`:DISP:CDP:VIEW CDE`

3.4.1.3 I/Q Error (Quad View)

Windows: "Magnitude Error Graph" on page 464, "Phase Error Graph" on page 464, "EVM Graph" on page 465, "Symbol Error Metrics" on page 465

Combination view of magnitude error, phase error, Symbol EVM, and the summary data using the above four windows.

The parameters displayed in these windows differ depending on the setting of Radio Device. When the parameter Capture Interval is set to Long Mode (4, 8 or 16 Frame), this view is not available, and only "Demod Bits" on page 517 view is available.

Example	`:DISP:CDP:VIEW SEVM`

3.4.1.4 Code Domain (Quad View)

Windows: "Code Domain Power Graph" on page 461, "Symbol Power Graph" on page 467, "I/Q Symbol Polar Graph" on page 468, "Symbol Error Metrics" on page 465

Combination view of the code domain power, symbol power, I/Q symbol polar vector and the summary data using the above 4 windows.

The parameters displayed in these windows differ depending on the setting of Radio Device. When the parameter Capture Interval is set to Long Mode (4, 8 or 16 Frame), this view is not available, and only "Demod Bits" on page 517 view is available.

Example	`:DISP:CDP:VIEW QUAD`

3.4.1.5 Demod Bits

Windows: "Code Domain Power Graph" on page 461, "Symbol Power Graph" on page 467, "Symbol Power Graph (Long Mode)" on page 467, "Demod Bits" on page 468

In this view, the number of windows that are displayed depends on the parameter setting of "Capture Interval" on page 557. See the following table for detailed settings of Capture Interval.

The parameters displayed in each window differ depending on the setting of Radio Device.

Capture Interval Setting	Number & Type of Windows
1 to 14 slots 1 to 3 frames	Three windows: – Power Bar Graph window (upper left) – Symbol/Chip Power vs. Time window (upper right) – Demod Bits text window (lower)
Long Mode (4, 8, 16 frames)	Two windows: – Symbol/Chip Power vs. Time window (upper) – Demod Bits text window (lower)

Example	`:DISP:CDP:VIEW DBIT` `:DISP:CDP:VIEW LDEM`

3.4.2 Windows

This section describes the windows that are available in the Code Domain Measurement.

3.4.2.1 Window Number List

Window	Number
Code Domain Power	1
Metrics	2
Code Domain Error	3
Mag Error	4
Phase Error	5

Window	Number
EVM	6
Symbol Error Metrics	7
Symbol Power	8
I/Q Symbol Polar	9
Demod Bits	10

Code Domain Power Graph

The Code Domain Power Graph window appears in several Views, as follows:

View	Size	Position
Power Graph & Metrics	Half, full width	Top
CDP Graph & CDE Graph	Half, full width	Top
Code Domain (Quad View)	Half, half width	Upper left
Demod Bits	Half, half width	Upper left

Marker Operation	Yes
Corresponding Trace	CDPower (n=2)

Note 1: These traces and scalar results are for the slot specified by the Meas Offset. (Not averaged through Meas Interval.)

Metrics

The Metrics window appears in the following View:

View	Size	Position
Power Graph & Metrics	One thirds, full width	Bottom

Radio Device: BTS

Name	Corresponding Results	Explanation
Total Power	n=1 8th Total Power (Note 1)	-nn.nn dBm
Total Active Ch	n=1 9th Total active power (Note 1)	-nnn.nnn dBc
CPICH	n=1 10th Common Pilot (CPICH) power (Note 1)	-nn.nnn dBc
PSCH	n=1 16th P-SCH (Primary SCH) Power (Note 1, 2)	-nnn.nn dBm
SSCH	n=1 17th	-nnn.nn dBm

Name	Corresponding Results	Explanation
	S-SCH (Secondary SCH) Power (Note 1, 2)	
Max Active Ch	n=1 11th Maximum active code power (Note 1)	-nnn.nnn dBc
Avg Active Ch	n=1 12th Average active code power (Note 1)	-nnn.nnn dBc
Max Inactive Ch	n=1 13th Maximum inactive code power (Note 1)	-nn.nnn dBc
Avg Inactive Ch	n=1 14th Average inactive code power (Note 1)	-nn.nnn dBc
Num of Active Ch	n=1 15th Number of active channels (Note 1)	nnn

Note 1: These traces and scalar results are for the slot specified by the Meas Offset. (Not averaged over Meas Interval.) SCH burst period (the first 10% of each slot) is included in the measurement. SCH's interference is suppressed if “SCH Suppress” setting is “On”.

Note 2: Primary and Secondary SCH power is estimated by MMSE algorithm.

Radio Device: MS

Name	Corresponding Results	Explanation
Total Power	n=1 8th Total Power	-nn.nn dBm
Total Active Ch	n=1 9th Total active power (Note 1)	-nnn.nnn dBc
DPCCH Power	n=1 18th DPCCH power, PRACH Message Control Power (Note 1)	-nn.nnn dBc
DPCCH Beta	n=1 20th DPCCH Beta Measured, PRACH Message Control Part Beta Measured (Note 1)	n.nnn
HS-DPCCH Beta	n=1 33rd HS-DPCCH Beta Measured (Note 1)	n.nnn
E-DPCCH Beta	n=1 38th E-DPCCH Beta Measured (Note 1)	n.nnn
DPDCH Beta #1:	n=1 22nd DPDCH 1 Beta Measured,	n.nnn

Name	Corresponding Results	Explanation
	PRACH Message Data Part Beta Measured (Note 1)	
DPDCH Beta #2:	n=1 23rd DPDCH 2 Beta Measured (Note 1)	n.nnn
DPDCH Beta #3:	n=1 24th DPDCH 3 Beta Measured (Note 1)	n.nnn
DPDCH Beta #4:	n=1 25th DPDCH 4 Beta Measured (Note 1)	n.nnn
DPDCH Beta #5:	n=1 26th DPDCH 5 Beta Measured (Note 1)	n.nnn
DPDCH Beta #6:	n=1 27th DPDCH 6 Beta Measured (Note 1)	n.nnn
E-DPDCH Beta 1st on I	n=1 39th E-DPDCH 1st on I-axis Beta Measured (Note 1)	n.nnn
E-DPDCH Beta 1st on Q	n=1 40th E-DPDCH 1st on Q-axis Beta Measured (Note 1)	n.nnn
E-DPDCH Beta 2nd on I	n=1 41st E-DPDCH 2nd on I-axis Beta Measured This result is used only when there are two E-DPDCHs on I-axis. In this case, beta for E-DPDCH at C1(1):I is returned (Note 1)	n.nnn
E-DPDCH Beta 2nd on Q	n=1 42nd E-DPDCH 2nd on Q-axis Beta Measured This result is used only when there are two E-DPDCHs on Q-axis. In this case, beta for E-DPDCH at C1(1):Q is returned (Note 1)	n.nnn
Control Part Power	n=1 18th DPCCH power, PRACH Message Control Power (Note 1, 2)	
Control Part Beta	n=1 20th DPCCH Beta Measured, PRACH Message Control Part Beta Measured (Note 1, 2)	
Data Part Beta	n=1 22nd DPDCH 1 Beta Measured, PRACH Message Data Part Beta Measured (Note 1, 2)	
I Avg Active Ch	n=1 28th I channel average active power (Note 1)	-nnn.nnn dBc
I Max	n=1 29th	-nnn.nnn dBc

Name	Corresponding Results	Explanation
Inactive Ch	I channel maximum inactive power (Note 1)	
Q Avg Active Ch	n=1 30th Q channel average active power (Note 1)	-nnn.nnn dBc
Q Max Inactive Ch	n=1 31st Q channel maximum inactive power (Note 1)	-nnn.nnn dBc
Num of Active Ch	n=1 15th Number of active channels (Note 1)	nnn

Note 1: These traces and scalar results are for the slot specified by the Meas Offset. (Not averaged over Meas Interval.)

Code Domain Error Graph

The Code Domain Error Graph appears in the following View:

View	Size	Position
CDP Graph & CDE Graph	Half, full width	Bottom

Marker Operation	Yes
Corresponding Trace	CDError (n=13)

Note 1: These traces and scalar results are for the slot specified by the Meas Offset. (Not averaged over Meas Interval.)

Magnitude Error Graph

The Magnitude Error window appears in the following View:

View	Size	Position
I/Q Error (Quad View)	Half, half width	Upper left

Marker Operation	Yes
Corresponding Trace	MERRor (n=6)
Note 1	When I/Q Branch is either I(-BPSK) or Q(-BPSK): EVM of single code Channel is calculated independently between I and Q each other When I/Q Branch is IQC(-Combined): EVM is calculated based on combined symbol vector of I and Q decision point

Phase Error Graph

The Phase Error window appears in the following View:

View	Size	Position
I/Q Error (Quad View)	Half, half width	Upper right

Marker Operation	Yes
Corresponding Trace	PERRor (n=7)
Note 1	When I/Q Branch is either I(-BPSK) or Q(-BPSK): EVM of single code Channel is calculated independently between I and Q each other When I/Q Branch is IQC(-Combined): EVM is calculated based on combined symbol vector of I and Q decision point
Note 2	When I/Q Branch is either I(-BPSK) or Q(-BPSK): IQ Phase error has no meaning When I/Q Branch is IQ(-Combined): IQ Phase error is calculated based on combined symbol vector of I and Q decision point

EVM Graph

The EVM window appears in the following View:

View	Size	Position
I/Q Error (Quad View)	Half, half width	Lower left

Marker Operation	Yes
Corresponding Trace	EVM (n=5)
Note 1	When I/Q Branch is either I(-BPSK) or Q(-BPSK): EVM of single code Channel is calculated independently between I and Q each other When I/Q Branch is IQC(-Combined): EVM is calculated based on combined symbol vector of I and Q decision point

Symbol Error Metrics

The Metrics window appears in the following Views:

View	Size	Position
I/Q Error (Quad View)	Half, half width	Lower right
Code Domain (Quad View)	Half, half width	Lower right

Radio Device: BTS

Name	Corresponding Results	Explanation
Code Number	N/A	CX(Y) N ksps X: OVSF level (2 … 9) 2: 960ksps … 9:7.5ksps Y: OVSF code number (0 … 2^X-1) N: 7.5, 15, 30 …, 960 ksps
RMS EVM	n=1 1st RMS symbol EVM	nn.nn % rms
Pk EVM	n=1 2nd Peak symbol EVM	nn.nn % pk
Magnitude Error	n=1 3rd Symbol magnitude error	nn.nn % rms
Phase Error	n=1 4th Symbol phase error	nn.nn °rms
Total Power	n=1 5th Total power	-nn.nn dBm
Channel Power	n=1 6th Channel Power	-nn.nn dBc
tDPCH	n=1 7th tDPCH	nnn

Note 1: The result metrics window indicates the modulation scheme (“QPSK” or “16QAM”) that was used in the measurement. If modulation scheme setting is “Auto”, the result is auto-detected one. If the setting is manual, either “QPSK” or “16QAM”, the result is the same as the specified one.

Radio Device: MS

Name	Corresponding Results	Explanation
Code Number	N/A	CX(Y) N ksps X: OVSF level (2 … 8) 2: 960ksps … 8:15ksps Y: OVSF code number (0 … 2^X-1) N: 15, 30 …, 960 ksps
RMS EVM	n=1 1st RMS symbol EVM (Note 1)	nn.nn % rms
Pk EVM	n=1 2nd Peak symbol EVM (Note 1)	nn.nn % pk
Magnitude Error	n=1 3rd	nn.nn % rms

Name	Corresponding Results	Explanation
	Symbol magnitude error (Note 1)	
Phase Error	n=1 4th Symbol phase error (Note 2)	nn.nn °rms
Total Power	n=1 5th Total power	-nn.nn dBm
Channel Power	n=1 6th Channel Power	-nn.nn dBc
tHS-DPCCH	n=1 7th tHS-DPCCH	nnn

Note 1	When I/Q Branch is either I(-BPSK) or Q(-BPSK): EVM of single code Channel is calculated independently between I and Q each other When I/Q Branch is IQC(-Combined): EVM is calculated based on combined symbol vector of I and Q decision point
Note 2	When I/Q Branch is either I(-BPSK) or Q(-BPSK): IQ Phase error has no meaning When I/Q Branch is IQ(-Combined): IQ Phase error is calculated based on combined symbol vector of I and Q decision point

Symbol Power Graph

This graph appears in the following Views:

View	Size	Position
Code Domain (Quad View)	Half, half width	Upper right
Demod Bits	Half, half width	Upper right

Marker Operation	Yes
Corresponding Trace	SPOWer (n=9), CPOWer (n=10)

Symbol Power Graph (Long Mode)

This graph appears in the following View:

View	Size	Position
Demod Bits	Half, full width	Top

Marker Operation	Yes
Corresponding Trace	SPOWer (n=9)

I/Q Symbol Polar Graph

This graph appears in the following View:

View	Size	Position
Code Domain (Quad View)	Half, half width	Lower left

Marker Operation	No
Corresponding Trace	IQ Corrected Measured Trace (n=8)
Note 1	When I/Q Branch is either I(-BPSK) or Q(-BPSK): Symbol Vector is independent between I and Q each other When I/Q Branch is IQC(-Combined) Symbol vector is combined between I and Q

Demod Bits

The Demod Bits window appears in the following View:

View	Size	Position
Demod Bits	Half, full width	Bottom

Marker Operation	No
Corresponding Trace	Selected Demod Bits by Meas Offset and Meas Interval (n=12)

Note 1: When Capture Interval is less than 1 frame, the channel type is not shown as the physical channel name. It is simply shown by Code Level and Index:

Cx(y) : x = Code Level, y = Code Index

3.4.3 Amplitude

Activates the **Amplitude** menu and selects **Reference Level** or **Reference Value** as the active function, depending on the measurement.

Some features in this menu apply to multiple measurements. Some other features apply only to specific measurements and their controls are blanked or grayed-out in measurements that do not support the feature.

3.4.3.1 Y Scale

The Y Scale Tab contains controls that pertain to the Y axis parameters of the measurement. These parameters control how data on the vertical (Y) axis is displayed and control instrument settings that affect the vertical axis.

Ref Value

Sets the value for the absolute power reference. The functionality depends on the selected window.

Remote Command	`:DISPlay:CDPower:WINDow[1]|3|4|5|6|8:TRACe:Y[:SCALe]:RLEVel <real>`
	`:DISPlay:CDPower:WINDow[1]|3|4|5|6|8:TRACe:Y[:SCALe]:RLEVel?`
	Window numbers are as follows:
	– CDP: 1
	– CDE: 3
	– Mag Error: 4
	– Phase Error: 5
	– EVM : 6
	– Symb Power: 8

Example	`:DISP:CDP:WIND:TRAC:Y:RLEV 0.0`
	1-CDP Window
	`:DISP:CDP:WIND3:TRAC:Y:RLEV 0.0`
	3-CDE Window
	`:DISP:CDP:WIND4:TRAC:Y:RLEV 0.0`
	4-Mag Error Window
	`:DISP:CDP:WIND5:TRAC:Y:RLEV 0.0`
	5-Phase Error Window
	`:DISP:CDP:WIND6:TRAC:Y:RLEV 0.0`
	6-EVM Window
	`:DISP:CDP:WIND8:TRAC:Y:RLEV 0.0`
	8-Symb Power Window

Couplings	When Auto Scaling is On (default), this value is automatically determined by the measurement result. When you set a value manually, Auto Scaling changes to Off
Preset	0.00
State Saved	Yes
Min/Max	see table below

View	Min/Max
1-CDP | 3-CDE	250.0/250.0
4-Mag Error | 6-EVM	-100/100
5-Phase Error	-360/360

Backwards Compatibility SCPI

Window Numbers used to be a combination of View and Window, now the VIEW parameter is not used and defaults to 1. All Windows are referenced through VIEW 1. For backwards compatibility the old View and Window numbers are honored as below:

Window	Old SCPI Command	New SCPI Command
CDP	!Power Graph & Metrics View DISP:CDP:VIEW:WIND:TRAC:Y:RLEV 0.0 !CDP/CDE View DISP:CDP:VIEW2:WIND:TRAC:Y:RLEV 0.0 !Code Domain View DISP:CDP:VIEW4:WIND:TRAC:Y:RLEV 0.0 !Demod Bits View DISP:CDP:VIEW5:WIND:TRAC:Y:RLEV 0.0	DISP:CDP:WIND:TRAC:Y:RLEV 0.0

3.4.3.2 Attenuation

Controls the attenuator functions and interactions between the attenuation system components.

There are two attenuator configurations in the X-Series. One is a Dual-Attenuator configuration consisting of a mechanical attenuator and an optional electronic attenuator. The other configuration uses a single attenuator with combined mechanical and electronic sections thatcontrols all the attenuation functions. Different models in the X-Series come with different configurations.

– See "Dual-Attenuator Configurations" on page 476

– See "Single-Attenuator Configuration" on page 476

Most attenuation settings are the same for all measurements – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by Meas Preset.

This tab is only available when the hardware set includes an input attenuator, which is typically only the case when using Keysight’s box instruments. For example, this tab does not appear in:

– VXT models M9420A/21A/10A/11A

– E7760

– M9391A

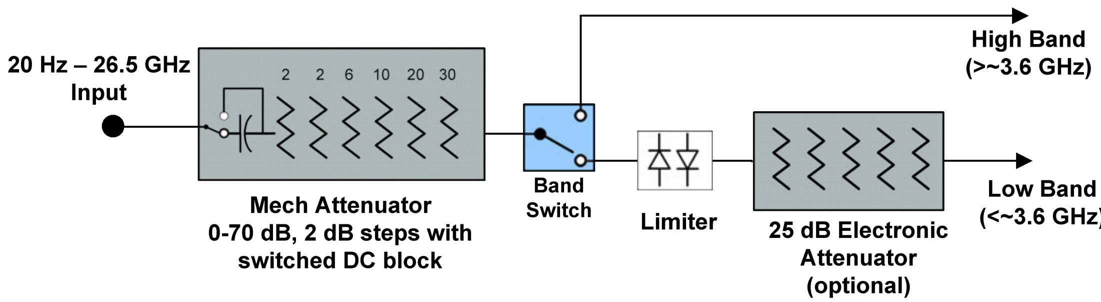
– M9393A

This tab also does not appear in UXM. In UXM all Attenuation and Range settings are disabled, as the expected input power level is handled by the Call Processing App that drives the DUT power control.

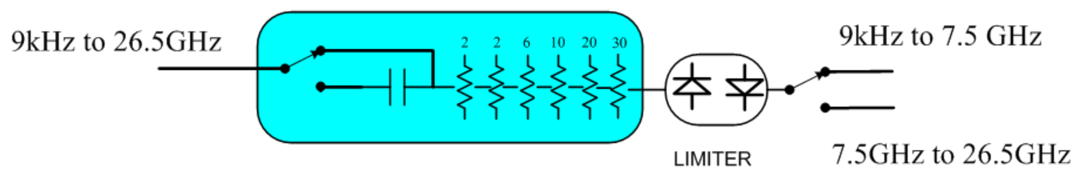
Dependencies	In measurements that support the I/Q inputs, this tab is unavailable when I/Q is the selected input, and is replaced by the Range tab in that case

Dual-Attenuator Configurations

Configuration 1: Mechanical attenuator + optional electronic attenuator

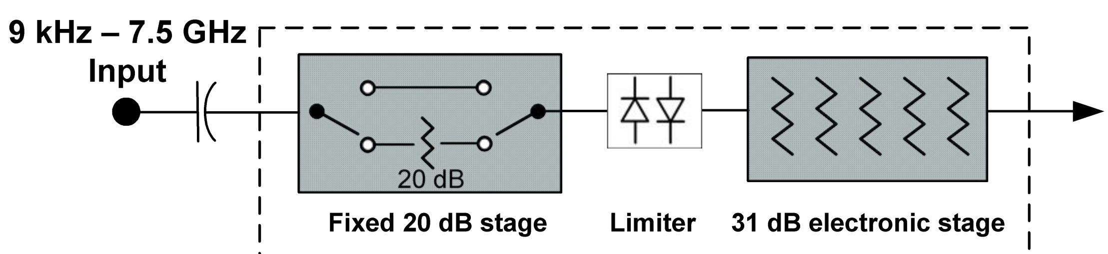


Configuration 2: Mechanical attenuator, no optional electronic attenuator

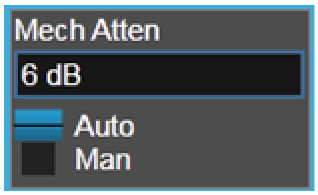


(note that Configuration 2 is not strictly speaking a dual-section attenuator, since there is no electronic section available. However, it behaves exactly like Configuration 1 without the Electronic Attenuator option EA3, therefore for the sake of this document it is grouped into the "Dual-Attenuator" configuration)

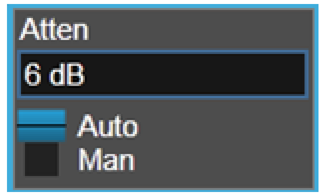
Single-Attenuator Configuration



You can tell which attenuator configuration you have by pressing the Attenuation tab, which (in most Modes) opensthe Attenuation menu. If the first control in the Attenuation menu says **Mech Atten** you have the Dual-Attenuator configuration. If the first control says **Atten** you have the Single-Attenuator configuration.



Dual Attenuator



Single Attenuator

(Note that depending on the measurement, there may be no Auto/Man functionality on the Mech Atten control).

In the Single-Attenuator configuration, youcontrol the attenuation with a single control, as the fixed stage has only two states. In the Dual-Attenuator configuration, both stages have significant range so you are given separate control of the mechanical and electronic attenuator stages.

When you have the Dual-Attenuator configuration, you may still have only a Single-Attenuator, because unless option EA3 (the Electronic Attenuator option) is available, and you purchase it, you will have only the mechanical attenuator.

Full Range Atten

The **Full Range Atten** control and **Attenuator Summary** only appear in N9041B, when the RF input is selected and the RF Input Port is set to RF Input 2, and the Full Range Attenuator is installed. The Full Range Attenuator adds a second input attenuator at the beginning of the RF Input 2, which enhances the protection and optimizes the performance of the extra internal mixers used by RF Input 2.

Remote Command	[:SENSe]:POWer[:RF]:FRATten <rel_ampl> [:SENSe]:POWer[:RF]:FRATten?
Example	:POW:FRAT 14 :POW:FRAT?
Notes	When you enter an amplitude value that falls between valid values, the value will be incremented to the next smallest valid value
Dependencies	Only appears if input RF is selected, and RF Input Port 2 is selected, and the Full Range Attenuator exists
Couplings	This value is never changed by any coupling, however other couplings use this value. See the **Reference Level** and "Mech Atten" on page 1750 command descriptions
Preset	20 dB
State Saved	Saved in instrument state
Min	0 dB
Max	Only valid values are 0, 6, 14, 20 dB
Annotation	When the Input is RF, and the Input Port is RF Input 2, and the Full Range Attenuator is installed: On the Meas Bar, the field "Atten" displays as follows:

- If the sweep is entirely < 50 GHz, the value shown after “Atten:” is equal to Mech Atten + Elec Atten + Full Range Atten
- If the sweep is entirely > 50 GHz, the value shown after “Atten:” is equal to Full Range Atten
- If the sweep straddles 50 GHz, the value shown after “Atten:” is preceded by the symbol “>=” and is equal to Full Range Atten

In the **Amplitude**, "Attenuation" on page 1747 menu, and the Atten Meas Bar dropdown menu panel, a summary is displayed as follows:

“Total Atten below 50 GHz” followed by the value of Full Range Atten + Mech Atten + Elec Atten

“Total Atten above 50 GHz” followed by the value of Full Range Atten

For example, if Mech Atten = 6 dB, Elec Atten = 4 dB, and Full Range Atten = 20 dB, the summary below is shown:

- Attenuator summary:
- Total Atten below 50 GHz: 30 dB
- Total Atten above 50 GHz: 20 dB

Mech Atten

This control is labeled **Mech Atten** in Dual-Attenuator models and **Atten** in Single-Attenuator models. In the Dual-Attenuator configuration, this control only affects the mechanical attenuator.

This control lets you modify the attenuation applied to the RF input signal path. This value is normally auto coupled to the Ref Level, the Internal Preamp Gain, any External Gain that is entered, and the Max Mixer Level, as described in the table below.

See "Attenuator Configurations and Auto/Man" on page 480

Remote Command	`[:SENSe]:POWer[:RF]:ATTenuation <rel_ampl>`
	`[:SENSe]:POWer[:RF]:ATTenuation?`
	`[:SENSe]:POWer[:RF]:ATTenuation:AUTO OFF | ON | 0 | 1`
	`[:SENSe]:POWer[:RF]:ATTenuation:AUTO?`

Example	`:POW:ATT 20`
	Dual-Attenuator configuration: sets the mechanical attenuator to 20 dB
	Single-Attenuator mode: sets the main attenuation to 20 dB (see below for definition of “main” attenuation)
	In either case, if the attenuator was in Auto, it is set to Manual
	`:POW:ATT:AUTO ON`
	Turn Auto Mech Atten ON

Dependencies	Some measurements do not support the Auto setting of "Mech Atten" on page 478. In these measurements, the Auto/Man selection is not available, and the Auto/Man toggle function is not

	available In Dual-Attenuator configurations, when the electronic attenuator is enabled, the mechanical attenuator has no auto setting and the Auto/Man toggle function is not available. The state of Auto/Man is remembered and restored when the electronic attenuator is once again disabled. This is described in more detail in "Elec Atten" on page 1753 See "Attenuator Configurations and Auto/Man" on page 480 for more information on the Auto/Man functionality `:POW:ATT:AUTO` is only available in measurements that support Mech Atten Auto, such as Swept SA
Couplings	If the RF Input Port is the RF Input: – If the USB Preamp is connected to USB, use 0 dB for Mech Atten – Otherwise compute the auto-selected value of Mech Atten based on **Reference Level**, Int Preamp, External Gain, Ref Level Offset, Max Mixer Level, µW Path Control and IF Gain settings. Limit this value to be no less than 6 dB (total attenuation below 6 dB can never be chosen by Auto) – In the N9041B, if the RF Input Port is RF Input 2, use the formula above and subtract the Full Range Atten value from the result to determine the Mech Atten. Limit the value so that it is never lower than 0 dB and so that total attenuation, including Full Range Atten, is never less than 6 dB (total attenuation, including Full Range Atten below 6 dB, can never be chosen by Auto) In External Mixingand BBIQ, where the Attenuator is not in the signal path, the Attenuator setting changes as described above when "Mech Atten" on page 478 is in Auto, but no changes are made to the actual attenuator hardware setting until the input is changed back to the RF Input For CXA-m with option FSA (Fine-Step Attenuator or 2 dB steps), the FSA-like behavior is only available when the frequency setting is <= 7.5GHz. So, when the frequency is changed from below 7.5GHz to above 7.5GHz, the attenuation setting will be changed to a multiple of 10dB which will be no smaller than the previous setting. For example, 4dB attenuation will be changed to 10dB
Preset	The preset for Mech Attenuation is "Auto" The Auto value of attenuation is 10 dB `ON`
State Saved	Saved in instrument state
Min	0 dB The attenuation set by this control cannot be decreased below 6 dB with the knob or step keys. Values below 6 dB must be directly entered from the keypad or via SCPI. This protects against setting a dangerously small attenuation value, which can put the instrument at risk of damage to input circuitry. If the current mechanical attenuation is below 6 dB, it can be increased with the knob and step keys, but not decreased
Max	CXA Option 503 or 507: 50 dB EXA: 60 dB All other models: 70 dB Note that in the Single-Attenuator configuration, the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB.
Annotation	The current value for Total Atten is displayed in the Measurement Bar at the top of the display. A value appears for Electronic Attenuation only if the Electronic Attenuator is enabled. The annotation appears as Atten: <total> dB (e<elec>)

The e letter is in amber in Single-Attenuator configurations

For example:

Dual-Attenuator configuration:

Atten: 24 dB (e14)

Indicating the total attenuation is at 24 dB and the electronic attenuation is at 14 dB

Single-Attenuator configuration:

A: 24 dB (e14)

Indicating the total attenuation is at 24 dB and the “soft” attenuation is at 14 dB (see below for definition of “soft” attenuation)

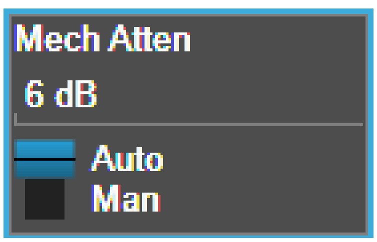
When in Manual, a # sign appears in front of Atten in the annotation

Attenuator Configurations and Auto/Man

As described in "Attenuation" on page 1747 , there are two distinct attenuator configurations available in the X-Series, the single attenuator and Dual-Attenuator configurations. In Dual-Attenuator configurations, we have the mechanical attenuation and the electronic attenuation, and the current total attenuation is the sum of the electronic + mechanical attenuation. In Single-Attenuator configurations, we refer to the attenuation set using "Mech Atten" on page 478 (or `:POW:ATT`) as the “main” attenuation; and the attenuation that is set by `:POW:EATT` as the “soft” attenuation (`:POW:EATT` is honored even in the Single-Attenuator configuration, for compatibility purposes). Then the current total attenuation is the sum of the main + soft attenuation. See "Elec Atten" on page 1753 for more on “soft” attenuation.

NOTE

In some measurements, the **Mech Atten** control has an Auto/Man function. In these measurements, an Auto/Man switch is shown on the **Mech Atten** control:



Note that in configurations that include an Electronic Attenuator, this switch is only shown when the Electronic Attenuator is disabled.

In other measurements, **Mech Atten** has no Auto/Man function. In these measurements, no switch is shown on the **Mech Atten** control:

Mech Atten also appears with no switch, as above, in configurations that include an Electronic Attenuator but when the Electronic Attenuator is enabled.

Elec Atten

Controls the Electronic Attenuator in Dual-Attenuator configurations. This control does not appear in Single-Attenuator configurations, as the control of both the mechanical and electronic stages of the Single-Attenuator is integrated into the single **Atten** control.

This control includes an Enable/Disable toggle switch; it is only possible to enter a value for the Electronic Attenuator when this switch is in the "Enable" position.

See "More Information" on page 482

Remote Command	`[:SENSe]:POWer[:RF]:EATTenuation <rel_ampl>`
	`[:SENSe]:POWer[:RF]:EATTenuation?`
	`[:SENSe]:POWer[:RF]:EATTenuation:STATe OFF | ON | 0 | 1`
	`[:SENSe]:POWer[:RF]:EATTenuation:STATe?`

Example	`:POW:EATT 10`
	`:POW:EATT?`
	`:POW:EATT:STAT ON`
	`:POW:EATT:STAT?`

Notes	Electronic Attenuation's specification is defined only when Mechanical Attenuation is 6 dB
Dependencies	This control only appears in Dual-Attenuator models with an Electronic Attenuator installed and licensed. It does not appear in models with the Single-Attenuator configuration, as in the Single-Attenuator configuration there is no "electronic attenuator" there is only a single integrated attenuator (which has both a mechanical and electronic stage). However, in the Single-Attenuator configuration, EATT SCPI commands are accepted for compatibility with other X-series instruments and set a "soft" attenuation as described in . The "soft" attenuation is treated as an addition to the "main" attenuation value set by the Atten control or the POW:ATT SCPI command and affects the total attenuation displayed on the Atten control and the Meas Bar The electronic attenuator (and the "soft" attenuation function provided in Single-Attenuator configurations) is unavailable above the low band (0-3.6 GHz, 0-3.4 GHz 0-3GHz, depending on the model). If the low band ranges from 0-3.6GHz, and Stop Frequency of the instrument is > 3.6 GHz, then the **Enabled/Disabled** section of the **Elec Atten** control will be OFF and grayed out If the Internal Preamp is on, meaning it is set to Low Band or Full, the electronic attenuator (and the "soft" attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the **Enabled/Disabled** section of the **Elec Atten** control will be OFF and grayed out If either of the above is true, if the SCPI command is sent, an error indicating that the electronic attenuator is unavailable will be sent If both of the above are true, pressing the control will generate error message -221, in other words, the frequency range lockout takes precedence If the electronic/soft Attenuator is enabled, then the Stop Freq of the instrument is limited to 3.6 GHz and the Internal Preamp is unavailable The SCPI-only "soft" electronic attenuation for the single-attenuator configuration is not available in all measurements; in particular, it is not available in the Swept SA measurement

Couplings	Enabling and disabling the Electronic Attenuator affects the setting of the Mechanical Attenuator (in Dual-Attenuator configurations). This is described in more detail below and in the section "Attenuator Configurations and Auto/Man" on page 1752
Preset	OFF (Disabled) for Swept SA measurement ON (Enabled) for all other measurements that support the electronic attenuator
State Saved	Saved in instrument state
Min	0 dB
Max	Dual-Attenuator configuration: 24 dB Single-Attenuator configuration: the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB
Annotation	See Annotation under the **Mech Atten** control description

More Information

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear. These advantages primarily aid in remote operation and are negligible for front panel use. See "Using the Electronic Attenuator: Pros and Cons" on page 483 for a detailed discussion of the pros and cons of using the electronic attenuator.

For the Single-Attenuator configuration, for SCPI backwards compatibility, the “soft” attenuation feature replaces the Dual-Attenuator configuration’s electronic attenuator. All the same couplings and limitations apply. See "Attenuator Configurations and Auto/Man" on page 1752

Mechanical Attenuator Transition Rules

When the Electronic Attenuator is enabled, the Mechanical Attenuator transitions to a state that has no Auto function. Below are the rules for transitioning the Mechanical Attenuator. Note that the information below ONLY applies to the Dual-Attenuator configurations, and ONLY when the Electronic Attenuator is installed:

When the Electronic Attenuation is enabled from a disabled state:

The Mechanical Attenuator is initialized to 10 dB (this is its optimal performance setting). You can then set it as desired with SCPI, numeric keypad, step keys, or knob, and it behaves as it normally would in manual mode

The Auto/Man state of (Mech) Atten is saved

The Auto/Man toggle on the (Mech) Atten control disappears and the auto rules are disabled

The Electronic Attenuator is set to 10 dB less than the previous value of the Mechanical Attenuator, within the limitation that it must stay within the range of 0 to 24 dB of attenuation

Examples in the Dual-Attenuator configuration:

Mech Atten at 20 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 10 dB. New total attenuation equals the value before Elec Atten enabled

Mech Atten at 0 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 0 dB. New total attenuation does not equal the value before Elec Atten enabled

Mech Atten at 40 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 24 dB. New total attenuation does not equal the value before Elec Atten enabled

When the Electronic Attenuation is disabled from an enabled state:

The Elec Atten control is grayed out

- The Auto/Man state of (Mech) Atten is restored

If now in Auto, (Mech) Atten recouples

If now in Man, (Mech) Atten is set to the value of total attenuation that existed before the Elec Atten was disabled. The resulting value is rounded up to the smallest value possible given the (Mech) Atten Step setting - (That is, 57 dB changes to 58 dB when (Mech) Atten Step is 2 dB)

Using the Electronic Attenuator: Pros and Cons

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear.

The “finer steps” advantage of the electronic attenuator is beneficial in optimizing the alignment of the instrument dynamic range to the signal power in the front panel as well as remote use. Thus, you can achieve improved relative signal measurement accuracy. Compared to a mechanical attenuator with 2 dB steps, the 1 dB resolution of the electronic attenuator only gives better resolution when the odd-decibel steps are used. Those odd-decibel steps are less accurately calibrated than the even-decibel steps, so one tradeoff for this superior relative accuracy is reduced absolute amplitude accuracy.

Another disadvantage of the electronic attenuator is that the spectrum analyzer loses its “Auto” setting, making operation less convenient.

Also, the relationship between the dynamic range specifications (TOI, SHI, compression, and noise) and instrument performance are less well-known with the electrical attenuator. With the mechanical attenuator, TOI, SHI, and compression threshold levels increase dB-for-dB with increasing attenuation, and the noise floor does as well. With the electronic attenuator, there is an excess attenuation of about 1 to 3 dB between 0 and 3.6 GHz, making the effective TOI, SHI, and so forth, less well known. Excess attenuation is the actual attenuation relative to stated attenuation. Excess attenuation is accounted for in the instrument calibration

Mech Atten Step

Controls thestep size used when making adjustments to the input attenuation.

This control is labeled **Mech Atten Step** in Dual-Attenuator models and **Atten Step** in Single-Attenuator models. In the Dual-Attenuator configuration, this control only affects the step size of the mechanical attenuator.

Remote Command	`[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement] 10 dB | 2 dB` `[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement]?`
Example	`:POW:ATT:STEP 2` `:POW:ATT:STEP?`
Notes	This feature has a toggle choice from the front panel, but it takes a specific value (in dB) when used remotely. The only valid values are 2 and 10
Dependencies	Blanked in EXA, CXA and CXA-m if option FSA (2 dB steps) is not present. If blanked, attempts to set it via SCPI yield an error
Couplings	When the attenuation step size changes, the current mechanical attenuation value is adjusted (if necessary) to be quantized to the new step size. That is, if step is set to 10 dB, mech atten is increased if necessary so it is a multiple of 10 dB
Preset	EXA, CXA and CXA-m: 10 dB (2 dB with option FSA) All other models: 2 dB
State Saved	Saved in instrument state

3.4.3.3 Range (Baseband Input models)

This tab is only available when Option BBA is present (I/Q Baseband Inputs), the current measurement supports option BBA, and I/Q is the selected input. It replaces the Attenuation tab in that case.

Each input channel (I and Q) has four internal gain ranges. The maximum allowed voltage in each gain range is slightly more than the nominal value, so the break point between ranges is a few millivolts higher than the nominal (setting a peak voltage of 0.502 mV will still map to the 0.5 V Peak range).

Gain Setting	Volts RMS	Volts Peak	Volts Peak - Peak	dBm (50Ω)	Break Point
0 dB	0.7071	1.0	2.0	10	n/a
6 dB	0.3536	0.5	1.0	4	0.502 V Peak
12 dB	0.1768	0.25	0.5	-2	0.252 V Peak
18 dB	0.0884	0.125	0.25	-8	0.127 V Peak

Dependencies	Available only when the selected input is I/Q. If the current measurement does not support baseband inputs, an error will be displayed: “No result; Meas invalid with I/Q inputs”
State Saved	No

Range Auto/Man

The Auto setting for Range causes the range to be set based on the Y Scale settings. When Range is “Auto”, the I & Q Range are set based on the top of the Y Scale when the Y scale is in dB units (for example, power), or to the max(abs(top), abs(bottom)) when the Y scale reference is not at the top of the screen.

Not all measurements support **Range Auto/Man**. If Auto is not supported in the current measurement, this control is grayed-out displaying “Man”, and `MAN` is returned to a SCPI query, but this does *not* change the Auto/Man setting for Range. When you switch to a measurement that supports Auto, it goes back to Auto if it was previously in Auto mode.

Remote Command	`[:SENSe]:VOLTage:IQ:RANGe:AUTO OFF | ON | 0 | 1` `[:SENSe]:VOLTage:IQ:RANGe:AUTO?`

Example	Put the I Range and Q Range in manual.
	`:VOLT:IQ:RANG:AUTO OFF`
	`:VOLT:IQ:RANG:AUTO?`

Dependencies	If Auto is not supported, sending the SCPI command generates an error
Couplings	When in Auto, both I Range and Q Range are set to the same value, computed as follows: Maximum absolute value is computed for the Y Scale. The top and bottom of the graph are computed based on Ref Value, Scale/Div, and Ref Position. Formula: Y_{Max} = max(abs(top), abs(bottom)) The I Range and Q Range are then set to Y_{Max}
Preset	`ON`
State Saved	Saved in instrument state
Annotation	When in Man, the Range annotation is preceded by "#"

This is an alternate form of the command to match the `POWer` form of the I Range and Q Range SCPI.

Remote Command	`[:SENSe]:POWer:IQ:RANGe:AUTO OFF | ON | 0 | 1` `[:SENSe]:POWer:IQ:RANGe:AUTO?`

Example	Put the I Range and Q Range in manual
	`:POW:IQ:RANG:AUTO OFF`
	`:POW:IQ:RANG:AUTO?`

Notes	`:POW:IQ:RANG:AUTO` is an alternate form of `:VOLT:IQ:RANG:AUTO`, to maintain consistency with I Range and Q Range, which support both the `POWer` and `VOLTage` forms of the command
Preset	`ON`
Range	Auto | Man

I Range

The internal gain range for the I channel when the Input Path is I Only or I and I/Q. Used for both the I and Q channels when the Input Path is I+jQ.

Remote Command	`[:SENSe]:VOLTage:IQ[:I]:RANGe[:UPPer] <voltage>` `[:SENSe]:VOLTage:IQ[:I]:RANGe[:UPPer]?`

Example	Set the I Range to 0.5 V Peak
	`:VOLT:IQ:RANG 0.5 V`
	`:VOLT:IQ:RANG?`

Notes	The numeric entries are mapped to the smallest gain range whose break point is greater than or equal to the value, or 1 V Peak if the value is greater than 1 V
Couplings	When "Q Same as I" on page 1580 is On, the **I Range** value will be copied to "Q Range" on page 1578 Changing the value also sets Range = Man
Preset	1 V Peak
State Saved	Saved in instrument state
Range	1 V Peak (10 dBm @ 50 Ω) | 0.5 V Peak (4 dBm @ 50Ω) | 0.25 V Peak (-2 dBm @ 50Ω) | 0.125 V Peak (-8 dBm @ 50Ω)
Min	0.125 V
Max	1 V
Annotation	The Range annotation replaces the RF Input context's "Atten" annotation "Rng: <I Range>". When Range = Man the annotation is preceded by "#" The I Range is not annotated in Input Path Q Only. When I Range and Q Range are the same, the annotation is "Rng: <Range>". When I Range and Q Range are different and the Input Path is Ind I/Q, the annotation is "Rng: <I Range>, <Q Range>" and "Peak" is removed from the text. Examples: "Rng: 1 V Peak" the I Range is 1 V Peak "Rng: 1 V, 0.5 V " the I Range is 1 V Peak and the Q Range is 0.5 V Peak

This is an alternate form of the command to allow entry as a power.

Remote Command	`[:SENSe]:POWer:IQ[:I]:RANGe[:UPPer] <ampl>` `[:SENSe]:POWer:IQ[:I]:RANGe[:UPPer]?`

Example	Set the I Range to 0.5 V Peak when Reference Z is 50 Ω, and to 1.0 V Peak when Reference Z is 75 **Ω**
	`:POW:IQ:RANG 4 dBm`
	`:POW:IQ:RANG?`

Notes	The `POWer` form of the command is provided for convenience. It maps to the same underlying gain range parameter as the `VOLTage` form of the command The Reference Z (not the I channel Input Z) is used to convert the power to peak voltage, which is then used to set the I Range as with the `VOLTage` form of the command. The power values of the 4 range states (1V Peak, 0.5V Peak, 0.25V Peak, and 0.125V Peak) will vary with Reference Z. Here are some examples:

	50 Ω: 10, 4, -2, -8 75 Ω: 8.2, 2.2, -3.8, -9.8 600 Ω: -0.8, -6.8, -12.8, -18.9
Preset	10.0 dBm
Range	-20 dBm to 10 dBm
Min	-20 dBm
Max	10 dBm

Q Range

The internal gain range for the Q channel.**Q Range** only applies to Input Path Q Only and Ind I/Q. For input I+jQ "I Range" on page 1577 determines both I and Q channel range settings.

Remote Command	`[:SENSe]:VOLTage:IQ:Q:RANGe[:UPPer] <voltage>` `[:SENSe]:VOLTage:IQ:Q:RANGe[:UPPer]?`

Example	Set the Q Range to 0.5 V Peak:
	`:VOLT:IQ:Q:RANG 0.5 V`
	`:VOLT:IQ:Q:RANG?`

Notes	The numeric entries are mapped to the smallest gain range whose break point is greater than or equal to the value, or 1 V Peak if the value is greater than 1 V **Q Range** is only used for Input Path Q Only and Ind I/Q. For input I+jQ, "I Range" on page 1577 determines both I and Q channel range settings
Couplings	When "Q Same as I" on page 1580 is On, the "I Range" on page 1577 value is copied to **Q Range** and the range value keys are disabled Changing the value also sets Range = Man
Preset	1 V Peak
State Saved	Saved in instrument state
Range	1 V Peak (10 dBm @ 50Ω) | 0.5 V Peak (4 dBm @ 50Ω) | 0.25 V Peak (-2 dBm @ 50Ω) | 0.125 V Peak (-8 dBm @ 50Ω)
Min	0.125 V
Max	1 V
Annotation	The Range annotation replaces the RF Input context's "Atten" annotation "Rng: <Q Range>". When Range = Man the annotation is preceded by "#" The Q Range is not annotated in Input Path I Only or I+jQ. When I Range and Q Range are the same, the annotation is "Rng: <Range>". When I Range and Q Range are different and the Input Path is Ind I/Q, the annotation is "Rng: <I Range>, <Q Range>" and "Peak" is removed from the text. Examples: "Rng: 1 V Peak" the Q Range is 1 V Peak "Rng: 1 V, 0.5 V " the I Range is 1 V Peak and the Q Range is 0.5 V Peak

This is an alternate form of the command to allow entry as a power.

Remote Command	[:SENSe]:POWer:IQ:Q:RANGe[:UPPer] <ampl> [:SENSe]:POWer:IQ:Q:RANGe[:UPPer]?
Example	Sets the Q Range to 0.5 V Peak when Reference Z is 50 Ω, and to 1.0 V Peak when Reference Z is 75 Ω: :POW:IQ:Q:RANG 4 dBm :POW:IQ:Q:RANG?
Notes	The POWer form of the command is provided for convenience. It maps to the same underlying gain range parameter as the VOLTage form of the command The Reference Z (not the Q channel Input Z) is used to convert the power to peak voltage, which is then used to set the Q Range as with the VOLTage form of the command. The power values of the 4 range states (1V Peak, 0.5V Peak, 0.25V Peak, and 0.125V Peak) will vary with Reference Z. Here are some examples: 50 Ω: 10, 4, -2, -8 75 Ω: 8.2, 2.2, -3.8, -9.8 600 Ω: -0.8, -6.8, -12.8, -18.9
Preset	10.0 dBm
Range	-20 dBm to 10 dBm
Min	-20 dBm
Max	10 dBm

Q Same as I

Many, but not all, usages require the I and Q channels to have an identical setup. To simplify channel setup, **Q Same as I** causes the Q channel range to be mirrored from the I channel. That way you only need to set up one channel (the I channel). The I channel values are copied to the Q channel, so at the time **Q Same as I** is Off, the I and Q channel setups will be identical.

Remote Command	[:SENSe]:VOLTage|POWer:IQ:MIRRored OFF | ON | 0 | 1 [:SENSe]:VOLTage|POWer:IQ:MIRRored?
Example	Turn off the mirroring of I Range to Q Range. :VOLT:IQ:MIRR OFF :POW:IQ:MIRR OFF
Couplings	When ON, the "I Range" on page 1577 value is mirrored (copied) to the "Q Range" on page 1578
Preset	ON
State Saved	Saved in instrument state
Range	OFF|ON

3.4.3.4 Range (Non-attenuator models)

This tab is only available for Keysight’s modular signal analyzers and certain other Keysight products. Examples include:

- VXT
- E7760
- M9391A
- M9393A

This tab also does not appear in UXM. In UXM, all Attenuation and Range settings are disabled, as the expected input power level is handled by the Call Processing App that drives the DUT power control.

State Saved	No

Range

Represents the amplitude of the largest sinusoidal signal that could be present within the IF without being clipped by the ADC. For signals with high peak-to-average ratios, the range may need to exceed the rms signal power by a significant amount to avoid clipping.

This is a measurement global setting.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe <real>` `[:SENSe]:POWer[:RF]:RANGe?`
Example	`:POW:RANG 10 dBm` `:POW:RANG?`
Notes	The MIN and MAX values are affected by the External Gain parameters, and by the **Center Frequency** The hardware compensates for frequency response and alters the Range setting
Preset	0 dBm
State Saved	Yes
Min	-100
Max	100
Annotation	Meas Bar

Adjust Range for Min Clipping

Sets the combination of attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an "immediate action" function, that is, it executes once, when the key is pressed.

This key does not appear in measurements that do not support this functionality.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMediate`

Notes	Executing Adjust Range for Min Clipping initiates the measurement
Dependencies	This control does not appear in the Swept SA and Monitor Spectrum measurements This control appears in all measurements in E7760

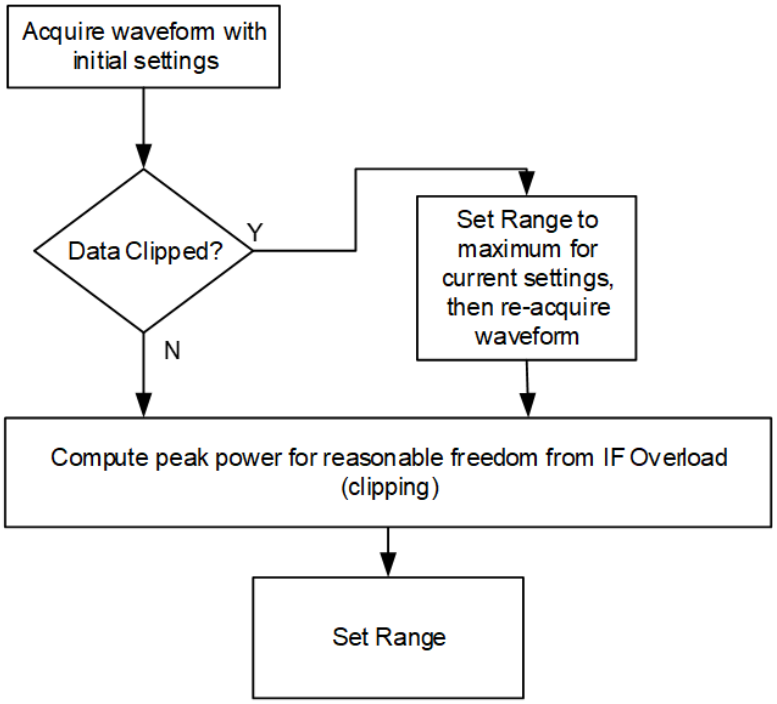
Pre-Adjust for Min Clipping

If this function is ON, it applies the adjustment described under Adjust Range For Min Clipping each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF | ON | ELECtrical | COMBined` `[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?`
Notes	Because there is no attenuator control available in these models, the control displays only ON and OFF choices. However, for SCPI compatibility with other platforms, all three parameters (ELECtrical, COMBined, and ON) are honored and all are mapped to ELECtrical, so if any of these three parameters is sent, a subsequent query will return ELEC
Dependencies	This control does not appear in the Swept SA and Monitor Spectrum measurements This control appears in all measurements in E7760
Preset	OFF for Swept SA measurement; ON for all other measurements that support **Pre-Adjust for Min Clipping**
State Saved	Saved in instrument state

Adjustment Algorithm

The algorithm for the adjustment is documented below:



Peak-to-Average Ratio

Used with "Range (Non-attenuator models)" on page 1864 to optimize the level control in the instrument. The value is the ratio, in dB, of the peak power to the average power of the signal to be measured. A ratio of 0 should be used for sinusoidal signals; for 802.11g OFDM signals use 9 dB.

All Applications (Modes) show the current value of Peak-to-Average ratio on the control. However, some applications do not permit changing the value. In these situations, the control is grayed-out.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:PARatio <real>` `[:SENSe]:POWer[:RF]:RANGe:PARatio?`
Example	`:POW:RANG:PAR 12 dB`
Notes	In some Applications (Modes) this parameter is read-only; meaning the value will appear on the control and query via SCPI, but is not changeable. In such applications the control is grayed-out. Attempting to change the value via SCPI will be ignored but no error message will be generated
Dependencies	This control does not appear in Spectrum Analyzer Mode
Preset	10 dB VXT Models M9410A/11A: 0 dB
State Saved	Saved in instrument state
Min	0 dB
Max	20 dB VXT Models M9410A/11A: 50 dB

Mixer Lvl Offset

This is an advanced setting to adjust target Range at the input mixer, which in turn affects the signal level in the instrument's IF. This setting can be used when additional optimization is needed after setting "Peak-to-Average Ratio" on page 1866. Positive values of offset optimize noise performance over distortion, negative values optimize distortion performance over noise.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet <real>` `[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet?`
Example	`:POW:RANG:MIX:OFFS -5 dB`
Preset	0 dB
State Saved	Saved in instrument state
Min	-35 dB VXT Models M9410A/11A: -34 dB
Max	30 dB

3.4.3.5 Signal Path

Contains controls that pertain to the routing of the signal through the frontend of the instrument.

In general, this tab only appears in instruments whose hardware supports this signal routing. For example, this tab does not appear in many of the modular instrument products, including VXT Models M9420/21A. It also does not appear in UXM.

This tab *does* appear in VXT Models M9410A/11A because the Software Preselection control is in this tab, and VXT Models M9410A/11A implement a version of Software Preselection.

Presel Center

Pressing this control adjusts the centering of the preselector filter to optimize the amplitude accuracy at the frequency of the selected marker. If the selected marker is not on when **Presel Center** is pressed, the instrument turns on the selected marker, performs a peak search, and then performs centering on the marker's center frequency. If the selected marker is already on and between the start and stop frequencies of the instrument, the instrument performs the preselector calibration on that marker's frequency. If the selected marker is already on, but outside the frequency range between Start Freq and Stop Freq, the instrument first performs a peak search, and then performs centering on the marker's center frequency.

The value displayed on "Preselector Adjust" on page 1869 will change to reflect the new preselector tuning.

A number of considerations should be observed to ensure proper operation. See "Proper Preselector Operation" on page 493.

Remote Command	`[:SENSe]:POWer[:RF]:PCENter`
Example	`:POW:PCEN`
Notes	Note that the rules outlined above under the control description apply for the remote command as well as the key. The result of the command is dependent on marker position, etc. Any message shown by the control press is also shown in response to the remote command
Dependencies	Does not appear in CXA-m Does not appear in VXT Models M9410A/11A Grayed-out if the microwave preselector is off – If the selected marker's frequency is below Band 1, an advisory message is generated "Preselector not used in this frequency range" and no action is taken – Grayed-out if entirely in Band 0, that is, if Stop Freq is below about 3.6 GHz – Grayed-out if entirely above 50 GHz, that is, if Start Freq is above 50 GHz – Blank in models that do not include a preselector, such as option 503. If the remote command is sent in these instruments, it is accepted without error, and the query always returns 0 – Grayed-out in the Spectrogram View
Couplings	The active marker position determines where the centering will be attempted If the instrument is in a measurement such as averaging when centering is initiated, the act of centering the preselector restarts averaging, but the first average trace will not be taken until the centering is completed The offset applied to do the centering reads out on the "Preselector Adjust" on page 1869 control
Status Bits/OPC dependencies	When centering the preselector, `*OPC` will not return true until the process is complete and a subsequent measurement has completed, nor will results be returned to `:READ` or `:MEASure` queries The Measuring bit should remain set while this command is operating and should not go false until the subsequent sweep/measurement has completed

Proper Preselector Operation

A number of considerations should be observed to ensure proper operation:

1 If the selected marker is off, the instrument turns on a marker, performs a peak search, and adjusts the preselector using the selected marker's frequency. It uses the "highest peak" peak search method unqualified by threshold or excursion, so that there is no chance of a 'no peak found' error. It continues with that peak, even if it is the peak of just noise. Therefore, for this operation to work properly, there should be a signal on screen in a preselected range for the peak search to find

2 If the selected marker is already on, the instrument attempts the centering at that marker's frequency. There is no preselector for signals below about 3.6 GHz, so if the marker is on a signal below 3.6 GHz, no centering will be attempted and an advisory message generated

3 In some models, the preselector can be bypassed. If it is bypassed, no centering will be attempted in that range and a message will be generated

Preselector Adjust

Allows you to manually adjust the preselector filter frequency to optimize its response to the signal of interest. This function is only available when "Presel Center" on page 1868is available.

For general purpose signal analysis, using **Presel Center** is recommended. Centering the filter minimizes the impact of long-term preselector drift. **Preselector Adjust** can be used instead to manually optimize the preselector. One application of manual optimization would be to peak the preselector response, which both optimizes the signal-to-noise ratio and minimizes amplitude variations due to small (short-term) preselector drifting.

When **Presel Center** is performed, the offset applied to do the centering becomes the new value of **Preselector Adjust**.

Remote Command	`[:SENSe]:POWer[:RF]:PADJust <freq>` `[:SENSe]:POWer[:RF]:PADJust?`
Example	`:POW:PADJ 100KHz` `:POW:PADJ?`
Notes	The value on the control reads out to 0.1 MHz resolution
Dependencies	– Does not appear in CXA-m – Does not appear in VXT Models M9410A/11A – Grayed-out if microwave preselector is off – Grayed-out if entirely in Band 0, that is, if Stop Freq is below about 3.6 GHz – Grayed-out if entirely above 50 GHz, that is, if Start Freq is above 50 GHz – Blank in models that do not include a preselector, such as option 503. If the SCPI is sent in these instruments, it is accepted without error, and the query always returns 0 – Grayed-out in the Spectrogram View
Preset	0 MHz
State Saved	The **Preselector Adjust** value set by "Presel Center" on page 1868, or by manually adjusting **Preselector Adjust** It is not saved in instrument state, and does not survive a Preset or power cycle
Min	-500 MHz
Max	500 MHz
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:MW:PADJust` `[:SENSe]:POWer[:RF]:MMW:PADJust`

Notes	PSA had multiple preselectors, and you could select which preselector to adjust. Since the X-Series has only one mm/uW preselector, the preselector selection control is no longer available. However, to provide backward compatibility, we accept the legacy remote commands The command form has no effect, the query always returns `MWAVe`
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:PADJust:PRESelector MWAVe | MMWave | EXTernal` `[:SENSe]:POWer[:RF]:PADJust:PRESelector?`

Internal Preamp

Accesses a menu of controls for the internal preamps. Turning on the preamp gives a better noise figure, but a poorer inter-modulation distortion (TOI) to noise floor dynamic range. You can optimize this setting for your particular measurement.

The instrument takes the preamp gain into account as it sweeps. If you sweep outside of the range of the preamp, the instrument will also account for that. The displayed result always reflects the correct gain.

For some measurements, when the preamp is on and any part of the displayed frequency range is below the lowest frequency for which the preamp has specifications, a warning condition message appears in the status line. For example, for a preamp with a 9 kHz lowest specified frequency: "Preamp: Accy unspec'd below 9 kHz".

Selection	Example	Note
Off	`:POW:GAIN OFF`	
Low Band	`:POW:GAIN ON` `:POW:GAIN:BAND LOW`	Sets the internal preamp to use only the low band. The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Low Band selection in the dropdown
Full Range	`:POW:GAIN ON` `:POW:GAIN:BAND FULL`	Sets the internal preamp to use its full range. The low band (0-3.6 GHz, 0-3.4 GHz, 0-3GHz, depending on the model) is supplied by the low band preamp and the frequencies above low band are supplied by the high band preamp The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Full Range selection in the dropdown. If the high band option is not installed the Full Range selection does not appear

Remote Command	`[:SENSe]:POWer[:RF]:GAIN:BAND LOW | FULL` `[:SENSe]:POWer[:RF]:GAIN:BAND?`

	[:SENSe]:POWer[:RF]:GAIN[:STATe] OFF | ON | 0 | 1 [:SENSe]:POWer[:RF]:GAIN[:STATe]?
Example	:POW:GAIN:BAND LOW :POW:GAIN:BAND? :POW:GAIN OFF :POW:GAIN?
Dependencies	Preamp is not available on all hardware platforms. If the preamp is not present or is unlicensed, the control is not shown Does not appear in VXT Models M9410A/11A/15A If :POW:GAIN:BAND FULL is sent when a low band preamp is available, the preamp band parameter is set to LOW instead of FULL, and an "Option not installed" message is generated The preamp is not available when the electronic/soft attenuator is enabled
Preset	LOW OFF
State Saved	Saved in instrument state
Annotation	When the USB Preamp is not connected to USB, the Preamp annotation in the Meas Bar says “Off” if the preamp is off and displays the frequency range of the low band or full range preamp depending on the setting. For example, if the Preamp is set to Low Band and the Low Band is 3.6 GHz the annotation says “3.6 GHz”. If it is a 13.6 GHz preamp and it is set to Full Range the annotation says “13.6 GHz” When the USB Preamp is connected to USB, the Preamp annotation says “Preamp: USB” if the internal preamp is off or “Preamp: USB, Int” if the internal preamp is on (only for measurements that support the USB preamp)

LNA

Lets you turn the Low Noise Amplifier (**LNA**) on or off.

The LNA is an additional preamplifier that provides superior DANL and frequency range compared to the Internal Preamp. The LNA provides lower system noise figure, especially at frequencies above 100 MHz, and can be operated up to the full range of 50 GHz instruments.

For best possible sensitivity, the LNA can be turned on together with the "Internal Preamp" on page 1870, although if you operate both preamps together, note that the TOI (distortion) specifications are impacted. The sensitivity improvement of this combination is substantial when operating in high band (frequencies above 3.6 GHz).

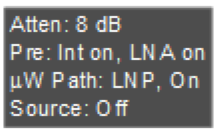
See "More Information" on page 497

Remote Command	[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe] OFF | ON | 0 | 1 [:SENSe]:POWer[:RF]:GAIN:LNA[:STATe]?
Example	:POW:GAIN:LNA ON

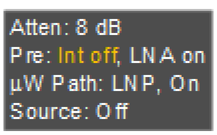
Dependencies	Requires option LNA Option LNA is not required by VXT model M9415A Does not appear in VXT models M9420A/21A/10A/11A May not appear in some measurements
Preset	OFF
State Saved	Saved in State

More Information

When the LNA is installed, the preamp annotation changes to show the state of both the LNA and the Internal Preamp. Below is an example:



Note that when operating entirely in the low band (below about 3.6 GHz), if the LNA is on, the Internal Preamp is switched off (even if you have its switch set to ON). This is because the noise performance is actually degraded in low band if both preamps are on. In this case, the annotation reflects the actual state of the two preamps, but the Internal Preamp annotation displays in amber, to warn you that the actual state of the Internal Preamp does not match the **Internal Preamp** switch control display:



µW Path Control

Options for this control include **µW Preselector Bypass** (Option MPB), **Low Noise Path** (Option LNP) and **Full Bypass Enable** in the High Band path circuits.

When the µW Preselector is bypassed, flatness is improved, but will be subject to spurs from out of band interfering signals. When **Low Noise Path Enable** is selected, the instrument automatically bypasses certain circuitry in the high frequency bands that can contribute to noise, when it is appropriate based on other instrument settings.

For most applications, the preset state is **Standard Path**, which provides the best remote-control throughput, minimizes acoustic noise from switching and minimizes the risk of wear in the hardware switches, particularly in remote test scenarios where both low band and high band setups will follow in rapid succession. In this path, the bypass of the low band/high band switch and microwave preamp is never activated, which can cause some noise degradation but preserves the life of the bypass switch.

For applications that utilize the wideband IF paths, the preset state is **µW Preselector Bypass**, if option MPB is present. This is because, when using a wideband IF such as the 140 MHz IF, the µW Preselector's bandwidth can be narrower than the available IF bandwidth, causing degraded amplitude flatness and phase linearity, so it is desirable to bypass the preselector in the default case.

You may choose **Low Noise Path Enable** for a lower noise floor, especially in the 21-26.5 GHz region, though without improving many measures of dynamic range, and without giving the best possible noise floor. The preamp, if purchased and used, gives better noise floor than does **Low Noise Path Enable**, but the preamp's compression threshold and third-order intercept are much poorer than that of **Low Noise Path Enable**.

A fourth choice is **Full Bypass Enable**, which combines **µW Preselector Bypass** and **Low Noise Path Enable**. Because this can bypass most of the circuitry between the input and the first mixer, care should be taken when using this setting to avoid damaging the mixer. **Full Bypass Enable** is only available if both options LNP and MPB are present, as well as option FBP.

Path	Example	Note
Standard Path	:POW:MW:PATH STD	Normal setting for most measurements. µW Preselector in circuit, Low Noise Path disabled
Low Noise Path Enable	:POW:MW:PATH LNP	See "Low Noise Path Enable" on page 502
µW Preselector Bypass	:POW:MW:PATH MPB	See "µW Preselector Bypass" on page 504
Full Bypass Enable	:POW:MW:PATH FULL	See "Full Bypass Enable" on page 504

Remote Command	[:SENSe]:POWer[:RF]:MW:PATH STD | LNPath | MPBypass | FULL [:SENSe]:POWer[:RF]:MW:PATH?
Example	:POW:MW:PATH LNP Enables the Low Noise path :POW:MW:PATH?
Notes	If "Presel Center" on page 1868 is performed, the instrument will momentarily switch to the Standard Path, regardless of the setting of **µW Path Control** The DC Block will always be switched in when the low noise path is switched in, to protect succeeding circuitry from DC. Note that this does not mean "when the low noise path is enabled" but when, based on the Low Noise Path rules, the path is actually switched in. This can happen when the selection is **Low Noise Path Enable** or **Full Bypass Enable**. In the case where the DC Block is switched in the instrument is now AC coupled. However, if you selected DC coupling, the UI would still behave as though it were DC coupled, including all annunciation, warnings, status bits, and responses to SCPI queries. This is because, based on other settings, the instrument could switch out the low noise path at any time and hence go back to being DC coupled Alignment switching ignores the settings in this menu, and restores them when finished
Dependencies	Does not appear in CXA-m

	Does not appear in VXT Models M9410A/11A Does not appear in BBIQ and External Mixing The **Low Noise Path Enable** selection does not appear unless Option LNP is present and licensed The **µW Preselector Bypass** selection does not appear unless Option MPB is present and licensed The **Full Bypass Enable** selection does not appear unless options LNP and MPB are both present as well as option FBP In any of these cases, if the required options are not present and the SCPI command is sent, error -241, "Hardware missing; Option not installed" is generated **Low Noise Path Enable** and **Full Bypass Enable** are grayed-out if the current measurement does not support them **Low Noise Path Enable** and **Full Bypass Enable** are not supported in Avionics and MMR Modes. In any of these cases (that is, the feature is not supported in either measurement or mode), if the SCPI command is sent, the following error is generated: -221, “Setting Conflict; Feature not supported for this measurement”

Annotation	In the Meas Bar, if the Standard path is chosen, it says: µW Path: Standard If Low Noise Path is enabled but the LNP switch is not thrown, it shows: µW Path: LNP,Off If the Low Noise Path is enabled and the LNP switch IS thrown, it shows: µW Path: LNP,On If the preselctor is bypassed, it says: µW Path: Bypass If Full Bypass Enable is selected but the LNP switch is not thrown, it shows: µW Path: FByp,Off If Full Bypass Enable is selected and the LNP switch IS thrown, it shows: µW Path: FByp,On

µW Path Control Auto [Mode: VMA, WLAN, NR5G, CQM]

In VMA, WLAN, 5G NR, CQM modes, an Auto/Man switch is added to **µW Path Control**:

This allows the function to automatically switch based on certain Auto Rules as shown below:

VMA Mode

Measurement	When µW Path Control is in Auto:
Digital Demod	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Monitor Spectrum	Always Presel Bypass
IQ Waveform	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Custom OFDM	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Channel Power	Always Presel Bypass
Occupied BW	Always Presel Bypass
CCDF	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
ACP	Always Presel Bypass
SEM	Always Presel Bypass
Spurious Emissions	Always Standard Path

WLAN Mode

Measurement	When µW Path Control is in Auto:
Modulation Analysis	Always Presel Bypass
Spectral Flatness	Always Presel Bypasss
Power vs Time	Always Presel Bypass
Monitor Spectrum	Always Presel Bypass
IQ Waveform	Always Presel Bypass
Channel Power	Always Presel Bypass
Occupied BW	Always Presel Bypass
CCDF	Always Presel Bypass
SEM	1. For 11be 320M, when 'Enabled Wideband IF for FFT' is OFF or 'Sweep Type Rule' is Best Dynamic Range, auto µW path is standard. 2. For other cases, auto µW path is presel bypass if presel bypass is enabled,

Measurement	When µW Path Control is in Auto:
	auto µW path is standard if presel bypass is not enabled.
Spurious Emissions	Always Standard Path

5G NR Mode

Measurement	When µW Path Control is in Auto:
Modulation Analysis	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Full Bypass if conditions warrant(FBP Option is available and “Allow Full Bypass in Auto” is On), otherwise choose Preselector Bypass
Monitor Spectrum	Always Standard Path
IQ Waveform	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Full Bypass if conditions warrant(FBP Option is available and “Allow Full Bypass in Auto” is On), otherwise choose Preselector Bypass
Channel Power	Always Standard Path
Occupied BW	Always Standard Path
CCDF	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
ACP	Always Standard Path
SEM	Always Standard Path
Spurious Emissions	Always Standard Path
Transmit On|Off Power	Use Standard Path unless tuned frequency > 3.6 GHz and Info BW > 15 MHz, in which case choose Preselector Bypass

Channel Quality Mode

Measurement	When µW Path Control is in Auto:
Group Delay	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Full Bypass if conditions warrant(FBP Option is available and “Allow Full Bypass in Auto” is On), otherwise choose Preselector Bypass
Monitor Spectrum	Always Standard Path
IQ Waveform	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
CCDF	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass

Remote Command	`[:SENSe]:POWer[:RF]:MW:PATH:AUTO ON | OFF | 1 | 0` `[:SENSe]:POWer[:RF]:MW:PATH:AUTO?`
Example	`:POW:MW:PATH:AUTO ON` `:POW:MW:PATH:AUTO?`

Dependencies	Only appears in VMA, WLAN, 5G NR and CQM modes
Couplings	See the tables above
Preset	ON
Range	ON|OFF

Low Noise Path Enable

You may select **Low Noise Path Enable**, which gives a lower noise floor under some circumstances, particularly when operating in the 21-26.5 GHz region. With the Low Noise Path enabled, the low band/high band switch and microwave preamp are bypassed whenever all of the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz
- the internal preamp is not installed or (if installed) is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Low Noise Path Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the **Low Noise Path Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Low Noise Path Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

For measurements that use IQ acquisition, the low noise path is used when **Center Frequency** is in High Band (> 3.6 GHz) and no preamp is in use. In other words, the rules above are modified to use only the center frequency to qualify which path to switch in. This is not the case for FFTs in the Swept SA measurement; they use the same rules as swept measurements.

Note that the Low Noise Path, while giving improved DANL, has the disadvantage of decreased TOI performance and decreased gain compression performance relative to the standard path.

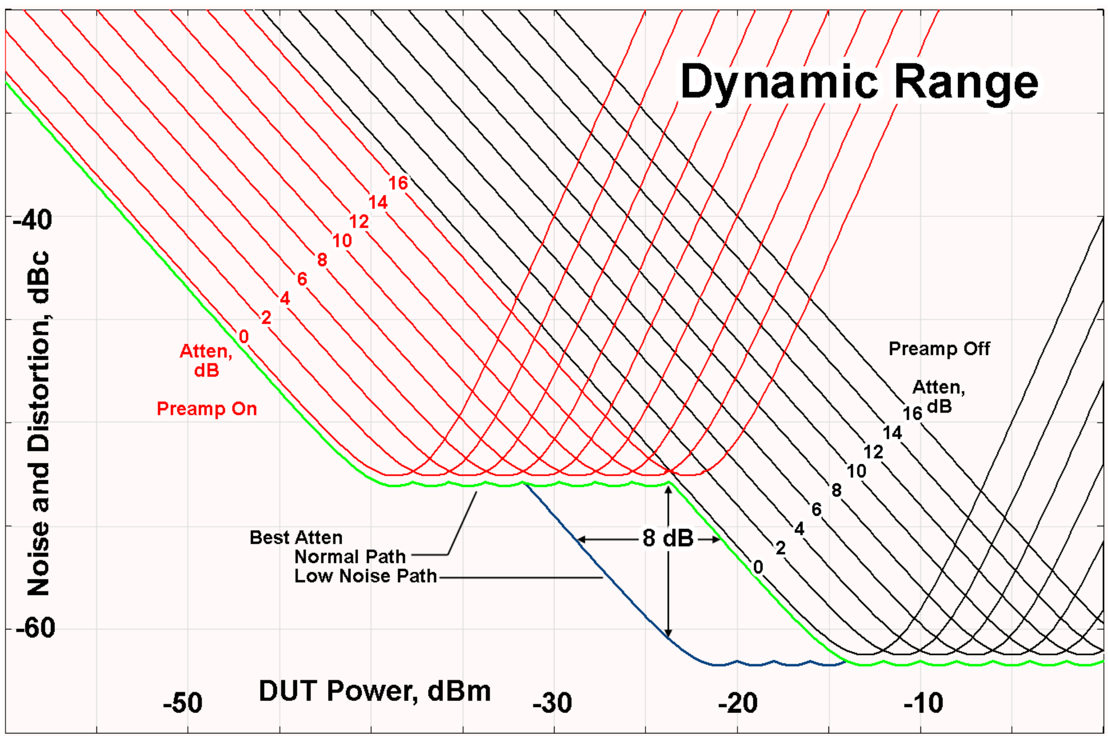
Note also that the bypass switch is a mechanical switch and has finite life, so if the **Low Noise Path Enable** is selected, it is possible to cause frequent cycling of this switch by frequently changing instrument settings such that the above conditions hold true only some of the time. A user making tests of this nature should consider opting for the **Standard Path**, which will never throw the bypass switch, at the expense of some degraded noise performance.

The low noise path is useful for situations where the signal level is so low that the instrument performance is dominated by noise even with 0 dB attenuation, but still high enough that the preamp option would have excessive third-order intermodulation or compression. The preamp, if purchased and used, gives better

noise floor than does the “Low Noise Path.” However, its compression threshold and third-order intercept are much poorer than that of the non-preamp path.

There are some applications, typically for signals around –30 dBm, for which the third-order dynamic range of the standard path is good enough, but the noise floor is not low enough even with 0 dB input attenuation. When the third-order dynamic range of the preamp path is too little and the noise floor of the standard path is too high, the Low Noise Path can provide the best dynamic range

The graph below illustrates the concept. It shows, in red, the performance of an instrument at different attenuation settings, both with the preamp on and off, in a measurement that is affected by both instrument noise and instrument TOI. The green shows the best available dynamic range, offset by 0.5 dB for clarity. The blue shows how the best available dynamic range improves for moderate signal levels with the low noise path switched in. In this illustration, the preamp improves the noise floor by 15 dB while degrading the third-order intercept by 30 dB, and the low noise path reduces loss by 8 dB. The attenuator step size is 2 dB.



There are other times where selecting the low noise path improves performance, too. Compression-limited measurements such as finding the nulls in a pulsed-RF spectrum can profit from the low noise path in a way similar to the TOI-limited measurement illustrated. Accuracy can be improved when the low noise path allows the optimum attenuation to increase from a small amount like 0, 2 or 4 dB to a larger amount, giving better return loss at the instrument input. Harmonic measurements, such as second and third harmonic levels, are much improved using the low noise path because of the superiority of that path for harmonic (though not intermodulation) distortion performance.

µW Preselector Bypass

Toggles the preselector bypass switch for band 1 and higher. When the microwave presel is on, the signal path is preselected. When the microwave preselector is off, the signal path is not preselected. The preselected path is the normal path for the instrument.

The preselector is a tunable bandpass filter which prevents signals away from the frequency of interest from combining in the mixer to generate in-band spurious signals (images). The consequences of using a preselector filter are its limited bandwidth, the amplitude and phase ripple in its passband, and any amplitude and phase instability due to center frequency drift.

Option MPB or pre-selector bypass provides an unpreselected input mixer path for certain X-Series signal analyzers with frequency ranges above 3.6 GHz. This signal path allows a wider bandwidth and less amplitude variability, which is an advantage when doing modulation analysis and broadband signal analysis. The disadvantage is that, without the preselector, image signals will be displayed. Another disadvantage of bypassing the preselector is increased LO emission levels at the front panel input port.

Image responses are separated from the real signal by twice the 1st IF. For IF Paths of 10 MHz and 25 MHz, the 1st IF is 322.5 MHz, so the image response and the real signal will be separated by 645 MHz. The 1st IF will be different for other IF Path settings. When viewing a real signal and its corresponding image response in internal mixing, the image response will be to the left of the real signal.

Also, the image response and the real signal typically have the same amplitude and exhibit the same shape factor.

However, if Option FS1, Fast Sweep Capability, is enabled, the image response in the Swept SA measurement appears lower in amplitude and has a much wider shape factor compared to the real signal.

Full Bypass Enable

With **Full Bypass Enable** selected, the microwave preselector is bypassed. In addition, the low band/high band switch and microwave preamp are bypassed whenever all of the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz.
- the internal preamp is not installed or (if installed) is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. The only time the Low

Noise Path is used is when **Full Bypass Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

CAUTION

When **Full Bypass Enable** is selected, and "Attenuation" on page 1747 is set to 0 dB, there will be a direct AC connection between the input and the first converter when the Low Noise Path switches in (when Start Freq >3.6 GHz and the Preamp is either not licensed, set to Low Band, or Off). This puts the first converter at high risk to be damaged by high AC power. Consequently, whenever **Full Bypass Enable** is selected, a warning message appears in the status bar:

Full Bypass Enabled, maximum safe input power reduced

Microwave Preselector Bypass Backwards Compatibility

Example	`:POW:MW:PRES OFF` Bypasses the microwave preselector
Notes	Included for Microwave Preselector Bypass backwards compatibility The `ON` parameter sets the `STD` path (`:POW:MW:PATH STD`) The `OFF` parameter sets path `MPB` (`:POW:MW:PATH MPB`)
Preset	`ON`
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe] ON | OFF | 0 | 1` `[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe]?`

Frequency Extender Preselection Bypass

Frequency Extender Preselection Bypass only applies to the high frequency path of the Frequency Extender and only if the Frequency Extender allows it. For example, the V3050A high frequency path is 50 – 110 GHz and does allow control of the preselector bypass.

When the Frequency Extender's preselection is bypassed, flatness is improved, but will be subject to spurs from out of band interfering signals. For bandwidths greater than 2.5 [GHz], it is recommended that the signal bypass the Frequency Extender Preselector since the max bandwidth of the Preselector can be as narrow as 2.5 [GHz].

For most applications, the preset state is `OFF`, which gives the best remote-control throughput, minimizes acoustic noise from switching, minimizes out of band spurs, and minimizes the risk of wear in the hardware switches.

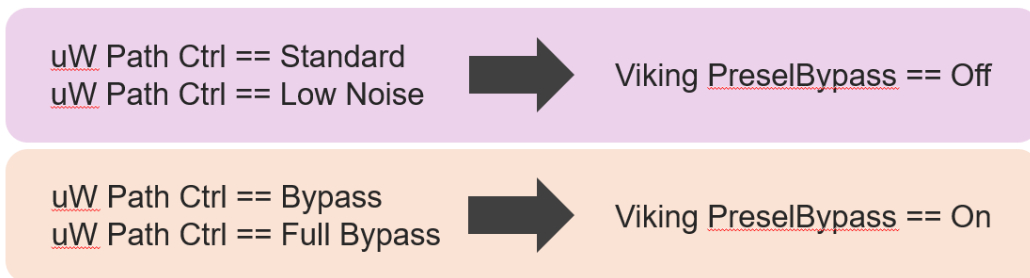
Coupling with Microwave Preselector Control

The control of whether to apply or bypass the Frequency Extender's preselection is dependent on the Microwave Path Control setting.

The coupling between the Microwave Path Control and Frequency Extender Preselector Bypass is described below.

UW PATH CTRL	UW PRESELECTOR	VIKING PRESELECTOR
Standard Path	On	**On**
Low Noise Path Enable	On	**On**
uW Presel Bypass	Off	**Off**
Full Bypass Enable	Off	**Off**

In other words…



For the Frequency Extender Preselector Bypass to take effect, it requires a Frequency Extender device (such as V3050A) be connected and External RF (ERFIN) selected as the input.

The Frequency Extender Preselector is applied or bypassed depending on the Microwave Path Control setting only when the acquisition is above 50 [GHz]. Hence, it will be bypassed only when the acquisition is above 50 [GHz].

Preselector and Bandwidth Conflict

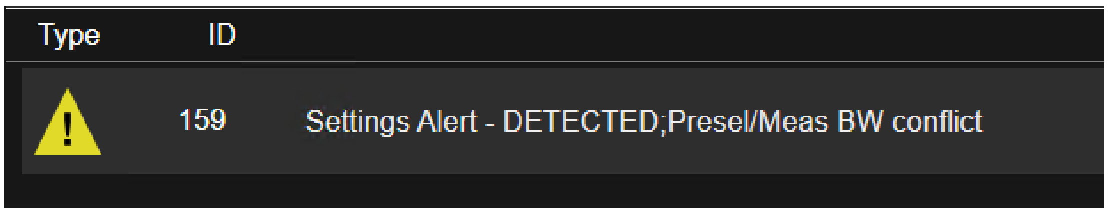
When the Frequency Extender Preselector is applied and the signal bandwidth is greater than 2.5 [GHz], then a settings alert message will show to warn the user that the signal may be distorted due to the limitation of the Frequency Extender Preselector bandwidth.

An example of the settings alert message is shown below.

Settings Alert message in the Status Bar at the bottom of the display.

Settings Alert message in the error queue

.



Software Preselection

Software Preselection is provided in some instruments, either to compensate for issues with provided hardware preselection or to provide the preselection function when there is no hardware preselector.

N9041B

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

In the N9041B, Software Preselection only applies for frequencies above 50 GHz, therefore it is only used for RF Input 2. Even if it is turned on, it will not be used for other inputs and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that in the N9041B, in Swept SA, Software Preselection will work even if the measurement is using an FFT sweep type. In measurements other than Swept SA, Software Preselection will not be used if the measurement is using an FFT sweep type.

N9042B+V3050A

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 88 GHz, software preselection must be used to suppress and separate images above 88 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

For N9042B+V3050A, Software Preselection only applies for frequencies above 88 GHz, therefore it is only used for External RF. Even if it is turned on, it will not be used for other inputs and never for frequencies below 88 GHz. This is why the label of this control contains the parenthetical note “(>~88 GHz)”.

Note that for N9042B+V3050A, in Swept SA, Software Preselection will work even if the measurement is using an FFT sweep type. In measurements other than Swept SA, Software Preselection will not be used if the measurement is using an FFT sweep type.

VXT models M9410A/11A

Software Preselection is used to provide the preselection function, as there is no hardware preselector in these models. Two background traces are taken and compared point by point, and the point with the lowest amplitude from the two traces is used. This provides a method to reduce spurs that are internally generated within the VXT, but the user should note the following when using Software Preselection:

- There is some speed cost due to the need to take multiple captures
- Taking the point with the lowest amplitude in each trace will make the average noise level lower at all points that do not have a spur. This can reduce the accuracy of the measurement of noise and noise-like signals.

Because of the difficulty in identifying spurs manually, you are encouraged to leave Software Preselection ON at all times in VXT models M9410A/11A. If you turn it off in order to speed up your measurement or improve noise accuracy, be aware of unwanted onscreen spurs.

Remote Command	`[:SENSe]:POWer[:RF]:SWPResel:STATe 0 | 1 | ON | OFF` `[:SENSe]:POWer[:RF]:SWPresel:STAT?`
Example	`:POW:SWPR:STAT 1` `:POW:SWPR:STAT?`
Dependencies	Only appears in N9041B, N9042B+V2050A, and VXT models M9410A/11A. Does not appear in all measurements
Couplings	Sweep Time is affected by SW Preselection. Also Auto Tune supports SW Preselection, so set SW Preselection state and then do Auto Tune
Preset	N9041B: OFF N9042B+V3050A: ON M9410A/11A: ON
State Saved	Saved in instrument state

SW Preselection Type

Specifies the algorithm used for software preselection.

Two hidden sweeps are taken in succession. The second sweep is offset in LO frequency by 2*IF/N. For each point in each trace, the smaller amplitude from the two traces is taken and placed in that point in the selected trace. The Peak detector is auto-selected to improve the image suppression effectiveness. Responses of each trace that lie on top of one another will remain and are valid signals. Other signals are images and are suppressed. The action of taking the smaller of the two traces will make the average noise level lower in all points that do not have an image, thus reducing the accuracy of the measurement of noise and noise-like signals.

– NORMal - mathematically removes all image and multiple responses of signals present at the input

– ADVanced - any trace processing (such as “max hold” or trace averaging) is performed on the points of both candidate traces before the “select minimum” operation occurs. This form of processing works better for non-stationary signals, such as pulsed-RF signals

Remote Command	[:SENSe]:POWer[:RF]:SWPResel NORMal | ADVanced [:SENSe]:POWer[:RF]:SWPResel?
Example	:POW:SWPR NORM :POW:SWPR?
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method When "Software Preselection" on page 1883 is Disabled, this control is grayed-out. Its grayout message is “Unavailable unless SW Presel enabled”
Preset	N9041B: ADVanced N9042B+V3050A: NORMal
State Saved	Saved in instrument state

SW Preselection BW

Specifies the effective bandwidth to be used for Software Preselection.

The choices are:

– NORMal – when making Swept measurements, a software preselection algorithm is used which takes up to 4 background acquisitions, then post-processes the result. This algorithm can remove images from signals with an occupied bandwidth up to around 3 GHz. (Default/Preset setting). When making FFT measurements, this algorithm is not used, instead the same algorithm is used as for NARRow (below)

– NARRow– a software preselection algorithm is used which takes two background acquisitions, then post-processes the result to detect and remove images from wideband signals with occupied bandwidths up to 2 GHz. This increases the risk of images failing to be rejected, but improves the measurement speed

Remote Command	[:SENSe]:POWer[:RF]:SWPResel:BW NORMal | NARRow [:SENSe]:POWer[:RF]:SWPResel:BW?
Example	:POW:SWPR:BW NARR
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method When "Software Preselection" on page 1883 is Disabled, this control is grayed out. Its grayout message is “Unavailable unless SW Presel enabled” For N9042B+V3050A the parameter is SCPI only and always set to NARRow when Software

	Preselection is enabled
Preset	N9041B: NORMal N9042B+V3050A: NARRow
State Saved	Saved in instrument state

High Freq Prefilter

Lets you set the state of Prefilter for Center Frequencies above 1310 MHz.

In VXT Models M9410A/11A, the Receiver RF path has a bank of filters that come after the RF Attenuator in the signal path. Since this bank of filters precedes the mixer they are known as the “Prefilter” bank. Their purpose is to eliminate unwanted in-band mixing products by filtering out all but the desired frequencies before the signals get to the mixer. There are 13 prefilter bands to cover the frequencies between 9 kHz and 6000 MHz. The Prefilter provides the necessary rejection of the unwanted signal.

Remote Command	`[:SENSe]:<measurement>:PFILter[:STATe] ON | OFF | 1 | 0` `[:SENSe]:<measurement>:PFILter[:STATe]?`

Example	For example, to enable High Freq Prefilter in IQ Analyzer Mode:
	For the Complex Spectrum Measurement:
	`:SPEC:PFIL ON`
	For the IQ Waveform Measurement:
	`:WAV:PFIL ON`
	`:`

Dependencies	This control only appears in VXT models M9410A/11A with center frequency above 1310 MHz
Preset	See “Prefilter Presets” below
State Saved	Saved in instrument state

3.4.4 BW

BW is not supported in the WCDMA Code Domain Measurement.

3.4.5 Display

The Display Menu lets you configure display items for the current Mode, Measurement View or Window.

3.4.5.1 Meas Display

The Meas Display tab contains controls for setting up the display for the current Measurement, View or Window.

Composite Symbol Boundary

Turns the composite code channel display function on or off.

The Composite Symbol Boundary for Power Bar Graph and CDE Graph functions are coupled to each other.

Remote Command	`:CALCulate:CDPower:SBOundary:COMPosite OFF | ON | 0 | 1` `:CALCulate:CDPower:SBOundary:COMPosite?`
Example	`:CALC:CDP:SBO:COMP ON` `:CALC:CDP:SBO:COMP?`

Notes	Only valid for CDPower Bar Graph window and CDE Graph window
Dependencies	This command is effective only when the [:SENSe]:CDPOwer:CAPTure:TIME (Capture Interval) is set to 0.067, 1.0, 2.0 and 3.0
Couplings	Setting this parameter to off activates the Symbol Rate control
Preset	ON
State Saved	Yes
Range	OFF|ON

Symbol Rate

Sets the display symbol rate to read the total power level of the combined code channels defined by the :CALCulate:CDPower:SRATe command.

The functions of Display Symbol Rate for Power Bar Graph and CDE Graph are coupled to each other.

Remote Command	:CALCulate:CDPower:SBOundary:SRATe <integer> :CALCulate:CDPower:SBOundary:SRATe?
Example	:CALC:CDP:SBO:SRAT 30000 :CALC:CDP:SBO:SRAT?
Notes	Only valid for CDP Bar Graph window and CDE Graph window 192000 choice for MS is available only when HSPA is enabled
Dependencies	This control is unavailable when Composite is On
Couplings	The functions of Display Symbol Rate for Power Bar Graph and CDE Graph are coupled to each other
Preset	15000
State Saved	Yes
Range	7500|15000|30000|60000|120000|240000|480000|960000 for BTS 15000|30000|60000|120000|240000|480000|960000|1920000 for MS

Composite Chip Pwr

Toggles the composite chip power display function between On and Off.

Remote Command	:DISPlay:CDPower:CPOWer[:STATe] 0 | 1 | OFF | ON :DISPlay:CDPower:CPOWer[:STATe]?
Example	:DISP:CDP:CPOW ON :DISP:CDP:CPOW?
Notes	Only valid for Symbol/Chip Power vs. Time window
Dependencies	This control is grayed out when Capture Intvl is set to Long Mode

Preset	ON
State Saved	Yes
Range	OFF|ON

Demod Bits Format (BTS only)

This control is displayed and active if Radio Device is BTS and Demod Bits window is selected.

- Binary: Demodulated bits are displayed in binary format
- Hex: Demodulated bits are displayed in hexadecimal format

The Demod Bits view changes as the above settings change.

This functionality works only when all the following conditions are met:

1. Radio Device is BTS
2. the Symbol Rate is 240 ksps
3. the modulation scheme on the result metrics window is 16QAM

For QPSK channels, this setting has no effect and the channels are always displayed in binary format.

(1) Binary format

In this format, each symbol appears in a column consisting of 4 index bits:

Sample:

Downlink HS-PDSCH: tDPCH(unknown:0)

```
I1:   1   1   0   0   1   1   0   0   1   1
Q1:   0   0   0   0   0   0   0   0   1   1
I2:   1   0   0   1   1   0   0   1   1   0
Q2:   1   1   1   1   0   0   0   0   0   0
```

(2) Hexadecimal format

In this format, each symbol is shown as a hexadecimal digit.

Sample (using the same data as for the above binary format case):

Downlink HS-PDSCH : tDPCH(unknown:0)

```
0x:   B   9   1   3   A   8   0   2   E   C
```

Remote Command	:DISPlay:CDPower:TEXT:BFORmat BINary | HEX :DISPlay:CDPower:TEXT:BFORmat?

Example	`:DISP:CDP:TEXT:BFOR BIN` `:DISP:CDP:TEXT:BFOR?`
Preset	`BINary`
State Saved	Yes
Range	`BINary|HEX`

3.4.5.2 View

Contains controls for selecting the current **View**, and for editing User Views.

Views

The Code Domain Power measurement has five views as follows.

Some of these Views are multiple-window Views. When in a multiple window View, you select a window by touching it. The menu controls may sometimes change depending on which window is selected.

Whenever the View changes, the default menu is Frequency, unless otherwise specified in the View description.

View	Result
Power Graph & Metrics	Code Domain Power Graph
	CDP Metrics
CDP Graph & CDE Graph	Code Domain Power Graph
	Code Domain Error Graph
I/Q Error (Quad View)	Mag Error Graph
	Phase Error Graph
	EVM Graph
	Symbol Error Metrics
Code Domain (Quad View)	Code Domain Power Graph
	Symbol Power Graph
	I/Q Symbol Polar Vector Graph
	Symbol Error Metrics
Demod Bits	Code Domain Power Graph
	Symbol Power Graph
	Demod Bits

View Selection

Selects the desired measurement view from the selections listed in the table below. There are two available commands, allowing you to select the view using either the ID string or a numeric ID value. For more details of the commands, see:

– "View Selection by Name" on page 516

– "View Selection by Number" on page 516

In the following table:

– The Enumerated ID is used with the SCPI Command `:DISP:CDP:VIEW[:SEL]`

– The Numeric ID is used with the SCPI Command `:DISP:CDP:VIEW:NSEL`

Enumerated ID	Numeric ID	View Name & Details
PGRaph	1	Power Graph & Metrics Provides a combination view of the code domain power graph and the summary data Not available if the [:SENSe]:CDPower:CAPTure:TIME (Capture Interval) is 4.0 or 8.0 (Long Mode)
CDE	2	Power Graph & CDE Graph Provides a combination view of the code domain power graph and the code domain error Not available if the [:SENSe]:CDPower:CAPTure:TIME (Capture Interval) is 4.0 or 8.0 or 16.0 (Long Mode)
SEVM	3	I/Q Error (Quad View) Symbol EVM provides a combination view of magnitude error, phase error, Symbol EVM, and the summary data Not available if the [:SENSe]:CDPower:CAPTure:TIME (Capture Interval) is set to 4.0 or 8.0 (Long Mode)
QUAD	4	Code Domain (Quad View) Provides a combination view for the code domain power symbol power, I/Q symbol polar vector and the summary data Not available if the [:SENSe]:CDPower:CAPTure:TIME (Capture Interval) is set to 4.0 or 8.0 (Long Mode)
DBITs	5	Demod Bits Provides a combination view of the graphs for the code domain power and symbol power, and the I/Q demodulated bit stream data for the symbol power slots selected by the measurement interval and measurement offset
LDEMod	6	Long Demodulation Provides a combination view of the symbol power and demodulation bits stream data for the symbol power slots selected by the measurement interval and measurement offset though long capture (capture interval > 3 frames)

View Selection by Name

Remote Command	`:DISPlay:CDPower:VIEW[:SELect] PGRaph | CDE | SEVM | QUAD | DBITs | LDEMod` `:DISPlay:CDPower:VIEW[:SELect]?`
Example	`:DISP:CDP:VIEW PGR` `:DISP:CDP:VIEW?`
Preset	`PGRaph`
State Saved	Yes
Range	Power Graph & Metrics|CDP Graph & CDE Graph|I/Q Error (Quad View)|Code Domain (Quad View)|Demod Bits|Long Demod

View Selection by Number

Displays the numeric values of the measurement results.

For a complete list of Numeric ID values for use with this command, see "View Selection" on page 515 above.

Remote Command	`:DISPlay:CDPower:VIEW:NSELect <integer>` `:DISPlay:CDPower:VIEW:NSELect?`
Example	`:DISP:CDP:VIEW:NSEL 2` `:DISP:CDP:VIEW:NSEL?`
Preset	1
State Saved	Yes
Min/Max	1/6

Power Graph & Metrics

Windows: "Code Domain Power Graph" on page 461, "Metrics" on page 461

Dual window view of the graph and the metrics. The parameters displayed in these windows differ depending on the setting of Radio Device. When the parameter Capture Interval is set to Long Mode (4, 8 or 16 Frame), this view is not available, and only the "Demod Bits" on page 517 view is available.

Example	`:DISP:CDP:VIEW PGR`

CDP Graph & CDE Graph

Windows: "Code Domain Power Graph" on page 461, "Code Domain Error Graph" on page 464

Dual window view of the CDP graph and the CDE graph.

These two windows are coupled in terms of: X/Y Scaling, Composite Symbol Boundary, and Display Symbol Rate.

The parameters displayed in these windows differ depending on the setting of Radio Device. When the parameter Capture Interval is set to Long Mode (4, 8 or 16 Frame), this view is not available, and only the "Demod Bits" on page 517 view is available.

Example	`:DISP:CDP:VIEW CDE`

I/Q Error (Quad View)

Windows: "Magnitude Error Graph" on page 464, "Phase Error Graph" on page 464, "EVM Graph" on page 465, "Symbol Error Metrics" on page 465

Combination view of magnitude error, phase error, Symbol EVM, and the summary data using the above four windows.

The parameters displayed in these windows differ depending on the setting of Radio Device. When the parameter Capture Interval is set to Long Mode (4, 8 or 16 Frame), this view is not available, and only "Demod Bits" on page 517 view is available.

Example	`:DISP:CDP:VIEW SEVM`

Code Domain (Quad View)

Windows: "Code Domain Power Graph" on page 461, "Symbol Power Graph" on page 467, "I/Q Symbol Polar Graph" on page 468, "Symbol Error Metrics" on page 465

Combination view of the code domain power, symbol power, I/Q symbol polar vector and the summary data using the above 4 windows.

The parameters displayed in these windows differ depending on the setting of Radio Device. When the parameter Capture Interval is set to Long Mode (4, 8 or 16 Frame), this view is not available, and only "Demod Bits" on page 517 view is available.

Example	`:DISP:CDP:VIEW QUAD`

Demod Bits

Windows: "Code Domain Power Graph" on page 461, "Symbol Power Graph" on page 467, "Symbol Power Graph (Long Mode)" on page 467, "Demod Bits" on page 468

In this view, the number of windows that are displayed depends on the parameter setting of "Capture Interval" on page 557. See the following table for detailed settings of Capture Interval.

The parameters displayed in each window differ depending on the setting of Radio Device.

Capture Interval Setting	Number & Type of Windows
1 to 14 slots 1 to 3 frames	Three windows: – Power Bar Graph window (upper left) – Symbol/Chip Power vs. Time window (upper right) – Demod Bits text window (lower)
Long Mode (4, 8, 16 frames)	Two windows: – Symbol/Chip Power vs. Time window (upper) – Demod Bits text window (lower)

Example	`:DISP:CDP:VIEW DBIT` `:DISP:CDP:VIEW LDEM`

User View

Lets you choose a View from the saved User Views for the current measurement. This panel only appears if a User View exists for the current measurement.

Remote Command	`:DISPlay:VIEW:ADVanced:SELect <alphanumeric>` `:DISPlay:VIEW:ADVanced:SELect?`
Example	Select Baseband as the current View `:DISP:VIEW:ADV:SEL “Baseband”`

Notes	You must be in the measurement whose View you are trying to set to send the command. You can only set Views for the current measurement using this command
	For predefined views, the parameter is derived from the view name that is shown in the View list in the user interface. For example, if you are trying to select the Trace Zoom view in the Swept SA measurement, you send:
	`:DISP:VIEW:ADV:SEL "Trace Zoom"`
	because “Trace Zoom” is the name of the View as seen in the Mode/Meas dialog or in the Display, View menu
	You *cannot* use the legacy View parameter (which in this case would be `TZOom`) with `:DISP:VIEW:ADV:SEL`
	`<alphanumeric>` is case insensitive; you can specify mixed case, however the name will be evaluated on a single case. Thus, both of the following forms work:
	`:DISP:VIEW:ADV:SEL "Trace Zoom"`
	`:DISP:VIEW:ADV:SEL "TRACE ZOOM"`
	If the specified view is not a valid View, the query returns the error message “-224, Illegal parameter value; View with the name <alphanumeric> does not exist”
	If the display is disabled (via `:DISP:ENAB OFF`) then the error message “-221, Settings conflict; View

	SCPI cannot be used while Display is disabled" is generated
Backwards Compatibility SCPI	The legacy node `:DISPlay:VIEW[:SELect]` is retained for backwards compatibility, but it only supports predefined views

Restore Layout to Default

Restores the Layout to the default for Basic.

Modified Views are very temporary; if you exit the current measurement they are discarded, and they are not saved in State. To retain this View for later use, and to be able to return easily to your original Basic View, you can save your edited View as a "User View".

Save Layout as New View

Saves your new View as a User View. An alpha keyboard appears, which lets you name your new View; the default is the old View name plus a number.

Remote Command	`:DISPlay:VIEW:ADVanced:NAME <alphanumeric>`
Example	`:DISP:VIEW:ADV:NAME "Baseband"` Creates a new View named `Baseband` from the current View, and selects it as the current View
Notes	`<alphanumeric>` is case insensitive; you can specify mixed case, however the name will be evaluated on a single case If `<alphanumeric>` name already exists as a View, the error message "-224, Illegal parameter value; View <alphanumeric> already exists" is generated If the display is disabled (via `:DISP:ENAB OFF`) then the error message "-221, Settings conflict; User View SCPI cannot be used while Display is disabled" is generated

Re-Save User View

You can re-edit a User View; if you make changes, then an asterisk will appear next to the User View's name. You can then tap **Re-Save User View** to save it back to its existing name, or **Save Layout as New View** to add another, new User View.

This is a front panel function only, there is no remote command available to perform this function. To do this remotely, you must first perform **Save Layout as New View**, then delete the old User View and rename the new one with the name of the View you just deleted.

Rename User View

You can rename the current View by giving it a new unique name. Only User Views can be renamed, if the current View is a Predefined View, an error occurs.

Remote Command	`:DISPlay:VIEW:ADVanced:REName <alphanumeric>`
Example	`:DISP:VIEW:ADV:REN "Baseband"`
Notes	`<alphanumeric>` is case insensitive; you can specify mixed case, however the name will be evaluated on a single case If the `<alphanumeric>` specifying the new name is already present in the list of View names, the error message "-224, Illegal parameter value; View <alphanumeric> already exists" is generated If the current View is a Predefined View, the error message "-224, Illegal parameter value; Cannot rename a Predefined View" is generated If the display is disabled (via `:DISP:ENAB OFF`) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated

Delete User View

You can delete the current View if it is a User View. The default view becomes the current view for the Measurement.

Remote Command	`:DISPlay:VIEW:ADVanced:DELete`
Example	`:DISP:VIEW:ADV:DEL`
Notes	`<alphanumeric>` is case insensitive; you can specify mixed case, however the name will be evaluated on a single case If the `<alphanumeric>` is not present in the list of View names, the error message "-224, Illegal parameter value; View <alphanumeric> does not exist" is generated If the current View is a Predefined View, the error message "-224, Illegal parameter value; Cannot delete a Predefined View" is generated If the display is disabled (via `:DISP:ENAB OFF`) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated

Delete All User Views

Deletes all previously saved User Views. The default view becomes the current view for the Measurement if a User View was the current view when this command was executed.

Remote Command	`:DISPlay:VIEW:ADVanced:DELete:ALL`
Example	`:DISP:VIEW:ADV:DEL:ALL`
Notes	Disabled if there are no User Views

View Editor Remote Commands

The following remote commands help you manage Views and User Views. Note that the SCPI node for User Views handles both Predefined and User Views. The legacy nodes, `:DISPlay:VIEW[:SELect]` and `:DISPlay:VIEW:NSEL`, are retained for backwards compatibility, but they only support predefined views.

View Listing Query

Returns a string containing a comma-separated list of names for *all* the Views, including User Views, available for the current Measurement.

Remote Command	`:DISPlay:VIEW:ADVanced:CATalog?`
Example	`:DISP:VIEW:ADV:CAT?`
Notes	Returns a quoted string of the available Views for the current measurement, separated by commas. The list includes names for *all* the Views, including User Views, available for the current Measurement Example: `"Normal,Trace Zoom,Spectrogram,Baseband,myView1,yourView1"` No distinction is made between Predefined and User Views If you switch measurements with the display disabled (via `:DISP:ENAB OFF`), then query the list of available Views, the result is undefined

User View Listing Query

Returns a string containing a comma-separated list of names for *only* the User Views available for the current Measurement.

Remote Command	`:DISPlay:VIEW:ADVanced:USER:CATalog?`
Example	`:DISP:VIEW:ADV:USER:CAT?`
Notes	Returns a quoted string of the available User Views for the current measurement, separated by commas. Example: `"Baseband,myView1,yourView1"` If you switch measurements with the display disabled (see "Display Enable (Remote Command Only)" on page 1894), then query the list of available Views, the result is undefined

3.4.5.3 Annotation

Contains controls for setting up the annotation for the current Mode or Measurement.

Graticule

Turns the display graticule On or Off for all windows with graticules in all measurements in the current Mode. Also turns the graticule Y-Axis annotation on and off.

Remote Command	`:DISPlay:GRATicule[:STATe] OFF | ON | 0 | 1` `:DISPlay:GRATicule[:STATe]?`
Example	`:DISP:GRAT OFF`
Notes	The graticule is the set of horizontal and vertical lines that make up the grid/divisions for the X-Axis and Y-Axis
Preset	`ON`
State Saved	Saved in instrument state

Backwards Compatibility SCPI	`:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe] OFF | ON | 0 | 1`
	`:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe]?`
	This command is accepted for backwards compatibility with older instruments, but the `WINDow`, `TRACe` and `GRID` parameters are ignored

Screen Annotation

Controls the display of the annunciation and annotation around the graticule, including any annotation on lines (such as the display line, the threshold line, etc.) and the Y-Axis annotation, for all windows with screen annotation in all measurements in the current Mode.

This does *not* include marker annotation (or the N dB result). When `OFF`, the graticule expands to fill the entire graticule area, leaving only the 1.5% gap above the graticule, as described in the **Trace** section.

Remote Command	`:DISPlay:ANNotation:SCReen[:STATe] OFF | ON | 0 | 1` `:DISPlay:ANNotation:SCReen[:STATe]?`
Example	`:DISP:ANN:SCR OFF`
Dependencies	Grayed-out and forced to `OFF` when **System Display Settings**, **Annotation** is `OFF`
Preset	`ON` This remains `OFF` through a Preset when **System Display Settings**, **Annotation** is set to `OFF`
State Saved	Saved in instrument state

Trace Annotation

Turns on and off the labels on the traces, showing their detector (or their Math Mode) as described in the **Trace** section, for all windows in all measurements in the current

Mode for which Trace Annotation on/off is supported.

If Trace Math is being performed on a trace, then the Trace Math annotation replaces the detector annotation.

For measurements that support limit lines, this key also turns on and off the labels on the Limit Lines. The label is the Limit number annotation and Limit Comment displayed on the graph. If the length of the comment is greater than 20 characters, the first 8 characters and the last 8 characters are displayed, joined with ….

Remote Command	`:DISPlay:ANNotation:TRACe[:STATe] ON | OFF | 1 | 0` `:DISPlay:ANNotation:TRACe[:STATe]?`
Example	`:DISP:ANN:TRAC OFF`
Preset	`OFF`
State Saved	Saved in instrument state

Control Annotation

Turns on and off the display of values on the Active Function controls for all measurements in the current Mode. This is a security feature.

Remote Command	`:DISPlay:ACTivefunc[:STATe] ON | OFF | 1 | 0` `:DISPlay:ACTivefunc[:STATe]?`
Example	`:DISP:ACT OFF`
Dependencies	Grayed out and forced to `OFF` when **System Display Settings**, **Annotation** is `OFF`
Preset	`ON` This remains `OFF` through a Preset when **System Display Settings**, **Annotation** is set to `OFF`
State Saved	Saved in instrument state

Meas Bar

Turns the Measurement Bar at the top of the screen on and off for all measurements in the current Mode. When `OFF`, the graticule area expands to fill the area formerly occupied by the Measurement Bar.

Remote Command	`:DISPlay:ANNotation:MBAR[:STATe] OFF | ON | 0 | 1` `:DISPlay:ANNotation:MBAR[:STATe]?`
Example	`:DISP:ANN:MBAR OFF`
Dependencies	Grayed out and forced to `OFF` when **System Display Settings**, **Annotation** is `OFF`
Preset	`ON` This remains `OFF` through a Preset when **System Display Settings**, **Annotation** is set to `OFF`
State Saved	Saved in instrument state

Display Enable (Remote Command Only)

Turns the display on/off, including the display drive circuitry. The backlight stays lit to confirm that the instrument is on. The display enable setting is mode global. Theare three reasons for turning the display off:

1. To increase speed as much as possible by freeing the instrument from having to update the display
2. To reduce emissions from the display, drive circuitry
3. For security purposes

If you have turned off the display:

– and you are in local operation, the display can be turned back on by pressing any key or by sending `:SYSTem:DEFaults MISC` or `:DISPlay:ENABle ON` (neither `*RST` nor :SYSTem:PRESet enable the display)

– and you are in remote operation, the display can be turned back on by pressing the **Local** or **Esc** keys, or by sending `:SYSTem:DEFaults MISC` or `:DISPlay:ENABle ON` (neither `*RST` nor `:SYSTem:PRESet` enable the display)

– and you are using either the `:SYSTem:KLOCk` command or GPIB local lockout, then *no* front-panel key press will turn the display back on. You must turn it back on remotely.

If the display is `OFF`, many SCPI commands related to User Views and Multiscreen functionality do not work, and return the error messages "-221, Settings conflict; Screen SCPI cannot be used when Display is disabled" or "221, Settings conflict; View SCPI cannot be used while Display is disabled". These commands include:

Name	Command
Select User View	`:DISPlay:VIEW:ADVanced:SELect`
Rename User View	`:DISPlay:VIEW:ADVanced:REName`
Delete User View	`:DISPlay:VIEW:ADVanced:DELete`
Create User View	`:DISPlay:VIEW:ADVanced:NAME`
Select Screen	`:INSTrument:SCReen:SELect`
Delete Screen	`:INSTrument:SCReen:DELete`
Delete All But This Screen	`:INSTrument:SCReen:DELete:ALL`
Add Screen	`:INSTrument:SCReen:CREate`
Rename Screen	`:INSTrument:SCReen:REName`
Sequencer On/Off	`:SYSTem:SEQuencer`

Remote Command	`:DISPlay:ENABle OFF | ON | 0 | 1`

	:DISPlay:ENABle?
Example	:DISP:ENAB OFF
Couplings	:DISP:ENAB OFF turns Backlight OFF and :DISP:ENAB ON turns Backlight ON, but changing Backlight settings does *not* change the state of :DISP:ENAB
Preset	ON Set by :SYST:DEF MISC, but not affected by *RST or :SYSTem:PRESet
State Saved	Not saved in instrument state
Backwards Compatibility Notes	:SYST:PRES no longer turns on :DISPlay:ENABle as it did in legacy analyzers

3.4.6 Freq

The Freq key opens the Frequency menu, which contains controls that allow you to control the Frequency and Channel parameters of the instrument.

Some features in the Frequency menu are the same for all measurements in the current Mode – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by Meas Preset. For example, the Center Freq setting is the same for all measurements - it does not change as you change measurements.

3.4.6.1 Settings

The Settings Tab contains controls that pertain to the X axis parameters of the measurement. These parameters control how data on the vertical (X) axis is displayed and control instrument settings that affect the horizontal axis.

Center Frequency

Sets the frequency that corresponds to the horizontal center of the graticule. While adjusting the Center Frequency the Span is held constant.

The center frequency setting is the same for all measurements within a mode, that is, it is Meas Global. Some modes are also able to share a Mode Global center frequency value. If this is the case, the Mode will have a Global tab in its Meas Setup menu.

The Center Freq function sets (and queries) the Center Frequency for the currently selected input. If your instrument has multiple inputs, and you select another input, the Center Freq changes to the value for that input. SCPI commands are available to directly set the Center Freq for a specific input.

Center Freq is remembered as you go from input to input. Thus you can set a Center Freq of 10 GHz with the RF Input selected, change to BBIQ and set a Center Freq of 20 MHz, then switch to External Mixing and set a Center Freq of 60 GHz, and when

you go back to the RF Input the Center Freq will go back to 10 GHz; back to BBIQ and it is 20 MHz; back to External Mixing and it is 60 GHz.

– See "RF Center Freq" on page 528

– See "Ext Mix Center Freq" on page 529

– See "I/Q Center Freq" on page 530

– See "Center Frequency Presets" on page 526

Remote Command	`[:SENSe]:FREQuency:CENTer <freq>` `[:SENSe]:FREQuency:CENTer?`

Example	Set Center Frequency to 50 MHz
	`:FREQ:CENT 50 MHz`
	Increment the Center Frequency by the value of CF Step
	`:FREQ:CENT UP`
	Return the current value of Center Frequency
	`:FREQ:CENT?`

Notes	This command sets the RF, External Mixing or I/Q Center Frequency depending on the selected input For RF input it is equivalent to `:FREQ:RF:CENT` For I/Q input it is equivalent to `:FREQ:IQ:CENT` For External Mixer it is equivalent to `:FREQ:EMIX:CENT` Preset and Max values are dependent on Hardware Options (5xx) If no terminator (e.g. MHz) is sent the terminator Hz is used. If a terminator with unit other than Frequency is used, an invalid suffix error message is generated
Preset	Depends on instrument maximum frequency, mode, measurement, and selected input See "Center Frequency Presets" on page 526 and "RF Center Freq" on page 528 and "Ext Mix Center Freq" on page 529 and "I/Q Center Freq" on page 530
State Saved	Saved in instrument state
Min	Depends on instrument maximum frequency, mode, measurement, and selected input See "Center Frequency Presets" on page 526 and "RF Center Freq" on page 528 and "Ext Mix Center Freq" on page 529 and "I/Q Center Freq" on page 530
Max	Depends on instrument maximum frequency, mode, measurement, and selected input See "Center Frequency Presets" on page 526 and "RF Center Freq" on page 528 and "Ext Mix Center Freq" on page 529 and "I/Q Center Freq" on page 530
Status Bits/OPC dependencies	Non-overlapped

Center Frequency Presets

The following table provides the Center Frequency Presets for the Spectrum Analyzer mode, and the Max Freq, for the various frequency options:

Freq Option	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
503 (all but CXA)	1.805 GHz	3.6 GHz	3.7 GHz
503 (CXA)	1.505 GHz	3.0 GHz	3.08 GHz
507 (all but CXA)	3.505 GHz	7.0 GHz	7.1 GHz
507 (CXA)	3.755 GHz	7.5 GHz	7.58 GHz
508 (all but MXE)	1.805 GHz	3.6 GHz	8.5 GHz
508 (MXE)	4.205 GHz	8.4 GHz	8.5 GHz
513	6.805 GHz	13.6 GHz	13.8 GHz
526 (except CXA and MXE)	13.255 GHz	26.5 GHz	27.0 GHz*
526 (CXA)	13.255 GHz	26.5 GHz	26.55 GHz
526 (MXE)	1.805 GHz	3.6 GHz	27.0 GHz
532	16.005 GHz	32.0 GHz	32.5 GHz
540	20.005 GHz	40.0 GHz	40.5 GHz
543	21.505 GHz	43.0 GHz	43.0 GHz
544	22.005 GHz	44.0 GHz	45.0 GHz
550	25.005 GHz	50.0 GHz	52 GHz
F03 (CXA-m)	1.505 GHz	3.0 GHz	3.08 GHz
F07 (CXA-m)	3.755 GHz	7.5 GHz	7.575 GHz
F13 (CXA-m)	6.805 GHz	13.6 GHz	13.8 GHz
F26 (CXA-m)	13.255 GHz	26.5 GHz	26.55 GHz
504 (M9420A/21A, M8920A)	2.145 GHz	3.88GHz	3.88 GHz
506 (M9420A/21A, M8920A)	3.245 GHz	6.08GHz	6.08 GHz
F06 (M9410A/11A)	1.0 GHz	6.08 GHz	6.08 GHz
F06 (M9415A)	1 GHz	1.08 GHz	6.6 GHz
F08 (M9415A)	1 GHz	1.08 GHz	8.6 GHz
F12 (M9415A)	1 GHz	1.08 GHz	12.9 GHz

*For option 526, the Max CF in RTSA is 26.999999995 GHz.

N9041B Center Freq Presets

Input	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
Input 1, all models	25.005 GHz	50.0 GHz	52 GHz
Input 2, opt 585	42.505 GHz	85.0 GHz	86 GHz
Input 2, opt 590	45.005 GHz	90.0 GHz	92 GHz
Input 2, opt 5CX	55.005 GHz	110.0 GHz	110 GHz

Input 2, CXA and MXE

Model	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
CXA opt C75	0.7505 GHz	1.5 GHz	1.58 GHz
MXE	505 MHz	1 GHz	1.000025 GHz

Tracking Generator Frequency Limits (CXA only)

Tracking Generator Option	Min Freq (clips to this freq when turn TG on and can't tune below while TG on)	If above this Freq, Stop Freq clipped to this Freq when TG turned on	Max Freq (can't tune above) while TG on
T03	9 kHz	3.0 GHz	3.08 GHz
T06	9 kHz	6.0 GHz	6.05 GHz

Tracking Generator Frequency Limits(CXA-m only)

Tracking Generator Option	Min Freq (clips to this freq when turn TG on and can't tune below while TG on)	If above this Freq, Stop Freq clipped to this Freq when TG turned on	Max Freq (can't tune above) while TG on
T03	2 MHz	3.08 GHz	3.08 GHz
T07	2 MHz	7.575 GHz	7.575 GHz
T13	2 MHz	13.8 GHz	13.8 GHz
T26	2 MHz	26.55 GHz	26.55 GHz

RF Center Freq

SCPI command for specifying the RF Center Frequency. This command will set the Center Frequency to be used when the RF input is selected, even if the RF input is not the input that is selected at the time the command is sent. Note that the **Center Freq** function in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command	`[:SENSe]:FREQuency:RF:CENTer <freq>` `[:SENSe]:FREQuency:RF:CENTer?`
Example	`:FREQ:RF:CENT 30 MHz` `:FREQ:RF:CENT?`
Notes	This command is the same in all modes, but the parameter is Measurement Global. So the value is independent in each mode and common across all the measurements in the mode
Dependencies	If the electronic/soft attenuator is enabled, any attempt to set Center Frequency such that the Stop Frequency would be >3.6 GHz fails and results in an advisory message. If the equivalent SCPI command is sent, this same message is generated as part of a "-221, Settings conflict" warning
Preset	See table above

State Saved	Saved in instrument state
Min	-79.999995 MHz
Max	See table above. Basically instrument maximum frequency - 5 Hz

Ext Mix Center Freq

SCPI command for specifying the External Mixer Center Frequency. This command will set the Center Frequency to be used when the External Mixer is selected, even if the External Mixer input is not the input which is selected at the time the command is sent. Note that the **Center Freq** function in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command	`[:SENSe]:FREQuency:EMIXer:CENTer <freq>` `[:SENSe]:FREQuency:EMIXer:CENTer?`
Example	`:FREQ:EMIX:CENT 60 GHz` `:FREQ:EMIX:CENT?`
Notes	This command is the same in all modes, but the parameter is Measurement Global. So the value is independent in each mode and common across all the measurements in the mode
Couplings	When returning to External Mixing after having been switched to one of the other inputs (e.g., RF), you will come back into the settings that you had when you left External Mixing. So you will come back to the band you were in with the Center Frequency that you had. However, Span is not an input-dependent parameter, therefore you will bring the span over from the other input. Therefore, the instrument comes back with the span from the previous input, limited as necessary by the current mixer setup
Preset	When a Mode Preset is performed while in External Mixing, the Start frequency of the current Mode is set to the nominal Min Freq of the lowest harmonic range in the Harmonic Table for the current mixer setup. Similarly, the Stop frequency of the current Mode is set to the nominal Max Freq of the highest harmonic range in the Harmonic Table. The Center Freq thus presets to the point arithmetically equidistant from these two frequencies Note that, if the current measurement has a limited Span available to it, and cannot achieve the Span shown in the table (Span=Stop Freq – Start Freq), the instrument uses the maximum Span the measurement allows, and still sets the Center Freq to the midpoint of the Start and Stop Freq values in the Harmonic Table When Restore Input/Output Defaults is performed, the mixer presets to the 11970A, whose Start and Stop frequencies are 26.5 and 40 GHz respectively. The center of these two frequencies is 33.25 GHz Therefore, after a Restore Input/Output Defaults, if you go into External Mixing and do a Mode Preset while in the Spectrum Analyzer Mode, the resulting Center Freq is 33.25 GHz
State Saved	Yes
Min	The minimum frequency in the currently selected mixer band + 5 Hz
Max	The maximum frequency in the currently selected mixer band - 5 Hz

I/Q Center Freq

SCPI command for specifying the I/Q Center Frequency. This command sets the Center Frequency to be used when the I/Q input is selected, even if the I/Q input is not the input that is selected at the time the command is sent. Note that the **Center Freq** function in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command	`[:SENSe]:FREQuency:IQ:CENTer <freq>` `[:SENSe]:FREQuency:IQ:CENTer?`
Example	`:FREQ:IQ:CENT 30 MHz`
Notes	This command is the same in all modes, but the parameter is Measurement Global. So the value is independent in each mode and common across all the measurements in the mode
Preset	0 Hz
State Saved	Saved in instrument state
Min	-40.049995 MHz
Max	40.049995 MHz

CF Step

Changes the step size for the center frequency and start and stop frequency functions. Once a step size has been selected and the center frequency function is active, the step keys (and the UP|DOWN parameters for **Center Frequency** from remote commands) change the center frequency by the step-size value. The step size function is useful for finding harmonics and sidebands beyond the current frequency span of the instrument.

Note that the start and stop frequencies also step by the CF Step value.

Remote Command	`[:SENSe]:FREQuency:CENTer:STEP[:INCRement] <freq>`
	`[:SENSe]:FREQuency:CENTer:STEP[:INCRement]?`
	`[:SENSe]:FREQuency:CENTer:STEP:AUTO OFF | ON | 0 | 1`
	`[:SENSe]:FREQuency:CENTer:STEP:AUTO?`

Example	`:FREQ:CENT:STEP 500 MHz`
	Increase the current center frequency value by 500 MHz
	`:FREQ:CENT UP`
	`:FREQ:CENT:STEP?`
	`:FREQ:CENT:STEP:AUTO ON`
	`:FREQ:CENT:STEP:AUTO?`

Notes	Preset and Max values are dependent on Hardware Options (5xx)

Dependencies	Span, RBW, Center frequency If the electronic/soft attenuator is enabled, any attempt to change the value of the center frequency >3.6 GHz by pressing the Up-arrow key, fails and results in an advisory message. If the equivalent SCPI command is sent, this same message is generated as part of a "-221, Settings conflict" warning
Couplings	When auto-coupled in a non-zero span, the center frequency step size is set to 10% of the span. When auto-coupled in zero span, the center frequency step size is set to the equivalent -3 dB RBW value
Preset	Auto ON
State Saved	Saved in instrument state
Min	– (the maximum frequency of the instrument). That is, 27 GHz max freq instrument has a CF step range of +/- 27 GHz. Note that this is the maximum frequency given the current settings of the instrument, so in External Mixing, for example, it is the maximum frequency of the current mixer band
Max	The maximum frequency of the instrument. That is, 27 GHz max freq instrument has a CF step range of +/- 27 GHz. Note that this is the maximum frequency given the current settings of the instrument, so in External Mixing, for example, it is the maximum frequency of the current mixer band
Status Bits/OPC dependencies	non-overlapped

3.4.7 Marker

Accesses a menu that enables you to select, set up and control the markers for the current measurement. If there are no active markers, Marker selects marker 1, sets it to Normal and places it at the center of the display. If the selected marker is Off, it is set to Normal and placed it at the center of the screen on the trace determined by the Marker Trace rules.

For more detailed information on the types of Markers and the interaction between Markers, see the Marker section of the Swept SA measurement.

3.4.7.1 Select Marker

Specifies the selected marker. The term "selected marker" is used throughout this document to specify which marker will be affected when you change marker settings, perform a Peak Search, etc.

The **Select Marker** control appears above the menu panel, indicating that it applies to all controls in the **Marker** menu panels. **Select Marker** is blanked if you select a tab whose controls do *not* depend on the selected marker (e.g., Counter).

On any menu tab for which **Select Marker** displays, the first control is always **Marker Frequency|Time**.

Notes	The selected marker is remembered even when not in the Marker menu and is used if a Search is done or a Band Function is turned on or for Signal Track or Continuous Peak
Preset	Marker 1

State Saved	The number of the selected marker is saved in instrument state
Annunciation	Appears in the marker results block label for Normal and Delta markers

3.4.7.2 Settings

The controls on the **Settings** tab include the Marker active function and a radio button selection of the marker control mode (Normal, Delta, or Off) for the selected marker, as well as additional functions that help you use markers.

Marker X Axis Value

Accesses a menu that enables you to select, set up and control the markers for the current measurement.

Marker Symbol Value

Sets the marker symbol value in the current marker for the trace of I/Q symbol polar vector. It has no effect if the control mode is Off, but is the SCPI equivalent of entering an X value if the control mode is Normal.

If no suffix is sent, uses ‘symbols’. If the suffix is not ‘symbols’, an error “Invalid suffix” is generated.

The query returns the marker’s ‘symbol’ value in the trace if the control mode is Normal. The query is returned in ‘symbols’. If the marker is Off the response is Not A Number.

NOTE **This command is only valid when Marker Trace is ‘POLar’ (I/Q symbol polar vector). For other Marker Traces, it is ignored.**

Remote Command	`:CALCulate:CDPower:MARKer[1]|2|...|12:SYMBol <real>` `:CALCulate:CDPower:MARKer[1]|2|...|12:SYMBol?`
Example	`:CALC:CDP:MARK:SYMB 1.0` `:CALC:CDP:MARK:SYMB?`
Notes	If no suffix is sent, uses ‘symbols’. If the suffix is not ‘symbols’, an error “Invalid suffix” is generated
Preset	Start point of the trace on the display window
State Saved	No
Min	-9.9E+37
Max	9.9E+37
Annotation	Mkr # <Symbol Value>, <X value> and <Y value> upper right on graph

Marker X Axis Value

Sets the marker X Axis value in the current marker X Axis Scale unit. It has no effect if the control mode is Off, but is the SCPI equivalent of entering an X value if the control mode is Normal or Delta.

NOTE: This command is not valid when Marker Trace is 'POLar' and ignored. Marker Symbol Value is supported instead.

Remote Command	`:CALCulate:CDPower:MARKer[1]|2|...|12:X <real>` `:CALCulate:CDPower:MARKer[1]|2|...|12:X?`
Example	`:CALC:CDP:MARK3:X 0.0` `:CALC:CDP:MARK3:X?`
Notes	If no suffix is sent, uses the fundamental units for the current marker X Axis Scale. If a suffix is sent that does not match the current marker X Axis Scale unit, an error "Invalid suffix" is generated The query returns the marker's absolute X Axis value if the control mode is Normal, or the offset from the marker's reference marker if the control mode is Delta. The query is returned in the fundamental units for the current marker X Axis scale: Hz for Frequency and Inverse Time, seconds for Period and Time. If the marker is Off the response is not a number
Preset	After a preset, all Markers are turned OFF, so Marker X Axis Value query returns a Not A Number (NAN)
State Saved	No
Min	–9.9E+37
Max	9.9E+37
Annotation	Mkr # <X value> and <Marker value> upper right on graph

Marker X Axis Position (Remote Command only)

Sets the marker X position in trace points. It has no effect if the control mode is Off, but is the SCPI equivalent of entering a value if the control mode is Normal or Delta - except in trace points rather than X Axis Scale units. The entered value is immediately translated into the current X Axis Scale units for setting the value of the marker.

Remote Command	`:CALCulate:CDPower:MARKer[1]|2|...|12:X:POSition <real>` `:CALCulate:CDPower:MARKer[1]|2|...|12:X:POSition?`
Example	`:CALC:CDP:MARK10:X:POS 0.0` `:CALC:CDP:MARK10:X:POS?`
Notes	The query returns the marker's absolute X Axis value in trace points if the control mode is Normal, or the offset from the marker's reference marker in trace points if the control mode is Delta. The value is returned as a real number, not an integer, corresponding to the translation from X Axis Scale units to trace points. If the marker is Off the response is *Not A Number (NAN)*

	This command is not available when Marker Trace of the selected marker (:CALCulate:CDPower:MARKer[1]|2|3|4|5|6|7|8|9|10|11|12:TRACe?) is set to POLar. In this case, this command is ignored
Preset	After a preset, all Markers are turned OFF, so Marker X Axis Value query returns a Not A Number (NAN)
State Saved	No
Min	-9.9E+37
Max	9.9E+37

Marker Y Axis Value (Remote Command only)

Queries the marker Y Axis value in the current marker Y Axis unit.

Remote Command	:CALCulate:CDPower:MARKer[1]|2|...|12:Y?
Example	:CALC:CDP:MARK11:Y?
Notes	The query returns the marker Y-axis result if the control mode is Normal or **Delta**. If the marker is Off, the response is not a number (NAN)
Preset	Result dependent on markers setup and signal source
State Saved	No
Backwards Compatibility SCPI	:CALCulate:CDPower:MARKer[1]|2|...|12:FUNCtion:RESult?

Marker Mode

Sets the marker control mode to Normal, Delta, or Off. All interactions and dependencies detailed under the control description are enforced when the remote command is sent. If the selected marker is Off, pressing Marker sets it to Normal and places it at the center of the screen on the trace determined by the Marker Trace rules. At the same time, Marker X Axis Value appears on the Active Function area.

The default active function is the active function for the currently selected marker control mode. If the current control mode is Off, there is no active function and the active function is turned off.

Remote Command	:CALCulate:CDPower:MARKer[1]|2|...|12:MODE POSition | DELTa | OFF :CALCulate:CDPower:MARKer[1]|2|...|12:MODE?
Example	:CALC:CDP:MARK:MODE POS :CALC:CDP:MARK:MODE?
Preset	OFF
State Saved	Saved in instrument state

Range	POSition|DELTa|OFF
Annotation	Mkr # <X value> and <Marker value> upper right on graph When Marker Trace is Polar in WCDMA mode: Mkr # <Symbol Value>, <X value> and <Y value> upper right on graph

Backward Compatibility SCPI Commands

Sets or queries the state of a marker. Setting a marker that is OFF to an ON state or 1, puts it in Normal mode and places it at the center of the screen.

Remote Command	:CALCulate:CDPower:MARKer[1]|2|...|12:STATe OFF | ON | 0 | 1 :CALCulate:CDPower:MARKer[1]|2|...|12:STATe?
Example	:CALC:CDP:MARK3:STAT ON :CALC:CDP:MARK3:STAT?
Preset	OFF
State Saved	Saved in instrument state
Range	OFF|ON

Delta Marker (Reset Delta)

Pressing this button is exactly the same as pressing the “Delta” selection on the Marker Mode radio button. The selected marker becomes a Delta Marker. If the selected marker is already a Delta marker, the reference marker is moved to the current position of the selected marker, thus resetting the Delta to zero.

Marker Settings Diagram

The Marker Settings Diagram lets you configure the Marker system using a visual utility.

All Markers Off

Turns off all markers.

Remote Command	:CALCulate:CDPower:MARKer:AOFF
Example	:CALC:CDP:MARK:AOFF

Couple Markers

When this function is On, moving any marker causes an equal X Axis movement of every other marker which is not Fixed or Off. By “equal X Axis movement” we mean that we preserve the difference between each marker’s X Axis value (in the fundamental x-axis units of the trace that marker is on) and the X Axis value of the marker being moved (in the same fundamental x-axis units).

When the marker is assigned to the Polar graph, a symbol value is coupled instead of an X axis value.

This may result in markers going off screen.

Remote Command	`:CALCulate:CDPower:MARKer:COUPle[:STATe] ON | OFF | 1 | 0` `:CALCulate:CDPower:MARKer:COUPle[:STATe]?`
Example	`:CALC:CDP:MARK:COUP ON` `:CALC:CDP:MARK:COUP?`
Preset	`OFF` Presets on Mode Preset and All Markers Off
State Saved	Saved in instrument state

3.4.7.3 Peak Search

The controls on the Peak Search tab allow you to move the marker to selected peaks of the signal, giving you enormous analysis capabilities, particularly when combined with the Delta Marker function.

NOTE: Pressing the **Peak Search** hardkey automatically moves you to the **Peak Search** page of the **Marker** menu *and* performs a Peak Search.

Pressing the **Peak Search** tab once you are already *in* the **Marker** menu does *not* perform a Peak Search.

Marker X Axis Value

The Marker X-Axis Value control is the fundamental control that you use to move a marker around on the trace. This is the same as the X-Axis Value control on the Settings tab.

Peak Search

Pressing the Peak Search control moves the selected marker to the trace point which has the maximum y-axis value for that marker's trace.

NOTE: Pressing the **Peak Search** hardkey automatically moves you to the **Peak Search** page of the **Marker** menu *and* performs a Peak Search.

Remote Command	`:CALCulate:CDPower:MARKer[1]|2|...|12:MAXimum`

Example	:CALC:CDP:MARK2:MAX :SYST:ERR? can be used to query the errors to determine if a peak is found. The message "No peak found" will be returned after an unsuccessful search
Notes	Sending this command selects the subopcoded marker This command does not work when the selected marker is located on the polar trace. In this case, the command is ignored

Next Peak

Pressing Next Peak moves the selected marker to the peak that is next lower in amplitude than the current marker value. Only peaks which meet all enabled peak criteria are considered. If there is no valid peak lower than the current marker position, a "No peak found" message is generated and the marker is not moved.

If the selected marker was off, then it is turned on as a normal marker and a peak search is performed.

Remote Command	:CALCulate:CDPower:MARKer[1]|2|...|12:MAXimum:NEXT
Example	:CALC:CDP:MARK2:MAX:NEXT
Notes	Sending this command selects the subopcoded marker
State Saved	Not part of saved state

Next Peak Right

Pressing Next Pk Right moves the selected marker to the nearest peak right of the current marker that meets all enabled peak criteria. If there is no valid peak to the right of the current marker position, a "No peak found" message is generated and the marker is not moved.

If the selected marker was off, then it is turned on as a normal marker and a peak search is performed.

Pressing this control moves the selected marker to the nearest active channel right of the current marker when Marker Trace is either Code Domain Power or Code Domain Error. In other cases, pressing this control moves the selected marker to the highest peak right of the current marker.

Remote Command	:CALCulate:CDPower:MARKer[1]|2|...|12:MAXimum:RIGHt
Example	:CALC:CDP:MARK2:MAX:RIGH
Notes	Sending this command selects the subopcoded marker
State Saved	Not part of saved state

Next Peak Left

Pressing Next Pk Left moves the selected marker to the nearest peak left of the current marker that meets all enabled peak criteria. If there is no valid peak to the left of the current marker position, a “No peak found” message is generated and the marker is not moved.

If the selected marker was off, then it is turned on as a normal marker and a peak search is performed.

Pressing this control moves the selected marker to the nearest active channel left of the current marker when Marker Trace is either Code Domain Power or Code Domain Error. In other cases, moves the selected marker to the highest peak left of the current marker.

Remote Command	`:CALCulate:CDPower:MARKer[1]|2|...|12:MAXimum:LEFT`
Example	`:CALC:CDP:MARK2:MAX:LEFT`
State Saved	Not part of saved state

Minimum Peak

Moves the selected marker to the minimum y-axis value on the current trace. Minimum (negative) peak searches do not have to meet the peak search criteria. It just looks for the lowest y-axis value. If the selected marker is Off, it is turned on before the minimum search is performed.

Remote Command	`:CALCulate:CDPower:MARKer[1]|2|...|12:MINimum`
Example	`:CALC:CDP:MARK:MIN`
Notes	Sending this command selects the subopcoded marker
State Saved	Not part of saved state

Pk-Pk Search

Finds and displays the amplitude and frequency (or time, if in zero span) differences between the highest and lowest y-axis value. It places the selected marker on the minimum value on its selected trace. And it places that marker’s reference marker on the peak of its selected trace.

This function turns on the reference marker and sets its mode to Normal if it is not already on. (These markers may be on two different traces.)

The rules for finding the maximum peak are exactly the same as for Peak Search, including the use of the peak criteria rules. However, the minimum trace value is not required to meet any criteria other than being the minimum y-axis value in the trace.

If the selected marker is off, a delta type marker is turned on and the peak-to-peak search is done. If the selected marker is on, but it is not a delta marker, then it is changed to delta which turns on the reference marker if needed, and then it performs the peak-to-peak function.

Remote Command	`:CALCulate:CDPower:MARKer[1]|2|...|12:PTPeak`
Example	`:CALC:CDP:MARK:PTP`
Notes	Turns on the Marker D active function Sending this command selects the subopcoded marker
Dependencies	Pk-Pk Search is not available when Coupled Markers is on
Couplings	The selected marker becomes a delta marker if not already in delta mode
State Saved	Not part of saved state

Marker Delta

Pressing this button is exactly the same as pressing the “Delta” selection on the Marker Mode radio button on the Settings tab. The selected marker becomes a Delta Marker. If the selected marker is already a Delta marker, the reference marker is moved to the current position of the selected marker, thus resetting the Delta to zero.

The control is duplicated here in the Peak Search Menu to allow you to conveniently perform a peak search and change the marker’s control mode to Delta without having to access two separate menus.

3.4.7.4 Properties

The controls on the Properties tab are used to set certain properties of the selected marker.

Marker X Axis Value

The Marker X-Axis Value control is the fundamental control that you use to move a marker around on the trace. This is the same as the X-Axis Value control on the Settings tab.

Relative To

Selects the marker to which the selected marker is relative (its reference marker).

Every marker has another marker to which it is relative. This marker is referred to as the “reference marker” for that marker. This attribute is set by the Marker, Properties, Relative To key. The marker must be a Delta marker to make this attribute relevant. If it is a Delta marker, the reference marker determines how the marker is controlled and how its value is displayed. A marker cannot be relative to itself.

Remote Command	`:CALCulate:CDPower:MARKer[1]|2|...|12:REFerence <integer>` `:CALCulate:CDPower:MARKer[1]|2|...|12:REFerence?`
Example	`:CALC:CDP:MARK:REF 5` `:CALC:CDP:MARK:REF?`
Notes	This command causes the marker specified with the subopcode to become selected Range (for SCPI command): 1 to 12. If the range is exceeded the value is clipped A marker cannot be relative to itself so that choice is not available, and if sent from SCPI generates error -221: "Settings conflict; marker cannot be relative to itself" When queried a single value is returned (the specified marker numbers relative marker)
Couplings	The act of specifying the selected marker's reference marker makes the selected marker a Delta marker If the reference marker is off it is turned on in Normal mode at the delta marker location
Preset	The preset default "Relative To" marker (reference marker) is the next higher numbered marker (current marker +1). For example, if marker 2 is selected, then it's default reference marker is marker 3. The exception is marker 12, which has a default reference of marker 1 Set to the defaults by using Restore Mode Defaults. This is not reset by Marker Off, All Markers Off, or Preset
State Saved	Saved in instrument state. Not affected by Marker Off and hence not affected by Preset or power cycle
Min	1
Max	12
Annunciation	Appears in the marker label of a **Delta** marker

Marker Trace

Assigns the specified marker to the designated trace.

Remote Command	`:CALCulate:CDPower:MARKer[1]|2|...|12:TRACe CDPower	EVM	MERRor	PERRor	SPOWer	CPOWer	CDError	POLar` `:CALCulate:CDPower:MARKer[1]|2|...|12:TRACe?`
Example	`:CALC:CDP:MARK:TRACE POL` `:CALC:CDP:MARK:TRACE?`
Preset	`CDPower`
State Saved	Yes
Range	Code Domain Power|Code Domain Error|Symbol Power|Chip Power|EVM|Phase Error|Mag Error|Polar

Marker Settings Diagram

The Marker Settings Diagram lets you configure the Marker system using a visual utility. This is the same as the"Marker Settings Diagram" on page 535 control on the Settings tab.

3.4.7.5 Marker To

The controls on the Marker -> tab enable you to copy the current marker value into other instrument parameters (for example, Center Freq). The currently selected marker is made the active function on entry to this menu (if the currently selected marker is not on when you press this front panel key, it will be turned on at the center of the screen as a normal type marker and then made the active function).

The Marker -> (or Marker To) feature is used to quickly assign a marker's x- or y-axis value to another parameter. For example, if a marker's x-axis value is 500 MHz and y-axis value is –20 dBm, pressing Mkr -> CF would assign 500 MHz to Center Freq and pressing Mkr - >Ref Lvl would assign –20 dBm to Ref Level.

All Marker To functions executed from the front panel use the selected marker's values, while all Marker To remote commands specify in the command which marker's value to use.

Mkr->Despread

Executes post processing for the selected marker.

Remote Command	`:CALCulate:CDPower:MARKer[1]|2|...|12[:SET]:DESPread`
Example	`:CALC:CDP:MARK4:SET:DESP`
Dependencies	This function is available only when the marker trace is either 'CDPower' or 'CDError'

3.4.8 Meas Setup

The Meas Setup menu panel contains functions for setting up the measurement parameters.

3.4.8.1 Settings

This tab enables you to set measurement parameters.

Meas Type

Sets the code domain power computation type to either the absolute power or the relative value to the mean power.

- ABSolute – Code domain power is computed as the absolute power
- RELative – Code domain power is computed relative to the mean power

Remote Command	`:CALCulate:CDPower:TYPE RELative	ABSolute` `:CALCulate:CDPower:TYPE?`

Example	:CALC:CDP:TYPE REL :CALC:CDP:TYPE?
Preset	RELative
State Saved	Yes
Range	RELative|ABSolute

IF Gain

Enables you to control an internally switched IF amplifier with approximately 10 dB of gain. When it can be turned on without an overload, the dynamic range is always better with the amplifier on than off. The control "**IF Gain**" can be used to set the IF Gain function to Auto, or to On (the extra 10 dB) or Off. These settings affect sensitivity and IF overloads.

Remote Command	[:SENSe]:CDPower:IF:GAIN[:STATe] ON | OFF | 1 | 0 [:SENSe]:CDPower:IF:GAIN[:STATe]? [:SENSe]:CDPower:IF:GAIN:AUTO[:STATe] OFF | ON | 0 | 1 [:SENSe]:CDPower:IF:GAIN:AUTO[:STATe]?
Example	:CDP:IF:GAIN ON :CDP:IF:GAIN? :CDP:IF:GAIN:AUTO ON :CDP:IF:GAIN:AUTO?
Notes	This only applies to the RF input. It does not apply to baseband I/Q input
Dependencies	This control does not appear in VXT, M9393A, M9391A, or UXM
Couplings	Auto sets IF Gain to High Gain under any of the following conditions: 1. The input attenuator is set to 0 dB, *or*, 2. The preamp is turned on, *or*, 3. The Max Mixer Level is –20 dBm or lower. For other settings, 'auto' sets IF Gain to 'Low Gain'
Preset	OFF OFF
State Saved	Yes
Range	Low Gain|High Gain

Auto Couple

Immediately puts all Auto/Man functions into Auto. The **Auto Couple** action is confined to the current measurement only. It does not affect other measurements in the mode.

In the Auto state, Auto/Man functions are said to be “coupled”, meaning their values change as you make changes to other values in the measurement. This helps ensure accurate measurements and optimum dynamic range. Auto Couple is an immediate action function, and when it is executed, all the Auto/Man controls for the current measurement are set to Auto, and all measurement settings coupled to the Auto/Man parameters are automatically set to their optimal value.

For further details of measurement-specific settings (if any), see "Measurement-Specific Details" on page 544 below.

Remote Command	`:COUPle ALL`
Example	`:COUP ALL`
Backwards Compatibility SCPI	`:COUPLE ALL | NONE`
Backwards Compatibility Notes	`:COUP:NONE` puts all Auto/Man parameters in manual mode, decoupling all the coupled instrument parameters. It is retained for backwards compatibility and is *not* recommended for making measurements or new designs

All Auto/Man parameter couplings in the measurement are set to Auto. This includes couplings that may be unavailable or grayed-out due to the current state. For example, in the Swept SA measurement, there is no Auto/Man coupling for RBW while in Zero Span. Nonetheless, if **Auto Couple** were executed while in Zero Span it would set RBW to Auto "behind the scenes" so that, on exit from Zero Span, it would be in Auto.

Any Auto/Man selection specific (local) to the other measurements in the current Mode will not be affected by **Auto Couple**. Any functions that are *not* coupled with other instrument parameters, such as ranging or leveling variables, such as "AutoRange" or "AutoScale", will not be affected.

Executing the **Auto Couple** command generates the informational message, "All Auto/Man functions have been set to Auto".

Each parameter, upon being set to Auto, selects and sets the appropriate auto-coupled value based on that parameter’s coupling rules. The Dependency Resolver orchestrates the couplings for parameters that are dependent on one or more other parameters. The coupling and dependency rules for each parameter are defined in the chapter describing that parameter.

Executing the **Auto Couple** command *does not* affect markers, marker functions, trace or display attributes, or any other instrument setting other than those specifically mentioned above.

Measurement-Specific Details

TOI

Parameters affected by Auto Couple are:

- Center Frequency Step
- Resolution Bandwidth
- Span/RBW Ratio
- Sweep Time
- Video BandwidthVBW/RBW ratio
- Upper and Lower Tone (set to Sense
-)Zero span measurement Resolution Bandwidth
- Zero span measurement Dwell Time

Harmonics

For Harmonics, these parameters are:

- Resolution Bandwidth
- Fundamental Frequency
- Dwell Time
- Range Table Resolution Bandwidths
- Range Table Dwell Times

Meas Preset

Restores all the measurement parameters to their default values.

Remote Command	`:CONFigure:CDPower`
Example	`:CONF:CDP`
Couplings	Selecting Meas Preset restores all measurement parameters to these default values

3.4.8.2 Radio

The Radio tab contains controls to select the Radio Device, and enable or disable HSPA/HSPA+ options.

Radio Device

Allows you to specify the device to be used.

Remote Command	`[:SENSe]:RADio:STANdard:DEVice BTS | MS` `[:SENSe]:RADio:STANdard:DEVice?`
Example	`:RAD:STAN:DEV MS` `:RAD:STAN:DEV?`
Preset	BTS
State Saved	Saved in instrument state.
Range	BTS | MS
Backwards Compatibility SCPI	`[:SENSe]:RADio:DEVice`

HSPA Enable

Allows you to turn on or off the HSDPA/HSUPA option enable. This selection is necessary because some of the auto detection functions that expect an HSPA signal are less tolerant when the signal is noisy or distorted. When the HSPA signal is not expected, turn HSPA Enable off.

Remote Command	`[:SENSe]:RADio:CONFigure:HSDPa[:STATe] 0 | 1 | OFF | ON` `[:SENSe]:RADio:CONFigure:HSDPa[:STATe]?`
Example	`:RAD:CONF:HSDP 0` `:RAD:CONF:HSDP?`
Preset	ON
State Saved	Saved in instrument state.
Range	On|Off

HSPA+ Enable

Allows you to turn on or off the HSPA+ option enable. This selection is necessary because some of the auto detection functions that expect an HSPA+ signal are less tolerant when the signal is noisy or distorted. When the HSPA+ signal is not expected, turn HSPA+ Enable off.

Remote Command	`[:SENSe]:RADio:CONFigure:EHSPa[:STATe] OFF | ON | 0 | 1` `[:SENSe]:RADio:CONFigure:EHSPa[:STATe]?`
Example	`:RAD:CONF:EHSP 0` `:RAD:CONF:EHSP?`
Notes	When HSPA enable is OFF, HSPA+ function is disabled too.
Preset	ON
State Saved	Saved in instrument state.
Range	On|Off

3.4.8.3 Sync

This tab enables you to set sync parameters.

Sync Type (BTS)

Displays a menu that allows you to select the Sync Type. The selections are as follows:

- CPICH - Synchronizes with the CPICH channel.
- Pilot-aided Timing Est(imator) - Enables additional symbol timing estimation to each detected code channel through the demod calculation process by referring to the pilot channel (CPICH) timing correlation.
- SCH - Synchronizes with the SCH channel.
- Symbol Based (See Note below) - Accesses the menu for the code symbol to synchronize with. This submenu provides the following selections:
- Symbol Rate - Sets the symbol rate ranging from 7.5 to 960 ksps. The parameter automatically sets the maximum value for Code Number when appropriate.
- Code Number - Sets the code number. The range is 0 to 511 depending on the Symbol Rate setting.
- Antenna-2 CPICH - Synchronizes with the STTD Antenna-2 common pilot channel.
- Pilot-aided Timing Est(imator) - Enables additional symbol timing estimation to each detected code channel through the demod calculation process by referring to the pilot channel (Antenna-2 CPICH) timing correlation.

- Antenna-1 TSTD SCH – Synchronizes with the TSTD SCH Antenna-1
- Antenna-2 TSTD SCH – Synchronizes with the TSTD SCH Antenna-2

NOTE When Sync Type is ‘Symbol Based’, the selected symbol is assumed to be QPSK. Therefore, for cases other than QPSK, it cannot be synchronized correctly. For example, 16QAM HS-PDSCH symbol cannot be used to synchronize.

Remote Command	`[:SENSe]:CDPower:SYNC[:BTS] CPICh | SCH | SYMBol | A2CPich | A1SCh | A2SCh` `[:SENSe]:CDPower:SYNC[:BTS]?`
Example	`:CDP:SYNC SCH` `:CDP:SYNC?`
Notes	This command is effective when `[:SENSe]:RADio:DEVice` is set to BTS
Couplings	SYMBol synchronizes to the code symbol specified by `[:SENSe]:CDPower-:SYNC:SYMBol:SRATe` and the `[:SENSe]:CDPower:SYNC:SYMBol:SPRead` commands
Preset	`CPICh`
State Saved	Yes
Range	CPICH|SCH|Symbol Based|Antenna-2 CPICH|Antenna-1 TSTD SCH|Antenna-2 TSTD SCH

Sync Type (MS)

Selects the channel to synchronize with. You can select from the following types:

- DPCCh - Synchronizes to DPCCH and Slot Format, which is set by `[:SENSe]:CDPower:SFORmat:MS`
- PMESsage - Synchronizes to PRACH Message and Slot Format, which is set by `[:SENSe]:CDPower:PRACh:SIGNature` and `[:SENSe]:CDPower:SFORmat:MS`
- EDPCch - Synchronizes to E-DPCCH C8(1):I, the spreading factor is 256, and the code index is 1 on I-branch)

Remote Command	`[:SENSe]:CDPower:SYNC:MS DPCCh | EDPCch | PMESsage` `[:SENSe]:CDPower:SYNC:MS?`
Example	`:CDP:SYNC:MS DPCC` `:CDP:SYNC:MS?`
Dependencies	This command is effective when `[:SENSe]:RADio:DEVice` is set to MS
Preset	`DPCCh`
State Saved	Yes
Range	DPCCH|E-DPCCH C8(1):I|PRACH Message

Pilot-aided Timing Estimator (BTS only)

Enables additional symbol timing estimation to each detected code channel through the demod calculation process by referring to the pilot channel (i.e. CPICH or Ant2 CPICH, accordingly) timing correlation. It is expected to improve symbol reference vector estimation robustness for some specific impairment conditions: for example, the signal under test is assumed to have asymmetric filter response. Note that this function would not always be effective to any signal condition; on the contrary, turning this “on” may decrease the estimation robustness and measurement speed for some different cases. A typical example it is worth to try this out is when you find that the peak symbol EVM result is unexpectedly high compared to the RMS symbol EVM result.

Remote Command	`[:SENSe]:CDPower:SYNC:CPICh:ESTimator OFF | ON | 0 | 1` `[:SENSe]:CDPower:SYNC:CPICh:ESTimator?`
Example	`:CDP:SYNC:CPIC:EST 0` `:CDP:SYNC:CPIC:EST?`
Notes	This command is effective when `[:SENSe]:RADio:DEVice` is set to BTS and `[:SENSe]:CDPower:SYNC[:BTS]` is set to CPICh or A2CPich
Preset	`OFF`
State Saved	Yes
Range	`OFF|ON`

Synchronization Symbol Rate (BTS only)

Sets the symbol rate of the code symbol to synchronize with.

Sets the symbol rate ranging from 7.5 to 960 ksps. The parameter automatically sets the maximum value for Code Number when appropriate.

Remote Command	`[:SENSe]:CDPower:SYNC:SYMBol:SRATe <integer>` `[:SENSe]:CDPower:SYNC:SYMBol:SRATe?`
Example	`:CDP:SYNC:SYMB:SRAT 30000` `:CDP:SYNC:SYMB:SRAT?`
Notes	This command is effective when `[:SENSe]:RADio:DEVice` is set to BTS, and `[:SENSe]:CDPower:SYNC[:BTS]` is set to SYMBol
Preset	7500
State Saved	Yes
Range	7500|15000|30000|60000|120000|240000|480000|960000

Synchronization Code Number (BTS only)

Sets the spread code number of the code symbol to synchronize with. The range depends on the Symbol Rate setting.

Remote Command	`[:SENSe]:CDPower:SYNC:SYMBol:SPRead <integer>` `[:SENSe]:CDPower:SYNC:SYMBol:SPRead?`
Example	`:CDP:SYNC:SYMB:SPR 255` `:CDP:SYNC:SYMB:SPR?`
Dependencies	This command is effective when `[:SENSe]:RADio:DEVice` is set to BTS, and `[:SENSe]:CDPower:SYNC[:BTS]` is set to SYMBol `[:SENSe]:CDPower:SYNC:SYMBol:SRATe`
Preset	1
State Saved	Yes
Range	(see table below)

[:SENSe]:CDPower:SYNC:SYMBol:SRATe	Range
7500	0 to 511
15000	0 to 255
30000	0 to 127
60000	0 to 63
120000	0 to 31
240000	0 to 15
480000	0 to 7
960000	0 to 3

Min/Max

Min: 0

Max: Dependent on the symbol rate settings as follows:

[:SENSe]:CDPower:SYNC:SYMBol:SRATe	Min/Max
7500	511
15000	255
30000	127
60000	63
120000	31
240000	15
480000	7
960000	3

Slot Format (MS only)

Selects Slot Format for synchronization to the uplink signal.

Remote Command	`[:SENSe]:CDPower:SFORmat:MS SF0 | SF1 | SF2 | SF3 | SF4 | SF5 | AUTO` `[:SENSe]:CDPower:SFORmat:MS?`
Example	`:CDP:SFOR:MS SF2` `:CDP:SFOR:MS?`
Dependencies	This command is effective when `[:SENSe]:RADio:DEVice` is set to MS, and `[:SENSe]:CDPower:SYNC:MS` is set to DPCCh
Preset	`SF0`
State Saved	Yes
Range	`SF0|SF1|SF2|SF3|SF4|SF5|AUTO`

Preamble Signature (MS only)

Sets the Preamble Signature number for PRACH Message detection. Based on this value, the code allocation of the PRACH message control part is calculated.

Remote Command	`[:SENSe]:CDPower:PRACh:SIGNature <integer>`
	`[:SENSe]:CDPower:PRACh:SIGNature?`
	`[:SENSe]:CDPower:PRACh:SIGNature:AUTO OFF | ON | 0 | 1`
	`[:SENSe]:CDPower:PRACh:SIGNature:AUTO?`

Example	`:CDP:PRAC:SIGN 2`
	`:CDP:PRAC:SIGN?`
	`:CDP:PRAC:SIGN:AUTO ON`
	`:CDP:PRAC:SIGN:AUTO?`

Notes	Sets Signature Auto mode to ON for PRACH Preamble detection
Dependencies	This command is effective when `[:SENSe]:RADio:DEVice` is set to MS, and `[:SENSe]:CDPower:SYNC:MS` is set to PMESsage
Preset	0 `ON`
State Saved	Yes Yes
Range	Auto|Man
Min/Max	0/15

Sync Start Slt

Toggles the Sync Start Slot state between on and off. Turning the Sync Start Slot parameter On and specifying the slot number to measure as the first slot, you can use any trigger (even “Free Run”) to get the measurement result beginning with the specified slot number.

Example 1

- Trigger Source: Free Run (Immediate)
- Sync Start Slot state : On
- Sync Start Slot number : 0
- Capture Interval : 1 frame

The synchronization always starts from slot number 0.0 to 15.0 regardless of the trigger type.

Example 2

If the Sync Start Slot state is set to Off, the measurement performs synchronization at any slot found right after the trigger timing.

Remote Command	`[:SENSe]:CDPower:SSLot:NUMBer <integer>`
	`[:SENSe]:CDPower:SSLot:NUMBer?`
	`[:SENSe]:CDPower:SSLot[:STATe] OFF | ON | 0 | 1`
	`[:SENSe]:CDPower:SSLot[:STATe]?`

Example	`:SENS:CDP:SSL:NUMB 5`
	`:SENS:CDP:SSL:NUMB?`
	`:SENS:CDP:SSL:STAT ON`
	`:SENS:CDP:SSL:STAT?`

Notes	Turn first slot number detection mode on or off
Preset	0 OFF
State Saved	Yes Yes
Range	0 to 14 OFF|ON
Min/Max	0/14

Freq Error Tol Range (MS only)

Specifies the frequency error tolerance range. You can select one of the following ranges:

- Normal
- Wide

Wide provides the wide range of the frequency error tolerance. To correctly demodulate signals of higher complexity, a reduced frequency tolerance is required. For example, composite number of channels is modulated on the test signal, the modulation is complex, and frequency error is very critical to demodulate correctly. Therefore, in such a case, to demodulate a complex signal, set this parameter to Normal.

Remote Command	`[:SENSe]:CDPower:FERRor:TRANge WIDE | NORMal` `[:SENSe]:CDPower:FERRor:TRANge?`
Example	`:CDP:FERR:TRAN WIDE` `:CDP:FERR:TRAN?`
Dependencies	This parameter is valid only when the device type is MS (Uplink). When the device type is BTS (Downlink), this control is not shown
Preset	`NORMal`
State Saved	Yes
Range	`WIDE|NORMal`

Primary Scramble Code (BTS only)

Sets a numeric value for the primary scramble code for synchronization.

- Autodetect - The instrument autodetects the primary scramble code. The result is also available using SCPI command, `:READ|FETCh:CDP19?` Available only when Sync Type for BTS is SCH or CPICH and Capture Interval is equal to or more than 1 frame. When Autodetect is not available, the result as detected primary scramble code is not valid
- Manual - You can specify the value for the primary scramble code. The range is 0 to 511

If the Device is set to MS, this label changes to Slot Format to define the DPCCH pilot pattern to synchronize with. It allows you to enter either 0 or 2 slot formats.

The BTS scramble code number (Down Link) is determined by “Primary Scramble Code”, “Scramble Code Offset” and “Scramble Code Type”.

The following information is an excerpt from TS25.213 Section 5.2.2 Scramble Code.

A total of 218-1 = 262,143 scrambling codes, numbered 0...262,142 can be generated. However, not all the scrambling codes are used. The scrambling codes are divided into 512 sets each of a primary scrambling code and 15 secondary scrambling codes.

The primary scrambling codes consist of scrambling codes n=16*i where i=0...511. The i:th set of secondary scrambling codes consists of scrambling codes 16*i+k, where k=1...15.

There is a one-to-one mapping between each primary scrambling code and 15 secondary scrambling codes in a set such that i:th primary scrambling code corresponds to i:th set of secondary scrambling codes.

Hence, according to the above, scrambling codes k = 0, 1, ..., 8191 are used. Each of these codes are associated with a left alternative scrambling code and a right alternative scrambling code, that may be used for compressed frames. The left alternative scrambling code corresponding to scrambling code k is scrambling code number k + 8192, while the right alternative scrambling code corresponding to scrambling code k is scrambling code number k + 16384. The alternative scrambling codes can be used for compressed frames. In this case, the left alternative scrambling code is used if n<SF/2 and the right alternative scrambling code is used if n^3SF/2, where cch,SF,n is the channelization code used for non-compressed frames. The usage of alternative scrambling code for compressed frames is signalled by higher layers for each physical channel respectively.

Primary Scramble Code corresponds to i (i=0 ... 511), Scramble Code Offset corresponds to k (k= 1 ... 15: Secondary Scramble Code, 0: Primary Scramble Code) and Scramble Code Type Left and Right correspond +8192 and +16384 offset respectively.

Remote Command	`[:SENSe]:CDPower:SYNC:SCRamble[:BTS] <integer>`
	`[:SENSe]:CDPower:SYNC:SCRamble[:BTS]?`
	`[:SENSe]:CDPower:SYNC:SCRamble[:BTS]:AUTO OFF | ON | 0 | 1`
	`[:SENSe]:CDPower:SYNC:SCRamble[:BTS]:AUTO?`

Example	`:CDP:SYNC:SCR 1`
	`:CDP:SYNC:SCR?`
	`:CDP:SYNC:SCR:AUTO 1`
	`:CDP:SYNC:SCR:AUTO?`

Notes	Autodetect is available when the following conditions are met: – Option N/W9073A-BFP (auto scramble code detection) is installed – `[:SENSe]:RADio:DEVice` is set to BTS – Sync Type for BTS is set to SCH or CPICH – Capture Interval is equal to or more than 1 frame
Dependencies	This command is effective when `[:SENSe]:RADio:DEVice` is set to BTS
Preset	0

	OFF
State Saved	Yes
Range	Auto Detect|Manual
Min/Max	0/511

Scramble Code (MS only)

Sets the MS scramble code for synchronization. When this control is selected, the "Hex Input" menu appears.

Remote Command	`[:SENSe]:CDPower:SYNC:SCRamble:MS <integer>` `[:SENSe]:CDPower:SYNC:SCRamble:MS?`
Example	`:CDP:SYNC:SCR:MS 0` `:CDP:SYNC:SCR:MS?`
Dependencies	This command is effective when [:SENSe]:RADio:DEVice is set to MS
Preset	0 (0x0; 24 bits)
State Saved	Yes
Min/Max	0 (0x0; 24 bits)/16777215 (0xFFFFFF; 24 bits)

Scramble Code Offset (BTS only)

Sets the number of the scramble code offset used in the measurement.

Remote Command	`[:SENSe]:CDPower:SYNC:SCRamble[:BTS]:OFFSet <integer>` `[:SENSe]:CDPower:SYNC:SCRamble[:BTS]:OFFSet?`
Example	`:CDP:SYNC:SCR:OFFS 1` `:CDP:SYNC:SCR:OFFS?`
Dependencies	This command is effective when `[:SENSe]:RADio:DEVice` is set to BTS. This command is not effective when `[:SENSe]:CDP:SYNC:SCRamble[:BTS]:AUTO` is set to ON
Preset	0
State Saved	Yes
Range	0 to 15 (0 for the primary scramble code; 1 to 15 for the secondary scramble code)
Min/Max	0/15

Scramble Code Type (BTS only)

Sets the BTS primary scramble code type for synchronization.

Sets the scramble code type to Std (standard), Left, or Right to make the measurement.

- LEFT – the left alternative scrambling code whose number is the primary scramble code number + 8192 is used
- RIGHt – the right alternative scrambling code whose number is the primary scrambling code number + 16384 is used
- STANdard – the standard scrambling code whose number is the primary scrambling code number is used

Remote Command	`[:SENSe]:CDPower:SYNC:SCRamble[:BTS]:TYPE LEFT | RIGHt | STANdard` `[:SENSe]:CDPower:SYNC:SCRamble[:BTS]:TYPE?`
Example	`:CDP:SYNC:SCR:TYPE LEFT` `:CDP:SYNC:SCR:TYPE?`
Dependencies	This command is effective when `[:SENSe]:RADio:DEVice` is set to BTS This command is not effective when `[:SENSe]:CDP:SYNC:SCRamble[:BTS]:AUTO` is set to ON
Preset	`STANdard`
State Saved	Yes
Range	`LEFT|RIGHt|STANdard`

Advanced Sync Setup

Enables you to access a dialog for advanced sync parameters.

Chip Rate

Changes the chip rate.

Remote Command	`[:SENSe]:CDPower:CRATe <freq>` `[:SENSe]:CDPower:CRATe?`
Example	`:CDP:CRAT 4000000` `:CDP:CRAT?`
Preset	3.84 MHz
State Saved	Yes
Min/Max	3.456 MHz/4.224 MHz

RRC Filter Control

Specifies the alpha value of the Root Raised Cosine (RRC) filter and changes its status (ON/OFF). This ON/OFF state change requires a measurement restart.

Remote Command	[:SENSe]:CDPower:FILTer:ALPHa <real> [:SENSe]:CDPower:FILTer:ALPHa? [:SENSe]:CDPower:FILTer[:RRC][:STATe] OFF | ON | 0 | 1 [:SENSe]:CDPower:FILTer[:RRC][:STATe]?
Example	:CDP:FILT:ALPH 0.3 :CDP:FILT:ALPH? :CDP:FILT ON :CDP:FILT?
Preset	0.22 ON
State Saved	Yes
Min/Max	0.01/0.50
Backwards Compatibility SCPI	[:SENSe]:CDPower:ALPHa

Spectrum Inversion

Toggles the spectrum function between Normal and Invert.

Invert: This function conjugates the spectrum, which is equivalent to taking the negative of the quadrature component in demodulation.

The correct setting (Normal or Invert) depends on whether the signal at the input of the instrument has a high or low side mix.

Remote Command	[:SENSe]:CDPower:SPECtrum INVert | NORMal [:SENSe]:CDPower:SPECtrum?
Example	:CDP:SPEC INV :CDP:SPEC?
Preset	NORMal
State Saved	Yes
Range	Normal|Invert

SCH Suppression

Subtracts the primary and secondary SCH power leakage from other code channels during the demodulation process in the instrument. This improves symbol EVM, magnitude error and phase error measurement accuracy. Downlink channels with low coding gain can suffer interference of primary and secondary SCH, because they are not orthogonal with other code channels. To correct this, the P-SCH and S-SCH power are calculated in the estimation ("Best Fitting") using MMSE, then they are subtracted from incoming signal before any other channels are demodulated.

Remote Command	`:CALCulate:CDPower:SSUPpress[:STATe] ON | OFF | 1 | 0` `:CALCulate:CDPower:SSUPpress[:STATe] ?`
Example	`:CALC:CDP:SSUP ON` `:CALC:CDP:SSUP?`
Dependencies	This control is available only when Device is BTS
Preset	ON
State Saved	Yes
Range	ON|OFF

MEQ (Equalizer Mode)

Sets the Equalizer mode as follows.

- Off: Equalizer is not active
- Normal: Equalizer is active (Mirror Frequency Spectrum is Off)
- Invert: Equalizer is active (Mirror Frequency Spectrum is On)

Remote Command	`[:SENSe]:CDPower:MEQ OFF | NORMal | INVert` `[:SENSe]:CDPower:MEQ?`
Example	`:CDP:MEQ OFF` `:CDP:MEQ?`
Dependencies	Available when Option BBA or N9073C-DP2 (or both), and N9073C-DFP are installed
Preset	OFF
State Saved	Yes
Range	OFF|NORMal|INVert

3.4.8.4 Time

This tab enables you to set time parameters.

Capture Interval

Accesses a menu that enables you to set the signal capture length for the code domain power measurement.

For details, see "Capture Interval Selection" on page 558.

For the associated remote command, see "Frame Capture Interval (Remote Command only)" on page 558.

Capture Interval Selection

Allows you to set the data capture length, from 1 slot to 16 frames, that will be used in the acquisition.

(1 frame = 10 ms)

Couplings	Changing this parameter forces a change: – 1 slot: 0.067 – 3 slots: 0.2 – 1 frame: 1.0 – 2 frames: 2.0 – 3 frames: 3.0 – 4 frames: 4.0 – frames: 8.0 – 16 frames: 16.0
Preset	1 frame
State Saved	Yes
Range	1 Slot|3 Slots|1 Frame|2 Frames|3 Frames|4 Frames|8 Frames|16 Frames

Frame Capture Interval (Remote Command only)

Sets the data capture length in frames (1 frame equals 10 ms) that will be used in the acquisition.

Remote Command	`[:SENSe]:CDPower:CAPTure:TIME[:FRAMe] <real>` `[:SENSe]:CDPower:CAPTure:TIME[:FRAMe]?`
Example	`:CDP:CAPT:TIME 1` `:CDP:CAPT:TIME?`
Preset	1
State Saved	Yes
Range	0.067 (any value below 1 is rounded to the nearest multiple of 0.067), 1.0, 2.0, 3.0, 4.0 and 8.0 and 16.0 frames (0.67 to 80 ms; 1/15 frame equals 1 slot). Other numeric values between 1 and 16 are rounded to the nearest integer; entries between integers are rounded up, excepting for entries above 16, which are rounded down to 16
Min/Max	0.067/16.0

Meas Offset

Sets the timing offset of measurement interval in slots. (1 slot = 666.6 us)

The sum of `:CALCulate:CDPower:SWEep:TIME` and `:CALCulate:CDPower:SWEep:OFFSet` must be equal to or less than `:SENSe:CDPower:CAPTure:TIME` * 15. If the sum exceeds this value, `:CALCulate:CDPower:SWEep:OFFSet` is adjusted automatically.

Remote Command	`:CALCulate:CDPower:SWEep:OFFSet <integer>` `:CALCulate:CDPower:SWEep:OFFSet?`
Example	`:CALC:CDP:SWE:OFFS 2` `:CALC:CDP:SWE:OFFS?`
Notes	The sum of Meas Offset and "Meas Interval" on page 559 must be equal to or less than Capture Interval. If the sum becomes more than the value, the "Meas Interval" on page 559 is adjusted automatically to Capture Interval – Meas Offset
Preset	0
State Saved	Yes
Min/Max	0/Capture Interval in slot - 1

Meas Interval

Sets the length of the measurement interval in slots (1 slot = 666.6us).

The sum of `:CALCulate:CDPower:SWEep:TIME` and `:CALCulate:CDPower:SWEep:OFFSet` must be equal to or less than `:SENSe:CDPower:CAPTure:TIME` * 15. If the sum exceeds this value, `:CALCulate:CDPower:SWEep:OFFSet` is adjusted automatically.

Remote Command	`:CALCulate:CDPower:SWEep:TIME <integer>` `:CALCulate:CDPower:SWEep:TIME?`
Example	`:CALC:CDP:SWE:TIME 2` `:CALC:CDP:SWE:TIME?`
Notes	The sum of "Meas Offset" on page 559and Meas Interval must be equal to or less than Capture Interval in slot If the sum is larger than the limit value, Meas Interval and/or "Meas Offset" on page 559 is adjusted automatically
Preset	1
State Saved	Yes
Min/Max	1/Capture Interval in slot

Capture Time Diagram

Accesses a diagram that enables you to set up time parameters.

3.4.8.5 Channel/Layer

This tab enables you to set channel/layer parameters.

Symbol Boundary (BTS only)

Opens a menu that enables you to specify the symbol boundary detection mode on downlink.

Available selections are as follows:

Auto Detect

Auto Detect [SCPI Enum: AUTO] - Select this to set the symbol boundary detection to the automatic mode. Various code channels are measured and the most appropriate code channel is selected as the reference channel.

Test Model 1

Test Model 1 - Accesses a menu with further selections of Test Model 1 with 4, 8, 16, 32 or 64 DPCH channels and with S-CCPCH

- Test Model 1 w/4DPCH w/ S-CCPCH [SCPI Enum: TM1D4] - Select this to set the Code Domain Power Measurement to the Test Model 1 with 4 DPCH channels and 1 S-CCPCH channel
- Test Model 1 w/8DPCH w/ S-CCPCH [SCPI Enum: TM1D8] - Select this to set the Code Domain Power Measurement to Test Model 1 with 8 DPCH channels and 1 S-CCPCH channel
- Test Model 1 w/16 DPCH w/ S-CCPCH [SCPI Enum: TM1D16] - Select this to set the Code Domain Power Measurement to the Test Model 1 with 16 DPCH channels and 1 S-CCPCH channel
- Test Model 1 w/32 DPCH w/ S-CCPCH [SCPI Enum: TM1D32] - Select this to set the Code Domain Power Measurement to Test Model 1 with 32 DPCH channels and 1 S-CCPCH channel
- Test Model 1 w/64 DPCH w/ S-CCPCH [SCPI Enum: TM1D64] - Select this to set the Code Domain Power Measurement to Test Model 1 with 64 DPCH channels and 1 S-CCPCH channel

3GPP TS25.141, Table 6.1: Test Model 1 (2009-12 version) (S-CCPCH included)

Type	Number of Channels	Fraction of Power (%)	Level setting (dB)	Channelization Code	Timing offset (x256Tchip)
P-CCPCH+SCH	1	10	-10	1	0
Primary CPICH	1	10	-10	0	0
PICH	1	1.6	-18	16	120
S-CCPCH containing PCH (SF=256)	1	1.6	-18	3	0
DPCH (SF=128)	4*/8*/16/32/64	76.8 in total	See 3GPP TS25.141 table 6.2	See 3GPP TS25.141 table 6.2	See 3GPP TS25.141 table 6.2

Table Note *: Only applicable to Home BS.

Test Model 2

Test Model 2 – Accesses a menu to allow selections of Test Model 2 with S-CCPCH.

– **Test Model 2 w/S-CCPCH** [SCPI Enum: TM2SC] – Select this to set the Code Domain Power measurement to Test Model 2 with 1 S-CCPCH channel

3GPP TS25.141, Table 6.3: Test Model 2 (2002-09 version) (S-CCPCH included)

Type	Number of Channels	Fraction of Power (%)	Level setting (dB)	Channelization Code	Timing offset (x256Tchip)
P-CCPCH+SCH	1	10	-10	1	0
Primary CPICH	1	10	-10	0	0
PICH	1	5	-13	16	120
S-CCPCH containing PCH (SF=256)	1	5	-13	3	0
DPCH (SF=128)	3	2 x 10, 1 x 50	2 x –10, 1 x –3	24, 72, 120	1, 7, 2

Test Model 3

Test Model 3 – Accesses a menu to allow further selections from Test Model 3 with 16 or 32 DPCH channels, and with S-CCPCH.

– **Test Model 3 w/4 DPCH w/ S-CCPCH** [SCPI Enum: TM3D4SC] – Select this to set the Code Domain Power Measurement to Test Model 3 with 4 DPCH channels and 1 S-CCPCH channel

- **Test Model 3 w/8 DPCH w/ S-CCPCH** [SCPI Enum: TM3D8SC] - Select this to set the Code Domain Power Measurement to Test Model 3 with 8 DPCH channels and 1 S-CCPCH channel
- **Test Model 3 w/16 DPCH w/ S-CCPCH** [SCPI Enum: TM3D16SC] - Select this to set the Code Domain Power measurement to Test Model 3 with 16 DPCH channels and 1 S-CCPCH channel
- **Test Model 3 w/32 DPCH w/ S-CCPCH** [SCPI Enum: TM3D32SC] - Select this to set the Code Domain Power measurement to Test Model 3 with 32 DPCH channels and 1 S-CCPCH channel

3GPP TS25.141, Table 6.4: Test Model 3 (2009-12 version) (S-CCPCH included)

Type	Number of Channels	Fraction of Power (%) 16/32	Level settings (dB) 16/32	Channelization Code	Timing offset (x256Tchip)
P-CCPCH+SCH	1	15,8/15,8/12,6/7,9	-8/ -8 / -9 / -11	1	0
Primary CPICH	1	15.8/15.8/12,6/7,9	-8 / -8 / -9 / -11	0	0
PICH	1	2.5/2.5/5/1.6	-16/-16/-13/-18	16	120
S-CCPCH containing PCH (SF=256)	1	2.5/2.5/5/1.6	-16/-16/-13/-18	3	0
DPCH (SF=256)	4*/8*/16/32	63,4/63,4/63,7/80,4 in total	See 3GPP TS25.141 table 6.5	See 3GPP TS25.141 table 6.5	See 3GPP TS25.141 table 6.5

Table Note *: Only applicable to Home BS

Test Model 4

Test Model 4 - Accesses a menu to allow further selections of Test Model 4.

- **Test Model 4 w/P-CPICH** [SCPI Enum: TM4CP] - Select this to set the Code Domain Power measurement to Test Model 4 with 1 CPICH channel
- **Test Model 4** [SCPI Enum: TM4] - Select this to set the Code Domain Power measurement to Test Model 4 (no CPICH channel)

3GPP TS25.141, Table 6.6: Test Model 4 Active Channels (2001-09 version)

Type	Number of Channels	Fraction of Power (%)	Level setting (dB)	Channelization Code	Timing offset	Type
PCCPCH+SCH	1	50 to 1.6	-3 to -18	1	0	PCCPCH+SCH
Primary CPICH[1]	1	10	-10	0	0	Primary CPICH[1]

Table Note 1: The CPICH channel is optional.

Test Model 5

Test Model 5 - Accesses a menu with further selections of Test Model 5. This feature is available when ‘HSPA Enable’ is on.

- Test Model 5 w/2 HS-PDSCH w/6 DPCH [SCPI Enum: TM5H2] - Select this to set the Code Domain Power measurement to Test Model 5 with 2 HS-PDSCH channels and 6 DPCH channels
- Test Model 5 w/4 HS-PDSCH w/14 DPCH [SCPI Enum: TM5H4] - Select this to set the Code Domain Power measurement to Test Model 5 with 4 HS-PDSCH channels and 14 DPCH channels
- Test Model 5 w/8 HS-PDSCH w/30 DPCH [SCPI Enum: TM5H8] - Select this to set the Code Domain Power measurement to Test Model 5 with 8 HS-PDSCH channels and 30 DPCH channels
- Test Model 5 w/4 HS-PDSCH w/4 DPCH [SCPI Enum: TM5D4] - Select this to set the Code Domain Power Measurement to Test Model 5 with 4 HS-PDSCH channels and 4 DPCH channels
- Enables you to select one from a variety of configurations using Test Model 5. This feature is available when ‘HSPA Enable’ is on

3GPP TS25.141, Table 6.6A: Test Model 5 Active Channels (2009-12 version)

Type	Number of Channels	Fraction of Power (%)	Level setting (dB)	Channelization Code	Timing offset (x256Tchip)
P-CCPCH+SCH	1	7.9	-11	1	0
Primary CPICH	1	7.9	-11	0	0
PICH	1	1.3	-19	16	120
S-CCPCH containing PCH (SF=256)	1	1.3	-19	3	0
DPCH	30/14/6/4	14/14.2/14.4/14.	See 3GPP	See 3GPP	See 3GPP

Type	Number of Channels	Fraction of Power (%)	Level setting (dB)	Channelization Code	Timing offset (x256Tchip)
(SF=128)	(*)	2 in total	TS25.141 table 6.6.B	TS25.141 table 6.6B	TS25.141 table 6.6.B
HS-SCCH	2	4 in total	See 3GPP TS25.141 table 6.6C	See 3GPP TS25.141 table 6.6C	See 3GPP TS25.141 table 6.6C
HS-PDSCH (16QAM)	8/4/2(*)	63.6/63.4/63.2 in total	See 3GPP TS25.141 table 6.6D	See 3GPP TS25.141 table 6.6D	See 3GPP TS25.141 table 6.6D

Table Note *: 2 HS-PDSCH shall be taken together with 6 DPCH, 4 HS-PDSCH shall be taken with 14 DPCH or (for Home BS only) 4 DPCH, and 8 HS-PDSCH shall be taken together with 30 DPCH.

Test Model 6

Test Model 6 – Accesses a menu with further selections of Test Model 6. This feature is available when both 'HSPA Enable' and 'HSPA+ Enable' are on.

- **Test Model 6 w/8 HS-PDSCH w/30 DPCH** [SCPI Enum: TM6H8] – Select this to set the Code Domain Power measurement to Test Model 6 with 8 HS-PDSCH channels and 30 DPCH channels
- **Test Model 6 w/4 HS-PDSCH w/4 DPCH** [SCPI Enum: TM6D4] – Select this to set the Code Domain Power measurement to Test Model 6 with 4HS-PDSCH channels and 4 DPCH channels

3GPP TS25.141 Table 6.6E: Test Model 6 Active Channels

Type	Number of Channels	Fraction of Power (%)	Level setting (dB)	Channelization Code	Timing offset (x256Tchip)
P-CCPCH+SCH	1	7.9	-11	1	0
Primary CPICH	1	7.9	-11	0	0
PICH	1	1.3	-19	16	120
S-CCPCH containing PCH (SF=256)	1	1.3	-19	3	0
DPCH (SF=128)	30/4*	27.1 in total	See 3GPP TS25.141 table 6.6F	See 3GPP TS25.141 table 6.6F	See 3GPP TS25.141 table 6.6F
HS-SCCH	2	4 in total	See 3GPP TS25.141 table 6.6G	See 3GPP TS25.141 table 6.6G	See 3GPP TS25.141 table 6.6G

Type	Number of Channels	Fraction of Power (%)	Level setting (dB)	Channelization Code	Timing offset (x256Tchip)
HS-PDSCH (64QAM)	8/4*	50.5 in total	See 3GPP TS25.141 table 6.6H	See 3GPP TS25.141 table 6.6H	See 3GPP TS25.141 table 6.6H

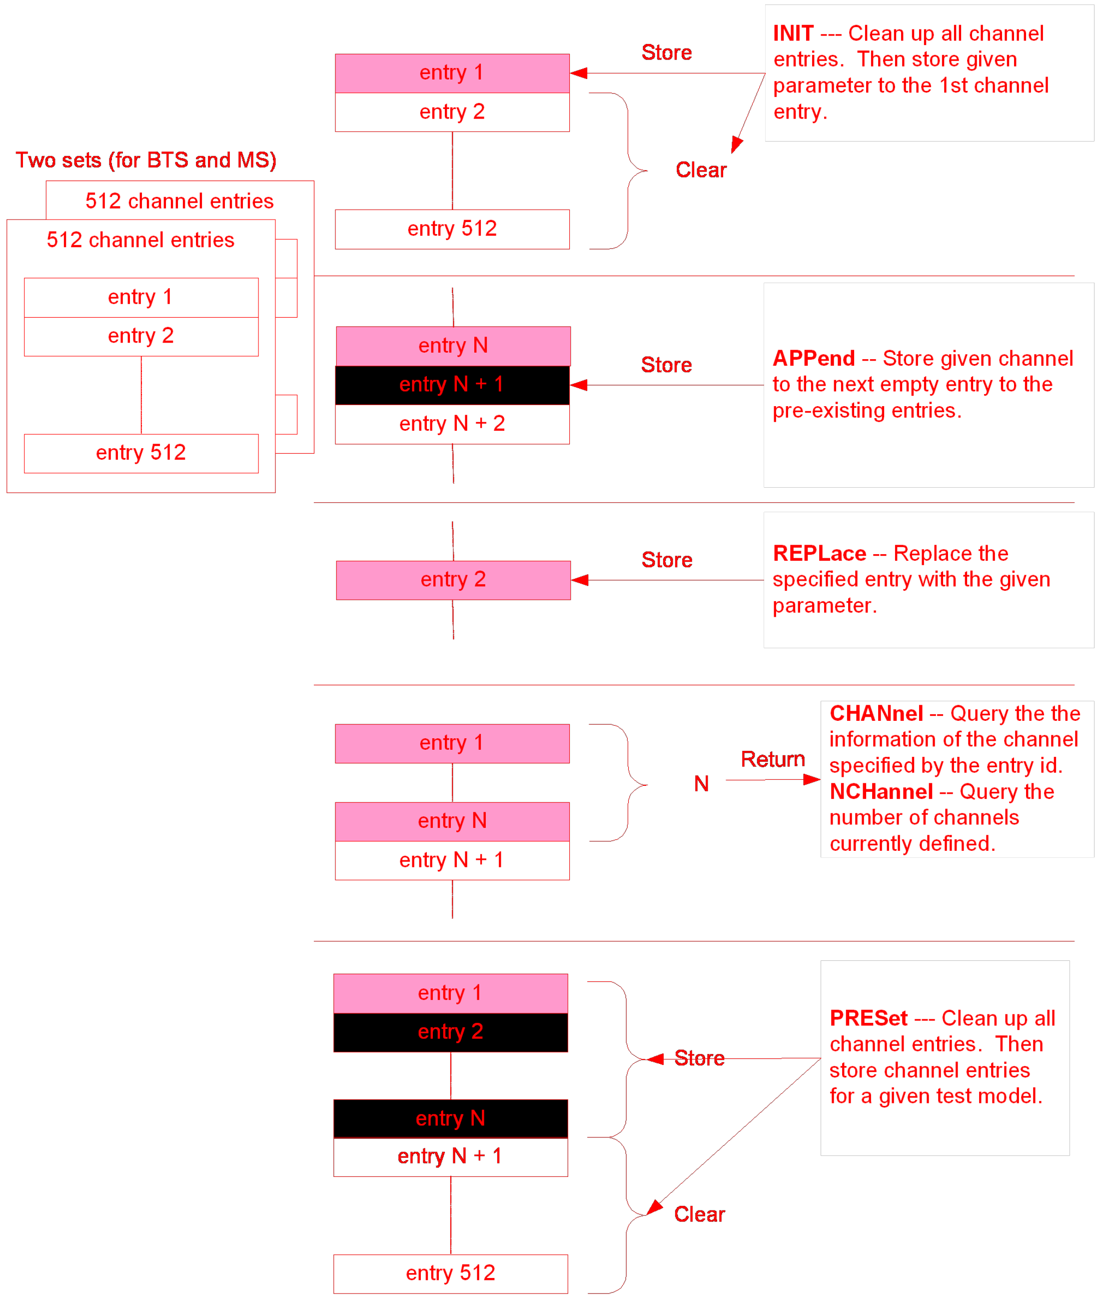
Table Note *: 8 HS-PDSCH shall be taken together with 30 DPCH, and (for Home BS only) 4 HS-PDSCH shall be taken with 4 DPCH.

Custom

Custom [SCPI Enum: CUSTom] – Provides a flexible way to specify predefined active channels. By choosing it, you can specify a customized list of active channels using the following remote command: Initialize List, Append List and Replace List.

The following commands handle the list of the custom active channel list for BTS.

- **INIT** – Cleans up all channel entries. Then stores given parameter to the 1st channel entry. See "Initialize List (Remote Command Only)" on page 566
- **APPend** – Stores given channel to the next empty entry to the pre-existing entries. See "Append List (Remote Command Only)" on page 569
- **REPLace** - Replaces the specified entry with the given parameter. See "Replace List (Remote Command Only)" on page 571
- **CHANnel** – Queries the information of the channel specified by the entry id. See "Query List (Remote Command Only)" on page 574
- **NCHannel** - Queries the number of channels currently defined. See "Symbol Boundary Custom Active Channel List – Number Of Entries BTS (Remote Command Only)" on page 575
- **PRESet** – Cleans up all channel entries. Then stores channel entries for a given test model. See "Symbol Boundary Custom Active Channel List – Load Preset Setting BTS (Remote Command Only)" on page 576



Initialize List (Remote Command Only)

Initializes the current custom active channel list. This creates a new entry with the given parameter.

Parameter	Name/Value	Description
1	<symbol_rate>	Specifies symbol rate of the channel

Parameter	Name/Value	Description
2	<code_num>	Specifies code number of the channel
3	QPSK	Specifies the channel's modulation scheme is QPSK
	QAM16	Specifies the channel's modulation scheme is QAM16 This choice is available only for channels with symbol rate 240000 Only when 'HSPA' functionality is enabled, 'QAM16' parameter is allowed
	QAM64	Specifies the channel's modulation scheme is QAM64 This choice is available only for channels with symbol rate 240000 Only when both 'HSPA' functionality and 'HSPA+' functionality are enabled, 'QAM64' parameter is allowed

Remote Command	`[:SENSe]:CDPower:SBOundary:LIST[:BTS]:INIT <symbol_rate>, <code_num>, QPSK | QAM16 | QAM64`

Example	In order to predefine the following channels:
	- CPICH (C8(0))
	- P-CCPCH (C8(1))
	- S-CCPCH(C8(3))
	- PICH(C8(16))
	- HS-DPCCH (C4(15)) 16QAM modulated
	`:CDP:SBO:LIST:INIT 15000,0, QPSK`
	`:CDP:SBO:LIST:APP 15000,1, QPSK`
	`:CDP:SBO:LIST:APP 15000,3, QPSK`
	`:CDP:SBO:LIST:APP 15000,16, QPSK`
	`:CDP:SBO:LIST:APP 240000,15, QAM16`
	`:CDP:SBO:LIST:NCH?`
	5
	`:CDP:SBO:LIST:CHAN? 1`
	15000,0, QPSK
	`:CDP:SBO:LIST:CHAN? 2`
	15000,1, QPSK
	`:CDP:SBO:LIST:CHAN? 3`
	15000,3, QPSK
	`:CDP:SBO:LIST:CHAN? 4`
	15000,16, QPSK
	`:CDP:SBO:LIST:CHAN? 5`

	240000,15, QAM16

Notes	Error messages associated with this parameter
	One of the following error messages is logged if the given parameter is invalid
	If an error is reported, the SCPI command is rejected and instrument's settings do not change
	(1) "Missing Parameter"
	This error is reported if the number of parameters is less than 3
	For example,
	`:SENSe:CDPower:SBOundary:LIST:BTS:INIT, 15000, 0`
	The 3rd parameter is missing.
	(2) "Illegal parameter value"
	This error is reported if parameter type is invalid or if enum value is invalid.
	For example,
	`:SENSe:CDPower:SBOundary:LIST:BTS:INIT, 15000, ON, QPSK`
	The 2nd parameter must be integer
	`:SENSe:CDPower:SBOundary:LIST:BTS:INIT 15001, 8, QPSK`
	1st parameter value (Symbol Rate) is not allowed
	Only the values given in Range field are valid for the Symbol Rate. You may specify these in numeric form, but they are interpreted as an enumeration and the error results if the value does not translate to one in the list
	(3) "Data out of range"
	This error is reported if parameter value is out of range
	For example,
	`:SENSe:CDPower:SBOundary:LIST:BTS:INIT 15000, 256, QPSK`
	The 2nd parameter is out of range
	1. "Setting Conflict"
	This error is reported if the given code channel overlaps other code channel on code domain
	For example, if a user sends the following two commands, the second command causes the error message because C7(0) overlaps C8(0)
	`:SENSe:CDPower:SBOundary:LIST:BTS:INIT 15000, 0, QPSK`
	The example above is OK
	`:SENSe:CDPower:SBOundary:LIST:BTS:APPend 30000, 0, QPSK`
	C7(0) overlaps C8(0)

Dependencies	(1) This command is effective when `[:SENSe]:RADio:DEVice` is set to BTS and `[:SENSe]:CDPower:SBOundary[:BTS]` is set to CUSTom (2) QAM16 for the 3rd parameter is available only when HSPA Enable is On QAM64 for the 3rd parameter is available only when both HSPA Enable and HSPA+ Enable are on
State Saved	Yes
Range	symbol_rate = 7500|15000|30000|60000|120000|240000|480000|960000

0<= code_num <= 511 if symbol_rate = 7500

0<= code_num <= 255 if symbol_rate = 15000

0<= code_num <= 127 if symbol_rate = 30000

0<= code_num <= 63 if symbol_rate = 60000

0<= code_num <= 31 if symbol_rate = 120000

0<= code_num <= 15 if symbol_rate = 240000

0<= code_num <= 7 if symbol_rate = 480000

0<= code_num <= 3 if symbol_rate = 960000

QAM16 and QAM64 for the 3rd parameter available only for channels with symbol rate 240000. For other channels, specify QPSK

Append List (Remote Command Only)

Appends the entry on the list of custom active channel list for BTS.

Parameter	Name/Value	Description
1	<symbol_rate>	Specifies symbol rate of the channel
2	<code_num>	Specifies code number of the channel
3	QPSK	Specifies the channel's modulation scheme is QPSK
	QAM16	Specifies the channel's modulation scheme is QAM16 This choice is available only for channels with symbol rate 240000 Only when 'HSPA' functionality is enabled, 'QAM16' parameter is allowed
	QAM64	Specifies the channel's modulation scheme is QAM64 This choice is available only for channels with symbol rate 240000. Only when both 'HSPA' functionality and 'HSPA+' functionality are enabled, 'QAM64' is valid to select

Remote Command	`[:SENSe]:CDPower:SBOundary:LIST[:BTS]:APPend <symbol_rate>, <code_num>, QPSK | QAM16 | QAM64`

Example	In order to predefine the following channels:
	- CPICH (C8(0))
	- P-CCPCH (C8(1))
	- S-CCPCH(C8(3))
	- PICH(C8(16))
	- HS-DPCCH (C4(15)) 16QAM modulated
	`:CDP:SBO:LIST:INIT 15000,0, QPSK`
	`:CDP:SBO:LIST:APP 15000,1, QPSK`
	`:CDP:SBO:LIST:APP 15000,3, QPSK`
	`:CDP:SBO:LIST:APP 15000,16, QPSK`

	`:CDP:SBO:LIST:APP 240000,15, QAM16`
	`:CDP:SBO:LIST:NCH?`
	5
	`:CDP:SBO:LIST:CHAN? 1`
	15000,0, QPSK
	`:CDP:SBO:LIST:CHAN? 2`
	15000,1, QPSK
	`:CDP:SBO:LIST:CHAN? 3`
	15000,3, QPSK
	`:CDP:SBO:LIST:CHAN? 4`
	15000,16, QPSK
	`:CDP:SBO:LIST:CHAN? 5`
	240000,15, QAM16

Notes	The maximum number of entries is 512
	Error messages associated with this parameter
	One of the following error messages is logged if the given parameter is invalid
	If an error is reported, the SCPI command is rejected and the instrument's settings do not change
	(1) "Missing Parameter"
	This error is reported if the number of parameters is less than 4
	For example,
	`:SENSe:CDPower:SBOundary:LIST:BTS:APPend, 15000, 0`
	The 3rd parameter is missing
	(2) "Illegal parameter value"
	This error is reported if parameter type is invalid or if enum value is invalid
	For example,
	`:SENSe:CDPower:SBOundary:LIST:BTS:APPend 15000, ON, QPSK`
	The 2nd parameter must be an integer
	`:SENSe:CDPower:SBOundary:LIST:BTS:APPend, 15001, 8, QPSK`
	The 1st parameter value (Symbol Rate) is not allowed
	Only the values given in Range field are valid for the Symbol Rate. You may specify these in numeric form, but they are interpreted as an enumeration and the error results if the value does not translate to one in the list
	(3) "Data out of range"
	This error is reported if parameter value is out of range
	For example,
	`:SENSe:CDPower:SBOundary:LIST:BTS:APPend 15000, 256, QPSK`
	The 2nd parameter is out of range

	1. "Setting Conflict"
	This error is reported if the given code channel overlaps other code channel on code domain
	For example, if a user sends the following two commands, the second command causes the error message because C7(0) overlaps C8(0)
	`:SENSe:CDPower:SBOundary:LIST:BTS:INIT, 15000, 0, QPSK`
	The example above is OK
	`:SENSe:CDPower:SBOundary:LIST:BTS:APPend 30000, 0, QPSK`
	C7(0) overlaps C8(0)

Dependencies	This command is effective when [:SENSe]:RADio:DEVice is set to BTS and [:SENSe]:CDPower-:SBOundary[:BTS] is set to CUSTom QAM16 for the 3rd parameter is available only when HSPA Enable is On QAM64 for the 3rd parameter is available only when both HSPA Enable and HSPA+ Enable are on
State Saved	Yes
Range	symbol_rate = 7500|15000|30000|60000|120000|240000|480000|960000 0<= code_num <= 511 if symbol_rate = 7500 0<= code_num <= 255 if symbol_rate = 15000 0<= code_num <= 127 if symbol_rate = 30000 0<= code_num <= 63 if symbol_rate = 60000 0<= code_num <= 31 if symbol_rate = 120000 0<= code_num <= 15 if symbol_rate = 240000 0<= code_num <= 7 if symbol_rate = 480000 0<= code_num <= 3 if symbol_rate = 960000 QAM16 andQAM64 for the 3rd parameter available only for channels with symbol rate 240000. For other channels, specify QPSK

Replace List (Remote Command Only)

Replaces the entry of the custom active channel list for BTS.

Parameter	Name/Value	Description
1	<entry_id>	Specifies entry ID of the channel to replace
2	<symbol_rate>	Specifies symbol rate of the channel
3	<code_num>	Specifies code number of the channel

Parameter	Name/Value	Description
4	QPSK	Specifies the channel's modulation scheme is QPSK
	QAM16	Specifies the channel's modulation scheme is QAM16 This choice is available only for channels with symbol rate 240000 Only when 'HSPA' functionality is enabled, 'QAM16' parameter is allowed
	QAM64	Specifies the channel's modulation scheme is QAM64 This choice is available only for channels with symbol rate 240000 Only when both 'HSPA' functionality and 'HSPA+' functionality are enabled, 'QAM64' is valid to select

Remote Command	`[:SENSe]:CDPower:SBOundary:LIST[:BTS]:REPLace <entry_id>, <symbol_rate>, <code_num>, QPSK | QAM16 | QAM64`

Example	In order to predefine the following channels:
	- CPICH (C8(0))
	- P-CCPCH (C8(1))
	- S-CCPCH(C8(3))
	- PICH(C8(16))
	- HS-DPCCH (C4(15)) 16QAM modulated
	`:CDP:SBO:LIST:INIT 15000,0, QPSK`
	`:CDP:SBO:LIST:APP 15000,1, QPSK`
	`:CDP:SBO:LIST:APP 15000,3, QPSK`
	`:CDP:SBO:LIST:APP 15000,16, QPSK`
	`:CDP:SBO:LIST:APP 240000,15, QAM1`
	And, P-CCPCH(C8(3)) is replaced as follows.
	`:CDP:SBO:LIST:REPLA 3,15000,5,QPSK`
	`:CDP:SBO:LIST:NCH?`
	5
	`:CDP:SBO:LIST:CHAN? 1`
	15000,0, QPSK
	`:CDP:SBO:LIST:CHAN? 2`
	15000,1, QPSK
	`:CDP:SBO:LIST:CHAN? 3`
	15000,5, QPSK
	`:CDP:SBO:LIST:CHAN? 4`

	15000,16, QPSK `:CDP:SBO:LIST:CHAN? 5` 240000,15, QAM16

Notes	The maximum number of entries is 512
	Error messages associated with this parameter
	One of the following error messages is logged if the given parameter is invalid
	If an error is reported, the SCPI command is rejected and the instrument's settings do not change
	(1) "Missing Parameter"
	This error is reported if the number of parameters is less than 4
	For example,
	`:SENSe:CDPower:SBOundary:LIST:BTS:REPLace 1,15000, 0`
	The 4th parameter is missing.
	(2) "Illegal parameter value"
	This error is reported if parameter type is invalid or if enum value is invalid
	For example,
	`:SENSe:CDPower:SBOundary:LIST:BTS:REPLace 1,15000, ON, QPSK`
	The 3rd parameter must be an integer.
	`:SENSe:CDPower:SBOundary:LIST:BTS:REPLace 1,15001, 8, QPSK`
	The 2nd parameter value (Symbol Rate) is not allowed
	Only the values given in Range field are valid for the Symbol Rate. You may specify these in numeric form, but they are interpreted as an enumeration and the error results if the value does not translate to one in the list
	3. "Data out of range"
	This error is reported if parameter value is out of range
	For example,
	`:SENSe:CDPower:SBOundary:LIST:BTS:REPLace 1,15000, 256, QPSK`
	The 3rd parameter is out of range
	4. "Setting Conflict"
	This error is reported if the given code channel overlaps other code channel on code domain
	For example, if a user sends the following two commands, the second command causes the error message because C7(0) overlaps C8(0)
	`:SENSe:CDPower:SBOundary:LIST:BTS:INIT 15000, 0, QPSK`
	The example above is OK
	`:SENSe:CDPower:SBOundary:LIST:BTS:REPLace 1,30000, 0, QPSK`
	C7(0) overlaps C8(0)

Dependencies	This command is effective when `[:SENSe]:RADio:DEVice` is set to BTS and `[:SENSe]:CDPower:SBOundary[:BTS]` is set to CUSTom QAM16 for the 4th parameter is available only when HSPA Enable is On

	QAM64 for the 4th parameter is available only when both HSPA Enable and HSPA+ Enable are on
State Saved	Yes
Range	The entry ID must be: 1 <= entry_id <= The number of entries that have been defined (see "Test Model 1" on page 560) symbol_rate = 7500|15000|30000|60000|120000|240000|480000|960000 0<= code_num <= 511 if symbol_rate = 7500 0<= code_num <= 255 if symbol_rate = 15000 0<= code_num <= 127 if symbol_rate = 30000 0<= code_num <= 63 if symbol_rate = 60000 0<= code_num <= 31 if symbol_rate = 120000 0<= code_num <= 15 if symbol_rate = 240000 0<= code_num <= 7 if symbol_rate = 480000 0<= code_num <= 3 if symbol_rate = 960000 QAM16and QAM64 for the 4th parameter available only for channels with symbol rate 240000. For other channels, specify QPSK

Query List (Remote Command Only)

Returns the entry of the custom active channel list for BTS.

Parameter	Name	Description
1	<entry_id>	Specifies entry ID of the channel to query

Remote Command	`[:SENSe]:CDPower:SBOundary:LIST[:BTS]:CHANnel? <entry_id>`

Example	In order to predefine the following channels:
	- CPICH (C8(0))
	- P-CCPCH (C8(1))
	- S-CCPCH(C8(3))
	- PICH(C8(16))
	- HS-DPCCH (C4(15)) 16QAM modulated
	`:CDP:SBO:LIST:INIT 15000,0, QPSK`
	`:CDP:SBO:LIST:APP 15000,1, QPSK`
	`:CDP:SBO:LIST:APP 15000,3, QPSK`
	`:CDP:SBO:LIST:APP 15000,16, QPSK`
	`:CDP:SBO:LIST:APP 240000,15, QAM16`
	`:CDP:SBO:LIST:NCH?`
	5
	`:CDP:SBO:LIST:CHAN? 1`

	15000,0, QPSK
	`:CDP:SBO:LIST:CHAN? 2`
	15000,1, QPSK
	`:CDP:SBO:LIST:CHAN? 3`
	15000,5, QPSK
	`:CDP:SBO:LIST:CHAN? 4`
	15000,16, QPSK
	`:CDP:SBO:LIST:CHAN? 5`
	240000,15, QAM16

Notes	The maximum number of entries is 512
	Default value of the parameter
	By default, there is one channel defined. (CPICH C8(0))
	In order to query the default entry, specify 1 for <entry_id>:
	`:SENSe:CDPower:SBOundary:LIST:BTS:CHANnel? 1`
	The instrument returns an array of three values:
	15000, 0, QPSK
	Query command needs <entry_id> parameter
	<entry_id> parameter is always required for query command
	The range of the parameter is from 1 to the total number of channels you have defined. For example, if you have defined two channels, you can query them as follows:
	`:SENSe:CDPower:SBOundary:LIST:BTS:CHANnel? 1`
	`:SENSe:CDPower:SBOundary:LIST:BTS:CHANnel? 2`
	If you want to know the number of channels you have defined, send the following query command:
	`:SENSe:CDPower:SBOundary:LIST:BTS:NCHannels?`

Dependencies	This command is effective when `[:SENSe]:RADio:DEVice` is set to BTS and `[:SENSe]:CDPower:SBOundary[:BTS]` is set to CUSTom QAM16 for the 4th parameter is available only when HSPA Enable is On QAM64 for the 4th parameter is available only when both HSPA Enable and HSPA+ Enable are on
Preset	15000, 0, QPSK
State Saved	Yes
Range	The entry ID must be: 1 <= entry_id <= The number of entries that have been defined. (See "Symbol Boundary Custom Active Channel List – Number Of Entries BTS (Remote Command Only)" on page 575)

Symbol Boundary Custom Active Channel List – Number Of Entries BTS (Remote Command Only)

Returns the number of entries in the custom predefined active channel list for BTS.

Remote Command	`[:SENSe]:CDPower:SBOundary:LIST[:BTS]:NCHannels?`

Example	`:SENS:CDP:SBO:LIST:BTS:NCH?`
Notes	This command is a query-only command
Dependencies	This command is effective when `[:SENSe]:RADio:DEVice` is set to BTS and `[:SENSe]:CDPower:SBOundary[:BTS]` is set to CUSTom
Preset	1
State Saved	No

Symbol Boundary Custom Active Channel List - Load Preset Setting BTS (Remote Command Only)

Loads preset setting to the custom active channel list for BTS.

Remote Command	`[:SENSe]:CDPower:SBOundary:LIST[:BTS]:PRESet TM1D16 | TM1D32 | TM1D64 | TM1D16SC | TM1D32SC | TM1D64SC | TM2 | TM2SC | TM3D16 | TM3D32 | TM3D16SC | TM3D32SC | TM4 | TM4CP | TM5H2 | TM5H4 | TM5H8 | TM6H8`
Example	`:SENS:CDP:SBO:LIST:BTS:PRES TM1D64`
Notes	This is a query-only command
Dependencies	(1) This command is effective when `[:SENSe]:RADio:DEVice` is set to BTS and `[:SENSe]:CDPower:SBOundary[:BTS]` is set to CUSTom (2) TM5H2, TM5H4, TM5H8 parameters are allowed if HSPA Enable is On (3)TM6H8 parameter is allowed if HSPA+ Enable is On
State Saved	No
Range	`TM1D16|TM1D32|TM1D64|TM1D16SC|TM1D32SC|TM1D64SC| TM2 | TM2SC | TM3D16 | TM3D32 | TM3D16SC | TM3D32SC | TM4 | TM4CP | TM5H2 | TM5H4 | TM5H8 | TM6H8`

Remote Command	`[:SENSe]:CDPower:SBOundary[:BTS] AUTO | TM1D4SC | TM1D8SC | TM1D16 | TM1D32 | TM1D64 | TM1D16SC | TM1D32SC | TM1D64SC | TM2 | TM2SC | TM3D4SC | TM3D8SC | TM3D16 | TM3D32 | TM3D16SC | TM3D32SC | TM4 | TM4CP | TM5H2 | TM5H4 | TM5H8 | TM5D4 | TM6H8 | TM6D4 | CUSTom` `[:SENSe]:CDPower:SBOundary[:BTS]?`
Example	`:CDP:SBO:BTS TM1D16` `:CDP:SBO:BTS?`
Notes	The reason that TM5H2, TM5H4 and TM5H8 have been selected is to align the enumerations with those of ESG For Test Model 5, W-CDMA HSPA option license is necessary to make parameters available. In addition, you must enable W-CDMA HSPA option functionality. Otherwise, this parameter is not available --- Test Model 5 is inactive (grayed out) and SCPI commands for Test Model 5 have no effect For Test Model 6, both W-CDMA HSPA+ option (N9073C-3FP) and W-CDMA HSPA option (N9073C-2FP) license are necessary to make the parameter available In addition, you must enable W-CDMA HSPA+ option functionality. Otherwise Test Model 6 is inactive

	(grayed out) and SCPI commands for Test Model 6 have no effect According to the 3GPP standard change for the test model, S-CCPCH needs to be supported in each test model. Therefore, for backward compatibility, the command of the test model is aliased as follows: TM1D16 -> TM1D16SC TM1D32 -> TM1D32SC TM1D64 -> TM1D64SC TM2 -> TM2SC TM3D16 -> TM3D16SC TM3D32 -> TM3D32SC
Dependencies	This command is effective when `[:SENSe]:RADio:DEVice` is set to BTS
Preset	`AUTO`
State Saved	Yes

Symbol Boundary (MS only)

Selects the symbol boundary detection mode for MS. Accesses the selection menu for the symbol boundary detection modes to specify active channel detection scheme on uplink.

Auto Detect

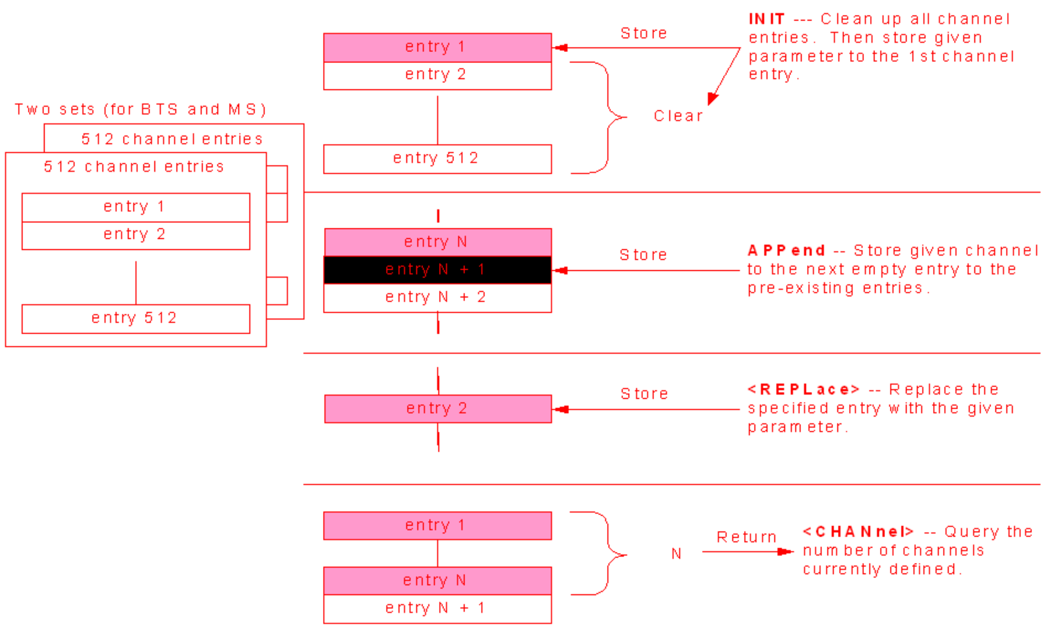
Auto Detect [SCPI Enum: `AUTO`] – Sets the symbol boundary detection to the automatic mode. Various code channels are measured and the most appropriate code channel is selected as the reference channel.

Custom

Custom [SCPI Enum: `CUSTom`] –Provides a flexible way to specify predefined active channels. By choosing it, you can specify a customized list of active channels using the following remote commands: Initialize List, Append List and Replace List.

The following commands handle the list of the custom active channel list for MS.

- INIT – Cleans up all channel entries. Then stores given parameter to the 1st channel entry. See "Initialize List (Remote Command Only)" on page 578
- APPend – Stores given channel to the next empty entry to the pre-existing entries. See "Append List (Remote Command Only)" on page 580
- REPLace - Replaces the specified entry with the given parameter. See "Replace List (Remote Command Only)" on page 581
- CHANnel – Queries the information of the channel specified by the entry id. See "Query List (Remote Command Only)" on page 583
- NCHannel - Queries the number of channels currently defined



Initialize List (Remote Command Only)

Initializes the current custom active channel list. This creates a new entry with the given parameter.

Parameter	Name/Value	Description
1	<symbol_rate>	Specifies symbol rate of the channel
2	<code_num>	Specifies spreading code of the channel
3	IPH	Specifies the channel is on I-axis
	QPH	Specifies the channel Is on Q-axis

Remote Command	`[:SENSe]:CDPower:SBOundary:LIST:MS:INIT <symbol_rate>, <code_num>, IPH | QPH`

Example	In order to predefine the following channels:
	- DPCCH (C8(0):Q)
	- DPDCH (C6(16):I)
	`:CDP:SBO:LIST:MS:INIT 15000, 0, QPH`
	`:CDP:SBO:LIST:MS:APP 60000, 16, IPH`
	`:CDP:SBO:LIST:MS:NCH?`
	2
	`:CDP:SBO:LIST:MS:CHAN? 1`

	15000, 0, QPH `:CDP:SBO:LIST:MS:CHAN? 2` 60000, 16, IPH

Notes	The maximum number of entries is 512
	One of the following error messages is logged if the given parameter is invalid
	If an error is reported, the SCPI command is rejected and the instrument’s settings do not change
	(1) “Missing Parameter”
	This error is reported if the number of parameters is less than 3
	For example,
	`:SENSe:CDPower:SBOundary:LIST:MS:INIT 15000, 0`
	The 3rd parameter is missing
	(2) “Illegal parameter value”
	This error is reported if parameter type is invalid or if enum value is invalid
	For example,
	`:SENSe:CDPower:SBOundary:LIST:MS:INIT 15000, ON, QPH`
	The 2nd parameter must be an integer
	`:SENSe:CDPower:SBOundary:LIST:MS:INIT 15001, 0, QPH`
	The 1st parameter value (Symbol Rate) is not allowed
	Only the values given in Range field are valid for the Symbol Rate. You may specify these in numeric form, but they are interpreted as an enumeration and the error results if the value does not translate to one in the list
	(3) “Data out of range”
	This error is reported if parameter value is out of range
	For example,
	`:SENSe:CDPower:SBOundary:LIST:MS:INIT 15000, 256, QPH`
	The 2nd parameter is out of range
	(4) “Setting Conflict”
	This error is reported if the given code channel overlaps other code channel on code domain
	For example, if a user sends the following two commands, the second command causes the error message because C7(0):Q overlaps C8(0):Q
	`:SENSe:CDPower:SBOundary:LIST:MS:INIT 15000, 0, QPH`
	The example above is OK
	`:SENSe:CDPower:SBOundary:LIST:MS:APPend 30000, 0, QPH`
	C7(0):Q overlaps C8(0):Q

Dependencies	This command is effective when `[:SENSe]:RADio:DEVice` is set to MS and `[:SENSe]:CDPower:SBOundary:MS` is set to CUSTom Symbol_rate = 1920000 is available when HSPA Enable is On
State Saved	Yes
Range	symbol_rate = 15000|30000|60000|120000|240000|480000|960000|19200000 0<= code_num <= 255 if symbol_rate = 15000

0<= code_num <= 127 if symbol_rate = 30000

0<= code_num <= 63 if symbol_rate = 60000

0<= code_num <= 31 if symbol_rate = 120000

0<= code_num <= 15 if symbol_rate = 240000

0<= code_num <= 7 if symbol_rate = 480000

0<= code_num <= 3 if symbol_rate = 960000

0<= code_num <= 1 if symbol_rate = 1920000

Append List (Remote Command Only)

Appends the entry of the custom active channel list.

Parameter	Name/Value	Description
1	<symbol_rate>	Specifies symbol rate of the channel
2	<code_num>	Specifies spreading code of the channel
3	IPH	Specifies the channel is on I-axis
	QPH	Specifies the channel Is on Q-axis

Remote Command

```
[:SENSe]:CDPower:SBOundary:LIST:MS:APPend <symbol_rate>, <code_num>, IPH | QPH
```

Example

In order to predefine the following channels:

- DPCCH (C8(0):Q)
- DPDCH (C6(16):I)

```
:CDP:SBO:LIST:MS:INIT 15000, 0, QPH
:CDP:SBO:LIST:MS:APP 60000, 16, IPH
:CDP:SBO:LIST:MS:NCH?
```

2

```
:CDP:SBO:LIST:MS:CHAN? 1
```

15000, 0, QPH

```
:CDP:SBO:LIST:MS:CHAN? 2
```

60000, 16, IPH

Notes

The maximum number of entries is 512

One of the following error messages is logged if the given parameter is invalid

If an error is reported, the SCPI command is rejected and the instrument's settings do not change

(1) "Missing Parameter"

This error is reported if the number of parameters is less than 3

For example,

```
:SENSe:CDPower:SBOundary:LIST:MS:APPend 15000, 0
```

The 3rd parameter is missing

	(2) "Illegal parameter value"
	This error is reported if parameter type is invalid or if enum value is invalid
	For example,
	`:SENSe:CDPower:SBOundary:LIST:MS:APPend 15000, ON, QPH`
	The 2nd parameter must be an integer
	`:SENSe:CDPower:SBOundary:LIST:MS:APPend 15001, 0, QPH`
	The 1st parameter value (Symbol Rate) is not allowed
	Only the values given in Range field are valid for the Symbol Rate. You may specify these in numeric form, but they are interpreted as an enumeration and the error results if the value does not translate to one in the list
	(3) "Data out of range"
	This error is reported if parameter value is out of range
	For example,
	`:SENSe:CDPower:SBOundary:LIST:MS:APPend 15000, 256, QPH`
	The 2nd parameter is out of range
	(4) "Setting Conflict"
	This error is reported if the given code channel overlaps other code channel on code domain
	For example, if a user sends the following two commands, the second command causes the error message because C7(0):Q overlaps C8(0):Q
	`:SENSe:CDPower:SBOundary:LIST:MS:INIT 15000, 0, QPH`
	The example above is OK
	`:SENSe:CDPower:SBOundary:LIST:MS:APPend 30000, 0, QPH`
	C7(0):Q overlaps C8(0):Q

Dependencies	This command is effective when `[:SENSe]:RADio:DEVice` is set to MS and `[:SENSe]:CDPower:SBOundary:MS` is set to CUSTom Symbol_rate = 1920000 is available when HSPA Enable is On
State Saved	Yes
Range	symbol_rate = 15000|30000|60000|120000|240000|480000|960000|19200000 0<= code_num <= 255 if symbol_rate = 15000 0<= code_num <= 127 if symbol_rate = 30000 0<= code_num <= 63 if symbol_rate = 60000 0<= code_num <= 31 if symbol_rate = 120000 0<= code_num <= 15 if symbol_rate = 240000 0<= code_num <= 7 if symbol_rate = 480000 0<= code_num <= 3 if symbol_rate = 960000 0<= code_num <= 1 if symbol_rate = 1920000

Replace List (Remote Command Only)

Replaces the entry of the custom active channel list.

Parameter	Name/Value	Description
1	<entry_id>	Specifies entry ID of the channel to replace
2	<symbol_rate>	Specifies symbol rate of the channel
3	<code_num>	Specifies spreading code of the channel
4	IPH	Specifies the channel is on I-axis
	QPH	Specifies the channel Is on Q-axis

Remote Command	`[:SENSe]:CDPower:SBOundary:LIST:MS:REPLace <entry_id>,<symbol_rate>, <code_num>, IPH | QPH`

Example	In order to predefine the following channels:
	- DPCCH (C8(0):Q)
	- DPDCH (C6(16):I)
	`:CDP:SBO:LIST:MS:INIT 15000, 0, QPH`
	`:CDP:SBO:LIST:MS:APP 60000, 16, IPH`
	`:CDP:SBO:LIST:MS:NCH?`
	2
	And, replace 2nd entry
	`:CDP:SBO:LIST:MS:REPL 2, 60000,17,QPH`
	`:CDP:SBO:LIST:MS:CHAN? 1`
	15000, 0, QPH
	`:CDP:SBO:LIST:MS:CHAN? 2`
	60000, 17, IPH

Notes	The maximum number of entries is 512
	One of the following error messages is logged if the given parameter is invalid
	If an error is reported, the SCPI command is rejected and the instrument’s settings do not change
	(1) “Missing Parameter”
	This error is reported if the number of parameters is less than 4
	For example,
	`:SENSe:CDPower:SBOundary:LIST:MS:REPLace 1,15000, 0`
	The 4th parameter is missing.
	(2) “Illegal parameter value”
	This error is reported if parameter type is invalid or if enum value is invalid
	For example,
	`:SENSe:CDPower:SBOundary:LIST:MS: REPLace 1,15000, ON, QPH`
	The 3rd parameter must be an integer
	`:SENSe:CDPower:SBOundary:LIST:MS:REPLace 1,15001, 0, QPH`
	The 2nd parameter value (Symbol Rate) is not allowed

	Only the values given in Range field are valid for the Symbol Rate. You may specify these in numeric form, but they are interpreted as an enumeration and the error results if the value does not translate to one in the list
	(3) "Data out of range"
	This error is reported if parameter value is out of range
	For example,
	`:SENSe:CDPower:SBOundary:LIST:MS:APPend 15000, 256, QPH`
	The 3rd parameter is out of range
	(4) "Setting Conflict"
	This error is reported if the given code channel overlaps other code channel on code domain
	For example, if a user sends the following two commands, the second command causes the error message because C7(0):Q overlaps C8(0):Q
	`:SENSe:CDPower:SBOundary:LIST:MS:INIT 15000, 0, QPH`
	The example above is OK
	`:SENSe:CDPower:SBOundary:LIST:MS: REPLace 1,30000, 0, QPH`
	C7(0):Q overlaps C8(0):Q

Dependencies	This command is effective when `[:SENSe]:RADio:DEVice` is set to MS and `[:SENSe]:CDPower:SBOundary:MS` is set to CUSTom Symbol_rate = 1920000 is available when HSPA Enable is On
State Saved	Yes
Range	The entry ID must be: 1 <= entry_id <= The number of entries that have been defined (see "Test Model 1" on page 560) symbol_rate = 15000|30000|60000|120000|240000|480000|960000|19200000 0<= code_num <= 255 if symbol_rate = 15000 0<= code_num <= 127 if symbol_rate = 30000 0<= code_num <= 63 if symbol_rate = 60000 0<= code_num <= 31 if symbol_rate = 120000 0<= code_num <= 15 if symbol_rate = 240000 0<= code_num <= 7 if symbol_rate = 480000 0<= code_num <= 3 if symbol_rate = 960000 0<= code_num <= 1 if symbol_rate = 1920000

Query List (Remote Command Only)

Returns the entry of the custom active channel list.

Parameter	Name/Value	Description
1	<entry_id>	Specifies entry ID of the channel to query

Remote Command	`[:SENSe]:CDPower:SBOundary:LIST:MS:CHANnel? <entry_id>`

Example	In order to predefine the following channels:
	- DPCCH (C8(0):Q)
	- DPDCH (C6(16):I)
	`:CDP:SBO:LIST:MS:INIT 15000, 0, QPH`
	`:CDP:SBO:LIST:MS:APP 60000, 16, IPH`
	`:CDP:SBO:LIST:MS:NCH?`
	2
	`:CDP:SBO:LIST:MS:CHAN? 1`
	15000, 0, QPH
	`:CDP:SBO:LIST:MS:CHAN? 2`
	60000, 16, IPH

Notes	The maximum number of entries is 512
	Default value of the parameter
	By default, there is one channel defined. (DPCCH C8(0):Q)
	In order to query the default entry, specify 1 for <entry_id>:
	`:SENSe:CDPower:SBOundary:LIST:MS:CHANnel? 1`
	The instrument returns an array of three values:
	`15000, 0, QPH`
	Query command needs <entry_id> parameter
	<entry_id> parameter is always required for query command
	The range of the parameter is from 1 to the total number of channels you have defined. For example, if you have defined two channels, you can query them as follows:
	`:SENSe:CDPower:SBOundary:LIST:MS:CHANnel? 1`
	`:SENSe:CDPower:SBOundary:LIST:MS:CHANnel? 2`
	If you want to know the number of channels you have defined, send the following query command:
	`:SENSe:CDPower:SBOundary:LIST:NCHannels:MS?`

Dependencies	This command is effective when `[:SENSe]:RADio:DEVice` is set to MS and `[:SENSe]:CDPower:SBOundary:MS` is set to CUSTom Symbol_rate = 1920000 is available when HSPA Enable is On
Preset	15000, 0, QPH
State Saved	Yes
Range	The entry ID must be: 1 <= entry_id <= The number of entries that have been defined. (See Custom Active Channel List for MS)

Symbol Boundary Custom Active Channel List – Number of Entries (MS only)

Returns the number of entries in the custom predefined active channel list MS.

Remote Command	[:SENSe]:CDPower:SBOundary:LIST:MS:NCHannels?
Example	:SENS:CDP:SBO:LIST:MS:NCH?
Notes	This command is a query-only command
Dependencies	This command is effective when [:SENSe]:RADio:DEVice is set to MS and [:SENSe]:CDPower:SBOundary:MS is set to CUSTom
Preset	1
State Saved	No

Remote Command	[:SENSe]:CDPower:SBOundary:MS AUTO | CUSTom [:SENSe]:CDPower:SBOundary:MS?
Example	:CDP:SBO:MS CUST :CDP:SBO:MS?
Dependencies	This parameter is effective when [:SENSe]:RADio:DEVice is set to MS If "Radio Device" selection is "BTS", a different control (Symbol Boundary BTS) appears
Preset	AUTO
State Saved	Yes
Range	AUTO|CUSTom

DPCH/E-DPCH Configuration (MS only)

This parameter configures how DPDCH, HS-DPCCH, E-DPCCH and E-DPDCH are recognized.

Remote Command	:CALCulate:CDPower:DPCH:MS:CONFigure C1 | C2WDpdch | C2WODpdch | C3 :CALCulate:CDPower:DPCH:MS:CONFigure?
Example	:CALC:CDP:DPCH:MS:CONF C3 :CALC:CDP:DPCH:MS:CONF?
Dependencies	This parameter is available when HSPA mode is enabled, Device is MS and Sync Type is DPCCH or E-DPCCH
Preset	C1
State Saved	Yes
Range	Config 1 (no E-DPCH)|Config 2 w/ DPDCH | Config 2 w/o DPDCH|Config 3 (no DPDCH)

Symbol Rate

Sets a symbol rate.

Remote Command	:CALCulate:CDPower:SRATe <integer>

	`:CALCulate:CDPower:SRATe?`
Example	`:CALC:CDP:SRAT 30000` `:CALC:CDP:SRAT?`
Dependencies	1920000 choice for MS is available only when HSPA is enabled
Preset	15000
State Saved	Yes
Range	7500|15000|30000|60000|120000|240000|480000|960000 for BTS 15000|30000|60000|120000|240000|480000|960000|1920000 for MS

Code Number

Sets a spread code.

Remote Command	`:CALCulate:CDPower:SPRead <integer>` `:CALCulate:CDPower:SPRead?`
Example	`:CALC:CDP:SPR 1` `:CALC:CDP:SPR?`
Couplings	Coupled with Section "Symbol Rate" on page 585, "Symbol Rate" on page 585
Preset	0
State Saved	Yes
Min/Max	Min: 0 Max: Dependent on the Symbol Rate as follows:

`:CALCulate:CDPower:SRATe`	Max
7500	511
15000	255
30000	127
60000	63
120000	31
240000	15
480000	7
960000	3
1920000	1

Mod Scheme (BTS Only)

Sets the modulation scheme.

- **Auto**: The specified channel by Symbol Rate and Code Number is considered to be modulated by auto-detected scheme
- **QPSK**: The specified channel by Symbol Rate and Code Number is considered to be modulated by QPSK
- **16QAM**: The specified channel by Symbol Rate and Code Number is considered to be modulated by 16QAM
- **64QAM**: The specified channel by Symbol Rate and Code Number is considered to be modulated by 64QAM

Remote Command	`:CALCulate:CDPower:MTYPe AUTO | QPSK | QAM16 | QAM64` `:CALCulate:CDPower:MTYPe?`
Example	`:CALC:CDP:MTYP QAM16` `:CALC:CDP:MTYP?`
Notes	W-CDMA HSPA option needs to be installed and enabled. Otherwise, this parameter is not available and SCPI commands for Modulation Scheme do not have effect To select "QAM64", W-CDMA HSPA+ option needs to be installed and enabled. Otherwise it is unavailable and the SCPI command to select "QAM64" is not valid
Dependencies	This control is active when Device is BTS *and* Symbol Rate is 240 ksps This control is inactive when Device is BTS *and* Symbol Rate is *not* 240 ksps. In this case, the last setting (Auto/QPSK/16QAM/64QAM) is displayed on the control even though the "QPSK" setting is always used This control is not displayed when Device is MS
Preset	`AUTO`
State Saved	Yes
Range	`AUTO|QPSK|QAM16|QAM64`

I/Q Branch (MS only)

Selects the I phase or Q phase for the demodulation axis.

Remote Command	`:CALCulate:CDPower:AXIS[:MS] IPH | QPH | IQCombined` `:CALCulate:CDPower:AXIS[:MS]?`
Example	`:CALC:CDP:AXIS IPH` `:CALC:CDP:AXIS?`
Notes	IPH – I Phase QPH – Q Phase IQCombined – Combined I and Q Phase
Dependencies	This command is effective when `[:SENSe]:RADio:DEVice` is set to MS This menu label is grayed out when `[:SENSe]:RADio:DEVice` is set to BTS
Preset	`QPH`

State Saved	Yes
Range	IPH|QPH|IQCombined

DTX/Burst Detect

For downlink signals, enables you to detect the power burst, for either “CM” (Compressed Mode) or “DTX”. In the Compressed Mode, both I and Q symbol powers are off. In DTX, one of the I or Q symbol power (or both) can be off.

For uplink signals, allows you to detect the HS-DPCCH burst, which the sub-frame does not align with the DPCCH slot boundary.

Remote Command	:CALCulate:CDPower:DTXBurst 0 | 1 | OFF | ON :CALCulate:CDPower:DTXBurst?
Example	:CALC:CDP:DTXB ON :CALC:CDP:DTXB?
Preset	OFF
State Saved	Yes

tDPCH (BTS only)

Toggles between Auto and Man. tDPCH value can be set when manual is selected. When AUTO is selected, tDPCH value is shown as "---". tDPCH specifies chip offset (1 unit = 256 chips) of DPCH slot #0 start point from CPICH slot #0 start position. tDPCH value affects the measurement results such as Symbol EVM (RMS, Peak), Symbol Magnitude Error, Symbol Phase Error, and Channel Power (Average Power). In this case, only (tDPCH mod 10) is concerned. This is the offset from CPICH slot boundary to DPCH slot boundary.

When input manually, this value is not checked by verifying the pilot pattern.

This value is set at its auto number and “---“ is replaced with the detected number, if Time Offset detection Auto mode is set to ON and tDPCH is detected successfully. Otherwise the value is not changed.

Remote Command	:CALCulate:CDPower:TDPCh <integer> :CALCulate:CDPower:TDPCh? :CALCulate:CDPower:TDPCh:AUTO OFF | ON | 0 | 1 :CALCulate:CDPower:TDPCh:AUTO?
Example	:CALC:CDP:TDPC 10 :CALC:CDP:TDPC? :CALC:CDP:TDPC:AUTO ON

	:CALC:CDP:TDPC:AUTO?
Notes	Sets tDPCH value manually, when :CALCulate:CDPower:TDPCh:AUTO is OFF. This value is set at its auto number if Time Offset detection Auto mode is set to ON – OFF – tDPCH can manually be set by :CALCulate:CDPower:TDPCh – ON – tDPCH is given automatically as a result of measurement for the specified Code Channel
Preset	0 ON
State Saved	Yes Yes
Range	Auto|Man
Min/Max	0/149

tHS-DPCCH (MS only)

Uplink HS-DPCCH's slots are not aligned with DPCCH slots. Therefore, to analyze its Symbol EVM and Demod Bits correctly, you need to manually specify the slot offset of the HS-DPCCH. Because SF256 code channel has 10 symbol per slot, the actual effective value is MOD (N, 10) even if the value is set more than 10.

Only manual setting is supported.

Remote Command	:CALCulate:CDPower:THSDpcch <integer> :CALCulate:CDPower:THSDpcch?
Example	:CALC:CDP:THSD 35 :CALC:CDP:THSD?
Notes	Auto detection of the tHS-DPCCH is not supported
Preset	0
State Saved	Yes
Min/Max	0/250

Tx Diversity I/Q Axis Rotation

Sets the rotation of the I/Q Axis.

Remote Command	:CALCulate:CDPower:IQPHase:ROTation <real> :CALCulate:CDPower:IQPHase:ROTation?
Example	:CALC:CDP:IQPH:ROT 0.0 :CALC:CDP:IQPH:ROT?
Notes	Input value is as follows -135.0 =< Input-Value =< +180.0

	The input value is rounded to the nearest value in the following 0|+45|+90|+135|+180|+225(= -135)|+270(= -90)|+315(= -45)
Preset	0.0
State Saved	Yes
Min/Max	-135.0/180.0

Advanced Channel/Layer Setup

Enables you to access a dialog for advanced sync parameters.

Active Threshold

Toggles the active channel identification function between Auto and Man.

When set to Auto, the active channels are determined automatically by the internal algorithm.

When set to Man, the active channel identification is determined by a user definable threshold ranging from 0.00 to -100.00 dB.

Remote Command	`:CALCulate:CDPower:ASET:THReshold <real>`
	`:CALCulate:CDPower:ASET:THReshold?`
	`:CALCulate:CDPower:ASET:THReshold:AUTO OFF | ON | 0 | 1`
	`:CALCulate:CDPower:ASET:THReshold:AUTO?`

Example	`:CALC:CDP:ASET:THR -50.0`
	`:CALC:CDP:ASET:THR?`
	`:CALC:CDP:ASET:THR:AUTO ON`
	`:CALC:CDP:ASET:THR:AUTO?`

Notes	Turn the automatic mode On or Off, for the active channel identification function: – OFF – The active channel identification for each code channel is determined by a value set by `:CALCulate:CDPower:ASET:THReshold` – ON – The internal algorithm determines the active channels automatically
Dependencies	BTS: This command is effective when "Symbol Boundary (BTS only)" on page 560 is set to AUTO MS: This command is always effective
Preset	0.0 ON
State Saved	Yes Yes
Range	Auto|Man
Min/Max	-100.0/0.0

Multi Channel Estimator

Toggles the multi-channel estimator function by MMSE between On and Off.

- On: The individual code channels are aligned to the pilot channel to improve the phase error (whether each code phase is aligned or not). This takes a longer time
- Off: The phase information is computed from one coded signal only. (The phase of each code channel needs to be aligned to the pilot channel)

Remote Command	[:SENSe]:CDPower:MCEStimator OFF | ON | 0 | 1 [:SENSe]:CDPower:MCEStimator?
Example	:CDP:MCES ON :CDP:MCES?
Preset	OFF
State Saved	Yes
Range	OFF|ON

Timing Estimation

Selects timing estimation function by MMSE between channel-by-channel and global.

- CHANnel-by-Channel - The code channels are estimated using individual channel timing. This takes a longer time
- GLOBal: The individual code channels are estimated using global timing

Remote Command	[:SENSe]:CDPower:MCEStimator:TIMing CHANnel | GLOBal [:SENSe]:CDPower:MCEStimator:TIMing?
Example	:CDP:MCES:TIM GLOB :CDP:MCES:TIM?
Dependencies	Only when Multi Channel Estimator is ON, this parameter is valid. When Multi Channel Estimator is OFF, this setting is forced to GLOBAL and the control is grayed out
Preset	GLOBal
State Saved	Yes
Range	Channel by Channel|Global

PICH Code Number

Specifies the code number of PICH (Paging Indicator Channel), which has the DTX (no transmission) part. PICH has 300 bits in 1 radio frame, but last 12 bits are not transmitted. Therefore, PICH needs the special handling to measure the code domain power. PICH Code Number specifies which code channel should be considered as PICH.

Note: Active ID auto-detection is done by Bebop regardless of this parameter. However, the result could be 7.5ksps channel if PICH's two consecutive demod bits are the same. This UI forces such 7.5ksps channels to be 15ksps channels.

Remote Command	`[:SENSe]:CDPower:PICH:SPRead <integer>` `[:SENSe]:CDPower:PICH:SPRead?`
Example	`:CDP:PICH:SPR 5` `:CDP:PICH:SPR?`
Notes	If PICH Code Number and MICH Code Number are the same, the channel is considered as PICH This parameter is meaningful only when Symbol Boundary setting is Auto
Dependencies	This parameter is available only for BTS
Preset	16
State Saved	Yes
Min/Max	2/255

MICH Code Number

Specifies the code number of MICH (MBMS Indicator channel), which has the DTX (no transmission) part. MICH has 300 bits in 1 radio frame, but last 6 symbols (12 bits) are not transmitted. Therefore, MICH needs the special handling to measure the code domain power. MICH Code Number specifies which code channel should be considered as MICH.

Since MICH is optional channel, the parameter has BAF setting (On|Off).

Remote Command	`[:SENSe]:CDPower:MICH:SPRead <integer>`
	`[:SENSe]:CDPower:MICH:SPRead?`
	`[:SENSe]:CDPower:MICH:STATe OFF | ON | 0 | 1`
	`[:SENSe]:CDPower:MICH:STATe?`

Example	`:SENS:CDP:MICH:SPR 4`
	`:SENS:CDP:MICH:SPR?`
	`:SENS:CDP:MICH:STAT ON`
	`:SENS:CDP:MICH:STAT?`

Notes	If PICH Code Number and MICH Code Number are the same, the channel is considered as PICH This parameter is meaningful only when Symbol Boundary setting is Auto This parameter enables or disables MICH code number setting
Dependencies	This parameter is active for BTS, but grayed out for MS
Preset	2 `OFF`

State Saved	Yes Yes
Range	2 to 255 OFF|ON
Min/Max	2/255

S-CCPCH Symbol Rate (BTS only)

To calculate the EVM value correctly, specifies the symbol rate for S-CCPCH (Secondary Common Control Physical Channel), which might be modulated with 64QAM, and is hard to detect as correct channelization code.

Remote Command	[:SENSe]:CDPower:SCCPch:SRATe <integer> [:SENSe]:CDPower:SCCPch:SRATe?
Example	:CDP:SCCP:SRAT 15000 :CDP:SCCP:SRAT?
Notes	This command is effective when [:SENSe]:RADio:DEVice is set to BTS This parameter is available only when both W-CDMA HSPA+ option (N9073C-3FP) and HSPA option (N9073C-2FP) licenses are installed, and HSPA+ option is enabled. Otherwise this control and the SCPI command are unavailable
Preset	15000
State Saved	Yes
Range	15000|30000|60000|120000|240000|480000|960000

S-CCPCH Code Number (BTS only)

To calculate the EVM value correctly, specifies the code number for S-CCPCH (Secondary Common Control Physical Channel), which might be modulated with 64QAM, and is hard to detect as correct channelization code.

Remote Command	[:SENSe]:CDPower:SCCPch:SPRead <integer> [:SENSe]:CDPower:SCCPch:SPRead?
Example	:CDP:SCCP:SPR 255 :CDP:SCCP:SPR?
Notes	This command is effective when [:SENSe]:RADio:DEVice is set to BTS This parameter is available only when both W-CDMA HSPA+ option (N9073C-3FP) and HSPA option (N9073C-2FP) licenses are installed, and HSPA+ option is enabled. Otherwise this control and the SCPI command are unavailable
Preset	3
State Saved	Yes
Min/Max	Min: 0

Max: Dependent on S-CCPCH Symbol Rate as follows:

[:SENSe]:CDP:SCCPch:SRATe	Max
15000	255
30000	127
60000	63
120000	31
240000	15
480000	7
960000	3

Frequency Compensation

Toggles the setting of the frequency compensation to calculate the symbol EVM.

Remote Command	:CALCulate:CDPower:SEVM:FCOMpen ON | OFF | 1 | 0 :CALCulate:CDPower:SEVM:FCOMpen?
Example	:CALC:CDP:SEVM:FCOM ON :CALC:CDP:SEVM:FCOM?
Preset	ON
State Saved	Yes
Range	ON|OFF

Phase Compensation

Toggles the setting of the phase compensation to calculate the symbol EVM.

Remote Command	:CALCulate:CDPower:SEVM:PCOMpen ON | OFF | 1 | 0 :CALCulate:CDPower:SEVM:PCOMpen?
Example	:CALC:CDP:SEVM:PCOM ON :CALC:CDP:SEVM:PCOM?
Preset	ON
State Saved	Yes
Range	ON|OFF

3.4.8.6 Packed Mode (Remote Command Only)

Selects the packed mode for Demod bits in SCPI result (of READ:CDP12).

- **OFF**: Demod Bits are not packed. (1.0:“1”, 0.0:“0”, -1.0:“X”)
- **PKM1**: Demod Bits per symbol is packed into 1 float value in bit-slice manner as follows:

64QAM(No DTX)	Float value 0......X5X4X3X2X1X0 (X5:I1, X4:Q1, X3:I2, X2:Q2, X1:I3, X0:Q3)
16QAM(No DTX)	Float value 0......0X3X2X1X0 (X3:I1, X2:Q1, X1:I2, X0:Q2)
QPSK(With DTX)	Float value 0......0M1M0B1B01
4PAM (No DTX)	Float value 0......0 I1 I2 Q1 Q2
4PAM on I branch and BPSK on Q branch (No DTX)	Float value 0......0 I1 I2 0 Q
BPSK on I branch and 4PAM on Q branch (No DTX)	Float value 0......0 0 I Q1 Q2

Table Note 1: The meaning of each bit is

- M1: Mask for B1 (1:DTX, 0:Normal)
- M0: Mask for B0, B1:I, B0:Q

NOTE Packed Mode is only available via the SCPI command, and changing Packed Mode does not bring any change on the results of Front panel display. It only controls the result format of `:READ|MEAS|FETCH|CONF:CDP12`.

Remote Command	`:CALCulate:CDPower:PACKed OFF | PKM1` `:CALCulate:CDPower:PACKed?`
Example	`:CALC:CDP:PACK OFF` `:CALC:CDP:PACK?`
Preset	`OFF`
State Saved	Yes
Range	`OFF|PKM1`

3.4.9 Sweep

The Sweep key contains controls which allow you to control the sweep and measurement functions of the instrument.

3.4.9.1 Sweep/Control

Contains controls for the Sweep and Control functions of the instrument, such as Sweep Time and Continuous/Single.

Sweep/Measure

Allows you to toggle between Continuous and Single sweep or measurement operation. The Single/Continuous state is Meas Global, so the setting affects *all* measurements.

The front-panel key **Single/Cont** performs exactly the same function

NOTE In the `WAVeform` measurement, this control only appears in the Meas Bar, and not in the **Sweep/Control** tab.

See "More Information" on page 596

Remote Command	`:INITiate:CONTinuous OFF | ON | 0 | 1` `:INITiate:CONTinuous?`

Example	`:INIT:CONT 0`
	`:INIT:CONT OFF`
	puts instrument into Single measurement operation
	`:INIT:CONT 1`
	`:INIT:CONT ON`
	puts instrument into Continuous measurement operation

Preset	ON Note that `:SYST:PRES` sets `:INIT:CONT` to `ON` but `*RST` sets `:INIT:CONT` to `OFF`
State Saved	Saved in instrument state
Annunciation	The **Single/Continuous** icon in the Meas Bar changes depending on the setting: – A line with an arrow is Single – A loop with an arrow is Continuous

More Information

With **Avg/Hold Num** (in the **Meas Setup** menu) set to **Off** or set to **On** with a value of 1, a sweep is taken after the trigger condition is met; and the instrument continues to take new sweeps after the current sweep has completed and the trigger condition is again met. However, with **Avg/Hold Num** set to On with a value >1, multiple sweeps (data acquisitions) are taken for the measurement. The trigger condition must be met prior to each sweep. The sweep is not stopped when the average count k equals the number N set for Avg/Hold Num is reached, but the number k stops incrementing. A measurement average usually applies to all traces, marker results, and numeric results, but sometimes only applies to the numeric results.

If the instrument is in Single measurement, pressing the **Cont/Single** toggle control does not change k and does not cause the sweep to be reset; the only action is to put the instrument into Continuous measurement operation.

If it is already in Continuous sweep:

- the `:INIT:CONT 1` command has no effect
- the `:INIT:CONT 0` command will place the instrument in Single Sweep but will have no effect on the current sequence until k = N, at which point the current sequence will stop and the instrument will go to the idle state.

See "Restart" on page 1738 control description for details on the `:INIT:IMM` (Restart) function.

If you are already in Single sweep, the `:INIT:CONT OFF` command has no effect.

If you are already in Single Sweep, then pressing the **Cont/Single** toggle control in the middle of a sweep does not restart the sweep or sequence. Similarly, pressing the **Cont/Single** toggle control does not restart the sweep or sequence if the sweep is not in the idle state (for example, if you are taking a very slow sweep, or the instrument is waiting for a trigger). Even though pressing the **Cont/Single** toggle control in the middle of a sweep does *not* restart the sweep, sending `:INIT:IMM` *does* reset it.

Restart

The **Restart** function restarts the current sweep, or measurement, or set of averaged/held sweeps or measurements. In measurements that support pausing, if you are Paused, pressing **Restart** performs a **Resume**.

The Restart function is accessed in several ways:

- Pressing the **Restart** key
- Sending the remote command `:INIT:IMM`
- Sending the remote command `:INIT:REST`

See "More Information" on page 598

Remote Command	`:INITiate[:IMMediate]` `:INITiate:RESTart`
Example	`:INIT:IMM` `:INIT:REST`
Notes	`:INIT:REST` and `:INIT:IMM` and the front-panel **Restart** key perform exactly the same function
Couplings	Resets average/hold count k For the first sweep, overwrites all active (update=on) traces with new current data For application modes, resets other parameters as required by the measurement
Status Bits/OPC	This is an Overlapped command

dependencies	The `:STATus:OPERation` register bits 0 through 8 are cleared The `:STATus:QUEStionable` register bit 9 (INTegrity sum) is cleared The `SWEEPING` bit is set The `MEASURING` bit is set
Backwards Compatibility Notes	For Spectrum Analysis mode in ESA and PSA, the **Restart** hardkey and the `:INIT:REST` command restart trace averages (displayed average count reset to 1) for a trace in **Clear Write**, but did not restart **Max Hold** and **Min Hold** In the X-Series, the **Restart** hardkey and the `:INIT:REST` command restart not only **Trace Average**, but **Max Hold** and **Min Hold** traces as well For wireless comms modes in ESA and PSA, the **Restart** hardkey and the `:INIT:REST` command restarted every measurement, including all traces and numeric results. There is no change to this operation

More Information

The **Restart** function first aborts the current sweep or measurement as quickly as possible. It then resets the sweep and trigger systems, sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is in the process of aligning when a Restart is executed, the alignment finishes before the restart function is performed.

Even when set for Single operation, multiple sweeps may be taken when **Restart** is pressed (for example, when averaging/holding is on). Thus when we say that Restart "restarts a measurement," depending on the current settings, we may mean:

- It restarts the current sweep
- It restarts the current measurement
- It restarts the current set of sweeps if any trace is in Trace Average, Max Hold or Min Hold
- It restarts the current set of measurements if Averaging, or Max Hold, or Min Hold is on for the measurement

With Average/Hold Number (in Meas Setup menu) set to 1, or Averaging off, or no trace in Trace Average or Hold, a single sweep is equivalent to a single measurement. A single sweep is taken after the trigger condition is met; and the instrument stops sweeping once that sweep has completed. However, with Average/Hold Number >1 and at least one trace set to Trace Average, Max Hold, or Min Hold (SA Measurement) or Averaging on (most other measurements), multiple sweeps/data acquisitions are taken for a single measurement. The trigger condition must be met prior to each sweep. The sweep is stopped when the average count k equals the number N set for Average/Hold Number. A measurement average usually applies to all traces, marker results, and numeric results, but sometimes only applies to the numeric results.

Once the full set of sweeps has been taken, the instrument will go to the idle state. To take one more sweep without resetting the average count, increment the average count by 1, by pressing the step up key while Average/Hold Number is the active function, or by sending the remote command `:CALC:AVER:TCON UP`.

Pause/Resume

Pauses a measurement after the current data acquisition is complete.

When a measurement is paused:

- The label on this control changes to **Resume**. Pressing **Resume** un-pauses the measurement.
- Pressing **Restart** also performs a **Resume**.

Remote Command	`:INITiate:PAUSe` `:INITiate:RESume`
Example	`:INIT:PAUS` `:INIT:RES`
Dependencies	Not displayed in Modes that do not support pausing
Couplings	When Averaging is On, if the measurement is paused no more updates will occur until either a Resume or Restart occurs If the measurement is resumed, the averaging continues to use the traces from before the Pause occurred and continues to use the traces from the point where the Resume occurred. This still provides real-time traces, but they will no longer be gap free In a view with a Waterfall window, when the measurement is paused, the Waterfall stops updating. When Resume is selected, the Waterfall will retain the existing traces and continue updating using traces from the point at which Resume was selected. The time stamp of the individual Waterfall traces will show the time from the beginning of the measurement the trace relates to, showing there was a gap in the Waterfall capture In Density view, when the measurement is paused, the Density Display stops updating. When the measurement is resumed, if Persistence is `ON`, the persistence fading will continue from the point when the measurement was paused If a Restart occurs, the average counter is reset and all results are discarded. The measurement begins again, using traces after the Restart occurred

Abort (Remote Command Only)

This command stops the current measurement. It aborts the current measurement as quickly as possible, resets the sweep and trigger systems, and puts the measurement into an "idle" state. If the instrument is in the process of aligning when `:ABORt` is sent, the alignment finishes before the abort function is performed, so `:ABORt` does *not* abort an alignment.

If the instrument is set for Continuous measurement, it sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is set for Single measurement, it remains in the "idle" state until an :INIT:IMM command is received.

Remote Command	:ABORt
Example	:ABOR
Notes	If :INIT:CONT is ON, then a new continuous measurement will start immediately, with sweep (data acquisition) occurring once the trigger condition has been met If :INIT:CONT is OFF, then :INIT:IMM is used to start a single measurement, with sweep (data acquisition) occurring once the trigger condition has been met
Dependencies	For continuous measurement, :ABORt is equivalent to the **Restart** key Not all measurements support the abort command
Status Bits/OPC dependencies	The :STATus:OPERation register bits 0 through 8 are cleared The :STATus:QUEStionable register bit 9 (INTegrity sum) is cleared Since all the bits that feed into OPC are cleared by :ABORt, the :ABORt will cause the *OPC query to return true

3.4.9.2 X Scale

This tab accesses controls that enable you to set the horizontal scale parameters.

X Ref Value

Controls the reference value of the X scale of the current measurement in the I/Q Error window.

Remote Command	:DISPlay:CDPower:WINDow4|5|6|8:TRACe:X[:SCALe]:RLEVel <real> :DISPlay:CDPower:WINDow4|5|6|8:TRACe:X[:SCALe]:RLEVel? Window numbers are as follows: – Mag Error: 4 – Phase Error: 5 – EVM : 6 – Symb Power: 8
Example	4-Mag Error Window :DISP:CDP:WIND4:TRAC:X:RLEV 0.0 5-Phase Error Window :DISP:CDP:WIND5:TRAC:X:RLEV 0.0 6-EVM Window

	`:DISP:CDP:WIND6:TRAC:X:RLEV 0.0`
	8-Symb Power Window
	`:DISP:CDP:WIND8:TRAC:X:RLEV 0.0`

Notes	Target window to control depends on the SubOpCode
Couplings	If Auto Scaling is set to On, this value is automatically determined by the measurement result. When you set this value manually, Auto Scaling automatically changes to Off
Preset	0.000
State Saved	Yes
Min/Max	0/5000000.0

Backwards Compatibility SCPI

Window Numbers used to be a combination of View and Window, now the VIEW parameter is not used and defaults to 1. All Windows are referenced through VIEW 1. For backwards compatibility the old View and Window numbers are honored as below:

Window	Old SCPI Command	New SCPI Command
Mag Error	`DISP:CDP:VIEW3:WIND:TRAC:X:RLEV 0.0`	`DISP:CDP:WIND4:TRAC:X:RLEV 0.0`
Phase Error	`DISP:CDP:VIEW3:WIND2:TRAC:X:RLEV 0.0`	`DISP:CDP:WIND5:TRAC:X:RLEV 0.0`
EVM	`DISP:CDP:VIEW3:WIND3:TRAC:X:RLEV 0.0`	`DISP:CDP:WIND6:TRAC:X:RLEV 0.0`

Symb Power	!Code Domain View
	`DISP:CDP:VIEW4:WIND2:TRAC:X:RLEV 0.0`
	!Demod Bits View
	`DISP:CDP:VIEW5:WIND2:TRAC:X:RLEV 0.0`
	!Demod Bits View (Long Mode)
	`DISP:CDP:VIEW6:WIND:TRAC:X:RLEV 0.0`
		`DISP:CDP:WIND8:TRAC:X:RLEV 0.0`

X Scale/Div

Sets the horizontal scale by changing a value per division.

Remote Command	`:DISPlay:CDPower:WINDow4|5|6|8:TRACe:X[:SCALe]:PDIVision <real>`
	`:DISPlay:CDPower:WINDow4|5|6|8:TRACe:X[:SCALe]:PDIVision?`
	Window numbers are as follows:
	– Mag Error: 4
	– Phase Error: 5

	– EVM : 6 – Symb Power: 8

Example	4-Mag Error Window
	`:DISP:CDP:WIND4:TRAC:X:PDIV 1.0`
	5-Phase Error Window
	`:DISP:CDP:WIND5:TRAC:X:PDIV 1.0`
	6-EVM Window
	`:DISP:CDP:WIND6:TRAC:X:PDIV 1.0`
	8-Symb Power Window
	`:DISP:CDP:WIND8:TRAC:X:PDIV 1.0`

Notes	Target window to control depends on the SubOpCode
Couplings	If Auto Scaling is set to On, this value is automatically determined by the measurement result. When you set this value manually, Auto Scaling automatically changes to Off
Preset	8-Symb Power: 16.0 All other windows: 0.9
State Saved	Yes
Min/Max	0.1/500000.0

Backwards Compatibility SCPI

Window	Old SCPI Command	New SCPI Command
Mag Error	`DISP:CDP:VIEW3:WIND:TRAC:X:PDIV 1.0`	`DISP:CDP:WIND4:TRAC:X:PDIV 1.0`
Phase Error	`DISP:CDP:VIEW3:WIND2:TRAC:X:PDIV 1.0`	`DISP:CDP:WIND5:TRAC:X:PDIV 1.0`
EVM	`DISP:CDP:VIEW3:WIND3:TRAC:X:PDIV 1.0`	`DISP:CDP:WIND6:TRAC:X:PDIV 1.0`

Symb Power	!Code Domain View
	`DISP:CDP:VIEW4:WIND2:TRAC:X:PDIV 1.0`
	!Demod Bits View
	`DISP:CDP:VIEW5:WIND2:TRAC:X:PDIV 1.0`
	!Demod Bits View (Long Mode)
	`DISP:CDP:VIEW6:WIND:TRAC:X:PDIV 1.0`
		`DISP:CDP:WIND8:TRAC:X:PDIV 1.0`

Auto Scaling

Determines the scale per division and reference value for the X axis based on the current measurement results.

Remote Command	`:DISPlay:CDPower:WINDow4|5|6|8:TRACe:X[:SCALe]:COUPle 0 | 1 | OFF | ON`
	`:DISPlay:CDPower:WINDow4|5|6|8:TRACe:X[:SCALe]:COUPle?`
	Window numbers are as follows:
	– Mag Error: 4
	– Phase Error: 5
	– EVM : 6
	– Symb Power: 8

Example	4-Mag Error Window
	`:DISP:CDP:WIND4:TRAC:X:COUP ON`
	5-Phase Error Window
	`:DISP:CDP:WIND5:TRAC:X:COUP ON`
	6-EVM Window
	`:DISP:CDP:WIND6:TRAC:X:COUP ON`
	8-Symb Power Window
	`:DISP:CDP:WIND8:TRAC:X:COUP ON`

Couplings	Upon pressing the Restart front-panel key, the Auto Scaling function automatically determines the scale per division and reference values based on the measurement results if this parameter is set to On. When you set a value to either Scale/Div or Ref Value manually, Auto Scaling automatically changes to Off
Preset	ON
State Saved	Yes
Range	OFF|ON

Backwards Compatibility SCPI

Window	Old SCPI Command	New SCPI Command
Mag Error	`DISP:CDP:VIEW3:WIND:TRAC:X:COUP ON`	`DISP:CDP:WIND4:TRAC:X:COUP ON`
Phase Error	`DISP:CDP:VIEW3:WIND2:TRAC:X:COUP ON`	`DISP:CDP:WIND5:TRAC:X:COUP ON`
EVM	`DISP:CDP:VIEW3:WIND3:TRAC:X:COUP ON`	`DISP:CDP:WIND6:TRAC:X:COUP ON`

Symb Power	!Code Domain View
	`DISP:CDP:VIEW4:WIND2:TRAC:X:COUP ON`
	!Demod Bits View
	`DISP:CDP:VIEW5:WIND2:TRAC:X:COUP ON`
	!Demod Bits View (Long Mode)
	`DISP:CDP:VIEW6:WIND:TRAC:X:COUP ON`
		`DISP:CDP:WIND8:TRAC:X:COUP ON`

Start Code Number

Sets the start value of the code range for the code domain power graph (CDP).

Remote Command	`:DISPlay:CDPower:CDOMain:SPAN:STARt <integer>` `:DISPlay:CDPower:CDOMain:SPAN:STARt?`
Example	`:DISP:CDP:CDOM:SPAN:STAR 10` `:DISP:CDP:CDOM:SPAN:STAR?`
Notes	The max value is device sensitive: BTS: 448 MS: 192
Couplings	Start Code Number and "Stop Code Number" on page 604 are coupled to each other, according to the following condition: Stop Code Number > Start Code Number If changing Start Code Number does not satisfy this condition, Stop Code Number is changed to satisfy the following condition Stop Code Number – Start Code Number = 63
Preset	0
State Saved	Yes
Min	0
Max	448

Stop Code Number

Sets the stop value of the code range for the code domain power graph (CDP).

Remote Command	`:DISPlay:CDPower:CDOMain:SPAN:STOP <integer>` `:DISPlay:CDPower:CDOMain:SPAN:STOP?`
Example	`:DISP:CDP:CDOM:SPAN:STOP 200` `:DISP:CDP:CDOM:SPAN:STOP?`
Notes	The max value is device sensitive: BTS: 511 MS: 255
Couplings	"Start Code Number" on page 604 and Stop Code Number are coupled to each other, according to: Stop Code Number > Start Code Number If changing Stop Code Number does not satisfy this condition, Start Code Number is changed to satisfy the following condition Stop Code Number – Start Code Number = 63
Preset	511

State Saved	Yes
Min	63
Max	511

Expand

Toggles the expanding function of the code domain power graph between On and Off. If set to On, the CDP graph is expanded horizontally to show 64 spread codes centered at the scale or the marker position. If toggled back to Off, the spread code range returns to the previous setting.

Notes	This control is valid only for Power Bar Graph window
Preset	Off
State Saved	Yes
Range	On|Off

3.4.10 Trace

Trace is not supported in the WCDMA Code Domain Measurement.

3.5 Power Control

The Power Control Measurement capability is one of the major functions of a W-CDMA (3GPP) digital radio system. For downlink signals, code domain power analysis and power versus time measurements based on symbols are used to analyze the power control function, as individual code channel powers are controlled. However, for uplink signals, the entire signal is controlled by the power control function, so code domain power analysis or power versus time measurement techniques do not provide relevant information. This Power Control measurement provides a solution for 3GPP uplink conformance tests, and can be used to accurately design, characterize, evaluate, and verify 3GPP transmitters, components, and devices for mobile stations.

The Power Control Measurement, also called a Power Step Measurement, includes three types of measurements:

1. Slot Power-measures uplink slot power level
2. PRACH Power-measures uplink PRACH preamble power level and message power level
3. Slot Phase-measures phase error, frequency error and EVM of uplink slots in addition to their slot power

The Slot Power and PRACH Power Measurement can be done using two methods:

- Waveform Method- is asynchronous. It provides results using a specified information bandwidth and a specified filter type for the number of frames, 1 through 8, specified by the capture interval.
- Chip Power Method- is synchronized to chip timing. It re-samples the power measurement results based on the chip clock timing of the radio system.

The Slot Phase Measurement is always made based on synchronized chip timing.

NOTE **The current Power Control Measurement can only measure uplink signals. Therefore, the Pwr Control menus are active only when the Radio Device selection is MS.**

Power Control Commands

The following commands and queries are used to retrieve the measurement results:

`:CONFigure:PCONtrol`

`:CONFigure:PCONtrol:NDEFault`

`:INITiate:PCONtrol`

`:FETCh:PCONtrol[n]?`

`:READ:PCONtrol[n]?`

`:MEASure:PCONtrol[n]?`

Remote Command Results for Power Control

For the queries listed above, the results returned depend on the value of **n**, as follows.

<table>
<tr><th>Index: n</th><th>Results Returned</th></tr>
<tr><td>0</td><td>Returns unprocessed I/Q trace data, as a series of comma-separated trace points, in volts. The I values are listed first in each pair, using the 0 through even-indexed values. The Q values are the odd-indexed values</td></tr>
<tr><td>1 (or not specified)</td><td>Returns the following 4 comma-separated scalar results in the following order:
1. Number of slots is an integer number of the number of slots found in the captured data. (In case of PRACH Power measurement, it always returns 0)
2. Number of PRACH preamble is an integer number to give the number of PRACH preamble burst found in captured data. (In case of Slot measurement, it always returns 0)
3. Number of PRACH Message is an integer number to give the number of PRACH Message found in captured data. (In case of Slot measurement, it always returns 0) This number must be 1 or 0, because once PRACH Message is found, no more PRACH burst search is performed after PRACH Message burst
4. First Slot Number is an integer number presenting the first slot number in the captured data. The returned value is valid in the following cases. In other cases, the returned value is 0
– View Selection is Slot Power and Meas Method is Chip Power
– View Selection is Slot Phase or Slot Phase w/Pwr Graph
DPCCH Slot Format: (floating)
– If Sync Type is DPCCH , the DPCCH slot format value used for synchronization is returned.
  – 0.0: Slot Format 0
  – 1.0: Slot Format 1
  – 2.0: Slot Format 2
  – 3.0: Slot Format 3
  – 4.0: Slot Format 4
  – 5.0: Slot Format 5
– If Sync Type is PRACH, the value returned is -999.0
In BTS mode, the value returned is -999.0
Preamble Signature: (floating)
– BTS mode
  – The returned value is always -999.0
– MS mode
  – In Preamble Signature auto-detection mode, the detected signature code number(from 0.0 to 15.0) is returned when Sync Type is PRACH Message
  – In Preamble Signature manual setting mode, the returned value is the same as the parameter setting. When Sync Type is not PRACH Message, the returned value is -999.0</td></tr>
<tr><td>2</td><td>Waveform/ChipPower trace data
Returns comma-separated waveform or chip power trace data (in dBm)</td></tr>
<tr><td>3</td><td>Slot Power Measurement trace (Absolute Power Measurement)
Returns comma-separated post-processed data trace for measured data. With "Slot Power Measurement" selected, the slot averaged data trace (in dBm) is returned. (This data trace corresponds to the ‘Result’ column in the Result window.) Number of slot is given as 1st parameter in :MEASure:PCONTrol?</td></tr>
<tr><td>4</td><td>PRACH Power result – returns comma-separated post-processed data Npreamble: Number of PRACH Preamble
– 1st number: Pre-Burst Off Pwr (float, in dBm) of 1st PRACH preamble</td></tr>
</table>

Index: n	Results Returned
	– 2nd number: Burst On Pwr (float, in dBm) of 1st PRACH preamble – 3rd number: Burst On Pwr relative to the previous data (float, in dB) of 1st PRACH (This returns always 0.0) – 4th number: Post-Burst Off Pwr (float, in dBm) of 1st PRACH preamble – 5th number: Time Offset (float, in chip) of 1st PRACH preamble This returns always 0.0) – ... – (N-1)*5+1: Pre-Burst Off Pwr (float, in dBm) of Nth PRACH preamble – (N-1)*5+2: Burst On Pwr (float, in dBm) of Nth PRACH preamble – (N-1)*5+3: Burst On Pwr relative to the previous data (float, in dB) of – Nth PRACH preamble – (N-1)*5+4: Post-Burst Off Pwr (float, in dBm) of Nth PRACH preamble – N*5: Time Offset (float, in chip) of Nth PRACH preamble – ... – (Npreamble-1)*5+1: Pre-Burst Off Pwr (float, in dBm) of Npreambleth PRACH preamble – (Npreamble-1)*5+2: Burst On Pwr (float, in dBm) of Npreambleth PRACH preamble – (Npreamble-1)*5+3: Burst On Pwr relative to the previous data (float, in dB) of Npreambleth PRACH preamble – (Npreamble-1)*5+4: Post-Burst Off Pwr (float, in dBm) of Npreambleth PRACH preamble – Npreamble*5: Time Offset (float, in chip) of Npreambleth PRACH preamble – Npreamble*5+1: Pre-Burst Off Pwr (float, in dBm) of PRACH Message (if available) – Npreamble*5+2: Burst On Pwr (float, in dBm) of PRACH Message (if available) – Npreamble*5+3: Burst On Pwr relative to the previous data (float, in dB) PRACH Message (if available) – Npreamble*5+4: Post-Burst Off Pwr (float, in dBm) of PRACH Message (if available) – Npreamble*5+5: Time Offset (float, in chip) of PRACH Message (if available)
5	Slot Power Measurement trace (Relative Power measurement –1) Returns comma-separated post-processed data trace for measured data. With "Slot Power Measurement" selected, the relative power with the previous slot data trace (in dB) is returned. (This data trace corresponds to the 'Delta Adj Pwr' column in the Result window.) The first data returns always '0.0' The number of slot is given as 1st parameter in :MEASure:PCONTrol?
6	Slot Power Measurement trace (Relative Power Measurement – 2) Returns comma-separated post-processed data trace for measured data. With "Slot Power Measurement" selected, the relative power level with the first slot (in dB) is returned. (This data trace corresponds to the 'Rel Pwr' column in the Results window.) The first data returns always '0.0' The number of slots is the first parameter from :MEASure:PCONTrol?
7	Chip by chip phase error trace Returns a series of floating point numbers (in degrees) that represents chip by chip phase error The number of values returned is equal to the number of chips in the capture interval
8	Chip phase error best-fit line

Index: n	Results Returned
	Returns a series of floating point numbers (in degrees) that represents best-fit phase line of chips to minimize the EVM of the slot The number of values returned is equal to the number of chips in the capture interval
9	Slot Phase Discontinuity Returns a series of floating point numbers (in degrees) that represents phase difference between the end of the previous slot and the beginning of the slot The number of values returned is equal to the number of slots in the capture interval
10	Slot phase error from the reference phase at the beginning of the slot Returns a series of floating point numbers (in degrees) that represents absolute phase error at the beginning of each slot The number of values returned is equal to the number of slots in the capture interval
11	RMS EVM of slots based on the best-fit line Returns a series of floating point numbers (in degrees) that represents RMS EVM of each slot excluding 25us at the beginning and tail of the slot The number of values returned is equal to the number of slots in the capture interval
12	RMS Magnitude error of slots Returns a series of floating point numbers (in degrees) that represents RMS Magnitude error of each slot excluding 25us at the beginning and end of the slot The number of values returned is equal to the number of slots in the capture interval
13	RMS Phase error of slot Returns a series of floating point numbers (in degrees) that represents frequency error of each slot, which is an element of the RMS EVM The number of values returned is equal to the number of slots in the capture interval
14	IQ Offset of slots Returns a series of floating point numbers (in dB) that represents IQ Origin Offset of each slot, which is an element of the RMS EVM The number of values returned is equal to the number of slots in the capture interval
15	Frequency error of the best-fit line for slots Returns a series of floating point numbers (in Hz) that represents frequency error of each slot, which is equivalent to the amount of the slope of the best-fit line and frequency error of the reference frequency that measurement algorithm determines for synchronization, and an element of the RMS EVM The number of values returned is equal to the number of slots in the capture interval
16	Active Channel List: Returns a series of floating point numbers: slot offset, symbol rate (ex. 15 ksps), OVSF code number, 1.0 (I) or -1.0 (Q) and relative power level for the active channels. The results would look like the following: – 1st number = Slot Offset – 2nd number = Symbol Rate – 3rd number = OVSF Code Number – 4th number = either +1(I) or -1(Q) – 5th number = Power Level (in dB) – … – (N-1) * 5 + 1st number = Slot Offset – (N-1) * 5 + 2nd number = Symbol Rate – (N-1) * 5 + 3rd number = OVSF Code Number – (N-1) * 5 + 4th number = either +1(I) or -1(Q) – (N-1) * 5 + 5th number = Power Level (in dB) N = number of total detected active channels in the captured signal Slot Offset: For the results of the latter half of a slot, 0.5 is added when Meas Interval is set to 0.5 First Slot Number (absolute number) is given by the 4th parameter of `:MEASure:PCONtrol[1]?` This result is available only after the measurement is done with no error when Measurement Type is Slot Phase (SPHase). Otherwise, 0.0 is returned
17	Numbers of active channels detected in a slot or a half slot: Returns a series of floating point numbers that represent number of active channels detected in either each slot or each half slot depending on Meas Interval

Index: n	Results Returned
	setting. The number of values returned are determined by Capture Interval and Meas Interval. For example, if Capture Interval is 1 Frame and Meas Interval is 1.0, 15 values are returned. If Capture Interval is 1 Frame and Meas Interval is 0.5 slots, 30 values are returned This result is available only after the measurement is done with no error when Measurement Type is Slot Phase (SPHase). Otherwise, 0.0 is returned

3.5.1 Views

The Power Control measurement has four views as follows.

These Views are multiple-window Views. When in a multiple window View, you select a window by touching it. The menu controls may sometimes change depending on which window is selected.

Whenever the View changes, the default menu is Frequency, unless otherwise specified in the View description.

View	Result
Slot Power	RF Envelope/Chip Power Graph
	Slot Power Table
PRACH Power	RF Envelope/Chip Power Graph
	PRACH Power Table
Slot Phase	Slot Phase Graph
	Slot Phase Table
Slot Phase w/Pwr Graph	Chip Power Graph
	Slot Power Table

View Selection Remote Commands

Allows you to select the desired measurement view.

- The Enumerated ID is used with the SCPI Command `:DISP:PCON:VIEW` ("View Selection by Name" on page 610)
- The Numeric ID is used with the SCPI Command `:DISP:PCON:VIEW:NSEL` ("View Selection by Number" on page 611)

Enumerated ID	Numeric ID	View Name
`POWer`	1	Slot Power
`PRACh`	3	PRACH Power
`PHASe`	2	Slot Phase
`SPPower`	4	Slot Phase w/Pwr Graph

View Selection by Name

Allows you to specify the view via its enumerated ID string.

Remote Command	`:DISPlay:PCONtrol:VIEW[:SELect] POWer | PHASe | PRACh | SPPower` `:DISPlay:PCONtrol:VIEW[:SELect]?`
Example	`:DISP:PCON:VIEW POW` `:DISP:PCON:VIEW?`
Notes	Measurement Type control under Meas Setup behaves in the same way as view switch. For details, see "Measurement Type" on page 681
Preset	`POWer`
State Saved	Yes
Range	Slot Power|PRACH Power|Slot Phase|Slot Phase w/Pwr Graph

View Selection by Number

Allows you to specify the view via its numeric ID value.

Remote Command	`:DISPlay:PCONtrol:VIEW:NSELect <integer>` `:DISPlay:PCONtrol:VIEW:NSELect?`
Example	`:DISP:PCON:VIEW:NSEL 1` `:DISP:PCON:VIEW:NSEL?`
Preset	1
State Saved	Yes
Min/Max	1/4

3.5.1.1 Slot Power

Windows: "Power Graph (RF Envelope/Chip Power)" on page 612, "Slot Power Metrics" on page 612

Example	`:DISP:PCON:VIEW POW`

3.5.1.2 PRACH Power

Windows: "Power Graph (RF Envelope/Chip Power)" on page 612, , "PRACH Power Metrics" on page 613

Example	`:DISP:PCON:VIEW PRAC`

3.5.1.3 Slot Phase

Windows: "Phase Graph" on page 614, "Slot Phase Metrics" on page 614

Example	`:DISP:PCON:VIEW PHAS`

3.5.1.4 Slot Phase w/Pwr Graph

Windows:"Power Graph (RF Envelope/Chip Power)" on page 612, "Slot Power Metrics" on page 612

Example	`:DISP:PCON:VIEW SPP`

3.5.2 Windows

The following section contains information on the Power Control Measurement windows.

3.5.2.1 Window Number List

Window	Number
Power	1
Slot Power Metrics	2
PRACH Power Metrics	3
Phase	4
Slot Phase Metrics	5

Power Graph (RF Envelope/Chip Power)

The power graph window appears in the Slot Power View, PRACH Power View and Slot Phase w/Pwr Graph View. In the Slot Phase w/Pwr Graph View, the contents are the same as those returned by the Slot Power Measurement in the Chip Power Method.

Marker Operation	Yes
Corresponding Trace	– yellow - Waveform/Chip Power trace (n=2) – light blue – Averaged absolute power level of each slot (n=3), which is also displayed in the “Result” column in the Metrics window (This trace is available only for Slot Power View and Slot Phase w/Pwr Graph View)

Slot Power Metrics

This window appears in the Slot Power View and Slot Phase w/Pwr Graph View. In the Slot Phase w/Pwr Graph View, the table contents are the same as those returned by the Slot Power Measurement in the Chip Power Method.

Name	Corresponding Results	Resolution
Number of slots	n=1 1st element Number of slots found in the captured data. (In case of PRACH	nnn

Name	Corresponding Results	Resolution
	Power measurement, it always returns 0)	
Slot	(1) If Meas Method is Waveform, it counts up from 1 to the number of slots (2) If Meas Method is Chip Power, there are two ways to show the slot number: – If the control "Slot Number" on the Display menu is Relative, the result counts up from 1 to the number of slots – If the control "Slot Number" on the Display menu is Absolute, the result shows the absolute slot number determined by the scrambling code In case (1), no corresponding information is returned via SCPI In case (2), the first slot number is always returned via SCPI (n=1 4th element)	nnn:
Result	n=3 Averaged absolute power level of each slot, which is also displayed as a light blue trace in RF Envelope window	nn.nn dBm
Delta Adjacent Pwr	n=5 Relative power level to the previous slot	nn.nn dB
Relative Pwr	n=6 Relative power level to the first slot	nn.nn dB

PRACH Power Metrics

This table window appears in the PRACH Power View.

Name	Corresponding Results	Resolution
Preamble	n=1 2nd and 3rd elements The preamble number counts of 1 to the number of PRACH preambles found in the captured data It indicates "Message" for the PRACH message burst	
Pre-Burst Off Pwr	n=4 (Npreamble - 1) * 5 + 1 th element Pre-Burst Off Power of Nth burst	nn.nn dBm
Burst On Pwr	n=4 (Npreamble - 1) *5 + 2 th element Burst On Power of Nth burst	nn.nn dBm
Burst On Pwr	n=4 (Npreamble - 1) *5 + 3 th element Burst On Power relative to the previous burst	nn.nn dB
Post-Burst Off Pwr	n=4 (Npreamble - 1) *5 + 4 th element Post-Burst Off Power of N th burst	nn.nn dBm
Time Offset Chip	n=4 (Npreamble - 1) *5 + 5 th element Time Offset relative to the previous burst	--- for first PRACH burst nnnnn for others

Phase Graph

This graph window appears in the Slot Phase View.

Marker Operation	Yes for all traces
Corresponding Trace	yellow – Chip phase error trace from the reference phase (n=7) light blue – Chip phase error best-fit line (n=8) violet – Phase Discontinuity line

Slot Phase Metrics

This table window appears in the Slot Phase View.

Name	Corresponding Results	Resolution
Number of slots	n=1 1st Number of slots found in the captured data. (In case of PRACH Power measurement, it always returns 0)	nnn
Slot	None Count up from 1 to Number of slots	nnn:
Phase Disc	n=9 Slot phase discontinuity from the previous slot. (Phase difference between the end of the previous slot and the beginning of the current slot)	nnn.nn degrees
Phase	n=10 Slot phase error from the reference phase at the beginning of the current slot	nnn.nn degrees
RMS EVM	n=11 RMS EVM of slots based on the best-fit line excluding 25us at the beginning and the end of the slot	nn.nn %
RMS Magnitude Error	n=12 RMS magnitude Error of the slot. It is an element of RMS EVM of the slot	nnn.nn degrees
RMS Phase Error	n=13 RMS Phase Error of the slot. It is an element of RMS EVM of the slot	nnn.nn degrees
IQ Origin Offset	n=14 IQ Origin offset of the slot. It is an element of RMS EVM of the slot	nnn.nn dB
Frequency Error	n=15 Frequency Error of the best-fit line for slots excluding 25 us at the beginning and the end of the slot It also includes the frequency error of the reference frequency that the measurement algorithm determines for synchronization	nnnn.nn Hz

3.5.3 Amplitude

The Amplitude front-panel key activates the Amplitude menu and selects Reference Value as the active function.

3.5.3.1 Y Scale

The Y Scale Tab contains controls that pertain to the Y axis parameters of the measurement. These parameters control how data on the vertical (Y) axis is displayed and control instrument settings that affect the vertical axis.

Ref Value

Sets the value for the absolute power reference. The functionality depends on the selected window. The reference line is at the top, center, or bottom of the graticule, depending on the value of the Ref Position function.

Remote Command	`:DISPlay:PCONtrol:WINDow[1]|4:TRACe:Y[:SCALe]:RLEVel <real>`
	`:DISPlay:PCONtrol:WINDow[1]|4:TRACe:Y[:SCALe]:RLEVel?`
	Window numbers are as follows:
	– Power: 1
	– Phase: 4

Example	1-Power window
	`:DISP:PCON:WIND:TRAC:Y:RLEV 0.0`
	4-Phase window
	`:DISP:PCON:WIND4:TRAC:Y:RLEV 0.0`

Couplings	When Auto Scaling is On (default), this value is automatically determined by the measurement result. When you set a value manually, Auto Scaling changes to Off
Preset	1-Power: 10.0 dBm 4-Phase: 0.0 deg
State Saved	Yes
Min/Max	1-Power: -250.0 dBm / 250.0 dBm 4-Phase: -36000.0 deg/36000.0 deg

Backwards Compatibility SCPI

Window Numbers used to be a combination of View and Window, now the VIEW parameter is not used and defaults to 1. All Windows are referenced through VIEW 1. For backwards compatibility the old View and Window numbers are honored as below:

Window	Old SCPI Command	New SCPI Command
Power	DISP:PCON:VIEW:WIND:TRAC:Y:RLEV 10.0	DISP:PCON:WIND:TRAC:Y:RLEV 0.0
Phase	DISP:PCON:VIEW2:WIND:TRAC:Y:RLEV 0.0	DISP:PCON:WIND4:TRAC:Y:RLEV 0.0

Scale/Div

Sets the units per division of vertical scale in the logarithmic display.

Remote Command	:DISPlay:PCONtrol:WINDow[1]|4:TRACe:Y[:SCALe]:PDIVision <rel_ampl> :DISPlay:PCONtrol:WINDow[1]|4:TRACe:Y[:SCALe]:PDIVision? Window numbers are as follows: – Power: 1 – Phase: 4
Example	1-Power window :DISP:PCON:WIND:TRAC:Y:PDIV 10.0 4-Phase window :DISP:PCON:WIND4:TRAC:Y:PDIV 10.0
Couplings	When the Auto Scaling is On, this value is automatically determined by the measurement result When the user sets a value manually, Auto Scaling automatically changes to Off
Preset	1-Power: 10.00 dB 4-Phase: 50.0 degrees
State Saved	Yes
Min/Max	1-Power: 0.1/20 dB 4-Phase: 0.01/3600.0 degrees

Backwards Compatibility SCPI

Window Numbers used to be a combination of View and Window, now the VIEW parameter is not used and defaults to 1. All Windows are referenced through VIEW 1. For backwards compatibility the old View and Window numbers are honored as below:

Window	Old SCPI Command	New SCPI Command
Power	DISP:PCON:VIEW1:WIND:TRAC:Y:PDIV 10.0	DISP:PCON:WIND:TRAC:Y:PDIV 10.0
Phase	DISP:PCON:VIEW2:WIND:TRAC:Y:PDIV 50.0	DISP:PCON:WIND4:TRAC:Y:PDIV 10.0

Ref Position

Positions the reference level at the top, center or bottom of the Y Scale display. Changing the reference position does not change the reference level value.

Remote Command	`:DISPlay:PCONtrol:WINDow[1]|4:TRACe:Y[:SCALe]:RPOSition TOP | CENTer | BOTTom`
	`:DISPlay:PCONtrol:WINDow[1]|4:TRACe:Y[:SCALe]:RPOSition?`
	Window numbers are as follows:
	– Power: 1
	– Phase: 4

Example	1-Power window
	`:DISP:PCON:WIND:TRAC:Y:RPOS TOP`
	4-Phase window
	`:DISP:PCON:WIND4:TRAC:Y:RPOS TOP`

Preset	1-Power: `TOP` 4-Phase: `CENTer`
State Saved	Yes
Range	`TOP|CENTer|BOTTom`

Backwards Compatibility SCPI

Window Numbers used to be a combination of View and Window, now the VIEW parameter is not used and defaults to 1. All Windows are referenced through VIEW 1. For backwards compatibility the old View and Window numbers are honored as below:

Window	Old SCPI Command	New SCPI Command
Power	`DISP:PCON:VIEW:WIND:TRAC:Y:RPOS TOP`	`DISP:PCON:WIND:TRAC:Y:RPOS TOP`
Phase	`DISP:PCON:VIEW2:WIND:TRAC:Y:RPOS TOP`	`DISP:PCON:WIND4:TRAC:Y:RPOS TOP`

Auto Scaling

Toggles the Auto Scaling function between On and Off.

Remote Command	`:DISPlay:PCONtrol:WINDow[1]|4:TRACe:Y[:SCALe]:COUPle 0 | 1 | OFF | ON`
	`:DISPlay:PCONtrol:WINDow[1]|4:TRACe:Y[:SCALe]:COUPle?`
	Window numbers are as follows:
	– Power: 1

	– Phase: 4

Example	1-Power window
	`:DISP:PCON:WIND:TRAC:Y:COUP ON`
	4-Phase window
	`:DISP:PCON:WIND4:TRAC:Y:COUP ON`

Notes	When Auto Scaling is On and the Restart front-panel key is pressed, this function automatically determines the scale per division and reference values based on the measurement results When you set a value to either Scale/Div or Ref Value manually, Auto Scaling automatically changes to Off
Preset	ON
State Saved	Yes
Range	OFF|ON

Backwards Compatibility SCPI

Window Numbers used to be a combination of View and Window, now the VIEW parameter is not used and defaults to 1. All Windows are referenced through VIEW 1. For backwards compatibility the old View and Window numbers are honored as below:

Window	Old SCPI Command	New SCPI Command
Power	DISP:PCON:VIEW:WIND:TRAC:Y:COUP ON	DISP:PCON:WIND:TRAC:Y:COUP ON
Phase	DISP:PCON:VIEW2:WIND:TRAC:Y:COUP ON	DISP:PCON:WIND4:TRAC:Y:COUP ON

3.5.3.2 Attenuation

Controls the attenuator functions and interactions between the attenuation system components.

There are two attenuator configurations in the X-Series. One is a Dual-Attenuator configuration consisting of a mechanical attenuator and an optional electronic attenuator. The other configuration uses a single attenuator with combined mechanical and electronic sections thatcontrols all the attenuation functions. Different models in the X-Series come with different configurations.

– See "Dual-Attenuator Configurations" on page 619

– See "Single-Attenuator Configuration" on page 620

Most attenuation settings are the same for all measurements – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by Meas Preset.

This tab is only available when the hardware set includes an input attenuator, which is typically only the case when using Keysight's box instruments. For example, this tab does not appear in:

– VXT models M9420A/21A/10A/11A

– E7760

– M9391A

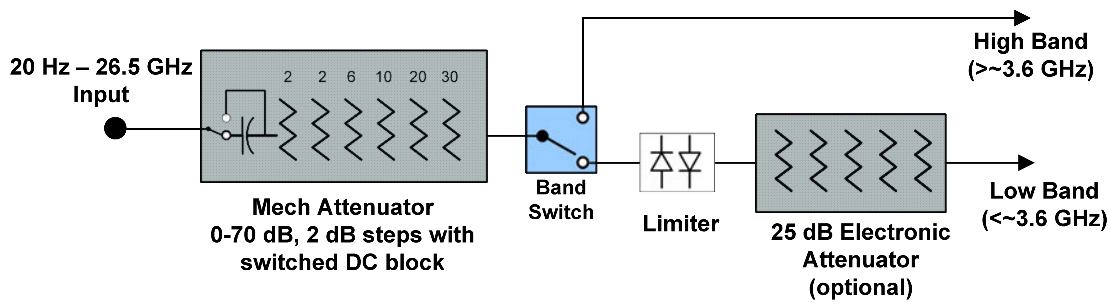
– M9393A

This tab also does not appear in UXM. In UXM all Attenuation and Range settings are disabled, as the expected input power level is handled by the Call Processing App that drives the DUT power control.

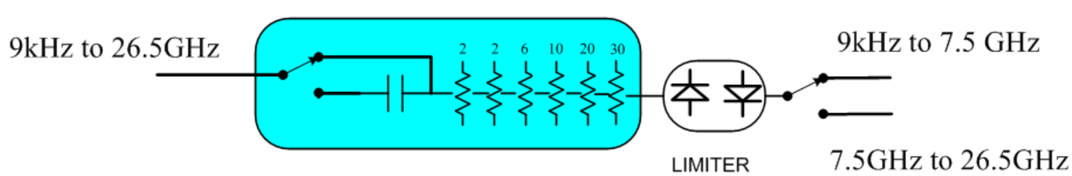
Dependencies	In measurements that support the I/Q inputs, this tab is unavailable when I/Q is the selected input, and is replaced by the Range tab in that case

Dual-Attenuator Configurations

Configuration 1: Mechanical attenuator + optional electronic attenuator

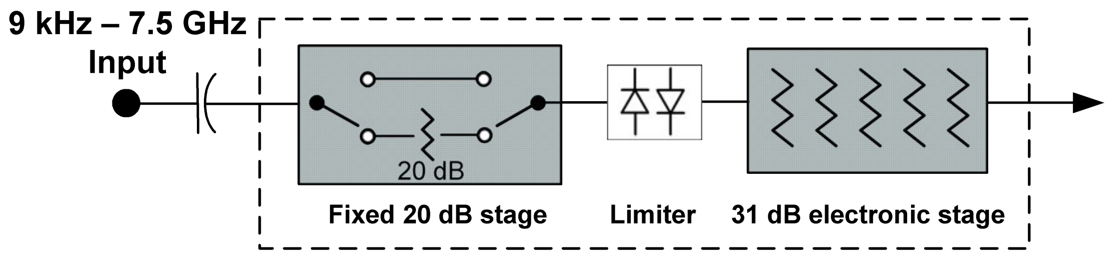


Configuration 2: Mechanical attenuator, no optional electronic attenuator



(note that Configuration 2 is not strictly speaking a dual-section attenuator, since there is no electronic section available. However, it behaves exactly like Configuration 1 without the Electronic Attenuator option EA3, therefore for the sake of this document it is grouped into the “Dual-Attenuator” configuration)

Single-Attenuator Configuration



You can tell which attenuator configuration you have by pressing the Attenuation tab, which (in most Modes) opensthe Attenuation menu. If the first control in the Attenuation menu says **Mech Atten** you have the Dual-Attenuator configuration. If the first control says **Atten** you have the Single-Attenuator configuration.

(Note that depending on the measurement, there may be no Auto/Man functionality on the Mech Atten control).

In the Single-Attenuator configuration, youcontrol the attenuation with a single control, as the fixed stage has only two states. In the Dual-Attenuator configuration, both stages have significant range so you are given separate control of the mechanical and electronic attenuator stages.

When you have the Dual-Attenuator configuration, you may still have only a Single-Attenuator, because unless option EA3 (the Electronic Attenuator option) is available, and you purchase it, you will have only the mechanical attenuator.

Full Range Atten

The **Full Range Atten** control and **Attenuator Summary** only appear in N9041B, when the RF input is selected and the RF Input Port is set to RF Input 2, and the Full Range Attenuator is installed. The Full Range Attenuator adds a second input attenuator at the beginning of the RF Input 2, which enhances the protection and optimizes the performance of the extra internal mixers used by RF Input 2.

Remote Command	`[:SENSe]:POWer[:RF]:FRATten <rel_ampl>` `[:SENSe]:POWer[:RF]:FRATten?`
Example	`:POW:FRAT 14` `:POW:FRAT?`

Notes	When you enter an amplitude value that falls between valid values, the value will be incremented to the next smallest valid value
Dependencies	Only appears if input RF is selected, and RF Input Port 2 is selected, and the Full Range Attenuator exists
Couplings	This value is never changed by any coupling, however other couplings use this value. See the **Reference Level** and "Mech Atten" on page 1750 command descriptions
Preset	20 dB
State Saved	Saved in instrument state
Min	0 dB
Max	Only valid values are 0, 6, 14, 20 dB
Annotation	When the Input is RF, and the Input Port is RF Input 2, and the Full Range Attenuator is installed: On the Meas Bar, the field “Atten” displays as follows: – If the sweep is entirely < 50 GHz, the value shown after “Atten:” is equal to Mech Atten + Elec Atten + Full Range Atten – If the sweep is entirely > 50 GHz, the value shown after “Atten:” is equal to Full Range Atten – If the sweep straddles 50 GHz, the value shown after “Atten:” is preceded by the symbol “>=” and is equal to Full Range Atten In the **Amplitude**, "Attenuation" on page 1747 menu, and the Atten Meas Bar dropdown menu panel, a summary is displayed as follows: “Total Atten below 50 GHz” followed by the value of Full Range Atten + Mech Atten + Elec Atten “Total Atten above 50 GHz” followed by the value of Full Range Atten For example, if Mech Atten = 6 dB, Elec Atten = 4 dB, and Full Range Atten = 20 dB, the summary below is shown: – Attenuator summary: – Total Atten below 50 GHz: 30 dB – Total Atten above 50 GHz: 20 dB

Mech Atten

This control is labeled **Mech Atten** in Dual-Attenuator models and **Atten** in Single-Attenuator models. In the Dual-Attenuator configuration, this control only affects the mechanical attenuator.

This control lets you modify the attenuation applied to the RF input signal path. This value is normally auto coupled to the Ref Level, the Internal Preamp Gain, any External Gain that is entered, and the Max Mixer Level, as described in the table below.

See "Attenuator Configurations and Auto/Man" on page 623

Remote Command	`[:SENSe]:POWer[:RF]:ATTenuation <rel_ampl>` `[:SENSe]:POWer[:RF]:ATTenuation?`

	`[:SENSe]:POWer[:RF]:ATTenuation:AUTO OFF | ON | 0 | 1` `[:SENSe]:POWer[:RF]:ATTenuation:AUTO?`

Example	`:POW:ATT 20`
	Dual-Attenuator configuration: sets the mechanical attenuator to 20 dB
	Single-Attenuator mode: sets the main attenuation to 20 dB (see below for definition of “main” attenuation)
	In either case, if the attenuator was in Auto, it is set to Manual
	`:POW:ATT:AUTO ON`
	Turn Auto Mech Atten ON

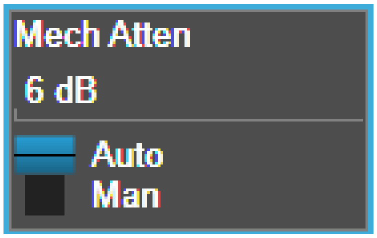
Dependencies	Some measurements do not support the Auto setting of "Mech Atten" on page 621. In these measurements, the Auto/Man selection is not available, and the Auto/Man toggle function is not available In Dual-Attenuator configurations, when the electronic attenuator is enabled, the mechanical attenuator has no auto setting and the Auto/Man toggle function is not available. The state of Auto/Man is remembered and restored when the electronic attenuator is once again disabled. This is described in more detail in "Elec Atten" on page 1753 See "Attenuator Configurations and Auto/Man" on page 623 for more information on the Auto/Man functionality `:POW:ATT:AUTO` is only available in measurements that support Mech Atten Auto, such as Swept SA
Couplings	If the RF Input Port is the RF Input: – If the USB Preamp is connected to USB, use 0 dB for Mech Atten – Otherwise compute the auto-selected value of Mech Atten based on **Reference Level**, Int Preamp, External Gain, Ref Level Offset, Max Mixer Level, µW Path Control and IF Gain settings. Limit this value to be no less than 6 dB (total attenuation below 6 dB can never be chosen by Auto) – In the N9041B, if the RF Input Port is RF Input 2, use the formula above and subtract the Full Range Atten value from the result to determine the Mech Atten. Limit the value so that it is never lower than 0 dB and so that total attenuation, including Full Range Atten, is never less than 6 dB (total attenuation, including Full Range Atten below 6 dB, can never be chosen by Auto) In External Mixingand BBIQ, where the Attenuator is not in the signal path, the Attenuator setting changes as described above when "Mech Atten" on page 621 is in Auto, but no changes are made to the actual attenuator hardware setting until the input is changed back to the RF Input For CXA-m with option FSA (Fine-Step Attenuator or 2 dB steps), the FSA-like behavior is only available when the frequency setting is <= 7.5GHz. So, when the frequency is changed from below 7.5GHz to above 7.5GHz, the attenuation setting will be changed to a multiple of 10dB which will be no smaller than the previous setting. For example, 4dB attenuation will be changed to 10dB
Preset	The preset for Mech Attenuation is “Auto” The Auto value of attenuation is 10 dB ON
State Saved	Saved in instrument state
Min	0 dB The attenuation set by this control cannot be decreased below 6 dB with the knob or step keys. Values

	below 6 dB must be directly entered from the keypad or via SCPI. This protects against setting a dangerously small attenuation value, which can put the instrument at risk of damage to input circuitry. If the current mechanical attenuation is below 6 dB, it can be increased with the knob and step keys, but not decreased
Max	CXA Option 503 or 507: 50 dB EXA: 60 dB All other models: 70 dB Note that in the Single-Attenuator configuration, the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB.
Annotation	The current value for Total Atten is displayed in the Measurement Bar at the top of the display. A value appears for Electronic Attenuation only if the Electronic Attenuator is enabled. The annotation appears as Atten: <total> dB (e<elec>) The e letter is in amber in Single-Attenuator configurations For example: Dual-Attenuator configuration: Atten: 24 dB (e14) Indicating the total attenuation is at 24 dB and the electronic attenuation is at 14 dB Single-Attenuator configuration: A: 24 dB (e14) Indicating the total attenuation is at 24 dB and the “soft” attenuation is at 14 dB (see below for definition of “soft” attenuation) When in Manual, a # sign appears in front of Atten in the annotation

Attenuator Configurations and Auto/Man

As described in "Attenuation" on page 1747 , there are two distinct attenuator configurations available in the X-Series, the single attenuator and Dual-Attenuator configurations. In Dual-Attenuator configurations, we have the mechanical attenuation and the electronic attenuation, and the current total attenuation is the sum of the electronic + mechanical attenuation. In Single-Attenuator configurations, we refer to the attenuation set using "Mech Atten" on page 621 (or `:POW:ATT`) as the “main” attenuation; and the attenuation that is set by `:POW:EATT` as the “soft” attenuation (`:POW:EATT` is honored even in the Single-Attenuator configuration, for compatibility purposes). Then the current total attenuation is the sum of the main + soft attenuation. See "Elec Atten" on page 1753 for more on “soft” attenuation.

NOTE	In some measurements, the **Mech Atten** control has an Auto/Man function. In these measurements, an Auto/Man switch is shown on the **Mech Atten** control:



Note that in configurations that include an Electronic Attenuator, this switch is only shown when the Electronic Attenuator is disabled.

In other measurements, **Mech Atten** has no Auto/Man function. In these measurements, no switch is shown on the **Mech Atten** control:

Mech Atten also appears with no switch, as above, in configurations that include an Electronic Attenuator but when the Electronic Attenuator is enabled.

Elec Atten

Controls the Electronic Attenuator in Dual-Attenuator configurations. This control does not appear in Single-Attenuator configurations, as the control of both the mechanical and electronic stages of the Single-Attenuator is integrated into the single **Atten** control.

This control includes an Enable/Disable toggle switch; it is only possible to enter a value for the Electronic Attenuator when this switch is in the “Enable” position.

See "More Information" on page 625

<table>
<tr><td>Remote Command</td><td><code>[:SENSe]:POWer[:RF]:EATTenuation <rel_ampl></code>
<code>[:SENSe]:POWer[:RF]:EATTenuation?</code>
<code>[:SENSe]:POWer[:RF]:EATTenuation:STATe OFF | ON | 0 | 1</code>
<code>[:SENSe]:POWer[:RF]:EATTenuation:STATe?</code></td></tr>
<tr><td>Example</td><td><code>:POW:EATT 10</code>
<code>:POW:EATT?</code>
<code>:POW:EATT:STAT ON</code>
<code>:POW:EATT:STAT?</code></td></tr>
<tr><td>Notes</td><td>Electronic Attenuation’s specification is defined only when Mechanical Attenuation is 6 dB</td></tr>
<tr><td>Dependencies</td><td>This control only appears in Dual-Attenuator models with an Electronic Attenuator installed and licensed. It does not appear in models with the Single-Attenuator configuration, as in the Single-</td></tr>
</table>

	Attenuator configuration there is no “electronic attenuator” there is only a single integrated attenuator (which has both a mechanical and electronic stage). However, in the Single-Attenuator configuration, EATT SCPI commands are accepted for compatibility with other X-series instruments and set a “soft” attenuation as described in . The “soft” attenuation is treated as an addition to the “main” attenuation value set by the Atten control or the POW:ATT SCPI command and affects the total attenuation displayed on the Atten control and the Meas Bar The electronic attenuator (and the “soft” attenuation function provided in Single-Attenuator configurations) is unavailable above the low band (0-3.6 GHz, 0-3.4 GHz 0-3GHz, depending on the model). If the low band ranges from 0-3.6GHz, and Stop Frequency of the instrument is > 3.6 GHz, then the **Enabled/Disabled** section of the **Elec Atten** control will be OFF and grayed out If the Internal Preamp is on, meaning it is set to Low Band or Full, the electronic attenuator (and the “soft” attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the **Enabled/Disabled** section of the **Elec Atten** control will be OFF and grayed out If either of the above is true, if the SCPI command is sent, an error indicating that the electronic attenuator is unavailable will be sent If both of the above are true, pressing the control will generate error message -221, in other words, the frequency range lockout takes precedence If the electronic/soft Attenuator is enabled, then the Stop Freq of the instrument is limited to 3.6 GHz and the Internal Preamp is unavailable The SCPI-only “soft” electronic attenuation for the single-attenuator configuration is not available in all measurements; in particular, it is not available in the Swept SA measurement
Couplings	Enabling and disabling the Electronic Attenuator affects the setting of the Mechanical Attenuator (in Dual-Attenuator configurations). This is described in more detail below and in the section "Attenuator Configurations and Auto/Man" on page 1752
Preset	`OFF` (Disabled) for Swept SA measurement `ON` (Enabled) for all other measurements that support the electronic attenuator
State Saved	Saved in instrument state
Min	0 dB
Max	Dual-Attenuator configuration: 24 dB Single-Attenuator configuration: the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB
Annotation	See Annotation under the **Mech Atten** control description

More Information

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear. These advantages primarily aid in remote operation and are negligible for front panel use. See "Using the Electronic Attenuator: Pros and Cons" on page 626 for a detailed discussion of the pros and cons of using the electronic attenuator.

For the Single-Attenuator configuration, for SCPI backwards compatibility, the “soft” attenuation feature replaces the Dual-Attenuator configuration’s electronic attenuator. All the same couplings and limitations apply. See "Attenuator Configurations and Auto/Man" on page 1752

Mechanical Attenuator Transition Rules

When the Electronic Attenuator is enabled, the Mechanical Attenuator transitions to a state that has no Auto function. Below are the rules for transitioning the Mechanical Attenuator. Note that the information below ONLY applies to the Dual-Attenuator configurations, and ONLY when the Electronic Attenuator is installed:

When the Electronic Attenuation is enabled from a disabled state:

The Mechanical Attenuator is initialized to 10 dB (this is its optimal performance setting). You can then set it as desired with SCPI, numeric keypad, step keys, or knob, and it behaves as it normally would in manual mode

The Auto/Man state of (Mech) Atten is saved

The Auto/Man toggle on the (Mech) Atten control disappears and the auto rules are disabled

The Electronic Attenuator is set to 10 dB less than the previous value of the Mechanical Attenuator, within the limitation that it must stay within the range of 0 to 24 dB of attenuation

Examples in the Dual-Attenuator configuration:

Mech Atten at 20 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 10 dB. New total attenuation equals the value before Elec Atten enabled

Mech Atten at 0 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 0 dB. New total attenuation does not equal the value before Elec Atten enabled

Mech Atten at 40 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 24 dB. New total attenuation does not equal the value before Elec Atten enabled

When the Electronic Attenuation is disabled from an enabled state:

The Elec Atten control is grayed out

- The Auto/Man state of (Mech) Atten is restored

If now in Auto, (Mech) Atten recouples

If now in Man, (Mech) Atten is set to the value of total attenuation that existed before the Elec Atten was disabled. The resulting value is rounded up to the smallest value possible given the (Mech) Atten Step setting - (That is, 57 dB changes to 58 dB when (Mech) Atten Step is 2 dB)

Using the Electronic Attenuator: Pros and Cons

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear.

The “finer steps” advantage of the electronic attenuator is beneficial in optimizing the alignment of the instrument dynamic range to the signal power in the front panel as well as remote use. Thus, you can achieve improved relative signal measurement accuracy. Compared to a mechanical attenuator with 2 dB steps, the 1 dB resolution of the electronic attenuator only gives better resolution when the odd-decibel steps are used. Those odd-decibel steps are less accurately calibrated than the even-decibel steps, so one tradeoff for this superior relative accuracy is reduced absolute amplitude accuracy.

Another disadvantage of the electronic attenuator is that the spectrum analyzer loses its “Auto” setting, making operation less convenient.

Also, the relationship between the dynamic range specifications (TOI, SHI, compression, and noise) and instrument performance are less well-known with the electrical attenuator. With the mechanical attenuator, TOI, SHI, and compression threshold levels increase dB-for-dB with increasing attenuation, and the noise floor does as well. With the electronic attenuator, there is an excess attenuation of about 1 to 3 dB between 0 and 3.6 GHz, making the effective TOI, SHI, and so forth, less well known. Excess attenuation is the actual attenuation relative to stated attenuation. Excess attenuation is accounted for in the instrument calibration

Adjust Atten for Min Clipping

Sets the combination of mechanical and electronic attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an "immediate action" function, that is, it executes once, when the control is pressed.

The algorithms that are used for the adjustment are documented under "Pre-Adjust for Min Clipping" on page 1757.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMediate`
Example	`:POW:RANG:OPT IMM`
Notes	Executing Adjust Atten for Min Clipping initiates the measurement.
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements For the Waveform measurement, this control is available only in 5G NR Mode

Adjust Atten

Allows you to select;

- Electric attenuator only
- Combination of Electric attenuator and Mechanical attenuator

when the command `[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMediate` is executed.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE EONLy | COMBined` `[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE?`

Example	:POW:RANG:OPT:TYPE EONL :POW:RANG:OPT:TYPE?
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements For the Waveform measurement, this control is available only in 5G NR Mode
Preset	COMBined
State Saved	Saved in instrument state

Pre-Adjust for Min Clipping

If this function is ON, it applies the adjustment described under "Adjust Atten for Min Clipping" on page 1756 each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

In Dual-Attenuator models, you can set **Elec+Mech Atten**, in which case both attenuators participate in the autoranging, or **Elec Atten Only**, in which case the mechanical attenuator does not participate in the autoranging. This latter case results in less wear on the mechanical attenuator and is usually faster.

See "Adjustment Algorithm" on page 629

Selection	Example	Note
Off	:POW:RANGe:OPT:ATT OFF	This is the default setting
Elec Atten Only	:POW:RANGe:OPT:ATT ELEC	Selects only the electric attenuator to participate in auto ranging. This offers less wear on the mechanical attenuator and is usually faster
Mech + Elec Atten	:POW:RANGe:OPT:ATT COMB	In Dual-Attenuator models, this selects both attenuators to participate in the autoranging

Remote Command	[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF | ON | ELECtrical | COMBined [:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?
Example	:POW:RANG:OPT:ATT OFF :POW:RANG:OPT:ATT?
Notes	The parameter option ELECtrical sets this function to ON in Single-Attenuator models The parameter option COMBined is mapped to ELECtrical in Single-Attenuator models. If you send COMBined, it sets the function to ON and returns ELEC to a query For SCPI compatibility with models that do not have an input attenuator, the ON parameter is honored and mapped to COMBined
Dependencies	This control only appears in Dual-Attenuator models with an Electronic Attenuator installed In instruments with Dual-Attenuator model, when **Enable** "Elec Atten" on page 1753 is OFF or grayed-out, "Pre-Adjust for Min Clipping" on page 628 is grayed-out

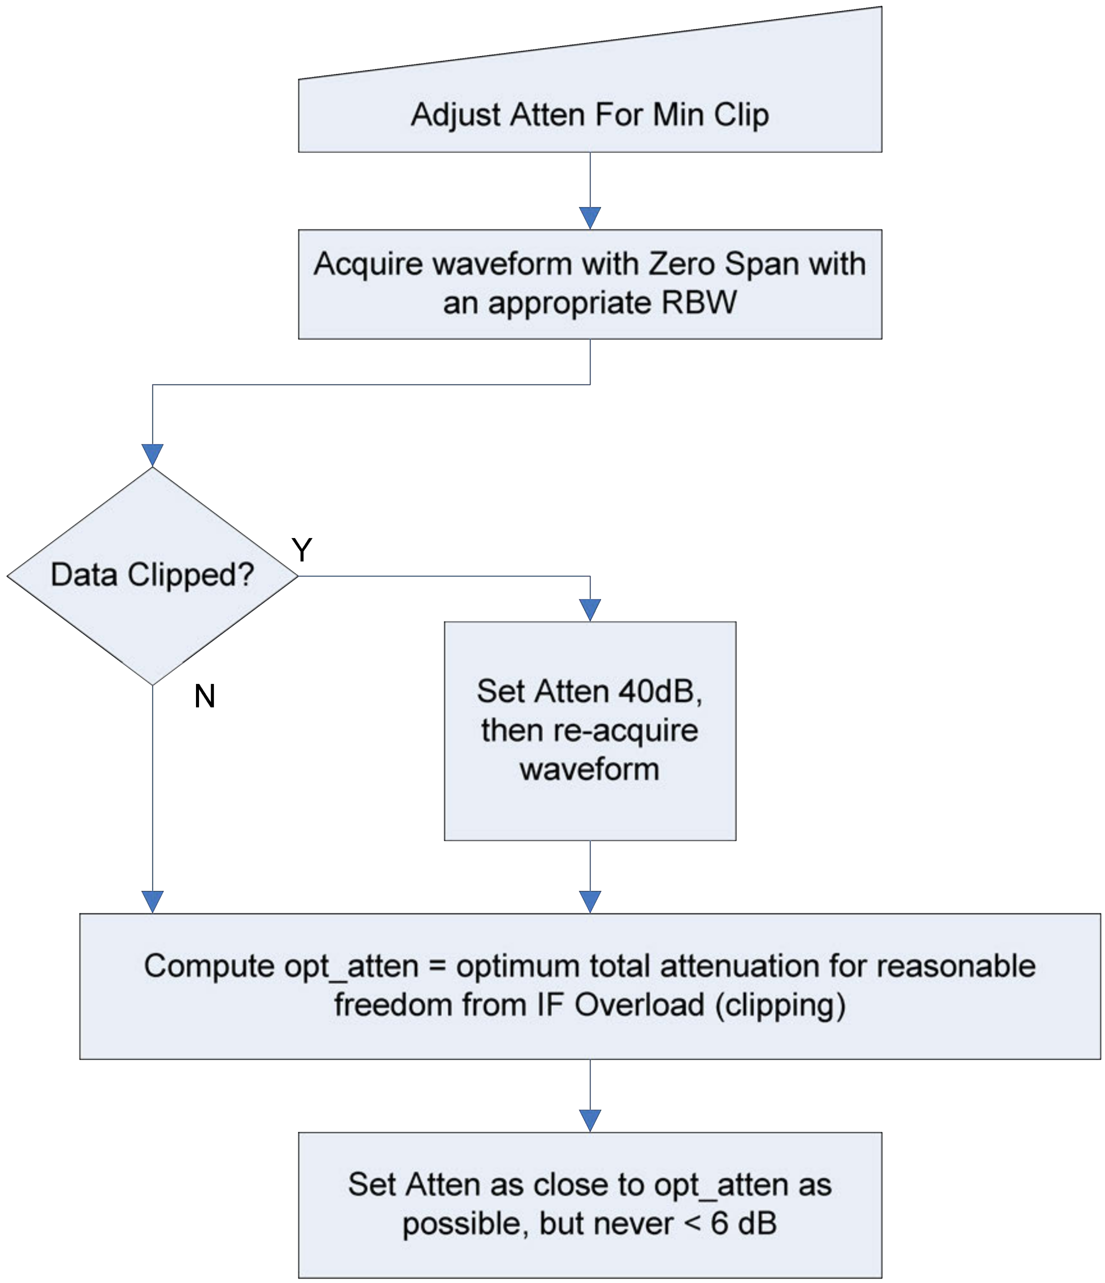
	This control does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements For the Waveform measurement, this control is available only in 5G NR Mode
Preset	`OFF` when Elec Atten is Disabled at preset, otherwise `ELEC`
State Saved	Saved in instrument state
Range	Dual-Attenuator models: Off | Elec Atten Only | Mech + Elec Atten Single-Attenuator models: Off | On

Notes	`ON` aliases to "Elec Atten Only" (`:POW:RANG:OPT:ATT ELEC`) `OFF` aliases to "Off" (`:POW:RANG:OPT:ATT OFF`) `:POW:RANG:AUTO?` returns true if `:POW:RANG:OPT:ATT` is not `OFF`
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:RANGe:AUTO ON | OFF | 1 | 0` `[:SENSe]:POWer[:RF]:RANGe:AUTO?`

Adjustment Algorithm

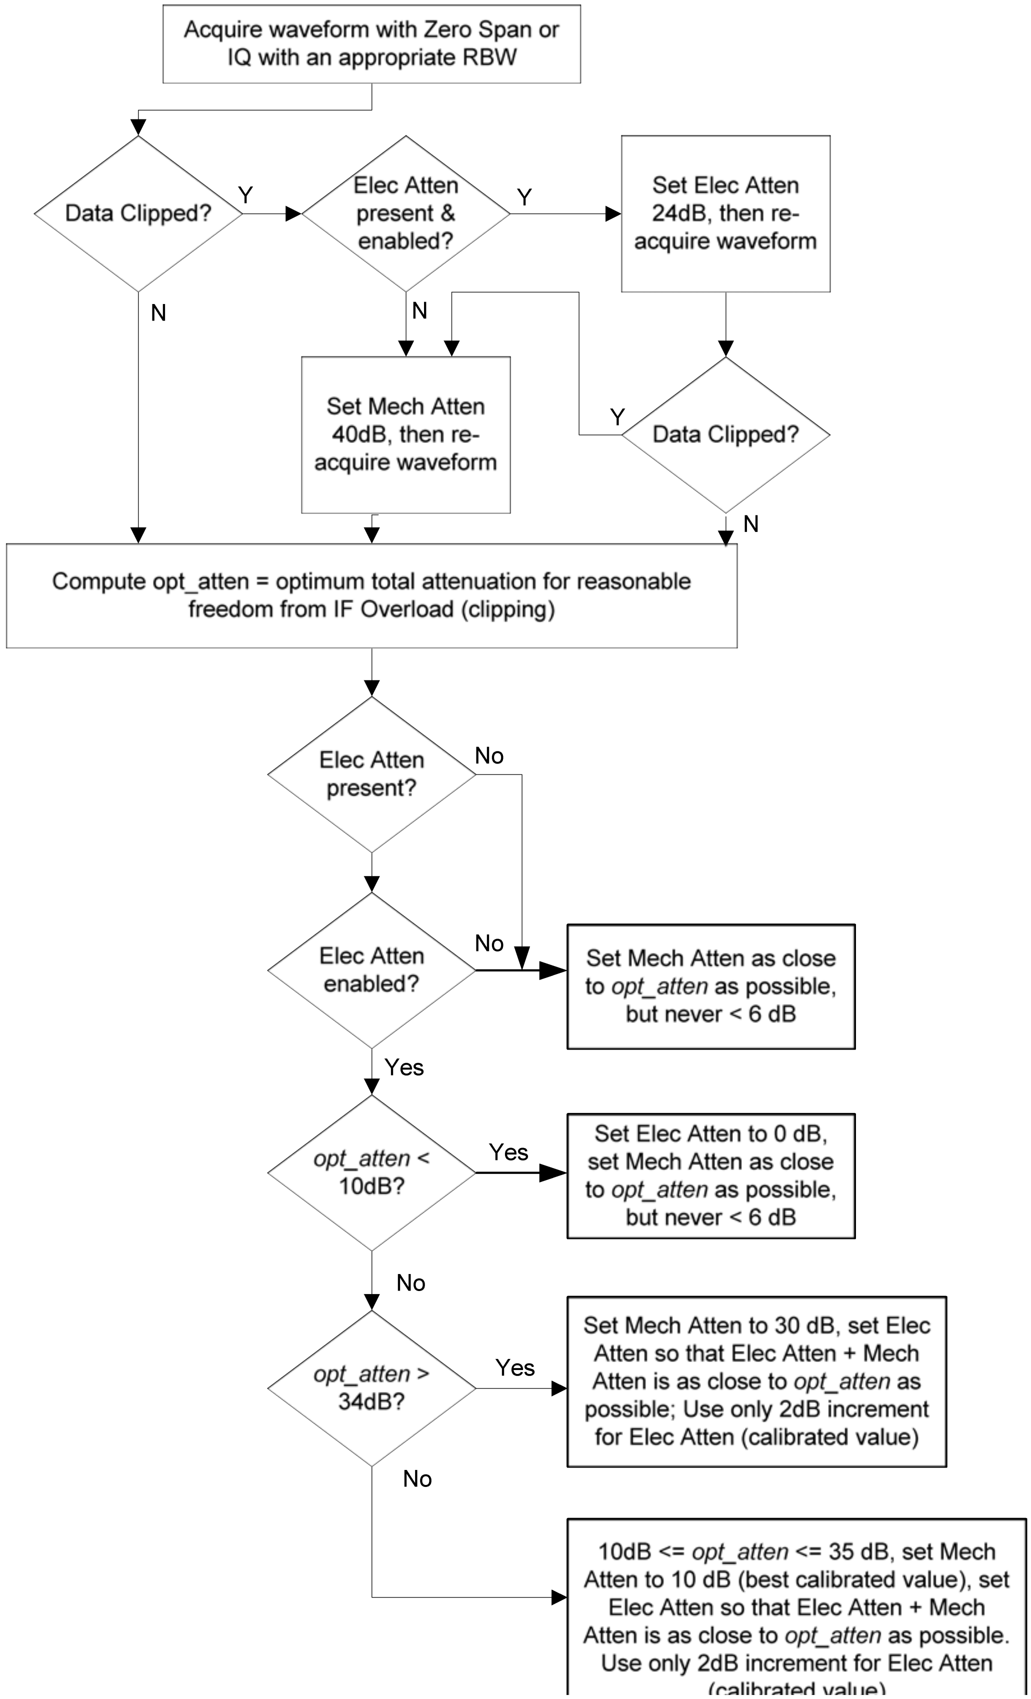
The algorithms for the adjustment are documented below:

Single-Attenuator Models



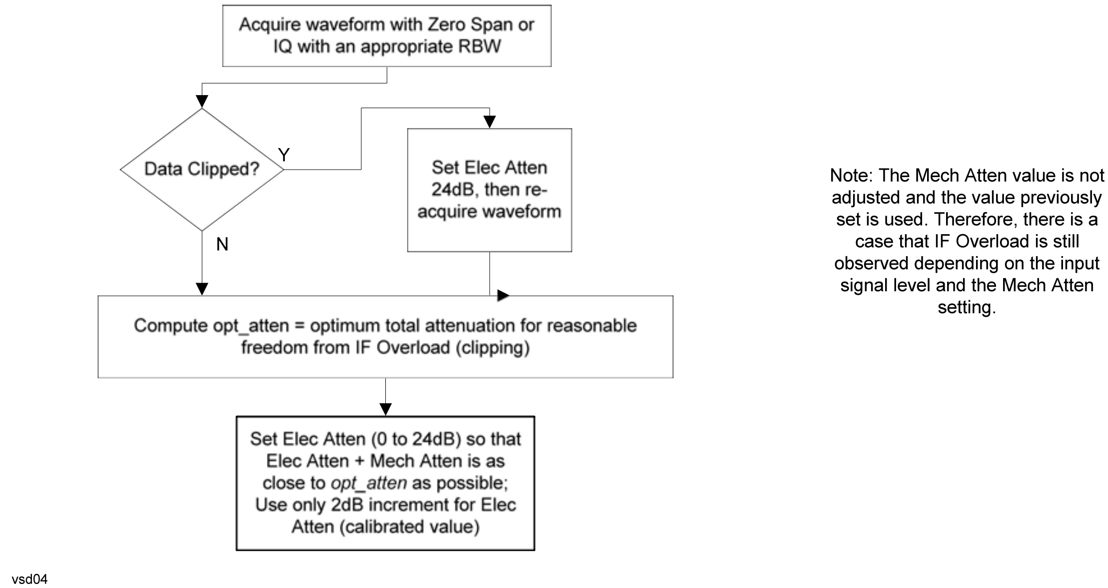
Dual-Attenuator models

"Adjust Atten for Min Clipping" on page 1756 or "Pre-Adjust for Min Clipping" on page 628 selection is Mech + Elec Atten:



Acquire waveform with Zero Span or IQ with an appropriate RBW
Data Clipped?
Y
N
Elec Atten present & enabled?
Y
N
Set Elec Atten 24dB, then re-acquire waveform
Set Mech Atten 40dB, then re-acquire waveform
Data Clipped?
Y
N
Compute opt_atten = optimum total attenuation for reasonable freedom from IF Overload (clipping)
Elec Atten present?
No
Elec Atten enabled?
No
Yes
Set Mech Atten as close to opt_atten as possible, but never < 6 dB
opt_atten < 10dB?
Yes
No
Set Elec Atten to 0 dB, set Mech Atten as close to opt_atten as possible, but never < 6 dB
opt_atten > 34dB?
Yes
No
Set Mech Atten to 30 dB, set Elec Atten so that Elec Atten + Mech Atten is as close to opt_atten as possible; Use only 2dB increment for Elec Atten (calibrated value)
10dB <= opt_atten <= 35 dB, set Mech Atten to 10 dB (best calibrated value), set Elec Atten so that Elec Atten + Mech Atten is as close to opt_atten as possible. Use only 2dB increment for Elec Atten

"Pre-Adjust for Min Clipping" on page 628 selection is Elec Only:



Mech Atten Step

Controls thestep size used when making adjustments to the input attenuation.

This control is labeled **Mech Atten Step** in Dual-Attenuator models and **Atten Step** in Single-Attenuator models. In the Dual-Attenuator configuration, this control only affects the step size of the mechanical attenuator.

Remote Command	`[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement] 10 dB | 2 dB` `[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement]?`
Example	`:POW:ATT:STEP 2` `:POW:ATT:STEP?`
Notes	This feature has a toggle choice from the front panel, but it takes a specific value (in dB) when used remotely. The only valid values are 2 and 10
Dependencies	Blanked in EXA, CXA and CXA-m if option FSA (2 dB steps) is not present. If blanked, attempts to set it via SCPI yield an error
Couplings	When the attenuation step size changes, the current mechanical attenuation value is adjusted (if necessary) to be quantized to the new step size. That is, if step is set to 10 dB, mech atten is increased if necessary so it is a multiple of 10 dB
Preset	EXA, CXA and CXA-m: 10 dB (2 dB with option FSA) All other models: 2 dB
State Saved	Saved in instrument state

Max Mixer Level

Allows you to set the maximum level to be applied to the mixer for a signal at the top of the screen. By setting this value up or down you can allow more or less signal through the system.

The major impact of changes to **Max Mixer Level** is seen in changes to the value to which **Reference Level** is limited. Max Ref Level depends on Max Mixer Level and Attenuation, and therefore a higher Max Mixer Level may let you set Ref Level higher. However, changing this value can impact your TOI, compression, or dynamic range. The preset value of this function is best for most measurements.

See also "Max Mixer Lvl Rules" on page 1762.

Remote Command	`[:SENSe]:POWer[:RF]:MIXer:RANGe[:UPPer] <real>` `[:SENSe]:POWer[:RF]:MIXer:RANGe[:UPPer]?`
Example	`:POW:MIX:RANG -15 dBm` `:POW:MIX:RANG?`
Dependencies	Only appears in Swept SA and RTSA measurements
Preset	-10 dBm
State Saved	Saved in instrument state
Min	-50 dBm
Max	0 dBm

Max Mixer Lvl Rules

Allows you to optimize the Max Mixer Level setting for certain kinds of measurements.

- `NORMal` – The historical, and thus backwards compatible, setting range (–50 to 0 dBm) and default setting (–10 dBm). The instrument has been designed so that, at the default setting, any signal below the **Reference Level** is extremely unlikely to create ADC overloads. At this mixer level the scale fidelity will be within specifications, thus compression with be negligible.
- `TOI` – Allows a range of settings of the "Max Mixer Level" on page 1762, –50 to –10 dBm, that can be optimum for measurements limited by the instrument third-order dynamic range. The default setting, –25 dBm, is commonly appropriate but RBW affects this. A good setting for Max Mixer Level would be higher than the optimum mixer level by half of the attenuator step size.
- `COMPression` – Allows a range of settings of the Max Mixer Level, –10 to +10 dBm or more, that can be optimum for measurements limited by the tradeoffs between instrument accuracy due to compression, and dynamic range due to the noise floor. The default setting, –3 dBm, is commonly appropriate, representing mixer drive levels that cause 1 dB or less compression at most carrier frequencies.

Typical measurements that would be optimized by this setting are the measurement of low sideband levels, including nulls, in angle-modulated signals (FM and PM). Also pulsed-RF measurements, including finding nulls to estimate pulse width, which are often best done with significant overdrive (compression) of the front end.

Setting Name (readback)	Setting Name (verbose)	Max Mixer Level Preset Value, dBm	Max Mixer Level minimum value, dBm	Max Mixer Level maximum value, dBm
NORMal	Normal – balance TOI, noise, and compression	–10	–50	0
TOI	TOI-limited dynamic range	–25	–50	–10
COMPression	Compression-limited dynamic range	–3	–10	+30

Remote Command	`[:SENSe]:POWer[:RF]:MIXer:RULEs NORMal | TOI | COMPression` `[:SENSe]:POWer[:RF]:MIXer:RULEs?`
Example	`:POW:MIX:RULE:COMP`
Dependencies	Only appears in Swept SA and RTSA
Preset	`NORM`

3.5.3.3 Range (Non-attenuator models)

This tab is only available for Keysight's modular signal analyzers and certain other Keysight products. Examples include:

- VXT
- E7760
- M9391A
- M9393A

This tab also does not appear in UXM. In UXM, all Attenuation and Range settings are disabled, as the expected input power level is handled by the Call Processing App that drives the DUT power control.

State Saved	No

Range

Represents the amplitude of the largest sinusoidal signal that could be present within the IF without being clipped by the ADC. For signals with high peak-to-average ratios, the range may need to exceed the rms signal power by a significant amount to avoid clipping.

This is a measurement global setting.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe <real>` `[:SENSe]:POWer[:RF]:RANGe?`
Example	`:POW:RANG 10 dBm` `:POW:RANG?`
Notes	The MIN and MAX values are affected by the External Gain parameters, and by the **Center Frequency** The hardware compensates for frequency response and alters the Range setting
Preset	0 dBm
State Saved	Yes
Min	-100
Max	100
Annotation	Meas Bar

Adjust Range for Min Clipping

Sets the combination of attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an "immediate action" function, that is, it executes once, when the key is pressed.

This key does not appear in measurements that do not support this functionality.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMediate`
Notes	Executing Adjust Range for Min Clipping initiates the measurement
Dependencies	This control does not appear in the Swept SA and Monitor Spectrum measurements This control appears in all measurements in E7760

Pre-Adjust for Min Clipping

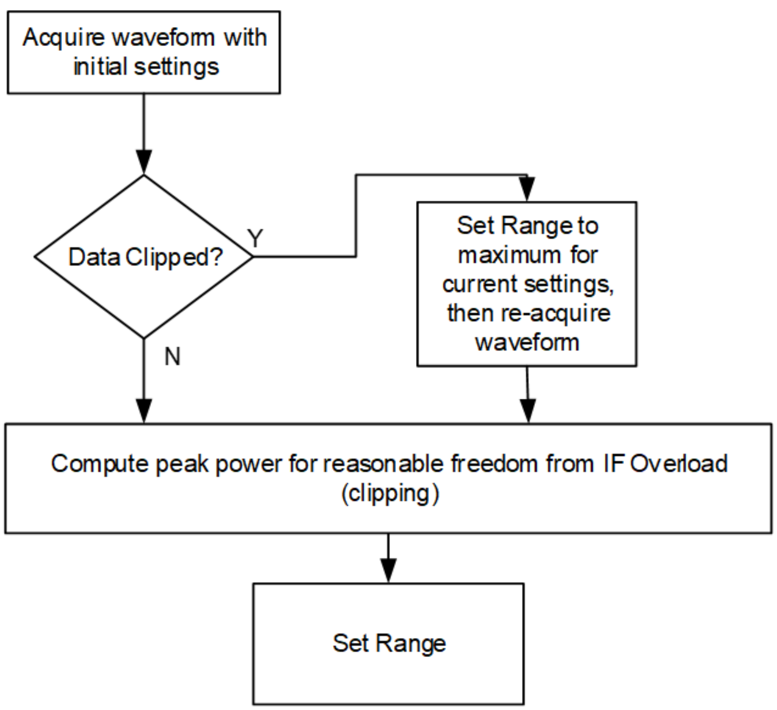
If this function is `ON`, it applies the adjustment described under Adjust Range For Min Clipping each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF | ON | ELECtrical | COMBined`

	[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?
Notes	Because there is no attenuator control available in these models, the control displays only ON and OFF choices. However, for SCPI compatibility with other platforms, all three parameters (ELECtrical, COMBined, and ON) are honored and all are mapped to ELECtrical, so if any of these three parameters is sent, a subsequent query will return ELEC
Dependencies	This control does not appear in the Swept SA and Monitor Spectrum measurements This control appears in all measurements in E7760
Preset	OFF for Swept SA measurement; ON for all other measurements that support **Pre-Adjust for Min Clipping**
State Saved	Saved in instrument state

Adjustment Algorithm

The algorithm for the adjustment is documented below:



Peak-to-Average Ratio

Used with "Range (Non-attenuator models)" on page 1864 to optimize the level control in the instrument. The value is the ratio, in dB, of the peak power to the average power of the signal to be measured. A ratio of 0 should be used for sinusoidal signals; for 802.11g OFDM signals use 9 dB.

All Applications (Modes) show the current value of Peak-to-Average ratio on the control. However, some applications do not permit changing the value. In these situations, the control is grayed-out.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:PARatio <real>` `[:SENSe]:POWer[:RF]:RANGe:PARatio?`
Example	`:POW:RANG:PAR 12 dB`
Notes	In some Applications (Modes) this parameter is read-only; meaning the value will appear on the control and query via SCPI, but is not changeable. In such applications the control is grayed-out. Attempting to change the value via SCPI will be ignored but no error message will be generated
Dependencies	This control does not appear in Spectrum Analyzer Mode
Preset	10 dB VXT Models M9410A/11A: 0 dB
State Saved	Saved in instrument state
Min	0 dB
Max	20 dB VXT Models M9410A/11A: 50 dB

Mixer Lvl Offset

This is an advanced setting to adjust target Range at the input mixer, which in turn affects the signal level in the instrument's IF. This setting can be used when additional optimization is needed after setting "Peak-to-Average Ratio" on page 1866. Positive values of offset optimize noise performance over distortion, negative values optimize distortion performance over noise.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet <real>` `[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet?`
Example	`:POW:RANG:MIX:OFFS -5 dB`
Preset	0 dB
State Saved	Saved in instrument state
Min	-35 dB VXT Models M9410A/11A: -34 dB
Max	30 dB

3.5.3.4 Signal Path

Contains controls that pertain to the routing of the signal through the frontend of the instrument.

In general, this tab only appears in instruments whose hardware supports this signal routing. For example, this tab does not appear in many of the modular instrument products, including VXT Models M9420/21A. It also does not appear in UXM.

This tab *does* appear in VXT Models M9410A/11A because the Software Preselection control is in this tab, and VXT Models M9410A/11A implement a version of Software Preselection.

Presel Center

Pressing this control adjusts the centering of the preselector filter to optimize the amplitude accuracy at the frequency of the selected marker. If the selected marker is not on when **Presel Center** is pressed, the instrument turns on the selected marker, performs a peak search, and then performs centering on the marker's center frequency. If the selected marker is already on and between the start and stop frequencies of the instrument, the instrument performs the preselector calibration on that marker's frequency. If the selected marker is already on, but outside the frequency range between Start Freq and Stop Freq, the instrument first performs a peak search, and then performs centering on the marker's center frequency.

The value displayed on "Preselector Adjust" on page 1869 will change to reflect the new preselector tuning.

A number of considerations should be observed to ensure proper operation. See "Proper Preselector Operation" on page 639.

Remote Command	`[:SENSe]:POWer[:RF]:PCENter`
Example	`:POW:PCEN`
Notes	Note that the rules outlined above under the control description apply for the remote command as well as the key. The result of the command is dependent on marker position, etc. Any message shown by the control press is also shown in response to the remote command
Dependencies	Does not appear in CXA-m Does not appear in VXT Models M9410A/11A Grayed-out if the microwave preselector is off – If the selected marker's frequency is below Band 1, an advisory message is generated "Preselector not used in this frequency range" and no action is taken – Grayed-out if entirely in Band 0, that is, if Stop Freq is below about 3.6 GHz – Grayed-out if entirely above 50 GHz, that is, if Start Freq is above 50 GHz – Blank in models that do not include a preselector, such as option 503. If the remote command is sent in these instruments, it is accepted without error, and the query always returns 0 – Grayed-out in the Spectrogram View
Couplings	The active marker position determines where the centering will be attempted If the instrument is in a measurement such as averaging when centering is initiated, the act of centering the preselector restarts averaging, but the first average trace will not be taken until the centering is completed The offset applied to do the centering reads out on the "Preselector Adjust" on page 1869 control
Status Bits/OPC dependencies	When centering the preselector, `*OPC` will not return true until the process is complete and a subsequent measurement has completed, nor will results be returned to `:READ` or `:MEASure` queries The Measuring bit should remain set while this command is operating and should not go false until the subsequent sweep/measurement has completed

Proper Preselector Operation

A number of considerations should be observed to ensure proper operation:

1 If the selected marker is off, the instrument turns on a marker, performs a peak search, and adjusts the preselector using the selected marker's frequency. It uses the "highest peak" peak search method unqualified by threshold or excursion, so that there is no chance of a 'no peak found' error. It continues with that peak, even if it is the peak of just noise. Therefore, for this operation to work properly, there should be a signal on screen in a preselected range for the peak search to find

2 If the selected marker is already on, the instrument attempts the centering at that marker's frequency. There is no preselector for signals below about 3.6 GHz, so if the marker is on a signal below 3.6 GHz, no centering will be attempted and an advisory message generated

3 In some models, the preselector can be bypassed. If it is bypassed, no centering will be attempted in that range and a message will be generated

Preselector Adjust

Allows you to manually adjust the preselector filter frequency to optimize its response to the signal of interest. This function is only available when "Presel Center" on page 1868is available.

For general purpose signal analysis, using **Presel Center** is recommended. Centering the filter minimizes the impact of long-term preselector drift. **Preselector Adjust** can be used instead to manually optimize the preselector. One application of manual optimization would be to peak the preselector response, which both optimizes the signal-to-noise ratio and minimizes amplitude variations due to small (short-term) preselector drifting.

When **Presel Center** is performed, the offset applied to do the centering becomes the new value of **Preselector Adjust**.

Remote Command	`[:SENSe]:POWer[:RF]:PADJust <freq>` `[:SENSe]:POWer[:RF]:PADJust?`
Example	`:POW:PADJ 100KHz` `:POW:PADJ?`
Notes	The value on the control reads out to 0.1 MHz resolution
Dependencies	– Does not appear in CXA-m – Does not appear in VXT Models M9410A/11A – Grayed-out if microwave preselector is off – Grayed-out if entirely in Band 0, that is, if Stop Freq is below about 3.6 GHz – Grayed-out if entirely above 50 GHz, that is, if Start Freq is above 50 GHz

	– Blank in models that do not include a preselector, such as option 503. If the SCPI is sent in these instruments, it is accepted without error, and the query always returns 0 – Grayed-out in the Spectrogram View
Preset	0 MHz
State Saved	The **Preselector Adjust** value set by "Presel Center" on page 1868, or by manually adjusting **Preselector Adjust** It is not saved in instrument state, and does not survive a Preset or power cycle
Min	-500 MHz
Max	500 MHz
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:MW:PADJust` `[:SENSe]:POWer[:RF]:MMW:PADJust`

Notes	PSA had multiple preselectors, and you could select which preselector to adjust. Since the X-Series has only one mm/uW preselector, the preselector selection control is no longer available. However, to provide backward compatibility, we accept the legacy remote commands The command form has no effect, the query always returns `MWAVe`
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:PADJust:PRESelector MWAVe | MMWave | EXTernal` `[:SENSe]:POWer[:RF]:PADJust:PRESelector?`

Internal Preamp

Accesses a menu of controls for the internal preamps. Turning on the preamp gives a better noise figure, but a poorer inter-modulation distortion (TOI) to noise floor dynamic range. You can optimize this setting for your particular measurement.

The instrument takes the preamp gain into account as it sweeps. If you sweep outside of the range of the preamp, the instrument will also account for that. The displayed result always reflects the correct gain.

For some measurements, when the preamp is on and any part of the displayed frequency range is below the lowest frequency for which the preamp has specifications, a warning condition message appears in the status line. For example, for a preamp with a 9 kHz lowest specified frequency: "Preamp: Accy unspec'd below 9 kHz".

Selection	Example	Note
Off	`:POW:GAIN OFF`	
Low Band	`:POW:GAIN ON` `:POW:GAIN:BAND LOW`	Sets the internal preamp to use only the low band. The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Low Band selection in the dropdown

Selection	Example	Note
Full Range	:POW:GAIN ON :POW:GAIN:BAND FULL	Sets the internal preamp to use its full range. The low band (0-3.6 GHz, 0-3.4 GHz, 0-3GHz, depending on the model) is supplied by the low band preamp and the frequencies above low band are supplied by the high band preamp The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Full Range selection in the dropdown. If the high band option is not installed the Full Range selection does not appear

Remote Command	[:SENSe]:POWer[:RF]:GAIN:BAND LOW | FULL [:SENSe]:POWer[:RF]:GAIN:BAND? [:SENSe]:POWer[:RF]:GAIN[:STATe] OFF | ON | 0 | 1 [:SENSe]:POWer[:RF]:GAIN[:STATe]?
Example	:POW:GAIN:BAND LOW :POW:GAIN:BAND? :POW:GAIN OFF :POW:GAIN?
Dependencies	Preamp is not available on all hardware platforms. If the preamp is not present or is unlicensed, the control is not shown Does not appear in VXT Models M9410A/11A/15A If :POW:GAIN:BAND FULL is sent when a low band preamp is available, the preamp band parameter is set to LOW instead of FULL, and an "Option not installed" message is generated The preamp is not available when the electronic/soft attenuator is enabled
Preset	LOW OFF
State Saved	Saved in instrument state
Annotation	When the USB Preamp is not connected to USB, the Preamp annotation in the Meas Bar says "Off" if the preamp is off and displays the frequency range of the low band or full range preamp depending on the setting. For example, if the Preamp is set to Low Band and the Low Band is 3.6 GHz the annotation says "3.6 GHz". If it is a 13.6 GHz preamp and it is set to Full Range the annotation says "13.6 GHz" When the USB Preamp is connected to USB, the Preamp annotation says "Preamp: USB" if the internal preamp is off or "Preamp: USB, Int" if the internal preamp is on (only for measurements that support the USB preamp)

LNA

Lets you turn the Low Noise Amplifier (LNA) on or off.

The LNA is an additional preamplifier that provides superior DANL and frequency range compared to the Internal Preamp. The LNA provides lower system noise figure, especially at frequencies above 100 MHz, and can be operated up to the full range of 50 GHz instruments.

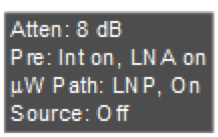
For best possible sensitivity, the LNA can be turned on together with the "Internal Preamp" on page 1870, although if you operate both preamps together, note that the TOI (distortion) specifications are impacted. The sensitivity improvement of this combination is substantial when operating in high band (frequencies above 3.6 GHz).

See "More Information" on page 642

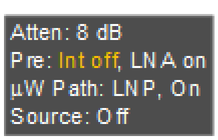
Remote Command	`[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe] OFF | ON | 0 | 1` `[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe]?`
Example	`:POW:GAIN:LNA ON`
Dependencies	Requires option LNA Option LNA is not required by VXT model M9415A Does not appear in VXT models M9420A/21A/10A/11A May not appear in some measurements
Preset	`OFF`
State Saved	Saved in State

More Information

When the LNA is installed, the preamp annotation changes to show the state of both the LNA and the Internal Preamp. Below is an example:



Note that when operating entirely in the low band (below about 3.6 GHz), if the LNA is on, the Internal Preamp is switched off (even if you have its switch set to ON). This is because the noise performance is actually degraded in low band if both preamps are on. In this case, the annotation reflects the actual state of the two preamps, but the Internal Preamp annotation displays in amber, to warn you that the actual state of the Internal Preamp does not match the **Internal Preamp** switch control display:



µW Path Control

Options for this control include **µW Preselector Bypass** (Option MPB), **Low Noise Path** (Option LNP) and **Full Bypass Enable** in the High Band path circuits.

When the µW Preselector is bypassed, flatness is improved, but will be subject to spurs from out of band interfering signals. When **Low Noise Path Enable** is selected, the instrument automatically bypasses certain circuitry in the high frequency bands that can contribute to noise, when it is appropriate based on other instrument settings.

For most applications, the preset state is **Standard Path**, which provides the best remote-control throughput, minimizes acoustic noise from switching and minimizes the risk of wear in the hardware switches, particularly in remote test scenarios where both low band and high band setups will follow in rapid succession. In this path, the bypass of the low band/high band switch and microwave preamp is never activated, which can cause some noise degradation but preserves the life of the bypass switch.

For applications that utilize the wideband IF paths, the preset state is **µW Preselector Bypas**s, if option MPB is present. This is because, when using a wideband IF such as the 140 MHz IF, the µW Preselector's bandwidth can be narrower than the available IF bandwidth, causing degraded amplitude flatness and phase linearity, so it is desirable to bypass the preselector in the default case.

You may choose **Low Noise Path Enable** for a lower noise floor, especially in the 21-26.5 GHz region, though without improving many measures of dynamic range, and without giving the best possible noise floor. The preamp, if purchased and used, gives better noise floor than does **Low Noise Path Enable**, but the preamp's compression threshold and third-order intercept are much poorer than that of **Low Noise Path Enable**.

A fourth choice is **Full Bypass Enable**, which combines **µW Preselector Bypass** and **Low Noise Path Enable**. Because this can bypass most of the circuitry between the input and the first mixer, care should be taken when using this setting to avoid damaging the mixer. **Full Bypass Enable** is only available if both options LNP and MPB are present, as well as option FBP.

Path	Example	Note
Standard Path	:POW:MW:PATH STD	Normal setting for most measurements. µW Preselector in circuit, Low Noise Path disabled
Low Noise Path Enable	:POW:MW:PATH LNP	See "Low Noise Path Enable" on page 647
µW Preselector Bypass	:POW:MW:PATH MPB	See "µW Preselector Bypass" on page 649
Full Bypass Enable	:POW:MW:PATH FULL	See "Full Bypass Enable" on page 650

Remote Command `[:SENSe]:POWer[:RF]:MW:PATH STD | LNPath | MPBypass | FULL`

	`[:SENSe]:POWer[:RF]:MW:PATH?`

Example	`:POW:MW:PATH LNP`
	Enables the Low Noise path
	`:POW:MW:PATH?`

Notes	If "Presel Center" on page 1868 is performed, the instrument will momentarily switch to the Standard Path, regardless of the setting of **µW Path Control** The DC Block will always be switched in when the low noise path is switched in, to protect succeeding circuitry from DC. Note that this does not mean "when the low noise path is enabled" but when, based on the Low Noise Path rules, the path is actually switched in. This can happen when the selection is **Low Noise Path Enable** or **Full Bypass Enable.** In the case where the DC Block is switched in the instrument is now AC coupled. However, if you selected DC coupling, the UI would still behave as though it were DC coupled, including all annunciation, warnings, status bits, and responses to SCPI queries. This is because, based on other settings, the instrument could switch out the low noise path at any time and hence go back to being DC coupled Alignment switching ignores the settings in this menu, and restores them when finished
Dependencies	Does not appear in CXA-m Does not appear in VXT Models M9410A/11A Does not appear in BBIQ and External Mixing The **Low Noise Path Enable** selection does not appear unless Option LNP is present and licensed The **µW Preselector Bypass** selection does not appear unless Option MPB is present and licensed The **Full Bypass Enable** selection does not appear unless options LNP and MPB are both present as well as option FBP In any of these cases, if the required options are not present and the SCPI command is sent, error -241, "Hardware missing; Option not installed" is generated **Low Noise Path Enable** and **Full Bypass Enable** are grayed-out if the current measurement does not support them **Low Noise Path Enable** and **Full Bypass Enable** are not supported in Avionics and MMR Modes. In any of these cases (that is, the feature is not supported in either measurement or mode), if the SCPI command is sent, the following error is generated: -221, "Setting Conflict; Feature not supported for this measurement"
Preset	All except modes specified below: `STD` IQ Analyzer, VXA, Pulse and Avionics mode: – MPB option present and licensed: `MPB` – MPB option not present and licensed: `STD`
State Saved	Save in instrument state
Range	Standard Path|Low Noise Path Enable|µW Presel Bypass|Full Bypass Enable
Annotation	In the Meas Bar, if the Standard path is chosen, it says: µW Path: Standard If Low Noise Path is enabled but the LNP switch is not thrown, it shows: µW Path: LNP,Off If the Low Noise Path is enabled and the LNP switch IS thrown, it shows: µW Path: LNP,On

If the preselctor is bypassed, it says:

µW Path: Bypass

If Full Bypass Enable is selected but the LNP switch is not thrown, it shows:

µW Path: FByp,Off

If Full Bypass Enable is selected and the LNP switch IS thrown, it shows:

µW Path: FByp,On

µW Path Control Auto [Mode: VMA, WLAN, NR5G, CQM]

In VMA, WLAN, 5G NR, CQM modes, an Auto/Man switch is added to **µW Path Control**:

This allows the function to automatically switch based on certain Auto Rules as shown below:

VMA Mode

Measurement	When µW Path Control is in Auto:
Digital Demod	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Monitor Spectrum	Always Presel Bypass
IQ Waveform	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Custom OFDM	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Channel Power	Always Presel Bypass
Occupied BW	Always Presel Bypass
CCDF	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
ACP	Always Presel Bypass
SEM	Always Presel Bypass
Spurious Emissions	Always Standard Path

WLAN Mode

Measurement	When µW Path Control is in Auto:
Modulation Analysis	Always Presel Bypass

Measurement	When µW Path Control is in Auto:
Spectral Flatness	Always Presel Bypasss
Power vs Time	Always Presel Bypass
Monitor Spectrum	Always Presel Bypass
IQ Waveform	Always Presel Bypass
Channel Power	Always Presel Bypass
Occupied BW	Always Presel Bypass
CCDF	Always Presel Bypass
SEM	1. For 11be 320M, when 'Enabled Wideband IF for FFT' is OFF or 'Sweep Type Rule' is Best Dynamic Range, auto µW path is standard. 2. For other cases, auto µW path is presel bypass if presel bypass is enabled, auto µW path is standard if presel bypass is not enabled.
Spurious Emissions	Always Standard Path

5G NR Mode

Measurement	When µW Path Control is in Auto:
Modulation Analysis	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Full Bypass if conditions warrant(FBP Option is available and "Allow Full Bypass in Auto" is On), otherwise choose Preselector Bypass
Monitor Spectrum	Always Standard Path
IQ Waveform	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Full Bypass if conditions warrant(FBP Option is available and "Allow Full Bypass in Auto" is On), otherwise choose Preselector Bypass
Channel Power	Always Standard Path
Occupied BW	Always Standard Path
CCDF	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
ACP	Always Standard Path
SEM	Always Standard Path
Spurious Emissions	Always Standard Path
Transmit On|Off Power	Use Standard Path unless tuned frequency > 3.6 GHz and Info BW > 15 MHz, in which case choose Preselector Bypass

Channel Quality Mode

Measurement	When µW Path Control is in Auto:
Group Delay	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Full Bypass if conditions warrant(FBP Option is available and "Allow Full Bypass in Auto" is On), otherwise choose Preselector Bypass
Monitor Spectrum	Always Standard Path
IQ Waveform	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in

Measurement	When µW Path Control is in Auto:
	which case choose Preselector Bypass
CCDF	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass

Remote Command	`[:SENSe]:POWer[:RF]:MW:PATH:AUTO ON | OFF | 1 | 0` `[:SENSe]:POWer[:RF]:MW:PATH:AUTO?`
Example	`:POW:MW:PATH:AUTO ON` `:POW:MW:PATH:AUTO?`
Dependencies	Only appears in VMA, WLAN, 5G NR and CQM modes
Couplings	See the tables above
Preset	`ON`
Range	`ON|OFF`

Low Noise Path Enable

You may select **Low Noise Path Enable**, which gives a lower noise floor under some circumstances, particularly when operating in the 21-26.5 GHz region. With the Low Noise Path enabled, the low band/high band switch and microwave preamp are bypassed whenever all of the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz
- the internal preamp is not installed or (if installed) is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Low Noise Path Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the **Low Noise Path Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Low Noise Path Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

For measurements that use IQ acquisition, the low noise path is used when **Center Frequency** is in High Band (> 3.6 GHz) and no preamp is in use. In other words, the rules above are modified to use only the center frequency to qualify which path to switch in. This is not the case for FFTs in the Swept SA measurement; they use the same rules as swept measurements.

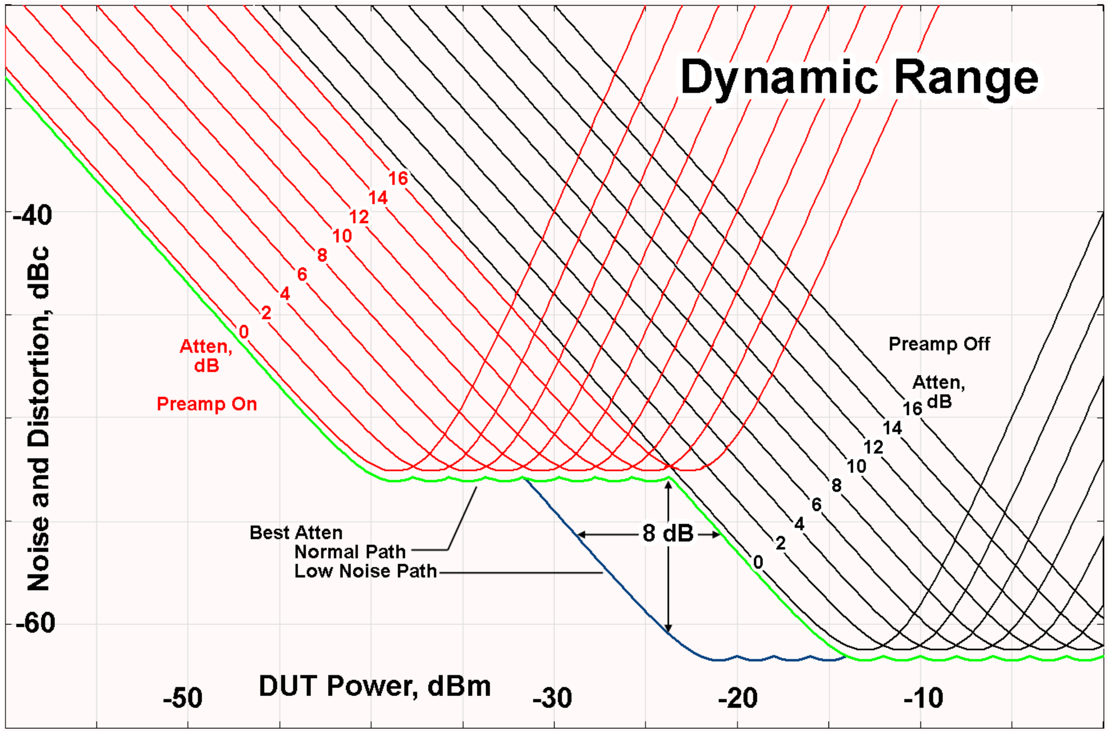
Note that the Low Noise Path, while giving improved DANL, has the disadvantage of decreased TOI performance and decreased gain compression performance relative to the standard path.

Note also that the bypass switch is a mechanical switch and has finite life, so if the **Low Noise Path Enable** is selected, it is possible to cause frequent cycling of this switch by frequently changing instrument settings such that the above conditions hold true only some of the time. A user making tests of this nature should consider opting for the **Standard Path**, which will never throw the bypass switch, at the expense of some degraded noise performance.

The low noise path is useful for situations where the signal level is so low that the instrument performance is dominated by noise even with 0 dB attenuation, but still high enough that the preamp option would have excessive third-order intermodulation or compression. The preamp, if purchased and used, gives better noise floor than does the "Low Noise Path." However, its compression threshold and third-order intercept are much poorer than that of the non-preamp path.

There are some applications, typically for signals around –30 dBm, for which the third-order dynamic range of the standard path is good enough, but the noise floor is not low enough even with 0 dB input attenuation. When the third-order dynamic range of the preamp path is too little and the noise floor of the standard path is too high, the Low Noise Path can provide the best dynamic range

The graph below illustrates the concept. It shows, in red, the performance of an instrument at different attenuation settings, both with the preamp on and off, in a measurement that is affected by both instrument noise and instrument TOI. The green shows the best available dynamic range, offset by 0.5 dB for clarity. The blue shows how the best available dynamic range improves for moderate signal levels with the low noise path switched in. In this illustration, the preamp improves the noise floor by 15 dB while degrading the third-order intercept by 30 dB, and the low noise path reduces loss by 8 dB. The attenuator step size is 2 dB.



There are other times where selecting the low noise path improves performance, too. Compression-limited measurements such as finding the nulls in a pulsed-RF spectrum can profit from the low noise path in a way similar to the TOI-limited measurement illustrated. Accuracy can be improved when the low noise path allows the optimum attenuation to increase from a small amount like 0, 2 or 4 dB to a larger amount, giving better return loss at the instrument input. Harmonic measurements, such as second and third harmonic levels, are much improved using the low noise path because of the superiority of that path for harmonic (though not intermodulation) distortion performance.

µW Preselector Bypass

Toggles the preselector bypass switch for band 1 and higher. When the microwave presel is on, the signal path is preselected. When the microwave preselector is off, the signal path is not preselected. The preselected path is the normal path for the instrument.

The preselector is a tunable bandpass filter which prevents signals away from the frequency of interest from combining in the mixer to generate in-band spurious signals (images). The consequences of using a preselector filter are its limited bandwidth, the amplitude and phase ripple in its passband, and any amplitude and phase instability due to center frequency drift.

Option MPB or pre-selector bypass provides an unpreselected input mixer path for certain X-Series signal analyzers with frequency ranges above 3.6 GHz. This signal path allows a wider bandwidth and less amplitude variability, which is an advantage when doing modulation analysis and broadband signal analysis. The disadvantage is that, without the preselector, image signals will be displayed. Another disadvantage of bypassing the preselector is increased LO emission levels at the front panel input port.

Image responses are separated from the real signal by twice the 1st IF. For IF Paths of 10 MHz and 25 MHz, the 1st IF is 322.5 MHz, so the image response and the real signal will be separated by 645 MHz. The 1st IF will be different for other IF Path settings. When viewing a real signal and its corresponding image response in internal mixing, the image response will be to the left of the real signal.

Also, the image response and the real signal typically have the same amplitude and exhibit the same shape factor.

However, if Option FS1, Fast Sweep Capability, is enabled, the image response in the Swept SA measurement appears lower in amplitude and has a much wider shape factor compared to the real signal.

Full Bypass Enable

With **Full Bypass Enable** selected, the microwave preselector is bypassed. In addition, the low band/high band switch and microwave preamp are bypassed whenever all of the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz.
- the internal preamp is not installed or (if installed) is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Full Bypass Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

CAUTION

When **Full Bypass Enable** is selected, and "Attenuation" on page 1747 is set to 0 dB, there will be a direct AC connection between the input and the first converter when the Low Noise Path switches in (when Start Freq >3.6 GHz and the Preamp is either not licensed, set to Low Band, or Off). This puts the first converter at high risk to be damaged by high AC power. Consequently, whenever **Full Bypass Enable** is selected, a warning message appears in the status bar:

Full Bypass Enabled, maximum safe input power reduced

Microwave Preselector Bypass Backwards Compatibility

Example	`:POW:MW:PRES OFF` Bypasses the microwave preselector
Notes	Included for Microwave Preselector Bypass backwards compatibility The `ON` parameter sets the `STD` path (`:POW:MW:PATH STD`) The `OFF` parameter sets path `MPB` (`:POW:MW:PATH MPB`)
Preset	`ON`
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe] ON | OFF | 0 | 1` `[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe]?`

Frequency Extender Preselection Bypass

Frequency Extender Preselection Bypass only applies to the high frequency path of the Frequency Extender and only if the Frequency Extender allows it. For example, the V3050A high frequency path is 50 – 110 GHz and does allow control of the preselector bypass.

When the Frequency Extender’s preselection is bypassed, flatness is improved, but will be subject to spurs from out of band interfering signals. For bandwidths greater than 2.5 [GHz], it is recommended that the signal bypass the Frequency Extender Preselector since the max bandwidth of the Preselector can be as narrow as 2.5 [GHz].

For most applications, the preset state is `OFF`, which gives the best remote-control throughput, minimizes acoustic noise from switching, minimizes out of band spurs, and minimizes the risk of wear in the hardware switches.

Coupling with Microwave Preselector Control

The control of whether to apply or bypass the Frequency Extender’s preselection is dependent on the Microwave Path Control setting.

The coupling between the Microwave Path Control and Frequency Extender Preselector Bypass is described below.

UW PATH CTRL	UW PRESELECTOR	VIKING PRESELECTOR
Standard Path	On	**On**
Low Noise Path Enable	On	**On**
uW Presel Bypass	Off	**Off**
Full Bypass Enable	Off	**Off**

In other words…

uW Path Ctrl == Standard
uW Path Ctrl == Low Noise
→ Viking PreselBypass == Off

uW Path Ctrl == Bypass
uW Path Ctrl == Full Bypass
→ Viking PreselBypass == On

For the Frequency Extender Preselector Bypass to take effect, it requires a Frequency Extender device (such as V3050A) be connected and External RF (ERFIN) selected as the input.

The Frequency Extender Preselector is applied or bypassed depending on the Microwave Path Control setting only when the acquisition is above 50 [GHz]. Hence, it will be bypassed only when the acquisition is above 50 [GHz].

Preselector and Bandwidth Conflict

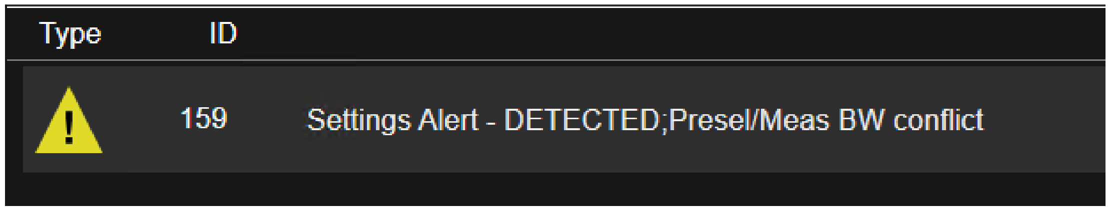
When the Frequency Extender Preselector is applied and the signal bandwidth is greater than 2.5 [GHz], then a settings alert message will show to warn the user that the signal may be distorted due to the limitation of the Frequency Extender Preselector bandwidth.

An example of the settings alert message is shown below.

Settings Alert message in the Status Bar at the bottom of the display.

Settings Alert message in the error queue

.



Software Preselection

Software Preselection is provided in some instruments, either to compensate for issues with provided hardware preselection or to provide the preselection function when there is no hardware preselector.

N9041B

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

In the N9041B, Software Preselection only applies for frequencies above 50 GHz, therefore it is only used for RF Input 2. Even if it is turned on, it will not be used for other inputs and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that in the N9041B, in Swept SA, Software Preselection will work even if the measurement is using an FFT sweep type. In measurements other than Swept SA, Software Preselection will not be used if the measurement is using an FFT sweep type.

N9042B+V3050A

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 88 GHz, software preselection must be used to suppress and separate images above 88 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

For N9042B+V3050A, Software Preselection only applies for frequencies above 88 GHz, therefore it is only used for External RF. Even if it is turned on, it will not be used for other inputs and never for frequencies below 88 GHz. This is why the label of this control contains the parenthetical note “(>~88 GHz)”.

Note that for N9042B+V3050A, in Swept SA, Software Preselection will work even if the measurement is using an FFT sweep type. In measurements other than Swept SA, Software Preselection will not be used if the measurement is using an FFT sweep type.

VXT models M9410A/11A

Software Preselection is used to provide the preselection function, as there is no hardware preselector in these models. Two background traces are taken and compared point by point, and the point with the lowest amplitude from the two traces is used. This provides a method to reduce spurs that are internally generated within the VXT, but the user should note the following when using Software Preselection:

- There is some speed cost due to the need to take multiple captures
- Taking the point with the lowest amplitude in each trace will make the average noise level lower at all points that do not have a spur. This can reduce the accuracy of the measurement of noise and noise-like signals.

Because of the difficulty in identifying spurs manually, you are encouraged to leave Software Preselection ON at all times in VXT models M9410A/11A. If you turn it off in order to speed up your measurement or improve noise accuracy, be aware of unwanted onscreen spurs.

Remote Command	`[:SENSe]:POWer[:RF]:SWPResel:STATe 0 | 1 | ON | OFF` `[:SENSe]:POWer[:RF]:SWPresel:STAT?`
Example	`:POW:SWPR:STAT 1` `:POW:SWPR:STAT?`
Dependencies	Only appears in N9041B, N9042B+V2050A, and VXT models M9410A/11A. Does not appear in all measurements
Couplings	Sweep Time is affected by SW Preselection. Also Auto Tune supports SW Preselection, so set SW Preselection state and then do Auto Tune
Preset	N9041B: OFF N9042B+V3050A: ON M9410A/11A: ON
State Saved	Saved in instrument state

SW Preselection Type

Specifies the algorithm used for software preselection.

Two hidden sweeps are taken in succession. The second sweep is offset in LO frequency by 2*IF/N. For each point in each trace, the smaller amplitude from the two traces is taken and placed in that point in the selected trace. The Peak detector is auto-selected to improve the image suppression effectiveness. Responses of each trace that lie on top of one another will remain and are valid signals. Other signals are images and are suppressed. The action of taking the smaller of the two traces will make the average noise level lower in all points that do not have an image, thus reducing the accuracy of the measurement of noise and noise-like signals.

- NORMal - mathematically removes all image and multiple responses of signals present at the input
- ADVanced - any trace processing (such as “max hold” or trace averaging) is performed on the points of both candidate traces before the “select minimum” operation occurs. This form of processing works better for non-stationary signals, such as pulsed-RF signals

Remote Command	[:SENSe]:POWer[:RF]:SWPResel NORMal | ADVanced [:SENSe]:POWer[:RF]:SWPResel?
Example	:POW:SWPR NORM :POW:SWPR?
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method When "Software Preselection" on page 1883 is Disabled, this control is grayed-out. Its grayout message is “Unavailable unless SW Presel enabled”
Preset	N9041B: ADVanced N9042B+V3050A: NORMal
State Saved	Saved in instrument state

SW Preselection BW

Specifies the effective bandwidth to be used for Software Preselection.

The choices are:

- NORMal – when making Swept measurements, a software preselection algorithm is used which takes up to 4 background acquisitions, then post-processes the result. This algorithm can remove images from signals with an occupied bandwidth up to around 3 GHz. (Default/Preset setting). When making FFT measurements, this algorithm is not used, instead the same algorithm is used as for NARRow (below)
- NARRow– a software preselection algorithm is used which takes two background acquisitions, then post-processes the result to detect and remove images from wideband signals with occupied bandwidths up to 2 GHz. This increases the risk of images failing to be rejected, but improves the measurement speed

Remote Command	[:SENSe]:POWer[:RF]:SWPResel:BW NORMal | NARRow [:SENSe]:POWer[:RF]:SWPResel:BW?
Example	:POW:SWPR:BW NARR
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method When "Software Preselection" on page 1883 is Disabled, this control is grayed out. Its grayout message is “Unavailable unless SW Presel enabled” For N9042B+V3050A the parameter is SCPI only and always set to NARRow when Software

	Preselection is enabled
Preset	N9041B: NORMal N9042B+V3050A: NARRow
State Saved	Saved in instrument state

High Freq Prefilter

Lets you set the state of Prefilter for Center Frequencies above 1310 MHz.

In VXT Models M9410A/11A, the Receiver RF path has a bank of filters that come after the RF Attenuator in the signal path. Since this bank of filters precedes the mixer they are known as the “Prefilter” bank. Their purpose is to eliminate unwanted in-band mixing products by filtering out all but the desired frequencies before the signals get to the mixer. There are 13 prefilter bands to cover the frequencies between 9 kHz and 6000 MHz. The Prefilter provides the necessary rejection of the unwanted signal.

Remote Command	`[:SENSe]:<measurement>:PFILter[:STATe] ON | OFF | 1 | 0` `[:SENSe]:<measurement>:PFILter[:STATe]?`

Example	For example, to enable High Freq Prefilter in IQ Analyzer Mode:
	For the Complex Spectrum Measurement:
	`:SPEC:PFIL ON`
	For the IQ Waveform Measurement:
	`:WAV:PFIL ON`
	`:`

Dependencies	This control only appears in VXT models M9410A/11A with center frequency above 1310 MHz
Preset	See “Prefilter Presets” below
State Saved	Saved in instrument state

Prefilter Presets

Meas	Mode	Preset
SPEC	BASIC	OFF
WAV	BASIC, WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA	OFF
MON	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA	OFF
RHO	WCDMA	OFF
CDP	WCDMA	OFF
PCON	WCDMA	OFF
EVMQ	WCDMA	OFF
CHP	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF

Meas	Mode	Preset
OBW	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
ACP	WCDMA, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
SEM	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
PST	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
PVT	WLAN, LTEAFDD, LTEATDD, 5GNR	OFF
EVM	WLAN, LTEAFDD, LTEATDD, 5GNR	OFF
FLAT	WLAN	OFF
EVMM	WLAN	OFF
CEVM	LTEAFDD, LTEATDD	OFF
PAVT	5GNR, VMA	OFF
DDEM	VMA	OFF
OFDM	VMA	OFF
SAN	SA	ON
HARM	SA	ON

3.5.4 BW

The BW key opens the bandwidth menu, which contains controls for the Information Bandwidth functions of the instrument.

The Information BW functions control filter bandwidth and filter type. There are two filter types, Gaussian and Flattop. The Gaussian filters have a response curve that is parabolic on a log scale. The Flattop filter shape is a close approximation of a rectangular filter.

3.5.4.1 Settings

The Settings tab contains the basic Bandwidth functions. It is the only tab under Bandwidth.

Info BW

Enables you to specify the information bandwidth for the instrument. This is used to set the hardware filter of the ADC.

Remote Command	[:SENSe]:PCONtrol:BANDwidth[:RESolution] <freq> [:SENSe]:PCONtrol:BANDwidth[:RESolution]?
Example	:PCON:BAND 8.0e6 :PCON:BAND?
Preset	6 MHz
State Saved	Yes

Min	100000
Max	8 MHz
Backwards Compatibility SCPI	[:SENSe]:PCONtrol:BWIDth[:RESolution]

Filter Type

Toggles the filter shapes between Gaussian and Flat (flattop).

Remote Command	[:SENSe]:PCONtrol:BANDwidth[:RESolution]:TYPE FLATtop | GAUSsian [:SENSe]:PCONtrol:BANDwidth[:RESolution]:TYPE?
Example	:PCON:BAND:TYPE FLAT :PCON:BAND:TYPE?
Preset	FLATtop
State Saved	Yes
Range	FLATtop|GAUSsian
Backwards Compatibility SCPI	[:SENSe]:PCONtrol:BWIDth[:RESolution]:TYPE

3.5.5 Display

The Display Menu lets you configure display items for the current Mode, Measurement View or Window.

3.5.5.1 Meas Display

The Meas Display tab contains controls for setting up the display for the current Measurement, View or Window.

Slot Number

Selects how the measurement results are shown. The following options are available:

RELative	The Slot column of the measurement results shows relative slot number to the beginning of the captured data. In this case, the slot number always begins with 1
ABSolute	The Slot column shows absolute slot number determined by scrambling code. In this case, the range of slot number is 0 to 14

Remote Command	:DISPlay:PCONtrol:WINDow:TEXT:SNUMber RELative | ABSolute :DISPlay:PCONtrol:WINDow:TEXT:SNUMber?
Example	:DISP:PCON:WIND:TEXT:SNUM REL :DISP:PCON:WIND:TEXT:SNUM?
Notes	This parameter is available only for the Slot Metrics window
Preset	REL
State Saved	Yes
Range	Relative|Absolute

Chip Phase Trace

Toggles the chip-by-chip phase trace (yellow trace) On and Off.

Remote Command	:DISPlay:PCONtrol:WINDow4:TRACe:CPHase[:STATe] ON | OFF | 1 | 0 :DISPlay:PCONtrol:WINDow4:TRACe:CPHase[:STATe]?
Example	:DISP:PCON:WIND4:TRAC:CPH ON :DISP:PCON:WIND4:TRAC:CPH?
Notes	This parameter is available only for the Phase graph
Preset	OFF
Range	ON|OFF
Backwards Compatibility SCPI	:DISPlay:PCONtrol:VIEW[1]:WINDow[1]:TRACe:CPHase[:STATe]

3.5.5.2 View

Contains controls for selecting the current **View**, and for editing User Views.

Views

The Power Control measurement has four views as follows.

These Views are multiple-window Views. When in a multiple window View, you select a window by touching it. The menu controls may sometimes change depending on which window is selected.

Whenever the View changes, the default menu is Frequency, unless otherwise specified in the View description.

View	Result
Slot Power	RF Envelope/Chip Power Graph
	Slot Power Table

View	Result
PRACH Power	RF Envelope/Chip Power Graph
	PRACH Power Table
Slot Phase	Slot Phase Graph
	Slot Phase Table
Slot Phase w/Pwr Graph	Chip Power Graph
	Slot Power Table

View Selection Remote Commands

Allows you to select the desired measurement view.

– The Enumerated ID is used with the SCPI Command `:DISP:PCON:VIEW` ("View Selection by Name" on page 660)

– The Numeric ID is used with the SCPI Command `:DISP:PCON:VIEW:NSEL` ("View Selection by Number" on page 660)

Enumerated ID	Numeric ID	View Name
POWer	1	Slot Power
PRACh	3	PRACH Power
PHASe	2	Slot Phase
SPPower	4	Slot Phase w/Pwr Graph

View Selection by Name

Allows you to specify the view via its enumerated ID string.

Remote Command	`:DISPlay:PCONtrol:VIEW[:SELect] POWer | PHASe | PRACh | SPPower` `:DISPlay:PCONtrol:VIEW[:SELect]?`
Example	`:DISP:PCON:VIEW POW` `:DISP:PCON:VIEW?`
Notes	Measurement Type control under Meas Setup behaves in the same way as view switch. For details, see "Measurement Type" on page 681
Preset	POWer
State Saved	Yes
Range	Slot Power|PRACH Power|Slot Phase|Slot Phase w/Pwr Graph

View Selection by Number

Allows you to specify the view via its numeric ID value.

Remote	`:DISPlay:PCONtrol:VIEW:NSELect <integer>`

Command	:DISPlay:PCONtrol:VIEW:NSELect?
Example	:DISP:PCON:VIEW:NSEL 1 :DISP:PCON:VIEW:NSEL?
Preset	1
State Saved	Yes
Min/Max	1/4

Slot Power

Windows: "Power Graph (RF Envelope/Chip Power)" on page 612, "Slot Power Metrics" on page 612

Example	:DISP:PCON:VIEW POW

PRACH Power

Windows: "Power Graph (RF Envelope/Chip Power)" on page 612, , "PRACH Power Metrics" on page 613

Example	:DISP:PCON:VIEW PRAC

Slot Phase

Windows: "Phase Graph" on page 614, "Slot Phase Metrics" on page 614

Example	:DISP:PCON:VIEW PHAS

Slot Phase w/Pwr Graph

Windows:"Power Graph (RF Envelope/Chip Power)" on page 612, "Slot Power Metrics" on page 612

Example	:DISP:PCON:VIEW SPP

User View

Lets you choose a View from the saved User Views for the current measurement. This panel only appears if a User View exists for the current measurement.

Remote Command	:DISPlay:VIEW:ADVanced:SELect <alphanumeric> :DISPlay:VIEW:ADVanced:SELect?
Example	Select Baseband as the current View

	:DISP:VIEW:ADV:SEL “Baseband”

Notes	You must be in the measurement whose View you are trying to set to send the command. You can only set Views for the current measurement using this command
	For predefined views, the parameter is derived from the view name that is shown in the View list in the user interface. For example, if you are trying to select the Trace Zoom view in the Swept SA measurement, you send:
	`:DISP:VIEW:ADV:SEL "Trace Zoom"`
	because “Trace Zoom” is the name of the View as seen in the Mode/Meas dialog or in the Display, View menu
	You *cannot* use the legacy View parameter (which in this case would be `TZOom`) with `:DISP:VIEW:ADV:SEL`
	`<alphanumeric>` is case insensitive; you can specify mixed case, however the name will be evaluated on a single case. Thus, both of the following forms work:
	`:DISP:VIEW:ADV:SEL "Trace Zoom"`
	`:DISP:VIEW:ADV:SEL "TRACE ZOOM"`
	If the specified view is not a valid View, the query returns the error message “-224, Illegal parameter value; View with the name <alphanumeric> does not exist”
	If the display is disabled (via `:DISP:ENAB OFF`) then the error message “-221, Settings conflict; View SCPI cannot be used while Display is disabled” is generated

Backwards Compatibility SCPI	The legacy node `:DISPlay:VIEW[:SELect]` is retained for backwards compatibility, but it only supports predefined views

Restore Layout to Default

Restores the Layout to the default for Basic.

Modified Views are very temporary; if you exit the current measurement they are discarded, and they are not saved in State. To retain this View for later use, and to be able to return easily to your original Basic View, you can save your edited View as a “User View”.

Save Layout as New View

Saves your new View as a User View. An alpha keyboard appears, which lets you name your new View; the default is the old View name plus a number.

Remote Command	`:DISPlay:VIEW:ADVanced:NAME <alphanumeric>`
Example	`:DISP:VIEW:ADV:NAME “Baseband”` Creates a new View named `Baseband` from the current View, and selects it as the current View
Notes	`<alphanumeric>` is case insensitive; you can specify mixed case, however the name will be evaluated on a single case

	If `<alphanumeric>` name already exists as a View, the error message "-224, Illegal parameter value; View <alphanumeric> already exists" is generated If the display is disabled (via `:DISP:ENAB OFF`) then the error message "-221, Settings conflict; User View SCPI cannot be used while Display is disabled" is generated

Re-Save User View

You can re-edit a User View; if you make changes, then an asterisk will appear next to the User View's name. You can then tap **Re-Save User View** to save it back to its existing name, or **Save Layout as New View** to add another, new User View.

This is a front panel function only, there is no remote command available to perform this function. To do this remotely, you must first perform **Save Layout as New View**, then delete the old User View and rename the new one with the name of the View you just deleted.

Rename User View

You can rename the current View by giving it a new unique name. Only User Views can be renamed, if the current View is a Predefined View, an error occurs.

Remote Command	`:DISPlay:VIEW:ADVanced:REName <alphanumeric>`
Example	`:DISP:VIEW:ADV:REN "Baseband"`
Notes	`<alphanumeric>` is case insensitive; you can specify mixed case, however the name will be evaluated on a single case If the `<alphanumeric>` specifying the new name is already present in the list of View names, the error message "-224, Illegal parameter value; View <alphanumeric> already exists" is generated If the current View is a Predefined View, the error message "-224, Illegal parameter value; Cannot rename a Predefined View" is generated If the display is disabled (via `:DISP:ENAB OFF`) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated

Delete User View

You can delete the current View if it is a User View. The default view becomes the current view for the Measurement.

Remote Command	`:DISPlay:VIEW:ADVanced:DELete`
Example	`:DISP:VIEW:ADV:DEL`
Notes	`<alphanumeric>` is case insensitive; you can specify mixed case, however the name will be evaluated on a single case If the `<alphanumeric>` is not present in the list of View names, the error message "-224, Illegal parameter value; View <alphanumeric> does not exist" is generated

	If the current View is a Predefined View, the error message "-224, Illegal parameter value; Cannot delete a Predefined View" is generated If the display is disabled (via `:DISP:ENAB OFF`) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated

Delete All User Views

Deletes all previously saved User Views. The default view becomes the current view for the Measurement if a User View was the current view when this command was executed.

Remote Command	`:DISPlay:VIEW:ADVanced:DELete:ALL`
Example	`:DISP:VIEW:ADV:DEL:ALL`
Notes	Disabled if there are no User Views

View Editor Remote Commands

The following remote commands help you manage Views and User Views. Note that the SCPI node for User Views handles both Predefined and User Views. The legacy nodes, `:DISPlay:VIEW[:SELect]` and `:DISPlay:VIEW:NSEL`, are retained for backwards compatibility, but they only support predefined views.

View Listing Query

Returns a string containing a comma-separated list of names for *all* the Views, including User Views, available for the current Measurement.

Remote Command	`:DISPlay:VIEW:ADVanced:CATalog?`
Example	`:DISP:VIEW:ADV:CAT?`
Notes	Returns a quoted string of the available Views for the current measurement, separated by commas. The list includes names for *all* the Views, including User Views, available for the current Measurement Example: `"Normal,Trace Zoom,Spectrogram,Baseband,myView1,yourView1"` No distinction is made between Predefined and User Views If you switch measurements with the display disabled (via `:DISP:ENAB OFF`), then query the list of available Views, the result is undefined

User View Listing Query

Returns a string containing a comma-separated list of names for *only* the User Views available for the current Measurement.

Remote Command	:DISPlay:VIEW:ADVanced:USER:CATalog?
Example	:DISP:VIEW:ADV:USER:CAT?
Notes	Returns a quoted string of the available User Views for the current measurement, separated by commas. Example: "Baseband,myView1,yourView1" If you switch measurements with the display disabled (see "Display Enable (Remote Command Only)" on page 1894), then query the list of available Views, the result is undefined

3.5.5.3 Annotation

Contains controls for setting up the annotation for the current Mode or Measurement.

Graticule

Turns the display graticule On or Off for all windows with graticules in all measurements in the current Mode. Also turns the graticule Y-Axis annotation on and off.

Remote Command	:DISPlay:GRATicule[:STATe] OFF | ON | 0 | 1 :DISPlay:GRATicule[:STATe]?
Example	:DISP:GRAT OFF
Notes	The graticule is the set of horizontal and vertical lines that make up the grid/divisions for the X-Axis and Y-Axis
Preset	ON
State Saved	Saved in instrument state
Backwards Compatibility SCPI	:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe] OFF | ON | 0 | 1 :DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe]? This command is accepted for backwards compatibility with older instruments, but the WINDow, TRACe and GRID parameters are ignored

Screen Annotation

Controls the display of the annunciation and annotation around the graticule, including any annotation on lines (such as the display line, the threshold line, etc.) and the Y-Axis annotation, for all windows with screen annotation in all measurements in the current Mode.

This does *not* include marker annotation (or the N dB result). When OFF, the graticule expands to fill the entire graticule area, leaving only the 1.5% gap above the graticule, as described in the Trace section.

Remote Command	`:DISPlay:ANNotation:SCReen[:STATe] OFF | ON | 0 | 1` `:DISPlay:ANNotation:SCReen[:STATe]?`
Example	`:DISP:ANN:SCR OFF`
Dependencies	Grayed-out and forced to `OFF` when **System Display Settings**, **Annotation** is `OFF`
Preset	`ON` This remains `OFF` through a Preset when **System Display Settings**, **Annotation** is set to `OFF`
State Saved	Saved in instrument state

Trace Annotation

Turns on and off the labels on the traces, showing their detector (or their Math Mode) as described in the **Trace** section, for all windows in all measurements in the current Mode for which Trace Annotation on/off is supported.

If Trace Math is being performed on a trace, then the Trace Math annotation replaces the detector annotation.

For measurements that support limit lines, this key also turns on and off the labels on the Limit Lines. The label is the Limit number annotation and Limit Comment displayed on the graph. If the length of the comment is greater than 20 characters, the first 8 characters and the last 8 characters are displayed, joined with ….

Remote Command	`:DISPlay:ANNotation:TRACe[:STATe] ON | OFF | 1 | 0` `:DISPlay:ANNotation:TRACe[:STATe]?`
Example	`:DISP:ANN:TRAC OFF`
Preset	`OFF`
State Saved	Saved in instrument state

Control Annotation

Turns on and off the display of values on the Active Function controls for all measurements in the current Mode. This is a security feature.

Remote Command	`:DISPlay:ACTivefunc[:STATe] ON | OFF | 1 | 0` `:DISPlay:ACTivefunc[:STATe]?`
Example	`:DISP:ACT OFF`
Dependencies	Grayed out and forced to `OFF` when **System Display Settings**, **Annotation** is `OFF`
Preset	`ON` This remains `OFF` through a Preset when **System Display Settings**, **Annotation** is set to `OFF`
State Saved	Saved in instrument state

Meas Bar

Turns the Measurement Bar at the top of the screen on and off for all measurements in the current Mode. When `OFF`, the graticule area expands to fill the area formerly occupied by the Measurement Bar.

Remote Command	`:DISPlay:ANNotation:MBAR[:STATe] OFF | ON | 0 | 1` `:DISPlay:ANNotation:MBAR[:STATe]?`
Example	`:DISP:ANN:MBAR OFF`
Dependencies	Grayed out and forced to `OFF` when **System Display Settings**, **Annotation** is `OFF`
Preset	`ON` This remains `OFF` through a Preset when **System Display Settings**, **Annotation** is set to `OFF`
State Saved	Saved in instrument state

Display Enable (Remote Command Only)

Turns the display on/off, including the display drive circuitry. The backlight stays lit to confirm that the instrument is on. The display enable setting is mode global. Theare three reasons for turning the display off:

1. To increase speed as much as possible by freeing the instrument from having to update the display
2. To reduce emissions from the display, drive circuitry
3. For security purposes

If you have turned off the display:

– and you are in local operation, the display can be turned back on by pressing any key or by sending `:SYSTem:DEFaults MISC` or `:DISPlay:ENABle ON` (neither `*RST` nor :SYSTem:PRESet enable the display)

– and you are in remote operation, the display can be turned back on by pressing the **Local** or **Esc** keys, or by sending `:SYSTem:DEFaults MISC` or `:DISPlay:ENABle ON` (neither `*RST` nor `:SYSTem:PRESet` enable the display)

– and you are using either the `:SYSTem:KLOCk` command or GPIB local lockout, then *no* front-panel key press will turn the display back on. You must turn it back on remotely.

If the display is `OFF`, many SCPI commands related to User Views and Multiscreen functionality do not work, and return the error messages "-221, Settings conflict; Screen SCPI cannot be used when Display is disabled" or "221, Settings conflict; View SCPI cannot be used while Display is disabled". These commands include:

Name	Command
Select User View	:DISPlay:VIEW:ADVanced:SELect
Rename User View	:DISPlay:VIEW:ADVanced:REName
Delete User View	:DISPlay:VIEW:ADVanced:DELete
Create User View	:DISPlay:VIEW:ADVanced:NAME
Select Screen	:INSTrument:SCReen:SELect
Delete Screen	:INSTrument:SCReen:DELete
Delete All But This Screen	:INSTrument:SCReen:DELete:ALL
Add Screen	:INSTrument:SCReen:CREate
Rename Screen	:INSTrument:SCReen:REName
Sequencer On/Off	:SYSTem:SEQuencer

Remote Command	`:DISPlay:ENABle OFF | ON | 0 | 1` `:DISPlay:ENABle?`
Example	`:DISP:ENAB OFF`
Couplings	`:DISP:ENAB OFF` turns Backlight `OFF` and `:DISP:ENAB ON` turns Backlight `ON`, but changing Backlight settings does *not* change the state of `:DISP:ENAB`
Preset	`ON` Set by `:SYST:DEF MISC`, but not affected by `*RST` or `:SYSTem:PRESet`
State Saved	Not saved in instrument state
Backwards Compatibility Notes	`:SYST:PRES` no longer turns on `:DISPlay:ENABle` as it did in legacy analyzers

3.5.6 Freq

The Freq key opens the Frequency menu, which contains controls that allow you to control the Frequency and Channel parameters of the instrument.

Some features in the Frequency menu are the same for all measurements in the current Mode – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by Meas Preset. For example, the Center Freq setting is the same for all measurements - it does not change as you change measurements.

3.5.6.1 Settings

The Settings Tab contains controls that pertain to the X axis parameters of the measurement. These parameters control how data on the vertical (X) axis is displayed and control instrument settings that affect the horizontal axis.

Center Frequency

Sets the frequency that corresponds to the horizontal center of the graticule. While adjusting the Center Frequency the Span is held constant.

The center frequency setting is the same for all measurements within a mode, that is, it is Meas Global. Some modes are also able to share a Mode Global center frequency value. If this is the case, the Mode will have a **Global** tab in its **Meas Setup** menu.

The **Center Freq** function sets (and queries) the Center Frequency for the currently selected input. If your instrument has multiple inputs, and you select another input, the Center Freq changes to the value for that input. SCPI commands are available to directly set the Center Freq for a specific input.

Center Freq is remembered as you go from input to input. Thus you can set a Center Freq of 10 GHz with the RF Input selected, change to BBIQ and set a Center Freq of 20 MHz, then switch to External Mixing and set a Center Freq of 60 GHz, and when you go back to the RF Input the Center Freq will go back to 10 GHz; back to BBIQ and it is 20 MHz; back to External Mixing and it is 60 GHz.

– See "RF Center Freq" on page 672
– See "Ext Mix Center Freq" on page 672
– See "I/Q Center Freq" on page 673
– See "Center Frequency Presets" on page 670

Remote Command	`[:SENSe]:FREQuency:CENTer <freq>` `[:SENSe]:FREQuency:CENTer?`

Example	Set the Center Frequency to 50 MHz:
	`:FREQ:CENT 50 MHz`
	Increment the Center Frequency by the value of CF Step:
	`:FREQ:CENT UP`
	Return the current value of the Center Frequency:
	`:FREQ:CENT?`

Notes	This command sets the RF, External Mixing or I/Q Center Frequency depending on the selected input For RF input it is equivalent to `:FREQ:RF:CENT` For I/Q input it is equivalent to `:FREQ:IQ:CENT` For External Mixer it is equivalent to `:FREQ:EMIX:CENT` Preset and Max values are dependent on Hardware Options (5xx) If no terminator (e.g. MHz) is sent the terminator Hz is used. If a terminator with unit other than Frequency is used, an invalid suffix error message is generated
Preset	Depends on instrument maximum frequency, mode, measurement, and selected input See "Center Frequency Presets" on page 670, "RF Center Freq" on page 672, "Ext Mix Center Freq" on page 672 and "I/Q Center Freq" on page 673

State Saved	Saved in instrument state
Min	Depends on instrument maximum frequency, mode, measurement, and selected input See "Center Frequency Presets" on page 670, "RF Center Freq" on page 672, "Ext Mix Center Freq" on page 672 and "I/Q Center Freq" on page 673
Max	Depends on instrument maximum frequency, mode, measurement, and selected input See "Center Frequency Presets" on page 670, "RF Center Freq" on page 672, "Ext Mix Center Freq" on page 672 and "I/Q Center Freq" on page 673
Status Bits/OPC dependencies	Non-overlapped

Center Frequency Presets

The following table provides the Center Frequency Presets for the Spectrum Analyzer mode, and the Max Freq, for the various frequency options:

Freq Option	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
503 (all but CXA)	1.805 GHz	3.6 GHz	3.7 GHz
503 (CXA)	1.505 GHz	3.0 GHz	3.08 GHz
507 (all but CXA)	3.505 GHz	7.0 GHz	7.1 GHz
507 (CXA)	3.755 GHz	7.5 GHz	7.58 GHz
508 (all but MXE)	1.805 GHz	3.6 GHz	8.5 GHz
508 (MXE)	4.205 GHz	8.4 GHz	8.5 GHz
513	6.805 GHz	13.6 GHz	13.8 GHz
526 (except CXA and MXE)	13.255 GHz	26.5 GHz	27.0 GHz*
526 (CXA)	13.255 GHz	26.5 GHz	26.55 GHz
526 (MXE)	1.805 GHz	3.6 GHz	27.0 GHz
532	16.005 GHz	32.0 GHz	32.5 GHz
540	20.005 GHz	40.0 GHz	40.5 GHz
543	21.505 GHz	43.0 GHz	43.0 GHz
544	22.005 GHz	44.0 GHz	45.0 GHz
550	25.005 GHz	50.0 GHz	52 GHz
F03 (CXA-m)	1.505 GHz	3.0 GHz	3.08 GHz
F07 (CXA-m)	3.755 GHz	7.5 GHz	7.575 GHz
F13 (CXA-m)	6.805 GHz	13.6 GHz	13.8 GHz
F26 (CXA-m)	13.255 GHz	26.5 GHz	26.55 GHz
504 (M9420A/21A, M8920A)	2.145 GHz	3.88GHz	3.88 GHz
506 (M9420A/21A, M8920A)	3.245 GHz	6.08GHz	6.08 GHz
F06 (M9410A/11A)	1.0 GHz	6.08 GHz	6.08 GHz

Freq Option	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
F06 (M9415A)	1 GHz	1.08 GHz	6.6 GHz
F08 (M9415A)	1 GHz	1.08 GHz	8.6 GHz
F12 (M9415A)	1 GHz	1.08 GHz	12.9 GHz

*For option 526, the Max CF in RTSA is 26.999999995 GHz.

N9041B Center Freq Presets

Input	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
Input 1, all models	25.005 GHz	50.0 GHz	52 GHz
Input 2, opt 585	42.505 GHz	85.0 GHz	86 GHz
Input 2, opt 590	45.005 GHz	90.0 GHz	92 GHz
Input 2, opt 5CX	55.005 GHz	110.0 GHz	110 GHz

Input 2, CXA and MXE

Model	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
CXA opt C75	0.7505 GHz	1.5 GHz	1.58 GHz
MXE	505 MHz	1 GHz	1.000025 GHz

Tracking Generator Frequency Limits (CXA only)

Tracking Generator Option	Min Freq (clips to this freq when turn TG on and can’t tune below while TG on)	If above this Freq, Stop Freq clipped to this Freq when TG turned on	Max Freq (can't tune above) while TG on
T03	9 kHz	3.0 GHz	3.08 GHz
T06	9 kHz	6.0 GHz	6.05 GHz

Tracking Generator Frequency Limits(CXA-m only)

Tracking Generator Option	Min Freq (clips to this freq when turn TG on and can’t tune below while TG on)	If above this Freq, Stop Freq clipped to this Freq when TG turned on	Max Freq (can't tune above) while TG on
T03	2 MHz	3.08 GHz	3.08 GHz
T07	2 MHz	7.575 GHz	7.575 GHz
T13	2 MHz	13.8 GHz	13.8 GHz
T26	2 MHz	26.55 GHz	26.55 GHz

RF Center Freq

SCPI command for specifying the RF Center Frequency. This command will set the Center Frequency to be used when the RF input is selected, even if the RF input is not the input that is selected at the time the command is sent. Note that the **Center Freq** function in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command	`[:SENSe]:FREQuency:RF:CENTer <freq>` `[:SENSe]:FREQuency:RF:CENTer?`
Example	`:FREQ:RF:CENT 30 MHz` `:FREQ:RF:CENT?`
Notes	This command is the same in all modes, but the parameter is Measurement Global. So the value is independent in each mode and common across all the measurements in the mode
Dependencies	If the electronic/soft attenuator is enabled, any attempt to set Center Frequency such that the Stop Frequency would be >3.6 GHz fails and results in an advisory message. If the equivalent SCPI command is sent, this same message is generated as part of a "-221, Settings conflict" warning
Preset	See table above
State Saved	Saved in instrument state
Min	-79.999995 MHz
Max	See table above. Basically instrument maximum frequency - 5 Hz

Ext Mix Center Freq

SCPI command for specifying the External Mixer Center Frequency. This command will set the Center Frequency to be used when the External Mixer is selected, even if the External Mixer input is not the input which is selected at the time the command is sent. Note that the **Center Freq** function in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command	`[:SENSe]:FREQuency:EMIXer:CENTer <freq>` `[:SENSe]:FREQuency:EMIXer:CENTer?`
Example	`:FREQ:EMIX:CENT 60 GHz` `:FREQ:EMIX:CENT?`
Notes	This command is the same in all modes, but the parameter is Measurement Global. So the value is independent in each mode and common across all the measurements in the mode
Couplings	When returning to External Mixing after having been switched to one of the other inputs (e.g., RF), you will come back into the settings that you had when you left External Mixing. So you will come back to the band you were in with the Center Frequency that you had. However, Span is not an input-dependent parameter, therefore you will bring the span over from the other input. Therefore, the instrument comes back with the span from the previous input, limited as necessary by the current mixer setup

Preset	When a Mode Preset is performed while in External Mixing, the Start frequency of the current Mode is set to the nominal Min Freq of the lowest harmonic range in the Harmonic Table for the current mixer setup. Similarly, the Stop frequency of the current Mode is set to the nominal Max Freq of the highest harmonic range in the Harmonic Table. The Center Freq thus presets to the point arithmetically equidistant from these two frequencies Note that, if the current measurement has a limited Span available to it, and cannot achieve the Span shown in the table (Span=Stop Freq – Start Freq), the instrument uses the maximum Span the measurement allows, and still sets the Center Freq to the midpoint of the Start and Stop Freq values in the Harmonic Table When Restore Input/Output Defaults is performed, the mixer presets to the 11970A, whose Start and Stop frequencies are 26.5 and 40 GHz respectively. The center of these two frequencies is 33.25 GHz Therefore, after a Restore Input/Output Defaults, if you go into External Mixing and do a Mode Preset while in the Spectrum Analyzer Mode, the resulting Center Freq is 33.25 GHz
State Saved	Yes
Min	The minimum frequency in the currently selected mixer band + 5 Hz
Max	The maximum frequency in the currently selected mixer band - 5 Hz

I/Q Center Freq

SCPI command for specifying the I/Q Center Frequency. This command will set the Center Frequency to be used when the I/Q input is selected, even if the I/Q input is not the input which is selected at the time the command is sent. Note that the **Center Freq** function in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command	`[:SENSe]:FREQuency:IQ:CENTer <freq>` `[:SENSe]:FREQuency:IQ:CENTer?`
Example	`:FREQ:IQ:CENT 30 MHz`
Notes	This command is the same in all modes, but the parameter is Measurement Global. So the value is independent in each mode and common across all the measurements in the mode
Preset	0 Hz
State Saved	Saved in instrument state
Min	-40.049995 MHz
Max	40.049995 MHz

CF Step

Changes the step size for the center frequency and start and stop frequency functions. Once a step size has been selected and the center frequency function is active, the step keys (and the UP|DOWN parameters for Center Frequency from remote commands) change the center frequency by the step-size value. The step size function is useful for finding harmonics and sidebands beyond the current frequency span of the instrument.

Note that the start and stop frequencies also step by the CF Step value.

Remote Command	`[:SENSe]:FREQuency:CENTer:STEP[:INCRement] <freq>`
	`[:SENSe]:FREQuency:CENTer:STEP[:INCRement]?`
	`[:SENSe]:FREQuency:CENTer:STEP:AUTO OFF | ON | 0 | 1`
	`[:SENSe]:FREQuency:CENTer:STEP:AUTO?`

Example	`:FREQ:CENT:STEP 500 MHz`
	`:FREQ:CENT UP`
	increases the current center frequency value by 500 MHz
	`:FREQ:CENT:STEP?`
	`:FREQ:CENT:STEP:AUTO ON`
	`:FREQ:CENT:STEP:AUTO?`

Notes	Preset and Max values are dependent on Hardware Options (5xx)
Dependencies	Span, RBW, Center frequency If the electronic/soft attenuator is enabled, any attempt to change the value of the center frequency >3.6 GHz by pressing the Up-arrow key, fails and results in an advisory message. If the equivalent SCPI command is sent, this same message is generated as part of a "-221, Settings conflict" warning
Couplings	When auto-coupled in a non-zero span, the center frequency step size is set to 10% of the span. When auto-coupled in zero span, the center frequency step size is set to the equivalent -3 dB RBW value
Preset	Auto `ON`
State Saved	Saved in instrument state
Min	– (the maximum frequency of the instrument). That is, 27 GHz max freq instrument has a CF step range of +/- 27 GHz. Note that this is the maximum frequency given the current settings of the instrument, so in External Mixing, for example, it is the maximum frequency of the current mixer band
Max	The maximum frequency of the instrument. That is, 27 GHz max freq instrument has a CF step range of +/- 27 GHz. Note that this is the maximum frequency given the current settings of the instrument, so in External Mixing, for example, it is the maximum frequency of the current mixer band
Status Bits/OPC dependencies	non-overlapped

3.5.7 Marker

Accesses a menu that enables you to select, set up and control the markers for the current measurement. If there are no active markers, Marker selects marker 1, sets it to Normal and places it at the center of the display. If the selected marker is Off, it is set to Normal and placed it at the center of the screen on the trace determined by the Marker Trace rules.

3.5.7.1 Select Marker

Specifies the selected marker. The term "selected marker" is used throughout this document to specify which marker will be affected when you change marker settings, perform a Peak Search, etc.

The Select Marker control appears above the menu panel, indicating that it applies to all controls in the Marker menu panels. Select Marker is blanked if you select a tab whose controls do NOT depend on the selected marker (e.g., Counter).

On any menu tab for which **Select Marker** displays, the first control is always **Marker Frequency|Time**.

Notes	The selected marker is remembered even when not in the Marker menu and is used if a Search is done or a Band Function is turned on or for Signal Track or Continuous Peak
Preset	Marker 1
State Saved	The number of the selected marker is saved in instrument state
Annunciation	Appears in the marker results block label for **Normal** and **Delta** markers

3.5.7.2 Settings

The controls on the Settings tab include the Marker active function and a radio button selection of the marker control mode (Normal, Delta, or Off) for the selected marker, as well as additional functions that help you use markers.

Marker Time

Sets the marker X Axis value in the current marker X Axis Scale unit. It has no effect if the control mode is Off, but is the SCPI equivalent of entering an X value if the control mode is Normal or Delta.

Remote Command	`:CALCulate:PCONtrol:MARKer[1]|2|...|12:X <real>` `:CALCulate:PCONtrol:MARKer[1]|2|...|12:X?`
Example	`:CALC:PCON:MARK3:X 0.0` `:CALC:PCON:MARK3:X?`
Notes	If no suffix is sent, uses the fundamental units for the current marker X Axis Scale. If a suffix is sent that does not match the current marker X Axis Scale unit, an error "Invalid suffix" is generated The query returns the marker's absolute X Axis value if the control mode is Normal, or the offset from the marker's reference marker if the control mode is Delta. The query is returned in the fundamental units for the current marker X Axis scale: Hz for Frequency and Inverse Time, seconds for Period and Time. If the marker is Off the response is Not A Number
Preset	After a preset, all Markers are turned OFF, so Marker X Axis Value query returns a Not A Number (NAN)
State Saved	No

Min	–9.9E+37
Max	9.9E+37
Annotation	Mkr # <X value> and <Marker value> upper right on graph

Marker X Axis Position (Remote Command only)

Sets the marker X position in trace points. It has no effect if the control mode is **Off,** but is the SCPI equivalent of entering a value if the control mode is **Normal** or **Delta** - except in trace points rather than X Axis Scale units. The entered value is immediately translated into the current X Axis Scale units for setting the value of the marker.

Remote Command	`:CALCulate:PCONtrol:MARKer[1]|2|...|12:X:POSition <real>` `:CALCulate:PCONtrol:MARKer[1]|2|...|12:X:POSition?`
Example	`:CALC:PCON:MARK10:X:POS 0.0` `:CALC:PCON:MARK10:X:POS?`
Notes	The query returns the marker's absolute X Axis value in trace points if the control mode is Normal, or the offset from the marker's reference marker in trace points if the control mode is Delta. The value is returned as a real number, not an integer, corresponding to the translation from X Axis Scale units to trace points. If the marker is Off the response is *Not A Number (NAN)* This command is not available when Marker Trace of the selected marker (`:CALCulate:PCONtrol:MARKer[1]|2|3|4|5|6|7|8|9|10|11|12:TRACe?`) is set to `POLar`. In this case, this command is ignored
Preset	After a preset, all Markers are turned OFF, so Marker X Axis Value query returns a Not A Number (NAN)
State Saved	No
Min	-9.9E+37
Max	9.9E+37

Marker Y Axis Value (Remote Command only)

Queries the marker Y Axis value in the current marker Y Axis unit.

Remote Command	`:CALCulate:PCONtrol:MARKer[1]|2|...|12:Y?`
Example	`:CALC:PCON:MARK11:Y?`
Notes	The query returns the marker Y-axis result if the control mode is Normal or Delta. If the marker is Off, the response is not a number (NAN)
Preset	Result dependent on markers setup and signal source
State Saved	No
Backwards Compatibility SCPI	`:CALCulate:PCONtrol:MARKer[1]|2|...|12:FUNCtion:RESult?`

Marker Mode

Sets the marker control mode to Normal, Delta, or Off. All interactions and dependencies detailed under the control description are enforced when the remote command is sent. If the selected marker is Off, pressing Marker sets it to Normal and places it at the center of the screen on the trace determined by the Marker Trace rules. At the same time, Marker X Axis Value appears on the Active Function area.

The default active function is the active function for the currently selected marker control mode. If the current control mode is Off, there is no active function and the active function is turned off.

Remote Command	`:CALCulate:PCONtrol:MARKer[1]|2|...|12:MODE POSition	DELTa	OFF` `:CALCulate:PCONtrol:MARKer[1]|2|...|12:MODE?`
Example	`:CALC:PCON:MARK:MODE POS` `:CALC:PCON:MARK:MODE?`
Preset	`OFF`
State Saved	Saved in instrument state
Range	`POSition|DELTa|OFF`
Annotation	Mkr # <X value> and <Marker value> upper right on graph

Backward Compatibility SCPI Commands

Sets or queries the state of a marker. Setting a marker which is OFF to state ON or 1 puts it in Normal mode and places it at the center of the screen.

Remote Command	`:CALCulate:PCONtrol:MARKer[1]|2|...|12:STATe OFF	ON	0	1` `:CALCulate:PCONtrol:MARKer[1]|2|...|12:STATe?`
Example	`:CALC:PCON:MARK3:STAT ON` `:CALC:PCON:MARK3:STAT?`
Preset	`OFF`
State Saved	Saved in instrument state
Range	`OFF|ON`

Delta Marker (Reset Delta)

Pressing this button is exactly the same as pressing the “Delta” selection on the Marker Mode radio button. The selected marker becomes a Delta Marker. If the selected marker is already a Delta marker, the reference marker is moved to the current position of the selected marker, thus resetting the Delta to zero.

Marker Settings Diagram

The Marker Settings Diagram lets you configure the Marker system using a visual utility.

All Markers Off

Turns off all markers.

Remote Command	`:CALCulate:PCONtrol:MARKer:AOFF`
Example	`:CALC:PCON:MARK:AOFF`

Couple Markers

When this function is On, moving any marker causes an equal X Axis movement of every other marker which is not Fixed or Off. By “equal X Axis movement” we mean that we preserve the difference between each marker’s X Axis value (in the fundamental x-axis units of the trace that marker is on) and the X Axis value of the marker being moved (in the same fundamental x-axis units).

In the WCDMA mode, when the marker is assigned to the Polar graph, a symbol value (Code Domain measurement) /a chip value (Mod Accuracy and QPSK EVM measurement) is coupled instead of an X axis value.

Note that Fixed markers do not couple. They stay where they were while all the other markers move. Of course, if a Fixed marker is being moved, all the non-fixed markers do move with it.

This may result in markers going off screen.

Remote Command	`:CALCulate:PCONtrol:MARKer:COUPle[:STATe] ON | OFF | 1 | 0` `:CALCulate:PCONtrol:MARKer:COUPle[:STATe]?`
Example	`:CALC:PCON:MARK:COUP ON` `:CALC:PCON:MARK:COUP?`
Preset	`OFF` Presets on Mode Preset and All Markers Off
State Saved	Saved in instrument state

3.5.7.3 Peak Search

The controls on the Peak Search tab allow you to move the marker to selected peaks of the signal, giving you enormous analysis capabilities, particularly when combined with the Delta Marker function.

NOTE

Pressing the **Peak Search** hardkey automatically moves you to the **Peak Search** page of the **Marker** menu *and* performs a Peak Search.

Pressing the **Peak Search** tab once you are already *in* the **Marker** menu does *not* perform a Peak Search.

Marker Time

The Marker Time control is the fundamental control that you use to move a marker around on the trace. This is the same as the Marker Time control on the Settings tab.

Peak Search

Pressing the Peak Search control moves the selected marker to the trace point which has the maximum y-axis value for that marker's trace.

NOTE

Pressing the **Peak Search** hardkey automatically moves you to the **Peak Search** page of the **Marker** menu *and* performs a Peak Search.

Remote Command	`:CALCulate:PCONtrol:MARKer[1]|2|...|12:MAXimum`

Example	`:CALC:PCON:MARK2:MAX`
	`:SYST:ERR?`
	can be used to query the errors to determine if a peak is found. The message "No peak found" will be returned after an unsuccessful search

Notes	Sending this command selects the subopcoded marker This command does not work when the selected marker is located on the polar trace. In this case, the command is ignored

Marker Delta

Pressing this button is exactly the same as pressing the "Delta" selection on the Marker Mode radio button on the Settings tab. The selected marker becomes a Delta Marker. If the selected marker is already a Delta marker, the reference marker is moved to the current position of the selected marker, thus resetting the Delta to zero.

The control is duplicated here in the Peak Search Menu to allow you to conveniently perform a peak search and change the marker's control mode to Delta without having to access two separate menus.

3.5.7.4 Properties

The controls on the Properties tab are used to set certain properties of the selected marker.

Marker Time

The Marker Time control is the fundamental control that you use to move a marker around on the trace. This is the same as the Marker Time control on the Settings tab.

Relative To

Selects the marker to which the selected marker is relative (its reference marker).

Every marker has another marker to which it is relative. This marker is referred to as the “reference marker” for that marker. This attribute is set by the Marker, Properties, Relative To key. The marker must be a Delta marker to make this attribute relevant. If it is a Delta marker, the reference marker determines how the marker is controlled and how its value is displayed. A marker cannot be relative to itself.

Remote Command	`:CALCulate:PCONtrol:MARKer[1]|2|...|12:REFerence <integer>` `:CALCulate:PCONtrol:MARKer[1]|2|...|12:REFerence?`
Example	`:CALC:PCON:MARK:REF 5` `:CALC:PCON:MARK:REF?`
Notes	This command causes the marker specified with the subopcode to become selected Range (for SCPI command): 1 to 12. If the range is exceeded the value is clipped A marker cannot be relative to itself so that choice is not available, and if sent from SCPI generates error -221: “Settings conflict; marker cannot be relative to itself” When queried a single value is returned (the specified marker numbers relative marker)
Couplings	The act of specifying the selected marker’s reference marker makes the selected marker a Delta marker If the reference marker is off it is turned on in Normal mode at the delta marker location
Preset	The preset default “Relative To” marker (reference marker) is the next higher numbered marker (current marker +1). For example, if marker 2 is selected, then it’s default reference marker is marker 3. The exception is marker 12, which has a default reference of marker 1 Set to the defaults by using Restore Mode Defaults. This is not reset by Marker Off, All Markers Off, or Preset
State Saved	Saved in instrument state. Not affected by Marker Off and hence not affected by Preset or power cycle
Min	1
Max	12
Annunciation	Appears in the marker label of a **Delta** marker

Marker Trace

Assigns the specified marker to the designated trace.

Remote Command	:CALCulate:PCONtrol:MARKer[1]|2|...|12:TRACe RFENvelope | SPOWer | CPHase | APHase | DPHase :CALCulate:PCONtrol:MARKer[1]|2|...|12:TRACe?
Example	:CALC:PCON:MARK:TRAC RFEN :CALC:PCON:MARK:TRAC?
Preset	RFENvelope | RFENvelope | RFENvelope | RFENvelope | RFENvelope | RFENvelope | RFENvelope | RFENvelope | RFENvelope | RFENvelope | RFENvelope | RFENvelope
State Saved	Yes
Range	RF Envelope|Slot Power|Chip Phase|Average Chip Phase|Phase Discontinuity

Marker Settings Diagram

The Marker Settings Diagram lets you configure the Marker system using a visual utility. This is the same as the"Marker Settings Diagram" on page 678 control on the Settings tab.

3.5.8 Meas Setup

The Meas Setup menu panel contains functions for setting up the measurement parameters.

3.5.8.1 Measurement Type

Changing Measurement Type behaves in the same way as changing Views. For details, see "Views" on page 659.

Measurement Type	Corresponding View Selection Command
Slot Power	DISP:PCON:VIEW POW
PRACH Power	DISP:PCON:VIEW PRAC
Slot Phase	DISP:PCON:VIEW PHAS
Slot Phase (Power Graph)	DISP:PCON:VIEW SPP

Notes	For backwards compatibility, the command [:SENSe]:PCONtrol:TYPE SPOWer-|PRACh|SPHase remains as SCPI only command and corresponds to view switch as follows: :PCON:TYPE SPOW -> :DISP:PCON:VIEW POW

	:PCON:TYPE PRAC -> :DISP:PCON:VIEW PRAC :PCON:TYPE SPH -> :DISP:PCON:VIEW PHAS
State Saved	Yes
Range	Slot Power|PRACH Power|Slot Phase|Slot Phase (Power Graph)

3.5.8.2 Settings

This tab enables you to set measurement parameters.

IF Gain

Sets the IF Gain function to Auto, Low Gain or High Gain. These settings affect sensitivity and IF overloads.

Remote Command	[:SENSe]:PCONtrol:IF:GAIN[:STATe] ON | OFF | 1 | 0 [:SENSe]:PCONtrol:IF:GAIN[:STATe]? [:SENSe]:PCONtrol:IF:GAIN:AUTO[:STATe] OFF | ON | 0 | 1 [:SENSe]:PCONtrol:IF:GAIN:AUTO[:STATe]?
Example	:PCON:IF:GAIN ON :PCON:IF:GAIN? :PCON:IF:GAIN:AUTO OFF :PCON:IF:GAIN:AUTO?
Notes	Where: – ON = high gain – OFF = low gain
Dependencies	This control does not appear in VXT, M9393A, M9391A, or UXM
Preset	OFF OFF
State Saved	Yes
Range	Low Gain|High Gain

Auto Couple

Immediately puts all Auto/Man functions into Auto. The **Auto Couple** action is confined to the current measurement only. It does not affect other measurements in the mode.

In the Auto state, Auto/Man functions are said to be “coupled”, meaning their values change as you make changes to other values in the measurement. This helps ensure accurate measurements and optimum dynamic range. Auto Couple is an immediate action function, and when it is executed, all the Auto/Man controls for the current measurement are set to Auto, and all measurement settings coupled to the Auto/Man parameters are automatically set to their optimal value.

For further details of measurement-specific settings (if any), see "Measurement-Specific Details" on page 683 below.

Remote Command	`:COUPle ALL`
Example	`:COUP ALL`
Backwards Compatibility SCPI	`:COUPLE ALL | NONE`
Backwards Compatibility Notes	`:COUP:NONE` puts all Auto/Man parameters in manual mode, decoupling all the coupled instrument parameters. It is retained for backwards compatibility and is *not* recommended for making measurements or new designs

All Auto/Man parameter couplings in the measurement are set to Auto. This includes couplings that may be unavailable or grayed-out due to the current state. For example, in the Swept SA measurement, there is no Auto/Man coupling for RBW while in Zero Span. Nonetheless, if **Auto Couple** were executed while in Zero Span it would set RBW to Auto "behind the scenes" so that, on exit from Zero Span, it would be in Auto.

Any Auto/Man selection specific (local) to the other measurements in the current Mode will not be affected by **Auto Couple**. Any functions that are *not* coupled with other instrument parameters, such as ranging or leveling variables, such as "AutoRange" or "AutoScale", will not be affected.

Executing the **Auto Couple** command generates the informational message, "All Auto/Man functions have been set to Auto".

Each parameter, upon being set to Auto, selects and sets the appropriate auto-coupled value based on that parameter's coupling rules. The Dependency Resolver orchestrates the couplings for parameters that are dependent on one or more other parameters. The coupling and dependency rules for each parameter are defined in the chapter describing that parameter.

Executing the **Auto Couple** command *does not* affect markers, marker functions, trace or display attributes, or any other instrument setting other than those specifically mentioned above.

Measurement-Specific Details

TOI

Parameters affected by Auto Couple are:

- Center Frequency Step
- Resolution Bandwidth
- Span/RBW Ratio
- Sweep Time
- Video BandwidthVBW/RBW ratio
- Upper and Lower Tone (set to Sense
-)Zero span measurement Resolution Bandwidth
- Zero span measurement Dwell Time

Harmonics

For Harmonics, these parameters are:

- Resolution Bandwidth
- Fundamental Frequency
- Dwell Time
- Range Table Resolution Bandwidths
- Range Table Dwell Times

Meas Preset

Restores all the measurement parameters to their default values.

Remote Command	`:CONFigure:PCONtrol`
Example	`:CONF:PCON`
Couplings	Selecting meas preset restores all measurement parameters to their default values

3.5.8.3 Radio

The Radio tab contains controls to select the Radio Device, and enable or disable HSPA/HSPA+ options.

Radio Device

Allows you to specify the device to be used.

Remote Command	`[:SENSe]:RADio:STANdard:DEVice BTS | MS` `[:SENSe]:RADio:STANdard:DEVice?`
Example	`:RAD:STAN:DEV MS` `:RAD:STAN:DEV?`
Preset	BTS
State Saved	Saved in instrument state.
Range	BTS | MS
Backwards Compatibility SCPI	`[:SENSe]:RADio:DEVice`

HSPA Enable

Allows you to turn on or off the HSDPA/HSUPA option enable. This selection is necessary because some of the auto detection functions that expect an HSPA signal are less tolerant when the signal is noisy or distorted. When the HSPA signal is not expected, turn HSPA Enable off.

Remote Command	`[:SENSe]:RADio:CONFigure:HSDPa[:STATe] 0 | 1 | OFF | ON` `[:SENSe]:RADio:CONFigure:HSDPa[:STATe]?`
Example	`:RAD:CONF:HSDP 0` `:RAD:CONF:HSDP?`
Preset	ON
State Saved	Saved in instrument state.
Range	On|Off

HSPA+ Enable

Allows you to turn on or off the HSPA+ option enable. This selection is necessary because some of the auto detection functions that expect an HSPA+ signal are less tolerant when the signal is noisy or distorted. When the HSPA+ signal is not expected, turn HSPA+ Enable off.

Remote Command	`[:SENSe]:RADio:CONFigure:EHSPa[:STATe] OFF | ON | 0 | 1` `[:SENSe]:RADio:CONFigure:EHSPa[:STATe]?`
Example	`:RAD:CONF:EHSP 0` `:RAD:CONF:EHSP?`
Notes	When HSPA enable is OFF, HSPA+ function is disabled too.

Preset	ON
State Saved	Saved in instrument state.
Range	On|Off

3.5.8.4 Sync

This tab enables you to set sync parameters.

Meas Method

Enables you to access the Meas Method Menu to select the data acquisition method, Waveform or Chip Power.

– WAVeform-Measures and performs a power calculation based on the waveform (raw data of A/D). This means a raw measurement under the specific BW, filter type and Capture Interval

– CPOWer-Measures and performs a power calculation based on the chip power (resample on chip clock). This means a re-sampled power measurement based on the chip clock timing for W-CDMA

The Meas Method is available only for the Slot Power and PRACH Power measurement types.

In the Slot Phase measurement type, resampling on the chip clock is always performed.

Remote Command	`[:SENSe]:PCONtrol:METHod WAVeform | CPOWer` `[:SENSe]:PCONtrol:METHod?`
Example	`:PCON:METH WAV` `:PCON:METH?`
Dependencies	This parameter is available when View Selection is Slot Power or PRACH Power and grayed out when View Selection is Slot Phase or Slot Phase w/Pwr Graph
Preset	WAVeform
State Saved	Yes
Range	Chip Power|Waveform

Slot Format

Enables you to access the Slot Format Menu to specify the slot format to be used for synchronization with the DPCCH Pilot channel. This format is used in the following two cases:

1. View Selection is Slot Power and Meas Method is Chip Power
2. View Selection is Slot Phase or Slot Phase w/Pwr Graph

Remote Command	`[:SENSe]:PCONtrol:SLOT:FORMat AUTO | SF0 | SF1 | SF2 | SF3 | SF4 | SF5` `[:SENSe]:PCONtrol:SLOT:FORMat?`
Example	`:PCON:SLOT:FORM SF0` `:PCON:SLOT:FORM?`
Preset	SF0
State Saved	Yes
Range	AUTO|SF0|SF1|SF2|SF3|SF4|SF5

Sync Start Slot

Specifies the first slot to measure.

When the Sync Start Slot parameter is set to On and the slot number to be used as the first slot to measure is specified, any trigger (even Free Run) initiates a measurement starting with the specified slot number.

For example:

- Trigger Source: Free Run (Immediate)
- Sync Start Slot state : On
- Sync Start Slot number : 0
- Capture Interval : 1 frame

The synchronization always starts from slot number 0.0 to 15.0 regardless of the trigger type.

When Sync Start Slot state is set to Off, the measurement performs synchronization at trigger timing.

Remote Command	`[:SENSe]:PCONtrol:SSLot:NUMBer <integer>`
	`[:SENSe]:PCONtrol:SSLot:NUMBer?`
	`[:SENSe]:PCONtrol:SSLot[:STATe] OFF | ON | 0 | 1`
	`[:SENSe]:PCONtrol:SSLot[:STATe]?`

Example	`:PCON:SSL:NUMB 5`
	`:PCON:SSL:NUMB?`
	`:PCON:SSL ON`
	`:PCON:SSL?`

Notes	Turn first slot number detection mode on or off
Dependencies	The control is not shown when device is MS and Sync Type is PRACH Message
Preset	0 OFF
State Saved	Yes Yes
Range	0 to 14 OFF|ON
Min/Max	0/14

Scramble Code

Sets the mobile station (MS) scramble code for synchronization. When this control is selected, a Hexadecimal Input menu appears.

Remote Command	`[:SENSe]:PCONtrol:SYNC:SCRamble <integer>` `[:SENSe]:PCONtrol:SYNC:SCRamble?`
Example	`:PCON:SYNC:SCR 0` `:PCON:SYNC:SCR?`
Preset	0 (0x0)
State Saved	Yes
Min/Max	0 (0x0; 24 bits)/16777215 (0xFFFFFF; 24 bits)

Preamble Sig

Sets the PRACH Preamble signature pattern to use for synchronization when the Meas Method is set to Chip Power. There are two modes:

- Auto - Automatically synchronizes with one of the PRACH Preamble signature patterns, 0 to 15
- Man - Specifies one of the PRACH Preamble signature patterns to which the synchronization is made

This value is set to its auto number when the PRACH Preamble Signature Auto mode is set to ON.

Remote Command	`[:SENSe]:PCONtrol:PRACh:SIGNature <integer>`
	`[:SENSe]:PCONtrol:PRACh:SIGNature?`
	`[:SENSe]:PCONtrol:PRACh:SIGNature:AUTO 0 | 1 | OFF | ON`
	`[:SENSe]:PCONtrol:PRACh:SIGNature:AUTO?`

Example	`:PCON:PRAC:SIGN 0`

	`:PCON:PRAC:SIGN?`
	 `:PCON:PRAC:SIGN:AUTO ON`
	 `:PCON:PRAC:SIGN:AUTO?`

Notes	When in Auto, the detected PRACH Preamble signature should be displayed. If synchronization fails, "---" should be displayed Set Signature Auto mode ON for PRACH Preamble detection
Preset	0 1
State Saved	Yes Yes
Range	Auto|Man
Min/Max	0/15

PRACH Noise Floor

Enables you to specify the PRACH noise floor. You can determine the signal noise floor level of the PRACH burst signal (since the system cannot recognize the noise floor level of the burst signal). The burst search algorithm needs a burst search threshold level. The level is calculated using this noise floor level and the peak level of the captured trace.

Remote Command	`[:SENSe]:PCONtrol:PRACh:NFLoor <real>` `[:SENSe]:PCONtrol:PRACh:NFLoor?`
Example	`:PCON:PRAC:NFL -70.0` `:PCON:PRAC:NFL?`
Dependencies	This control appears only when View Selection is PRACH Power
Preset	-69
State Saved	Yes
Min/Max	-156/-36

Advanced Sync Setup

The Advanced Sync Setup enables you to access advanced sync parameters in the Meas Setup menus on one screen.

Chip Rate

Changes the chip rate for the measurement.

Remote Command	`[:SENSe]:PCONtrol:CRATe <freq>` `[:SENSe]:PCONtrol:CRATe?`

Example	:PCON:CRAT 3.84e6 :PCON:CRAT?
Preset	3.84 MHz
State Saved	Yes
Min/Max	3.456 MHz/4.224 MHz

Filter Alpha

Sets the alpha value of the root raised cosine (RRC) filter.

Remote Command	[:SENSe]:PCONtrol:FILTer[:RRC]:ALPHa <real> [:SENSe]:PCONtrol:FILTer[:RRC]:ALPHa?
Example	:PCON:FILT:ALPH 0.22 :PCON:FILT:ALPH?
Preset	0.220
State Saved	Yes
Min/Max	0.01/0.50

RRC Filter

Enables you to turn the root-raised cosine filter On, Off, or set it to Auto.

Remote Command	[:SENSe]:PCONtrol:FILTer[:RRC][:STATe] 0 | 1 | OFF | ON [:SENSe]:PCONtrol:FILTer[:RRC][:STATe]? [:SENSe]:PCONtrol:FILTer[:RRC]:AUTO OFF | ON | 0 | 1 [:SENSe]:PCONtrol:FILTer[:RRC]:AUTO?
Example	:PCON:FILT OFF :PCON:FILT? :PCON:FILT:AUTO OFF :PCON:FILT:AUTO?
Couplings	When RRC Filter Auto is ON, RRC Filter State changes depending on the Meas Method: When Meas Method is changed to Chip Power, RRC Filter State is set to ON; and when Meas Method is changed to Waveform, it is set to OFF
Preset	0 ON
State Saved	Yes

PRACH Threshold (Remote Command only)

This number is calculated by the noise floor level and peak level of the captured trace. The threshold level is displayed with the signal as a white horizontal line. The burst search algorithm recognizes the burst that crosses this level.

Remote Command	`[:SENSe]:PCONtrol:PRACh:THReshold?`
Example	`:PCON:PRAC:THR?`
Notes	Query only
Preset	Automatically calculated
State Saved	Yes
Annotation	This value is displayed in bottom right of trace display

3.5.8.5 Time

This tab enables you to set Time parameters.

Capture Interval

Accesses a menu that enables you to select the number of frames for data acquisition.

Notes	For consistency, this parameter must be controlled with a float numeric from remote commands, but the front panel interface uses Enum for easier operation
Preset	4 Frames
State Saved	Yes
Range	1 Frame|2 Frames|4 Frames|8 Frames

Capture Interval (Remote Command only)

Enables you to specify the capture interval in frame units.

Remote Command	`[:SENSe]:PCONtrol:CAPTure:TIME <real>` `[:SENSe]:PCONtrol:CAPTure:TIME?`
Example	`:PCON:CAPT:TIME 4.0` `:PCON:CAPT:TIME?`
Notes	For consistency, this parameter must be controlled with a float numeric from remote commands, but the front panel interface uses Enum for easier operation
Preset	4.0
State Saved	Yes
Range	1.0|2.0|4.0|8.0

Slot Offset

Specifies the number of chips to be offset from the first acquisition data to the slot boundary.

Remote Command	`:CALCulate:PCONtrol:SLOT:OFFSet <real>` `:CALCulate:PCONtrol:SLOT:OFFSet?`
Example	`:CALC:PCON:SLOT:OFFS 0.0` `:CALC:PCON:SLOT:OFFS?`
Preset	0.0
State Saved	Yes
Min/Max	0.0/5120.0

Meas Delay

Specifies the number of chips to be delayed from the slot boundary to the start point of the power measurement. The range is 0.0 chips to (PCG Length - Meas Intvl) chips. The default is 96.0 chips which is equivalent to 25 µs at the 3.840 MHz chip rate.

Remote Command	`:CALCulate:PCONtrol:SLOT:DELay <real>` `:CALCulate:PCONtrol:SLOT:DELay?`
Example	`:CALC:PCON:SLOT:DEL 96.0` `:CALC:PCON:SLOT:DEL?`
Preset	96.0
State Saved	Yes
Min/Max	0.0/`:CALCulate:PCONtrol:SLOT:LENGth` - `:CALCulate:PCONtrol:SLOT:INTerval`

Meas Interval

Specifies the number of chips to be used as the measuring interval for the averaged RMS power measurement.

Remote Command	`:CALCulate:PCONtrol:SLOT:INTerval <real>` `:CALCulate:PCONtrol:SLOT:INTerval?`
Example	`:CALC:PCON:SLOT:INT 1088.0` `:CALC:PCON:SLOT:INT?`
Preset	2368.0
State Saved	Yes
Min/Max	1.0/`:CALCulate:PCONtrol:SLOT:LENGth` - `:CALCulate:PCONtrol:SLOT:OFFSet`

PCG Length

Specifies the number of chips to be used as the integration time for the slot power measurement.

Remote Command	`:CALCulate:PCONtrol:SLOT:LENGth <real>` `:CALCulate:PCONtrol:SLOT:LENGth?`
Example	`:CALC:PCON:SLOT:LENG 2560.0` `:CALC:PCON:SLOT:LENG?`
Preset	2560.0
State Saved	Yes
Min/Max	`:CALCulate:PCONtrol:SLOT:DELay` + `:CALCulate:PCONtrol:SLOT:INTerval` or 768.0 (larger one)/25600.0

Preamble Length

Specifies the number of chips to be used as the length for PRACH preamble power-on period.

Remote Command	`:CALCulate:PCONtrol:PRACh:PLENgth <real>` `:CALCulate:PCONtrol:PRACh:PLENgth?`
Example	`:CALC:PCON:PRAC:PLEN 4096.0` `:CALC:PCON:PRAC:PLEN?`
Preset	4096.0
State Saved	Yes
Min/Max	4000.0/4200.0

Message Length

Specifies the time value, in seconds, to be used as the length for the PRACH message burst-on period.

Remote Command	`:CALCulate:PCONtrol:PRACh:MLENgth <time>` `:CALCulate:PCONtrol:PRACh:MLENgth?`
Example	`:CALC:PCON:PRAC:MLEN 20ms` `:CALC:PCON:PRAC:MLEN?`
Preset	20.0 ms
State Saved	Yes
Min/Max	10.0 ms/20.0 ms

Meas Offset

Sets the measurement offset (excluding the period before and after the reference point due to a transient) for the PRACH Power Measurement.

Remote Command	`:CALCulate:PCONtrol:PRACh:OFFSet <real>` `:CALCulate:PCONtrol:PRACh:OFFSet?`
Example	`:CALC:PCON:PRAC:OFFS 96.0` `:CALC:PCON:PRAC:OFFS?`
Preset	96.0
State Saved	Yes
Min/Max	0.0/200.0

Off Power Interval

Specifies the number of chips to be used as the length for the power-off measurement interval.

Remote Command	`:CALCulate:PCONtrol:PRACh:INTerval <real>` `:CALCulate:PCONtrol:PRACh:INTerval?`
Example	`:CALC:PCON:PRAC:INT 2368.0` `:CALC:PCON:PRAC:INT?`
Preset	2368.0
State Saved	Yes
Min/Max	1.0/12800.0

Transient Period

Allows you to Exclude/Include the Transient Period.

For 3GPP Rel-5 and later releases where tests may include power changes, the measurement interval is further clarified as being one (or a half) timeslot. The exception is when the mean power between slots (or half slots) is expected to change, then the measurement interval is reduced by 25 us at each end of the slot (or half-slot).

- `EXCLude` (default) – Exclude the 25 us (= 96 chips) at each end of the slot (or half-slot) for Phase/EVM calculation
- `INCLude` – Include the transient periods at each end of the slot (or half-slot) for Phase/EVM calculation

Remote Command	[:SENSe]:PCONtrol:SWEep:TIME:TRANsient INCLude | EXCLude [:SENSe]:PCONtrol:SWEep:TIME:TRANsient?
Example	:PCON:SWE:TIME:TRAN EXCL :PCON:SWE:TIME:TRAN?
Preset	EXCLude
State Saved	Yes
Range	INCLude|EXCLude

Meas Interval (Slot Phase)

Sets the slot interval either to 1 or 0.5 for the MS power control measurement.

- 1 slot - default
- 0.5 slot - for Half-slot Phase Discontinuity when HS- DPCCH is present

Remote Command	[:SENSe]:PCONtrol:MINTerval <real> [:SENSe]:PCONtrol:MINTerval?
Example	:PCON:MINT 1 :PCON:MINT?
Dependencies	Enabled only when HSPA enable is On and View Selection is set to Slot Phase
Preset	1.0
State Saved	Yes
Range	1|0.5
Min/Max	0.5/1.0

Capture Time Diagram

Accesses a menu that enables you to set up time parameters.

3.5.8.6 Channel/Layer

This tab enables you to set Channel/Layer parameters.

Symbol Boundary (MS only)

Selects the symbol boundary detection mode for the MS.

Auto Detect

AUTO - Sets the symbol boundary detection to the automatic mode. Various code channels are measured and the most appropriate code channel is selected as the reference channel.

Custom

CUSTom - Provides a flexible way to specify predefined active channels. By choosing it, you can specify a customized list of active channels using the following command::

```
[:SENSe]:PCONtrol:SBOundary:LIST:MS INIT | APPend | <entry_id>, <symbol_rate>,
<code_num>, IPH | QPH
```

All the specified channels are considered as active.

There is no front panel menu key to specify the custom active channel list. The following commands are used to configure the list of custom predefined channels for the MS.

– "Initialize List" on page 696

– "Append List" on page 697

– "Replace List" on page 698

– "Query List" on page 700

– "Symbol Boundary Custom Active Channel List – The Number Of Entries (MS only)" on page 701

Initialize List

Initializes the current custom active channel list. This creates a new entry with the given parameter.

Parameter	Name/Value	Description
1	<symbol_rate>	This parameter specifies the symbol rate of the channel
2	<code_num>	This parameter specifies the spreading code of the channel
3	IPH	Specifies the channel is on the I-axis
	QPH	Specifies the channel Is on the Q-axis

Remote Command	`[:SENSe]:PCONtrol:SBOundary:LIST:MS:INIT <symbol_rate>, <code_num>, IPH | QPH`
Example	In order to predefine the following channels: - DPCCH (C8(0):Q) - DPDCH (C6(16):I)

	`:PCON:SBO:LIST:MS:INIT 15000, 0, QPH`
	`:PCON:SBO:LIST:MS:APP 60000, 16, IPH`
	`:PCON:SBO:LIST:MS:NCH?`
	2
	`:PCON:SBO:LIST:MS:CHAN? 1`
	15000, 0, QPH
	`:PCON:SBO:LIST:MS:CHAN? 2`
	60000, 16, IPH

Notes	1. This command is effective when [:SENSe]:RADio:DEVice is set to MS and [:SENSe]:PCONtrol:SBOundary:MS is set to CUSTom 2. `symbol_rate` = 1920000 is available when HSDPA/HSUPA Enable is On 3. The maximum number of entries is 512 For details of possible error messages, see "Parameter Errors (MS)" on page 699 below
State Saved	Yes
Range	Depends on Symbol Rate. See "Range (MS)" on page 700 below

Append List

Appends the entry of the custom active channel list.

Parameter	Name/Value	Description
1	<symbol_rate>	This parameter specifies the symbol rate of the channel
2	<code_num>	This parameter specifies the spreading code of the channel
3	IPH	Specifies the channel is on the I-axis
	QPH	Specifies the channel Is on the Q-axis

Remote Command	`[:SENSe]:PCONtrol:SBOundary:LIST:MS:APPend <symbol_rate>, <code_num>, IPH | QPH`

Example	In order to predefine the following channels:
	- DPCCH (C8(0):Q)
	- DPDCH (C6(16):I)
	`:PCON:SBO:LIST:MS:INIT 15000, 0, QPH`
	`:PCON:SBO:LIST:MS:APP 60000, 16, IPH`
	`:PCON:SBO:LIST:MS:NCH?`
	2
	`:PCON:SBO:LIST:MS:CHAN? 1`
	15000, 0, QPH
	`:PCON:SBO:LIST:MS:CHAN? 2`

	60000, 16, IPH
Notes	1. This command is effective when [:SENSe]:RADio:DEVice is set to MS and [:SENSe]:PCONtrol:SBOundary:MS is set to CUSTom 2. `symbol_rate` = 1920000 is available when HSDPA/HSUPA Enable is On 3. The maximum number of entries is 512 For details of possible error messages, see "Parameter Errors (MS)" on page 699 below
State Saved	Yes
Range	Depends on Symbol Rate. See "Range (MS)" on page 700 below

Replace List

Replaces the entry of the custom active channel list.

Parameter	Name/Value	Description
1	<entry_id>	This parameter specifies the entry ID of the channel to replace
2	<symbol_rate>	This parameter specifies the symbol rate of the channel
3	<code_num>	This parameter specifies the spreading code of the channel
4	IPH	Specifies the channel is on the I-axis
	QPH	Specifies the channel Is on the Q-axis

Remote Command	`[:SENSe]:PCONtrol:SBOundary:LIST:MS:REPLace <entry_id>,<symbol_rate>, <code_num>, IPH | QPH`

Example	In order to predefine the following channels:
	- DPCCH (C8(0):Q)
	- DPDCH (C6(16):I)
	`:PCON:SBO:LIST:MS:INIT 15000, 0, QPH`
	`:PCON:SBO:LIST:MS:APP 60000, 16, IPH`
	`:PCON:SBO:LIST:MS:NCH?`
	2
	And, replace 2nd entry.
	`:PCON:SBO:LIST:MS:REPL 2, 60000,17,QPH`
	`:PCON:SBO:LIST:MS:CHAN? 1`
	15000, 0, QPH
	`:PCON:SBO:LIST:MS:CHAN? 2`
	60000, 17, IPH

Notes	1. This command is effective when [:SENSe]:RADio:DEVice is set to MS and [:SENSe]:PCONtrol:SBOundary:MS is set to CUSTom

	2. `symbol_rate` = 1920000 is available when HSDPA/HSUPA Enable is On 3. The maximum number of entries is 512 For details of possible error messages, see "Parameter Errors (MS)" on page 699 below
State Saved	Yes
Range	The entry ID must be: 1 <= entry_id <= The number of entries which is currently appended Depends on Symbol Rate. See "Range (MS)" on page 700 below

Parameter Errors (MS)

One of the following error messages is logged if the given parameter is invalid. If an error is reported, the SCPI command is rejected and instrument's settings do not change

Error Type	Cause	Examples
Missing Parameter	The number of parameters is less than 3	`:SENSe:PCONtrol:SBOundary:LIST:MS:APPend 15000, 0` 3rd parameter is missing.

Illegal parameter value	The parameter type is invalid, or the enum value is invalid	`:SENSe:PCONtrol:SBOundary:LIST:MS:APPend 15000, ON, QPH`
		2nd parameter must be an integer
		`:SENSe:PCONtrol:SBOundary:LIST:MS:APPend 15001, 0, QPH`
		1st parameter value (Symbol Rate) is not allowed
		Only the values given in the Range field are valid for the Symbol Rate. You may specify these in numeric form, but they are interpreted as an enumeration and an error results if the value does not translate to one in the list

Data out of range	The parameter value is out of range	`:SENSe:PCONtrol:SBOundary:LIST:MS:APPend 15000, 256, QPH` 2nd parameter is out of range

Setting Conflict	The given code channel overlaps another code channel on Power Control	If you send the following two commands, the second command causes an error message, because C7(0):Q overlaps C8(0):Q
		`:SENSe:PCONtrol:SBOundary:LIST:MS:INIT 15000, 0, QPH`
		Command is OK
		`:SENSe:PCONtrol:SBOundary:LIST:MS:APPend 30000, 0, QPH`
		C7(0):Q overlaps C8(0):Q

Range (MS)

Symbol Rate	Range
15000	0<= code_num <= 255
30000	0<= code_num <= 127
60000	0<= code_num <= 63
120000	0<= code_num <= 31
240000	0<= code_num <= 15
480000	0<= code_num <= 7
960000	0<= code_num <= 3
1920000	0<= code_num <= 1

Query List

Returns the entry of the custom active channel list.

Parameter	Name	Description
1	<entry_id>	This parameter specifies entry ID of the channel to query

Remote Command	`[:SENSe]:PCONtrol:SBOundary:LIST:MS:CHANnel? <entry_id>`

Example	In order to predefine the following channels:
	- DPCCH (C8(0):Q)
	- DPDCH (C6(16):I)
	`:PCON:SBO:LIST:MS:INIT 15000, 0, QPH`
	`:PCON:SBO:LIST:MS:APP 60000, 16, IPH`
	`:PCON:SBO:LIST:MS:NCH?`
	2
	`:PCON:SBO:LIST:MS:CHAN? 1`
	15000, 0, QPH
	`:PCON:SBO:LIST:MS:CHAN? 2`
	60000, 16, IPH

Notes	1. This command is effective when [:SENSe]:RADio:DEVice is set to MS and [:SENSe]:PCONtrol:SBOundary:MS is set to CUSTom 2. `symbol_rate` = 1920000 is available when HSDPA/HSUPA Enable is On 3. The maximum number of entries is 512 Default value of the parameter By default, there is one channel defined. (DPCCH C8(0):Q) In order to query the default entry, specify 1 for <entry_id>:

	`:SENSe:PCONtrol:SBOundary:LIST:MS:CHANnel? 1`
	The instrument returns an array of three values:
	15000, 0, QPH
	Query commands need an <entry_id> parameter
	The <entry_id> parameter is always required for query commands
	The range of the parameter is from 1 to the total number of channels you have defined. For example, if you have defined two channels, you can query them as follows:
	`:SENSe:PCONtrol:SBOundary:LIST:MS:CHANnel? 1`
	`:SENSe:PCONtrol:SBOundary:LIST:MS:CHANnel? 2`
	If you want to know the number of channels you have defined, send the following query command:
	`:SENSe:PCONtrol:SBOundary:LIST:NCHannels:MS?`
	One of the following error messages is logged if the given parameter is invalid
	If an error is reported, the SCPI command is rejected and instrument's settings do not change
	<entry_id> out of range
	The entry ID must be:
	1 <= entry_id <= The number of entries which is currently appended

Preset	15000, 0, QPH
State Saved	Yes
Range	The entry ID must be: 1 <= entry_id <= The number of entries which is currently appended

Symbol Boundary Custom Active Channel List – The Number Of Entries (MS only)

Returns the number of entries in the custom predefined active channel list MS.

Remote Command	`[:SENSe]:PCONtrol:SBOundary:LIST:MS:NCHannels?`
Example	`:PCON:SBO:LIST:MS:NCH?`
Notes	This command is effective when `[:SENSe]:RADio:DEVice` is set to MS and `[:SENSe]:PCONtrol:SBOundary:MS` is set to `CUSTom` This is a query-only command
Preset	1
State Saved	No

NOTE

The Custom choice is selectable even if you have not sent the following SCPI command: `[:SENSe]:PCONtrol:SBOundary:LIST:MS`, because the default custom list contains DPCCH (15000, 0, QPH) as a predefined active channel. Choosing the Custom setting makes one channel (C8(0):Q) active, and all other channels inactive.

Remote Command	`[:SENSe]:PCONtrol:SBOundary:MS AUTO | CUSTom` `[:SENSe]:PCONtrol:SBOundary:MS?`
Example	`:PCON:SBO:MS CUST` `:PCON:SBO:MS?`
Dependencies	This parameter is effective when [:SENSe]:RADio:DEVice is set to MS
Preset	AUTO
State Saved	Yes
Range	AUTO|CUSTom

3.5.9 Sweep

The Sweep key contains controls which allow you to control the sweep and measurement functions of the instrument. This tab accesses controls that enable you to operate the Sweep and Control functions of the instrument.

3.5.9.1 Sweep/Control

Contains controls for the Sweep and Control functions of the instrument, such as Sweep Time and Continuous/Single.

Sweep/Measure

Allows you to toggle between Continuous and Single sweep or measurement operation. The Single/Continuous state is Meas Global, so the setting affects *all* measurements.

The front-panel key **Single/Cont** performs exactly the same function

NOTE: In the `WAVeform` measurement, this control only appears in the Meas Bar, and not in the **Sweep/Control** tab.

See "More Information" on page 703

Remote Command	`:INITiate:CONTinuous OFF | ON | 0 | 1` `:INITiate:CONTinuous?`

Example	`:INIT:CONT 0`
	`:INIT:CONT OFF`
	puts instrument into Single measurement operation
	`:INIT:CONT 1`
	`:INIT:CONT ON`

	puts instrument into Continuous measurement operation
Preset	ON Note that :SYST:PRES sets :INIT:CONT to ON but *RST sets :INIT:CONT to OFF
State Saved	Saved in instrument state
Annunciation	The **Single/Continuous** icon in the Meas Bar changes depending on the setting: – A line with an arrow is Single – A loop with an arrow is Continuous

More Information

With **Avg/Hold Num** (in the **Meas Setup** menu) set to **Off** or set to **On** with a value of 1, a sweep is taken after the trigger condition is met; and the instrument continues to take new sweeps after the current sweep has completed and the trigger condition is again met. However, with **Avg/Hold Num** set to On with a value >1, multiple sweeps (data acquisitions) are taken for the measurement. The trigger condition must be met prior to each sweep. The sweep is not stopped when the average count k equals the number N set for Avg/Hold Num is reached, but the number k stops incrementing. A measurement average usually applies to all traces, marker results, and numeric results, but sometimes only applies to the numeric results.

If the instrument is in Single measurement, pressing the **Cont/Single** toggle control does not change k and does not cause the sweep to be reset; the only action is to put the instrument into Continuous measurement operation.

If it is already in Continuous sweep:

- the `:INIT:CONT 1` command has no effect
- the `:INIT:CONT 0` command will place the instrument in Single Sweep but will have no effect on the current sequence until k = N, at which point the current sequence will stop and the instrument will go to the idle state.

See "Restart" on page 1738 control description for details on the `:INIT:IMM` (Restart) function.

If you are already in Single sweep, the `:INIT:CONT OFF` command has no effect.

If you are already in Single Sweep, then pressing the **Cont/Single** toggle control in the middle of a sweep does not restart the sweep or sequence. Similarly, pressing the **Cont/Single** toggle control does not restart the sweep or sequence if the sweep is not in the idle state (for example, if you are taking a very slow sweep, or the instrument is waiting for a trigger). Even though pressing the **Cont/Single** toggle control in the middle of a sweep does *not* restart the sweep, sending `:INIT:IMM` *does* reset it.

Restart

The **Restart** function restarts the current sweep, or measurement, or set of averaged/held sweeps or measurements. In measurements that support pausing, if you are Paused, pressing **Restart** performs a **Resume**.

The Restart function is accessed in several ways:

- Pressing the **Restart** key
- Sending the remote command `:INIT:IMM`
- Sending the remote command `:INIT:REST`

See "More Information" on page 704

Remote Command	`:INITiate[:IMMediate]` `:INITiate:RESTart`
Example	`:INIT:IMM` `:INIT:REST`
Notes	`:INIT:REST` and `:INIT:IMM` and the front-panel **Restart** key perform exactly the same function
Couplings	Resets average/hold count k For the first sweep, overwrites all active (update=on) traces with new current data For application modes, resets other parameters as required by the measurement
Status Bits/OPC dependencies	This is an Overlapped command The `:STATus:OPERation` register bits 0 through 8 are cleared The `:STATus:QUEStionable` register bit 9 (INTegrity sum) is cleared The `SWEEPING` bit is set The `MEASURING` bit is set
Backwards Compatibility Notes	For Spectrum Analysis mode in ESA and PSA, the **Restart** hardkey and the `:INIT:REST` command restart trace averages (displayed average count reset to 1) for a trace in **Clear Write**, but did not restart **Max Hold** and **Min Hold** In the X-Series, the **Restart** hardkey and the `:INIT:REST` command restart not only **Trace Average**, but **Max Hold** and **Min Hold** traces as well For wireless comms modes in ESA and PSA, the **Restart** hardkey and the `:INIT:REST` command restarted every measurement, including all traces and numeric results. There is no change to this operation

More Information

The **Restart** function first aborts the current sweep or measurement as quickly as possible. It then resets the sweep and trigger systems, sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is in the process of aligning when a Restart is executed, the alignment finishes before the restart function is performed.

Even when set for Single operation, multiple sweeps may be taken when **Restart** is pressed (for example, when averaging/holding is on). Thus when we say that Restart "restarts a measurement," depending on the current settings, we may mean:

- It restarts the current sweep
- It restarts the current measurement
- It restarts the current set of sweeps if any trace is in Trace Average, Max Hold or Min Hold
- It restarts the current set of measurements if Averaging, or Max Hold, or Min Hold is on for the measurement

With Average/Hold Number (in Meas Setup menu) set to 1, or Averaging off, or no trace in Trace Average or Hold, a single sweep is equivalent to a single measurement. A single sweep is taken after the trigger condition is met; and the instrument stops sweeping once that sweep has completed. However, with Average/Hold Number >1 and at least one trace set to Trace Average, Max Hold, or Min Hold (SA Measurement) or Averaging on (most other measurements), multiple sweeps/data acquisitions are taken for a single measurement. The trigger condition must be met prior to each sweep. The sweep is stopped when the average count k equals the number N set for Average/Hold Number. A measurement average usually applies to all traces, marker results, and numeric results, but sometimes only applies to the numeric results.

Once the full set of sweeps has been taken, the instrument will go to the idle state. To take one more sweep without resetting the average count, increment the average count by 1, by pressing the step up key while Average/Hold Number is the active function, or by sending the remote command `:CALC:AVER:TCON UP`.

Pause/Resume

Pauses a measurement after the current data acquisition is complete.

When a measurement is paused:

- The label on this control changes to **Resume**. Pressing **Resume** un-pauses the measurement.
- Pressing **Restart** also performs a **Resume**.

Remote Command	`:INITiate:PAUSe` `:INITiate:RESume`
Example	`:INIT:PAUS` `:INIT:RES`

Dependencies	Not displayed in Modes that do not support pausing
Couplings	When Averaging is On, if the measurement is paused no more updates will occur until either a Resume or Restart occurs If the measurement is resumed, the averaging continues to use the traces from before the Pause occurred and continues to use the traces from the point where the Resume occurred. This still provides real-time traces, but they will no longer be gap free In a view with a Waterfall window, when the measurement is paused, the Waterfall stops updating. When Resume is selected, the Waterfall will retain the existing traces and continue updating using traces from the point at which Resume was selected. The time stamp of the individual Waterfall traces will show the time from the beginning of the measurement the trace relates to, showing there was a gap in the Waterfall capture In Density view, when the measurement is paused, the Density Display stops updating. When the measurement is resumed, if Persistence is `ON`, the persistence fading will continue from the point when the measurement was paused If a Restart occurs, the average counter is reset and all results are discarded. The measurement begins again, using traces after the Restart occurred

Abort (Remote Command Only)

This command stops the current measurement. It aborts the current measurement as quickly as possible, resets the sweep and trigger systems, and puts the measurement into an "idle" state. If the instrument is in the process of aligning when `:ABORt` is sent, the alignment finishes before the abort function is performed, so `:ABORt` does *not* abort an alignment.

If the instrument is set for Continuous measurement, it sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is set for Single measurement, it remains in the "idle" state until an `:INIT:IMM` command is received.

Remote Command	`:ABORt`
Example	`:ABOR`
Notes	If `:INIT:CONT` is `ON`, then a new continuous measurement will start immediately, with sweep (data acquisition) occurring once the trigger condition has been met If `:INIT:CONT` is `OFF`, then `:INIT:IMM` is used to start a single measurement, with sweep (data acquisition) occurring once the trigger condition has been met
Dependencies	For continuous measurement, `:ABORt` is equivalent to the **Restart** key Not all measurements support the abort command
Status Bits/OPC dependencies	The `:STATus:OPERation` register bits 0 through 8 are cleared The `:STATus:QUEStionable` register bit 9 (INTegrity sum) is cleared Since all the bits that feed into OPC are cleared by `:ABORt`, the `:ABORt` will cause the *OPC query to return true

3.5.9.2 X Scale

This tab accesses controls that enable you to set the horizontal scale parameters.

Ref Value

Sets the display reference value for the current measurement.

Remote Command	`:DISPlay:PCONtrol:WINDow[1]|4:TRACe:X[:SCALe]:RLEVel <time>`
	`:DISPlay:PCONtrol:WINDow[1]|4:TRACe:X[:SCALe]:RLEVel?`
	Window numbers are as follows:
	– Power: 1
	– Phase: 4

Example	1-Power window
	`:DISP:PCON:WIND:TRAC:X:RLEV 0.0`
	4-Phase window
	`:DISP:PCON:WIND4:TRAC:X:RLEV 0.0`

Couplings	If the Scale Coupling is On, this value is automatically determined by the measurement result. When you set a value manually, Scale Coupling automatically changes to Off
Preset	0.0 s
State Saved	Yes
Min/Max	-1.0/10.0 s

Backwards Compatibility SCPI

Window Numbers used to be a combination of View and Window, now the VIEW parameter is not used and defaults to 1. All Windows are referenced through VIEW 1. For backwards compatibility the old View and Window numbers are honored as below:

Window	Old SCPI Command	New SCPI Command
Power	`DISP:PCON:VIEW:WIND:TRAC:X:RLEV 10.0`	`DISP:PCON:WIND:TRAC:X:RLEV 0.0`
Phase	`DISP:PCON:VIEW2:WIND:TRAC:X:RLEV 0.0`	`DISP:PCON:WIND4:TRAC:X:RLEV 0.0`

Scale/Div

Enables you to enter a time value to change the horizontal scale.

Remote Command	`:DISPlay:PCONtrol:WINDow[1]|4:TRACe:X[:SCALe]:PDIVision <time>` `:DISPlay:PCONtrol:WINDow[1]|4:TRACe:X[:SCALe]:PDIVision?`

	Window numbers are as follows: – Power: 1 – Phase: 4

Example	1-Power windo
	`:DISP:PCON:WIND:TRAC:X:PDIV 4.0e-3`
	4-Phase window
	`:DISP:PCON:WIND4:TRAC:X:PDIV 4.0e-3`

Couplings	If the Scale Coupling is On, this value is automatically determined by the measurement result. When you set a value manually, Scale Coupling automatically changes to Off
Preset	4.000 ms
State Saved	Yes
Min/Max	1.0 ns/1.0 s

Backwards Compatibility SCPI

Window Numbers used to be a combination of View and Window, now the VIEW parameter is not used and defaults to 1. All Windows are referenced through VIEW 1. For backwards compatibility the old View and Window numbers are honored as below:

Window	Old SCPI Command	New SCPI Command
Power	`DISP:PCON:VIEW:WIND:TRAC:X:PDIV 4.0e-3`	`DISP:PCON:WIND:TRAC:X:PDIV 4.0e-3 0.0`
Phase	`DISP:PCON:VIEW2:WIND:TRAC:X:PDIV 4.0e-3`	`DISP:PCON:WIND4:TRAC:X:PDIV 4.0e-3 0.0`

Ref Position

Sets the display reference position to Left, Ctr (center), or Right.

Remote Command	`:DISPlay:PCONtrol:WINDow[1]|4:TRACe:X[:SCALe]:RPOSition LEFT | CENTer | RIGHt`
	`:DISPlay:PCONtrol:WINDow[1]|4:TRACe:X[:SCALe]:RPOSition?`
	Window numbers are as follows:
	– Power: 1
	– Phase: 4

Example	1-Power window
	`:DISP:PCON:WIND:TRAC:X:RPOS LEFT`
	4-Phase window
	`:DISP:PCON:WIND4:TRAC:X:RPOS LEFT`

Preset	LEFT
State Saved	Yes
Range	LEFT|CENTer|RIGHt

Backwards Compatibility SCPI

Window Numbers used to be a combination of View and Window, now the VIEW parameter is not used and defaults to 1. All Windows are referenced through VIEW 1. For backwards compatibility the old View and Window numbers are honored as below:

Window	Old SCPI Command	New SCPI Command
Power	DISP:PCON:VIEW:WIND:TRAC:X:RPOS LEFT	DISP:PCON:WIND:TRAC:X:RPOS LEFT
Phase	DISP:PCON:VIEW2:WIND:TRAC:X:RPOS LEFT	DISP:PCON:WIND4:TRAC:X:RPOS LEFT

Auto Scaling

Toggles the scale coupling function between On and Off.

Remote Command	:DISPlay:PCONtrol:WINDow[1]|4:TRACe:X[:SCALe]:COUPle 0 | 1 | OFF | ON :DISPlay:PCONtrol:WINDow[1]|4:TRACe:X[:SCALe]:COUPle? Window numbers are as follows: – Power: 1 – Phase: 4
Example	:DISP:PCON:WIND:TRAC:X:COUP ON :DISP:PCON:WIND:TRAC:X:COUP?
Couplings	When Auto Scaling is On and the Restart front-panel key is pressed, this function automatically determines the scale per division and reference values based on the measurement results When you set a value to either Scale/Div or Ref Value manually, Auto Scaling automatically changes to Off
Preset	ON
State Saved	Saved in instrument state
Range	OFF|ON

3.5.10 Trace

Trace is not supported in the WCDMA Power Control Measurement.

3.6 QPSK EVM Measurement

The quadrature phase shift keying (QPSK) error vector magnitude (EVM) measurement is a measure of phase and amplitude modulation quality that relates the performance of the actual signal compared to an ideal signal as a percentage, as calculated over the course of the ideal constellation. These phase and frequency errors are measures of modulation quality for the W-CDMA (3GPP) system, and can be quantified through QPSK EVM measurements.

QPSK EVM Measurement Commands

The following commands and queries are used to retrieve the measurement results:

`:CONFigure:EVMQpsk`

`:CONFigure:EVMQpsk:NDEFault`

`:FETCh:EVMQpsk[n]?`

`:READ:EVMQpsk[n]?`

`:MEASure:EVMQpsk[n]?`

Remote Command Results for QPSK EVM Measurement

The following table describes the results returned by the queries listed above, according to the index value `n`.

n	Results Returned
0	Returns unprocessed I/Q trace data, as a series of comma-separated trace points, in volts
not specified or n = 1	Returns the following 11 scalar results: 1. RMS EVM is a floating point number (in percent) of EVM over the entire measurement area 2. RMS EVM maximum is the maximum RMS EVM over the average counts 3. Peak EVM is a floating point number (in percent) of peak EVM in the measurement area 4. Peak EVM maximum is the maximum peak EVM over the average counts 5. Magnitude Error is a floating point number (in percent) of averaged magnitude error over the entire measurement area 6. Magnitude Error maximum is a floating point number over the average counts 7. Phase Error is a floating point number (in degrees) of the averaged phase error over the entire measurement area 8. Phase Error maximum is the maximum phase error over the average counts 9. Frequency Error is a floating point number (in Hz) of the frequency error in the measured signal 10. Frequency Error maximum is the maximum frequency error over the average counts 11. I/Q Origin Offset is a floating point number (in dB) of the I and Q error (magnitude squared) offset from the origin

n	Results Returned
2	**EVM trace** – Returns a series of floating point numbers (in percent) that represent each sample in the EVM trace. The first number is the symbol 0 decision point. There are X points per symbol (X=points/chip). Therefore, the decision points are at 0, 1*X, 2*X, and so on
3	**Magnitude error trace** – Returns a series of floating point numbers (in percent) that represent each sample in the magnitude error trace. The first number is the symbol 0 decision point. There are X points per symbol (X=points/chip). Therefore, the decision points are at 0, 1*X, 2*X, ...
4	**Phase error trace** – Returns a series of floating point numbers (in percent) that represent each sample in the phase error trace. The first number is the symbol 0 decision point. There are X points per symbol (X=points/chip). Therefore, the decision points are at 0, 1*X, 2*X, ...
5	**Corrected measured trace** – Returns a series of floating point numbers that alternately represent I and Q pairs of the corrected measured trace. The magnitude of each I and Q pair are normalized to 1.0. The first number is the I sample of symbol 0 decision point and the second number is the Q sample of symbol 0 decision point. There are X points per symbol (X=points/chip). Therefore, the series of numbers is: – 1st number = I of the symbol 0 decision point – 2nd number = Q of the symbol 0 decision point – ... – (2*X)+1 number = I of the symbol 1 decision point – (2*X)+2 number = Q of the symbol 1 decision point – ... – (2*X)*N+1 th number = I of the symbol N decision point – (2*X)*N+2 th number = Q of the symbol N decision point

3.6.1 Views

The table below shows the Views and Windows used for this Measurement.

These Views are multiple-window Views and you select a window by touching it. The menu controls may sometimes change depending on which window is selected.

Whenever the View changes, the default menu is Frequency, unless otherwise specified in the View description.

View	Result
I/Q Measured Polar Graph	I/Q Measured Polar Graph
	Metrics
I/Q Error	Mag Error Graph
	Phase Error Graph
	EVM Graph
	Small-sized Metrics

The following remote commands are available for view selection:

View Selection by Name

Selects the format for the measurement results view.

Remote Command	:DISPlay:EVMQpsk:VIEW[:SELect] POLar | ERRor :DISPlay:EVMQpsk:VIEW[:SELect]?
Example	:DISP:EVMQ:VIEW ERR :DISP:EVMQ:VIEW?
Couplings	Changing parameter of "ViewNum" (:DISPlay:EVMQpsk:VIEW:NSELect) also changes this parameter
Preset	POLar
State Saved	Yes
Range	I/Q Measured Polar Graph|I/Q Error

View Selection by Number

Displays the numeric values of the measurement results.

Remote Command	:DISPlay:EVMQpsk:VIEW:NSELect <integer> :DISPlay:EVMQpsk:VIEW:NSELect?
Example	:DISP:EVMQ:VIEW:NSEL 2 :DISP:EVMQ:VIEW:NSEL?
Couplings	Changing parameter of "View" (:DISPlay:EVMQpsk:VIEW[:SELect]) also changes this parameter
Preset	1
State Saved	Yes
Min/Max	1/2

3.6.1.1 I/Q Measured Polar Graph

Windows: "I/Q Measured Polar Graph" on page 713, "Metrics" on page 713

Combination view of the I/Q demodulated signals using vector lines to connect the chip dots.

Example	:DISP:EVMQ:VIEW POL

3.6.1.2 I/Q Error

Windows: "Mag Error Graph" on page 714, "Phase Error Graph" on page 714, "EVM Graph" on page 714, "Small-sized Metrics" on page 715

Provides a combination view. This view consists of the above four windows.

3.6.2 Windows

3.6.2.1 Window Number List

Window	Number
Metrics	1
I/Q Measured Polar	2
Mag Error	3
Phase Error	4
EVM	5
Small-sized Metrics	6

I/Q Measured Polar Graph

The Graph window appears in the I/Q Measured Polar Graph View:

Polar Graph consists of Constellation points and Vector line.

Marker Trace	Yes
Corresponding Trace	Display I/Q trace (n=5)

Metrics

The Metrics window appears in the following Views:

View	Size	Position
I/Q Measured Polar Graph	Full, one thirds width	Left

Shows numeric results of the I/Q polar graph.

Name		Type	Description	Unit	Format
RMS EVM		float64	EVM over the entire measurement area	percent	XX.XX %
Peak EVM		float64	peak EVM in the measurement area.	percent	XX.XX %
Mag Error	Avg	float64	averaged magnitude error over the entire measurement area	percent	XX.XX %
	Max	float64	maximum magnitude error over the entire measurement area	percent	XX.XX %
Phase Error	Avg	float64	averaged phase error over the entire measurement area	°	XX.XX °
	Max	float64	maximum phase error over	°	XX.XX °

Name		Type	Description	Unit	Format
			the entire measurement area		
Freq Error	Avg	float64	averaged frequency error in the measured signal.	Hz	XX.XX Hz
	Max	float64	maximum frequency error in the measured signal	Hz	XX.XX Hz
I/Q Origin Offset		float64	the I and Q error (magnitude squared) offset from the origin.	dB	XX.XX dB

Mag Error Graph

This graph appears in the following View:

View	Size	Position
I/Q Error	Half, half width	Upper left

Marker Trace	Yes
Corresponding Trace	Magnitude Error trace (n=3)

Phase Error Graph

This graph appears in the following View:

View	Size	Position
I/Q Error	Half, half width	Upper right

Marker Trace	Yes
Corresponding Trace	Phase Error trace (n=4)

EVM Graph

This graph appears in the following View:

View	Size	Position
I/Q Error	Half, half width	Lower left

Marker Trace	Yes
Corresponding Trace	EVM trace (n=2)

Small-sized Metrics

This window appears in the following View. The contents are the same as those in the"Metrics" on page 713 window.

View	Size	Position
I/Q Error	Half, half width	Lower right

3.6.3 Amplitude

Activates the **Amplitude** menu and selects **Reference Level** or **Reference Value** as the active function, depending on the measurement.

Some features in this menu apply to multiple measurements. Some other features apply only to specific measurements and their controls are blanked or grayed-out in measurements that do not support the feature.

3.6.3.1 Y Scale

The Y Scale Tab contains controls that pertain to the Y axis parameters of the measurement. These parameters control how data on the vertical (Y) axis is displayed and control instrument settings that affect the vertical axis.

Ref Value

Sets the absolute power reference value in the Mag Error, Phase Error and EVM windows. The functionality depends on the selected window. The reference line is at the top, center, or bottom of the graticule, depending on the value of the Ref Position function.

Remote Command	`:DISPlay:EVMQpsk:WINDow3|4|5:TRACe:Y[:SCALe]:RLEVel <real>`
	`:DISPlay:EVMQpsk:WINDow3|4|5:TRACe:Y[:SCALe]:RLEVel?`
	Window numbers are as follows:
	– Mag Error: 3
	– Phase Error: 4
	– EVM: 5

Example	3-Mag Error
	`:DISP:EVMQ:WIND3:TRAC:Y:RLEV 0`
	4-Phase Error
	`:DISP:EVMQ:WIND4:TRAC:Y:RLEV 0`
	5-EVM
	`:DISP:EVMQ:WIND5:TRAC:Y:RLEV 0`

Couplings	When Auto Scaling is On (default), this value is automatically determined by the measurement result. When you set a value manually, Auto Scaling changes to Off
Preset	0.0
State Saved	Yes
Min/Max	3-Mag Error: -500 % / 500 % 4-Phase Error: -36000 deg / 36000 deg 5-EVM: -500 % / 500 %

Backwards Compatibility SCPI

Window Numbers used to be a combination of View and Window, now only Window number is sent. For backwards compatibility the old View and Window numbers are honored as below:

Window	Old SCPI Command	New SCPI Command
Mag Error	`DISP: EVMQ:VIEW2:WIND:TRAC:Y:RLEV 0.0`	`DISP: EVMQ:WIND3:TRAC:Y:RLEV 0.0`
Phase Error	`DISP: EVMQ:VIEW2:WIND2:TRAC:Y:RLEV 0.0`	`DISP: EVMQ:WIND4:TRAC:Y:RLEV 0.0`
EVM	`DISP: EVMQ:VIEW2:WIND3:TRAC:Y:RLEV 0.0`	`DISP: EVMQ:WIND5:TRAC:Y:RLEV 0.0`

Scale/Div

Sets the units per division of vertical scale in the logarithmic display. However, since the Auto Scaling is defaulted to On, this value is automatically determined by the measurement result. When you set a value manually, Auto Scaling automatically changes to Off.

Remote Command	`:DISPlay:EVMQpsk:WINDow3|4|5:TRACe:Y[:SCALe]:PDIVision <real>`
	`:DISPlay:EVMQpsk:WINDow3|4|5:TRACe:Y[:SCALe]:PDIVision?`
	– Window numbers are as follows:
	– Mag Error: 3
	– Phase Error: 4
	– EVM: 5

Example	3-Mag Error
	`:DISP:EVMQ:WIND3:TRAC:Y:PDIV 10.0`
	4-Phase Error
	`:DISP:EVMQ:WIND4:TRAC:Y:PDIV 10.0`
	5-EVM

	`:DISP:EVMQ:WIND5:TRAC:Y:PDIV 10.0`
Couplings	When the Auto Scaling is On, this value is automatically determined by the measurement result When the user sets a value manually, Auto Scaling automatically changes to Off
Preset	3-Mag Error: 1 4-Phase Error | 5-EVM: 0.5
State Saved	Yes
Min/Max	3-Mag Error | 5-EVM: 0.1/50 4-Phase Error: 0.1/360

Backwards Compatibility SCPI

Window Numbers used to be a combination of View and Window, now only Window number is sent. For backwards compatibility the old View and Window numbers are honored as below:

Window	Old SCPI Command	New SCPI Command
Mag Error	`DISP:EVMQ:VIEW2:WIND:TRAC:Y:PDIV 25`	`DISP:EVMQ:WIND3:TRAC:Y:PDIV 10.0`
Phase Error	`DISP:EVMQ:VIEW2:WIND2:TRAC:Y:PDIV 25`	`DISP:EVMQ:WIND4:TRAC:Y:PDIV 10.0`
EVM	`DISP:EVMQ:VIEW2:WIND3:TRAC:Y:PDIV 20`	`DISP:EVMQ:WIND5:TRAC:Y:PDIV 10.0`

Ref Position

Positions the Y-axis scale reference level at the top, center or bottom of the display. Changing the reference position does not change the reference level value. This function can be used for all three QPSK EVM measurement results graphs.

Remote Command	`:DISPlay:EVMQpsk:WINDow3|4|5:TRACe:Y[:SCALe]:RPOSition TOP | CENTer | BOTTom`
	`:DISPlay:EVMQpsk:WINDow3|4|5:TRACe:Y[:SCALe]:RPOSition?`
	Window numbers are as follows:
	– Mag Error: 3
	– Phase Error: 4
	– EVM: 5

Example	3-Mag Error `:DISP:EVMQ:WIND3:TRAC:Y:RPOS TOP` 4-Phase Error

	:DISP:EVMQ:WIND4:TRAC:Y:RPOS TOP 5-EVM :DISP:EVMQ:WIND5:TRAC:Y:RPOS TOP
Notes	When Auto Scaling is On and this parameter is changed, Ref Value changes to adjust the trace to one that is most suitable for the window
Preset	3-Mag Error | 4-Phase Error: CENTer 5-EVM: BOTTom
State Saved	Yes
Range	TOP|CENTer|BOTTom

Backwards Compatibility SCPI

Window Numbers used to be a combination of View and Window, now only Window number is sent. For backwards compatibility the old View and Window numbers are honored as below:

Window	Old SCPI Command	New SCPI Command
Mag Error	DISP:EVMQ:VIEW2:WIND:TRAC:Y:RPOS TOP	DISP:EVMQ:WIND3:TRAC:Y:RPOS TOP
Phase Error	DISP:EVMQ:VIEW2:WIND2:TRAC:Y:RPOS TOP	DISP:EVMQ:WIND4:TRAC:Y:RPOS TOP
EVM	DISP:EVMQ:VIEW2:WIND3:TRAC:Y:RPOS TOP	DISP:EVMQ:WIND5:TRAC:Y:RPOS TOP

Auto Scaling

Toggles the Auto Scaling function between On and Off. Upon pressing the Restart front-panel key, this function automatically determines the scale per division and reference values based on the measurement results.

Remote Command	:DISPlay:EVMQpsk:WINDow3|4|5:TRACe:Y[:SCALe]:COUPle 0 | 1 | OFF | ON :DISPlay:EVMQpsk:WINDow3|4|5:TRACe:Y[:SCALe]:COUPle? Window numbers are as follows: – Mag Error: 3 – Phase Error: 4 – EVM: 5
Example	3-Mag Error :DISP:EVMQ:WIND3:TRAC:Y:COUP ON 4-Phase Error :DISP:EVMQ:WIND4:TRAC:Y:COUP ON

	5-EVM :DISP:EVMQ:WIND5:TRAC:Y:COUP ON
Notes	When Auto Scaling is On and the Restart front-panel key is pressed, this function automatically determines the scale per division and reference values based on the measurement results When you set a value to either Scale/Div or Ref Value manually, Auto Scaling automatically changes to Off
Preset	ON
State Saved	Yes
Range	OFF|ON

Backwards Compatibility SCPI

Window Numbers used to be a combination of View and Window, now only Window number is sent. For backwards compatibility the old View and Window numbers are honored as below:

Window	Old SCPI Command	New SCPI Command
Mag Error	DISP:EVMQ:VIEW2:WIND:TRAC:Y:COUP ON	DISP:EVMQ:WIND3:TRAC:Y:COUP ON
Phase Error	DISP:EVMQ:VIEW2:WIND2:TRAC:Y:COUP ON	DISP:EVMQ:WIND4:TRAC:Y:COUP ON
EVM	DISP:EVMQ:VIEW2:WIND3:TRAC:Y:COUP ON	DISP:EVMQ:WIND5:TRAC:Y:COUP ON

3.6.3.2 Attenuation

Controls the attenuator functions and interactions between the attenuation system components.

There are two attenuator configurations in the X-Series. One is a Dual-Attenuator configuration consisting of a mechanical attenuator and an optional electronic attenuator. The other configuration uses a single attenuator with combined mechanical and electronic sections thatcontrols all the attenuation functions. Different models in the X-Series come with different configurations.

– See "Dual-Attenuator Configurations" on page 720

– See "Single-Attenuator Configuration" on page 721

Most attenuation settings are the same for all measurements – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by Meas Preset.

This tab is only available when the hardware set includes an input attenuator, which is typically only the case when using Keysight’s box instruments. For example, this tab does not appear in:

– VXT models M9420A/21A/10A/11A

– E7760

– M9391A

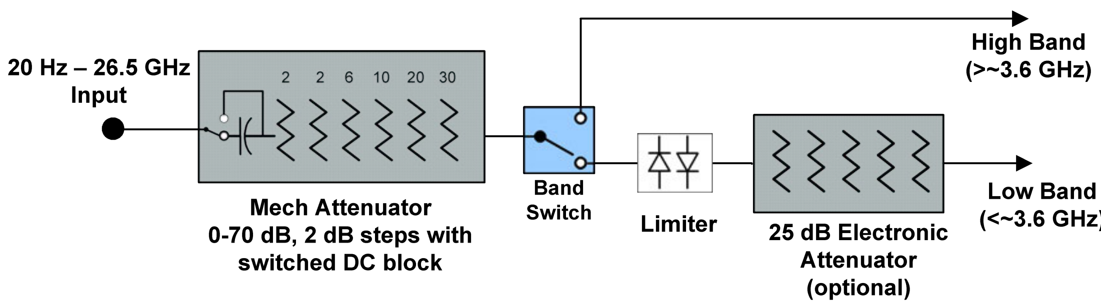
– M9393A

This tab also does not appear in UXM. In UXM all Attenuation and Range settings are disabled, as the expected input power level is handled by the Call Processing App that drives the DUT power control.

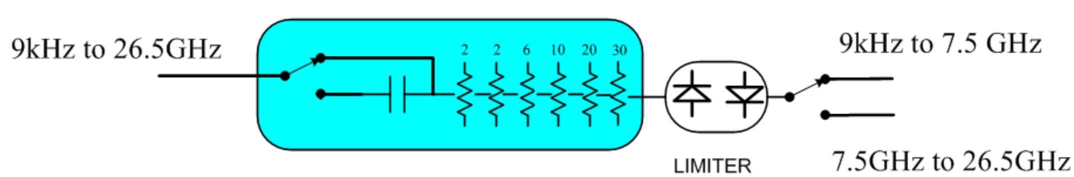
Dependencies	In measurements that support the I/Q inputs, this tab is unavailable when I/Q is the selected input, and is replaced by the Range tab in that case

Dual-Attenuator Configurations

Configuration 1: Mechanical attenuator + optional electronic attenuator

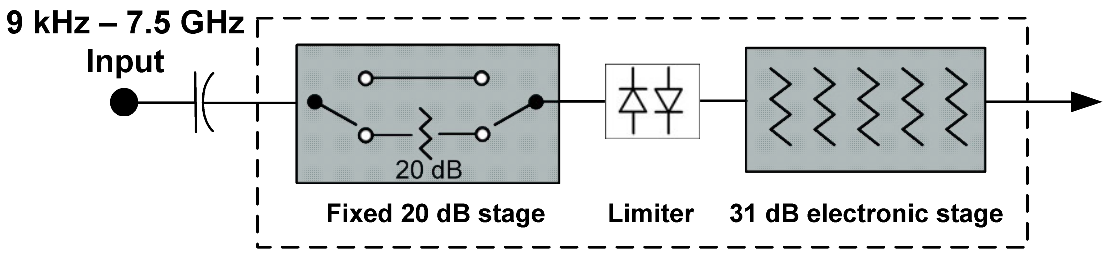


Configuration 2: Mechanical attenuator, no optional electronic attenuator



(note that Configuration 2 is not strictly speaking a dual-section attenuator, since there is no electronic section available. However, it behaves exactly like Configuration 1 without the Electronic Attenuator option EA3, therefore for the sake of this document it is grouped into the “Dual-Attenuator” configuration)

Single-Attenuator Configuration



You can tell which attenuator configuration you have by pressing the Attenuation tab, which (in most Modes) opensthe Attenuation menu. If the first control in the Attenuation menu says **Mech Atten** you have the Dual-Attenuator configuration. If the first control says **Atten** you have the Single-Attenuator configuration.

(Note that depending on the measurement, there may be no Auto/Man functionality on the Mech Atten control).

In the Single-Attenuator configuration, youcontrol the attenuation with a single control, as the fixed stage has only two states. In the Dual-Attenuator configuration, both stages have significant range so you are given separate control of the mechanical and electronic attenuator stages.

When you have the Dual-Attenuator configuration, you may still have only a Single-Attenuator, because unless option EA3 (the Electronic Attenuator option) is available, and you purchase it, you will have only the mechanical attenuator.

Full Range Atten

The **Full Range Atten** control and **Attenuator Summary** only appear in N9041B, when the RF input is selected and the RF Input Port is set to RF Input 2, and the Full Range Attenuator is installed. The Full Range Attenuator adds a second input attenuator at the beginning of the RF Input 2, which enhances the protection and optimizes the performance of the extra internal mixers used by RF Input 2.

Remote Command	`[:SENSe]:POWer[:RF]:FRATten <rel_ampl>` `[:SENSe]:POWer[:RF]:FRATten?`
Example	`:POW:FRAT 14` `:POW:FRAT?`
Notes	When you enter an amplitude value that falls between valid values, the value will be incremented to the

	next smallest valid value
Dependencies	Only appears if input RF is selected, and RF Input Port 2 is selected, and the Full Range Attenuator exists
Couplings	This value is never changed by any coupling, however other couplings use this value. See the **Reference Level** and "Mech Atten" on page 1750 command descriptions
Preset	20 dB
State Saved	Saved in instrument state
Min	0 dB
Max	Only valid values are 0, 6, 14, 20 dB
Annotation	When the Input is RF, and the Input Port is RF Input 2, and the Full Range Attenuator is installed: On the Meas Bar, the field “Atten” displays as follows: – If the sweep is entirely < 50 GHz, the value shown after “Atten:” is equal to Mech Atten + Elec Atten + Full Range Atten – If the sweep is entirely > 50 GHz, the value shown after “Atten:” is equal to Full Range Atten – If the sweep straddles 50 GHz, the value shown after “Atten:” is preceded by the symbol “>=” and is equal to Full Range Atten In the **Amplitude**, "Attenuation" on page 1747 menu, and the Atten Meas Bar dropdown menu panel, a summary is displayed as follows: “Total Atten below 50 GHz” followed by the value of Full Range Atten + Mech Atten + Elec Atten “Total Atten above 50 GHz” followed by the value of Full Range Atten For example, if Mech Atten = 6 dB, Elec Atten = 4 dB, and Full Range Atten = 20 dB, the summary below is shown: – Attenuator summary: – Total Atten below 50 GHz: 30 dB – Total Atten above 50 GHz: 20 dB

Mech Atten

This control is labeled **Mech Atten** in Dual-Attenuator models and **Atten** in Single-Attenuator models. In the Dual-Attenuator configuration, this control only affects the mechanical attenuator.

This control lets you modify the attenuation applied to the RF input signal path. This value is normally auto coupled to the Ref Level, the Internal Preamp Gain, any External Gain that is entered, and the Max Mixer Level, as described in the table below.

See "Attenuator Configurations and Auto/Man" on page 724

Remote Command	`[:SENSe]:POWer[:RF]:ATTenuation <rel_ampl>` `[:SENSe]:POWer[:RF]:ATTenuation?`

	`[:SENSe]:POWer[:RF]:ATTenuation:AUTO OFF | ON | 0 | 1` `[:SENSe]:POWer[:RF]:ATTenuation:AUTO?`

Example	`:POW:ATT 20`
	Dual-Attenuator configuration: sets the mechanical attenuator to 20 dB
	Single-Attenuator mode: sets the main attenuation to 20 dB (see below for definition of “main” attenuation)
	In either case, if the attenuator was in Auto, it is set to Manual
	`:POW:ATT:AUTO ON`
	Turn Auto Mech Atten ON

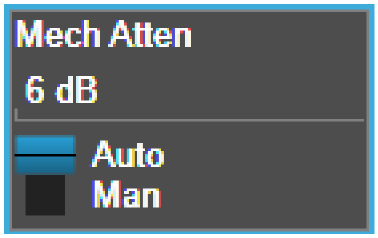
Dependencies	Some measurements do not support the Auto setting of "Mech Atten" on page 722. In these measurements, the Auto/Man selection is not available, and the Auto/Man toggle function is not available In Dual-Attenuator configurations, when the electronic attenuator is enabled, the mechanical attenuator has no auto setting and the Auto/Man toggle function is not available. The state of Auto/Man is remembered and restored when the electronic attenuator is once again disabled. This is described in more detail in "Elec Atten" on page 1753 See "Attenuator Configurations and Auto/Man" on page 724 for more information on the Auto/Man functionality `:POW:ATT:AUTO` is only available in measurements that support Mech Atten Auto, such as Swept SA
Couplings	If the RF Input Port is the RF Input: – If the USB Preamp is connected to USB, use 0 dB for Mech Atten – Otherwise compute the auto-selected value of Mech Atten based on **Reference Level**, Int Preamp, External Gain, Ref Level Offset, Max Mixer Level, µW Path Control and IF Gain settings. Limit this value to be no less than 6 dB (total attenuation below 6 dB can never be chosen by Auto) – In the N9041B, if the RF Input Port is RF Input 2, use the formula above and subtract the Full Range Atten value from the result to determine the Mech Atten. Limit the value so that it is never lower than 0 dB and so that total attenuation, including Full Range Atten, is never less than 6 dB (total attenuation, including Full Range Atten below 6 dB, can never be chosen by Auto) In External Mixingand BBIQ, where the Attenuator is not in the signal path, the Attenuator setting changes as described above when "Mech Atten" on page 722 is in Auto, but no changes are made to the actual attenuator hardware setting until the input is changed back to the RF Input For CXA-m with option FSA (Fine-Step Attenuator or 2 dB steps), the FSA-like behavior is only available when the frequency setting is <= 7.5GHz. So, when the frequency is changed from below 7.5GHz to above 7.5GHz, the attenuation setting will be changed to a multiple of 10dB which will be no smaller than the previous setting. For example, 4dB attenuation will be changed to 10dB
Preset	The preset for Mech Attenuation is “Auto” The Auto value of attenuation is 10 dB ON
State Saved	Saved in instrument state
Min	0 dB The attenuation set by this control cannot be decreased below 6 dB with the knob or step keys. Values below 6 dB must be directly entered from the keypad or via SCPI. This protects against setting a

	dangerously small attenuation value, which can put the instrument at risk of damage to input circuitry. If the current mechanical attenuation is below 6 dB, it can be increased with the knob and step keys, but not decreased
Max	CXA Option 503 or 507: 50 dB EXA: 60 dB All other models: 70 dB Note that in the Single-Attenuator configuration, the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB.
Annotation	The current value for Total Atten is displayed in the Measurement Bar at the top of the display. A value appears for Electronic Attenuation only if the Electronic Attenuator is enabled. The annotation appears as Atten: <total> dB (e<elec>) The e letter is in amber in Single-Attenuator configurations For example: Dual-Attenuator configuration: Atten: 24 dB (e14) Indicating the total attenuation is at 24 dB and the electronic attenuation is at 14 dB Single-Attenuator configuration: A: 24 dB (e14) Indicating the total attenuation is at 24 dB and the “soft” attenuation is at 14 dB (see below for definition of “soft” attenuation) When in Manual, a # sign appears in front of Atten in the annotation

Attenuator Configurations and Auto/Man

As described in "Attenuation" on page 1747 , there are two distinct attenuator configurations available in the X-Series, the single attenuator and Dual-Attenuator configurations. In Dual-Attenuator configurations, we have the mechanical attenuation and the electronic attenuation, and the current total attenuation is the sum of the electronic + mechanical attenuation. In Single-Attenuator configurations, we refer to the attenuation set using "Mech Atten" on page 722 (or `:POW:ATT`) as the “main” attenuation; and the attenuation that is set by `:POW:EATT` as the “soft” attenuation (`:POW:EATT` is honored even in the Single-Attenuator configuration, for compatibility purposes). Then the current total attenuation is the sum of the main + soft attenuation. See "Elec Atten" on page 1753 for more on “soft” attenuation.

NOTE	In some measurements, the **Mech Atten** control has an Auto/Man function. In these measurements, an Auto/Man switch is shown on the **Mech Atten** control:



Note that in configurations that include an Electronic Attenuator, this switch is only shown when the Electronic Attenuator is disabled.

In other measurements, **Mech Atten** has no Auto/Man function. In these measurements, no switch is shown on the **Mech Atten** control:

Mech Atten also appears with no switch, as above, in configurations that include an Electronic Attenuator but when the Electronic Attenuator is enabled.

Elec Atten

Controls the Electronic Attenuator in Dual-Attenuator configurations. This control does not appear in Single-Attenuator configurations, as the control of both the mechanical and electronic stages of the Single-Attenuator is integrated into the single **Atten** control.

This control includes an Enable/Disable toggle switch; it is only possible to enter a value for the Electronic Attenuator when this switch is in the “Enable” position.

See "More Information" on page 726

Remote Command	`[:SENSe]:POWer[:RF]:EATTenuation <rel_ampl>`
	`[:SENSe]:POWer[:RF]:EATTenuation?`
	`[:SENSe]:POWer[:RF]:EATTenuation:STATe OFF | ON | 0 | 1`
	`[:SENSe]:POWer[:RF]:EATTenuation:STATe?`

Example	`:POW:EATT 10`
	`:POW:EATT?`
	`:POW:EATT:STAT ON`
	`:POW:EATT:STAT?`

Notes	Electronic Attenuation’s specification is defined only when Mechanical Attenuation is 6 dB
Dependencies	This control only appears in Dual-Attenuator models with an Electronic Attenuator installed and licensed. It does not appear in models with the Single-Attenuator configuration, as in the Single-Attenuator configuration there is no “electronic attenuator” there is only a single integrated attenuator

	(which has both a mechanical and electronic stage). However, in the Single-Attenuator configuration, EATT SCPI commands are accepted for compatibility with other X-series instruments and set a “soft” attenuation as described in . The “soft” attenuation is treated as an addition to the “main” attenuation value set by the Atten control or the POW:ATT SCPI command and affects the total attenuation displayed on the Atten control and the Meas Bar The electronic attenuator (and the “soft” attenuation function provided in Single-Attenuator configurations) is unavailable above the low band (0-3.6 GHz, 0-3.4 GHz 0-3GHz, depending on the model). If the low band ranges from 0-3.6GHz, and Stop Frequency of the instrument is > 3.6 GHz, then the **Enabled/Disabled** section of the **Elec Atten** control will be OFF and grayed out If the Internal Preamp is on, meaning it is set to Low Band or Full, the electronic attenuator (and the “soft” attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the **Enabled/Disabled** section of the **Elec Atten** control will be OFF and grayed out If either of the above is true, if the SCPI command is sent, an error indicating that the electronic attenuator is unavailable will be sent If both of the above are true, pressing the control will generate error message -221, in other words, the frequency range lockout takes precedence If the electronic/soft Attenuator is enabled, then the Stop Freq of the instrument is limited to 3.6 GHz and the Internal Preamp is unavailable The SCPI-only “soft” electronic attenuation for the single-attenuator configuration is not available in all measurements; in particular, it is not available in the Swept SA measurement
Couplings	Enabling and disabling the Electronic Attenuator affects the setting of the Mechanical Attenuator (in Dual-Attenuator configurations). This is described in more detail below and in the section "Attenuator Configurations and Auto/Man" on page 1752
Preset	OFF (Disabled) for Swept SA measurement ON (Enabled) for all other measurements that support the electronic attenuator
State Saved	Saved in instrument state
Min	0 dB
Max	Dual-Attenuator configuration: 24 dB Single-Attenuator configuration: the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB
Annotation	See Annotation under the **Mech Atten** control description

More Information

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear. These advantages primarily aid in remote operation and are negligible for front panel use. See "Using the Electronic Attenuator: Pros and Cons" on page 727 for a detailed discussion of the pros and cons of using the electronic attenuator.

For the Single-Attenuator configuration, for SCPI backwards compatibility, the “soft” attenuation feature replaces the Dual-Attenuator configuration’s electronic attenuator. All the same couplings and limitations apply. See "Attenuator Configurations and Auto/Man" on page 1752

Mechanical Attenuator Transition Rules

When the Electronic Attenuator is enabled, the Mechanical Attenuator transitions to a state that has no Auto function. Below are the rules for transitioning the Mechanical Attenuator. Note that the information below ONLY applies to the Dual-Attenuator configurations, and ONLY when the Electronic Attenuator is installed:

When the Electronic Attenuation is enabled from a disabled state:

The Mechanical Attenuator is initialized to 10 dB (this is its optimal performance setting). You can then set it as desired with SCPI, numeric keypad, step keys, or knob, and it behaves as it normally would in manual mode

The Auto/Man state of (Mech) Atten is saved

The Auto/Man toggle on the (Mech) Atten control disappears and the auto rules are disabled

The Electronic Attenuator is set to 10 dB less than the previous value of the Mechanical Attenuator, within the limitation that it must stay within the range of 0 to 24 dB of attenuation

Examples in the Dual-Attenuator configuration:

Mech Atten at 20 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 10 dB. New total attenuation equals the value before Elec Atten enabled

Mech Atten at 0 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 0 dB. New total attenuation does not equal the value before Elec Atten enabled

Mech Atten at 40 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 24 dB. New total attenuation does not equal the value before Elec Atten enabled

When the Electronic Attenuation is disabled from an enabled state:

The Elec Atten control is grayed out

- The Auto/Man state of (Mech) Atten is restored

If now in Auto, (Mech) Atten recouples

If now in Man, (Mech) Atten is set to the value of total attenuation that existed before the Elec Atten was disabled. The resulting value is rounded up to the smallest value possible given the (Mech) Atten Step setting - (That is, 57 dB changes to 58 dB when (Mech) Atten Step is 2 dB)

Using the Electronic Attenuator: Pros and Cons

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear.

The “finer steps” advantage of the electronic attenuator is beneficial in optimizing the alignment of the instrument dynamic range to the signal power in the front panel as well as remote use. Thus, you can achieve improved relative signal measurement accuracy. Compared to a mechanical attenuator with 2 dB steps, the 1 dB resolution

of the electronic attenuator only gives better resolution when the odd-decibel steps are used. Those odd-decibel steps are less accurately calibrated than the even-decibel steps, so one tradeoff for this superior relative accuracy is reduced absolute amplitude accuracy.

Another disadvantage of the electronic attenuator is that the spectrum analyzer loses its “Auto” setting, making operation less convenient.

Also, the relationship between the dynamic range specifications (TOI, SHI, compression, and noise) and instrument performance are less well-known with the electrical attenuator. With the mechanical attenuator, TOI, SHI, and compression threshold levels increase dB-for-dB with increasing attenuation, and the noise floor does as well. With the electronic attenuator, there is an excess attenuation of about 1 to 3 dB between 0 and 3.6 GHz, making the effective TOI, SHI, and so forth, less well known. Excess attenuation is the actual attenuation relative to stated attenuation. Excess attenuation is accounted for in the instrument calibration

Adjust Atten for Min Clipping

Sets the combination of mechanical and electronic attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an "immediate action" function, that is, it executes once, when the control is pressed.

The algorithms that are used for the adjustment are documented under "Pre-Adjust for Min Clipping" on page 1757.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMediate`
Example	`:POW:RANG:OPT IMM`
Notes	Executing Adjust Atten for Min Clipping initiates the measurement.
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements For the Waveform measurement, this control is available only in 5G NR Mode

Adjust Atten

Allows you to select;

– Electric attenuator only

– Combination of Electric attenuator and Mechanical attenuator

when the command `[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMediate` is executed.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE EONLy | COMBined` `[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE?`

Example	`:POW:RANG:OPT:TYPE EONL` `:POW:RANG:OPT:TYPE?`
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements For the Waveform measurement, this control is available only in 5G NR Mode
Preset	`COMBined`
State Saved	Saved in instrument state

Pre-Adjust for Min Clipping

If this function is `ON`, it applies the adjustment described under "Adjust Atten for Min Clipping" on page 1756 each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

In Dual-Attenuator models, you can set **Elec+Mech Atten**, in which case both attenuators participate in the autoranging, or **Elec Atten Only**, in which case the mechanical attenuator does not participate in the autoranging. This latter case results in less wear on the mechanical attenuator and is usually faster.

See "Adjustment Algorithm" on page 730

Selection	Example	Note
Off	`:POW:RANGe:OPT:ATT OFF`	This is the default setting
Elec Atten Only	`:POW:RANGe:OPT:ATT ELEC`	Selects only the electric attenuator to participate in auto ranging. This offers less wear on the mechanical attenuator and is usually faster
Mech + Elec Atten	`:POW:RANGe:OPT:ATT COMB`	In Dual-Attenuator models, this selects both attenuators to participate in the autoranging

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF | ON | ELECtrical | COMBined` `[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?`
Example	`:POW:RANG:OPT:ATT OFF` `:POW:RANG:OPT:ATT?`
Notes	The parameter option `ELECtrical` sets this function to `ON` in Single-Attenuator models The parameter option `COMBined` is mapped to `ELECtrical` in Single-Attenuator models. If you send `COMBined`, it sets the function to `ON` and returns `ELEC` to a query For SCPI compatibility with models that do not have an input attenuator, the `ON` parameter is honored and mapped to `COMBined`
Dependencies	This control only appears in Dual-Attenuator models with an Electronic Attenuator installed In instruments with Dual-Attenuator model, when **Enable** "Elec Atten" on page 1753 is `OFF` or grayed-out, "Pre-Adjust for Min Clipping" on page 729 is grayed-out This control does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum

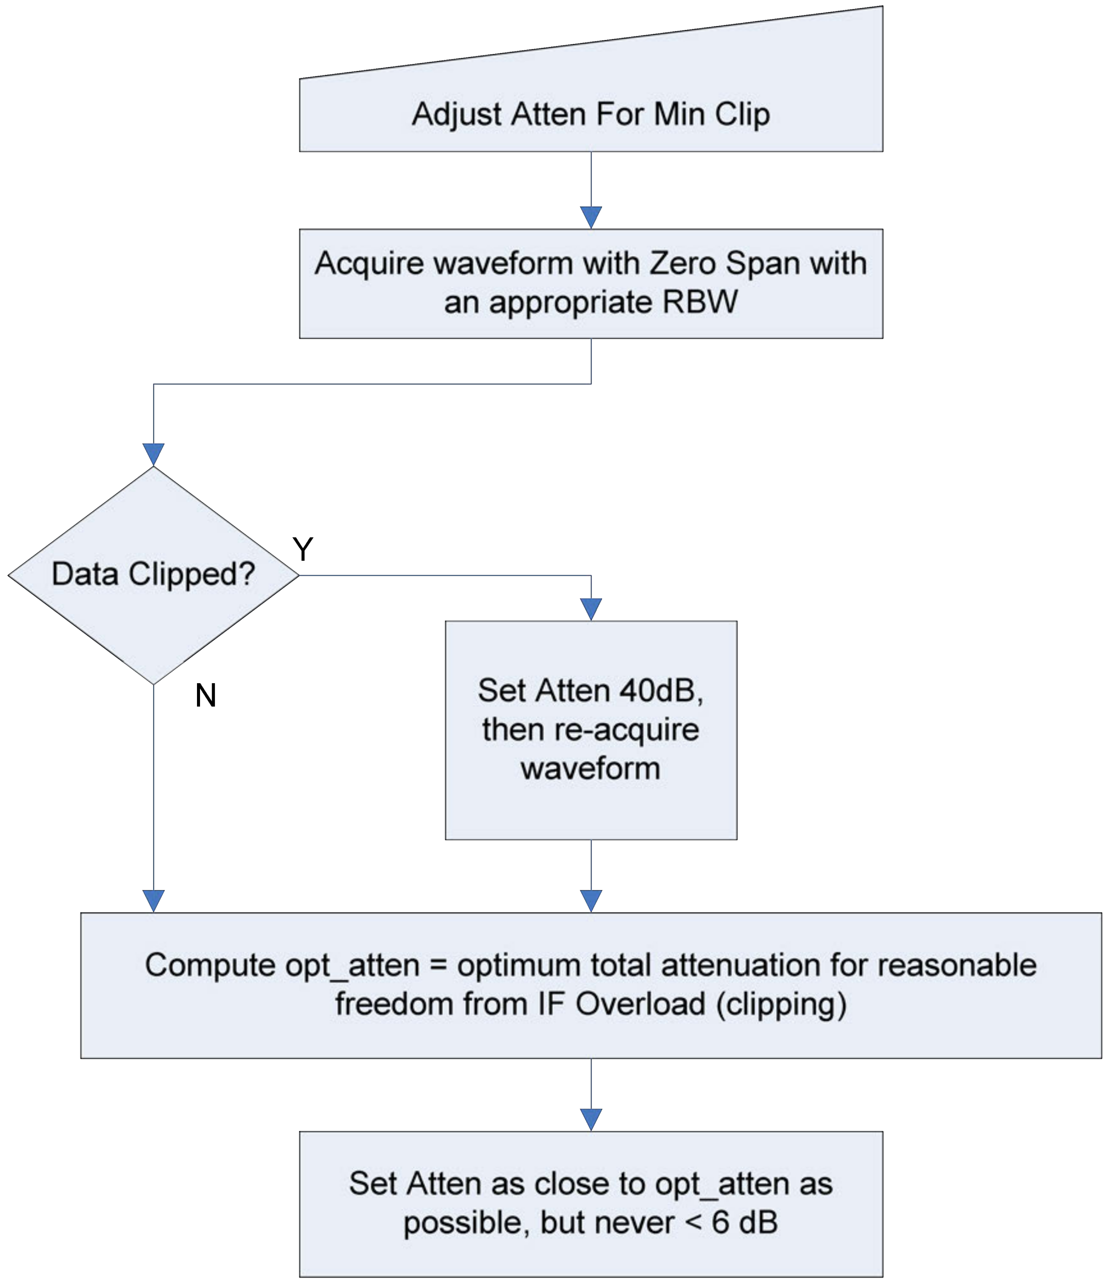
	measurements For the Waveform measurement, this control is available only in 5G NR Mode
Preset	`OFF` when Elec Atten is Disabled at preset, otherwise `ELEC`
State Saved	Saved in instrument state
Range	Dual-Attenuator models: Off | Elec Atten Only | Mech + Elec Atten Single-Attenuator models: Off | On

Notes	`ON` aliases to "Elec Atten Only" (`:POW:RANG:OPT:ATT ELEC`) `OFF` aliases to "Off" (`:POW:RANG:OPT:ATT OFF`) `:POW:RANG:AUTO?` returns true if `:POW:RANG:OPT:ATT` is not `OFF`
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:RANGe:AUTO ON | OFF | 1 | 0` `[:SENSe]:POWer[:RF]:RANGe:AUTO?`

Adjustment Algorithm

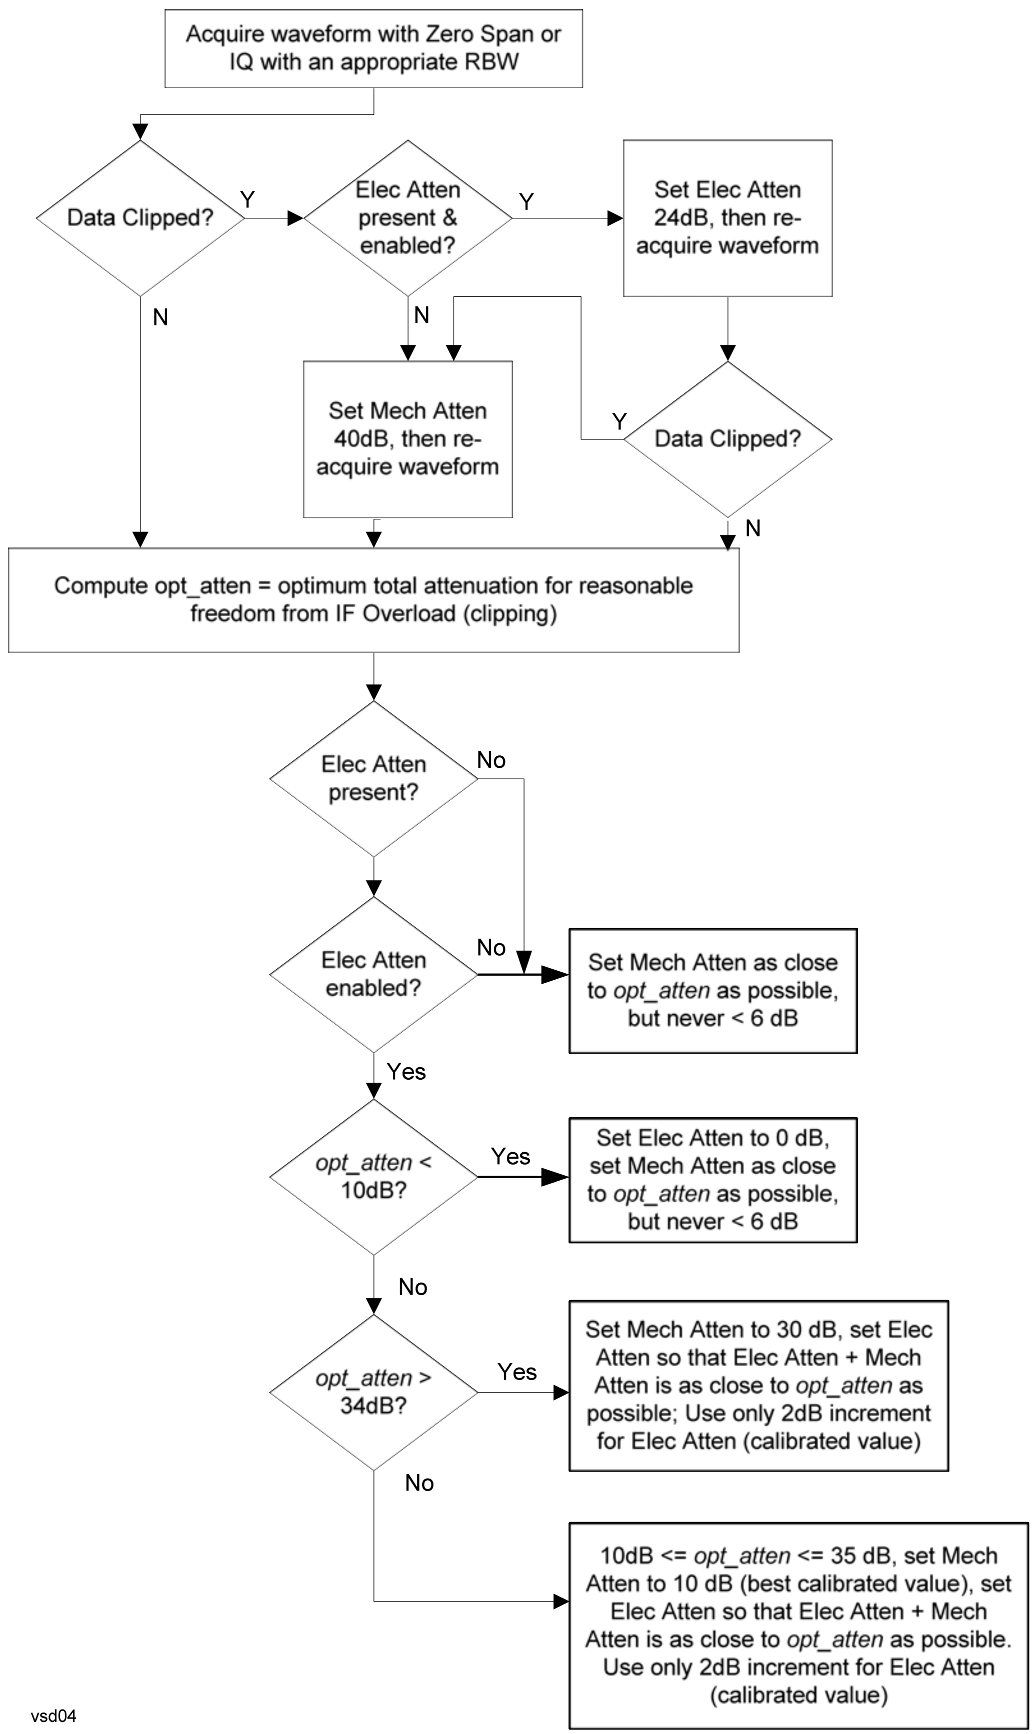
The algorithms for the adjustment are documented below:

Single-Attenuator Models



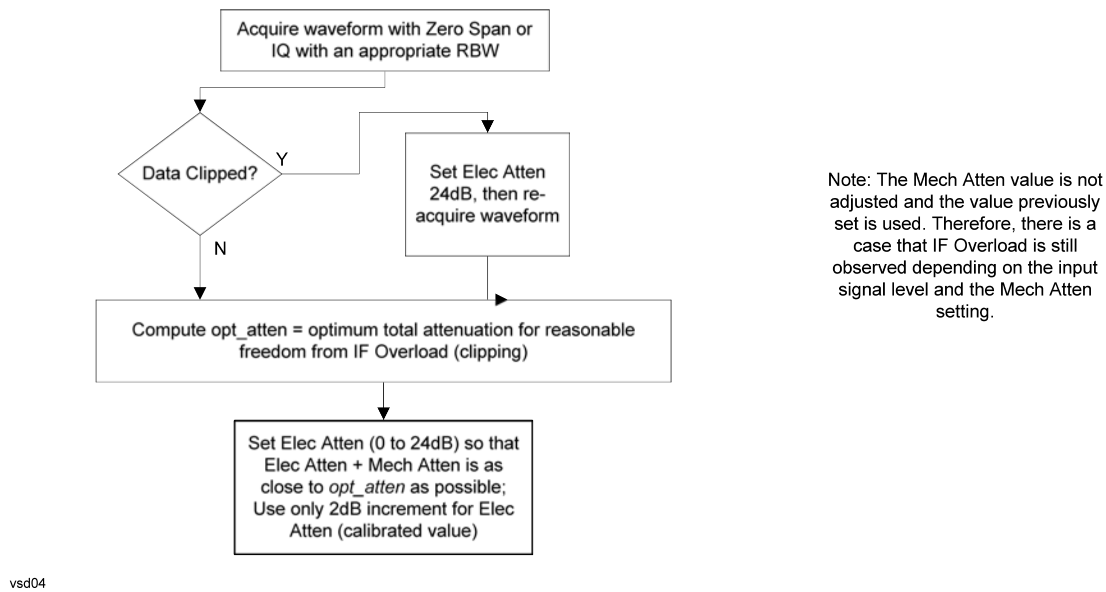
Dual-Attenuator models

"Adjust Atten for Min Clipping" on page 1756 or "Pre-Adjust for Min Clipping" on page 729 selection is Mech + Elec Atten:



Acquire waveform with Zero Span or IQ with an appropriate RBW
Data Clipped?
Y
N
Elec Atten present & enabled?
Y
N
Set Elec Atten 24dB, then re-acquire waveform
Set Mech Atten 40dB, then re-acquire waveform
Y
Data Clipped?
N
Compute opt_atten = optimum total attenuation for reasonable freedom from IF Overload (clipping)
Elec Atten present?
No
Elec Atten enabled?
No
Set Mech Atten as close to *opt_atten* as possible, but never < 6 dB
Yes
opt_atten < 10dB?
Yes
Set Elec Atten to 0 dB, set Mech Atten as close to *opt_atten* as possible, but never < 6 dB
No
opt_atten > 34dB?
Yes
Set Mech Atten to 30 dB, set Elec Atten so that Elec Atten + Mech Atten is as close to *opt_atten* as possible; Use only 2dB increment for Elec Atten (calibrated value)
No
10dB <= *opt_atten* <= 35 dB, set Mech Atten to 10 dB (best calibrated value), set Elec Atten so that Elec Atten + Mech Atten is as close to *opt_atten* as possible. Use only 2dB increment for Elec Atten (calibrated value)
vsd04

"Pre-Adjust for Min Clipping" on page 729 selection is Elec Only:



Mech Atten Step

Controls thestep size used when making adjustments to the input attenuation.

This control is labeled **Mech Atten Step** in Dual-Attenuator models and **Atten Step** in Single-Attenuator models. In the Dual-Attenuator configuration, this control only affects the step size of the mechanical attenuator.

Remote Command	`[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement] 10 dB | 2 dB` `[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement]?`
Example	`:POW:ATT:STEP 2` `:POW:ATT:STEP?`
Notes	This feature has a toggle choice from the front panel, but it takes a specific value (in dB) when used remotely. The only valid values are 2 and 10
Dependencies	Blanked in EXA, CXA and CXA-m if option FSA (2 dB steps) is not present. If blanked, attempts to set it via SCPI yield an error
Couplings	When the attenuation step size changes, the current mechanical attenuation value is adjusted (if necessary) to be quantized to the new step size. That is, if step is set to 10 dB, mech atten is increased if necessary so it is a multiple of 10 dB
Preset	EXA, CXA and CXA-m: 10 dB (2 dB with option FSA) All other models: 2 dB
State Saved	Saved in instrument state

Max Mixer Level

Allows you to set the maximum level to be applied to the mixer for a signal at the top of the screen. By setting this value up or down you can allow more or less signal through the system.

The major impact of changes to **Max Mixer Level** is seen in changes to the value to which **Reference Level** is limited. Max Ref Level depends on Max Mixer Level and Attenuation, and therefore a higher Max Mixer Level may let you set Ref Level higher. However, changing this value can impact your TOI, compression, or dynamic range. The preset value of this function is best for most measurements.

See also "Max Mixer Lvl Rules" on page 1762.

Remote Command	`[:SENSe]:POWer[:RF]:MIXer:RANGe[:UPPer] <real>` `[:SENSe]:POWer[:RF]:MIXer:RANGe[:UPPer]?`
Example	`:POW:MIX:RANG -15 dBm` `:POW:MIX:RANG?`
Dependencies	Only appears in Swept SA and RTSA measurements
Preset	-10 dBm
State Saved	Saved in instrument state
Min	-50 dBm
Max	0 dBm

Max Mixer Lvl Rules

Allows you to optimize the Max Mixer Level setting for certain kinds of measurements.

- `NORMal` – The historical, and thus backwards compatible, setting range (–50 to 0 dBm) and default setting (–10 dBm). The instrument has been designed so that, at the default setting, any signal below the **Reference Level** is extremely unlikely to create ADC overloads. At this mixer level the scale fidelity will be within specifications, thus compression with be negligible.
- `TOI` – Allows a range of settings of the "Max Mixer Level" on page 1762, –50 to –10 dBm, that can be optimum for measurements limited by the instrument third-order dynamic range. The default setting, –25 dBm, is commonly appropriate but RBW affects this. A good setting for Max Mixer Level would be higher than the optimum mixer level by half of the attenuator step size.
- `COMPression` – Allows a range of settings of the Max Mixer Level, –10 to +10 dBm or more, that can be optimum for measurements limited by the tradeoffs between instrument accuracy due to compression, and dynamic range due to the noise floor. The default setting, –3 dBm, is commonly appropriate, representing mixer drive levels that cause 1 dB or less compression at most carrier

frequencies. Typical measurements that would be optimized by this setting are the measurement of low sideband levels, including nulls, in angle-modulated signals (FM and PM). Also pulsed-RF measurements, including finding nulls to estimate pulse width, which are often best done with significant overdrive (compression) of the front end.

Setting Name (readback)	Setting Name (verbose)	Max Mixer Level Preset Value, dBm	Max Mixer Level minimum value, dBm	Max Mixer Level maximum value, dBm
NORMal	Normal – balance TOI, noise, and compression	–10	–50	0
TOI	TOI-limited dynamic range	–25	–50	–10
COMPression	Compression-limited dynamic range	–3	–10	+30

Remote Command	[:SENSe]:POWer[:RF]:MIXer:RULEs NORMal | TOI | COMPression [:SENSe]:POWer[:RF]:MIXer:RULEs?
Example	:POW:MIX:RULE:COMP
Dependencies	Only appears in Swept SA and RTSA
Preset	NORM

3.6.3.3 Range (Baseband Input models)

This tab is only available when Option BBA is present (I/Q Baseband Inputs), the current measurement supports option BBA, and I/Q is the selected input. It replaces the Attenuation tab in that case.

Each input channel (I and Q) has four internal gain ranges. The maximum allowed voltage in each gain range is slightly more than the nominal value, so the break point between ranges is a few millivolts higher than the nominal (setting a peak voltage of 0.502 mV will still map to the 0.5 V Peak range).

Gain Setting	Volts RMS	Volts Peak	Volts Peak - Peak	dBm (50Ω)	Break Point
0 dB	0.7071	1.0	2.0	10	n/a
6 dB	0.3536	0.5	1.0	4	0.502 V Peak
12 dB	0.1768	0.25	0.5	-2	0.252 V Peak
18 dB	0.0884	0.125	0.25	-8	0.127 V Peak

Dependencies	Available only when the selected input is I/Q. If the current measurement does not support baseband inputs, an error will be displayed: “No result; Meas invalid with I/Q inputs”

State Saved	No

Range Auto/Man

The Auto setting for Range causes the range to be set based on the Y Scale settings. When Range is "Auto", the I & Q Range are set based on the top of the Y Scale when the Y scale is in dB units (for example, power), or to the max(abs(top), abs(bottom)) when the Y scale reference is not at the top of the screen.

Not all measurements support **Range Auto/Man**. If Auto is not supported in the current measurement, this control is grayed-out displaying "Man", and `MAN` is returned to a SCPI query, but this does *not* change the Auto/Man setting for Range. When you switch to a measurement that supports Auto, it goes back to Auto if it was previously in Auto mode.

Remote Command	`[:SENSe]:VOLTage:IQ:RANGe:AUTO OFF | ON | 0 | 1` `[:SENSe]:VOLTage:IQ:RANGe:AUTO?`

Example	Put the I Range and Q Range in manual.
	`:VOLT:IQ:RANG:AUTO OFF`
	`:VOLT:IQ:RANG:AUTO?`

Dependencies	If Auto is not supported, sending the SCPI command generates an error
Couplings	When in Auto, both I Range and Q Range are set to the same value, computed as follows: Maximum absolute value is computed for the Y Scale. The top and bottom of the graph are computed based on Ref Value, Scale/Div, and Ref Position. Formula: Y_{Max} = max(abs(top), abs(bottom)) The I Range and Q Range are then set to Y_{Max}
Preset	`ON`
State Saved	Saved in instrument state
Annotation	When in Man, the Range annotation is preceded by "#"

This is an alternate form of the command to match the `POWer` form of the I Range and Q Range SCPI.

Remote Command	`[:SENSe]:POWer:IQ:RANGe:AUTO OFF | ON | 0 | 1` `[:SENSe]:POWer:IQ:RANGe:AUTO?`

Example	Put the I Range and Q Range in manual
	`:POW:IQ:RANG:AUTO OFF`
	`:POW:IQ:RANG:AUTO?`

Notes	`:POW:IQ:RANG:AUTO` is an alternate form of `:VOLT:IQ:RANG:AUTO`, to maintain consistency with I Range and Q Range, which support both the `POWer` and `VOLTage` forms of the command
Preset	`ON`
Range	Auto | Man

I Range

The internal gain range for the I channel when the Input Path is I Only or I and I/Q. Used for both the I and Q channels when the Input Path is I+jQ.

Remote Command	`[:SENSe]:VOLTage:IQ[:I]:RANGe[:UPPer] <voltage>` `[:SENSe]:VOLTage:IQ[:I]:RANGe[:UPPer]?`

Example	Set the I Range to 0.5 V Peak
	`:VOLT:IQ:RANG 0.5 V`
	`:VOLT:IQ:RANG?`

Notes	The numeric entries are mapped to the smallest gain range whose break point is greater than or equal to the value, or 1 V Peak if the value is greater than 1 V
Couplings	When "Q Same as I" on page 1580 is On, the **I Range** value will be copied to "Q Range" on page 1578 Changing the value also sets Range = Man
Preset	1 V Peak
State Saved	Saved in instrument state
Range	1 V Peak (10 dBm @ 50 Ω) | 0.5 V Peak (4 dBm @ 50Ω) | 0.25 V Peak (-2 dBm @ 50Ω) | 0.125 V Peak (-8 dBm @ 50Ω)
Min	0.125 V
Max	1 V
Annotation	The Range annotation replaces the RF Input context's "Atten" annotation "Rng: <I Range>". When Range = Man the annotation is preceded by "#" The I Range is not annotated in Input Path Q Only. When I Range and Q Range are the same, the annotation is "Rng: <Range>". When I Range and Q Range are different and the Input Path is Ind I/Q, the annotation is "Rng: <I Range>, <Q Range>" and "Peak" is removed from the text. Examples: "Rng: 1 V Peak" the I Range is 1 V Peak "Rng: 1 V, 0.5 V " the I Range is 1 V Peak and the Q Range is 0.5 V Peak

This is an alternate form of the command to allow entry as a power.

Remote Command	`[:SENSe]:POWer:IQ[:I]:RANGe[:UPPer] <ampl>` `[:SENSe]:POWer:IQ[:I]:RANGe[:UPPer]?`

Example	Set the I Range to 0.5 V Peak when Reference Z is 50 Ω, and to 1.0 V Peak when Reference Z is 75 **Ω**
	`:POW:IQ:RANG 4 dBm`
	`:POW:IQ:RANG?`

Notes	The `POWer` form of the command is provided for convenience. It maps to the same underlying gain range parameter as the `VOLTage` form of the command The Reference Z (not the I channel Input Z) is used to convert the power to peak voltage, which is then used to set the I Range as with the `VOLTage` form of the command. The power values of the 4 range states (1V Peak, 0.5V Peak, 0.25V Peak, and 0.125V Peak) will vary with Reference Z. Here are some examples: 50 Ω: 10, 4, -2, -8

	75 Ω: 8.2, 2.2, -3.8, -9.8 600 Ω: -0.8, -6.8, -12.8, -18.9
Preset	10.0 dBm
Range	-20 dBm to 10 dBm
Min	-20 dBm
Max	10 dBm

Q Range

The internal gain range for the Q channel.**Q Range** only applies to Input Path Q Only and Ind I/Q. For input I+jQ "I Range" on page 1577 determines both I and Q channel range settings.

Remote Command	`[:SENSe]:VOLTage:IQ:Q:RANGe[:UPPer] <voltage>` `[:SENSe]:VOLTage:IQ:Q:RANGe[:UPPer]?`

Example	Set the Q Range to 0.5 V Peak:
	`:VOLT:IQ:Q:RANG 0.5 V`
	`:VOLT:IQ:Q:RANG?`

Notes	The numeric entries are mapped to the smallest gain range whose break point is greater than or equal to the value, or 1 V Peak if the value is greater than 1 V **Q Range** is only used for Input Path Q Only and Ind I/Q. For input I+jQ, "I Range" on page 1577 determines both I and Q channel range settings
Couplings	When "Q Same as I" on page 1580 is On, the "I Range" on page 1577 value is copied to **Q Range** and the range value keys are disabled Changing the value also sets Range = Man
Preset	1 V Peak
State Saved	Saved in instrument state
Range	1 V Peak (10 dBm @ 50Ω) | 0.5 V Peak (4 dBm @ 50Ω) | 0.25 V Peak (-2 dBm @ 50Ω) | 0.125 V Peak (-8 dBm @ 50Ω)
Min	0.125 V
Max	1 V
Annotation	The Range annotation replaces the RF Input context's "Atten" annotation "Rng: <Q Range>". When Range = Man the annotation is preceded by "#" The Q Range is not annotated in Input Path I Only or I+jQ. When I Range and Q Range are the same, the annotation is "Rng: <Range>". When I Range and Q Range are different and the Input Path is Ind I/Q, the annotation is "Rng: <I Range>, <Q Range>" and "Peak" is removed from the text. Examples: "Rng: 1 V Peak" the Q Range is 1 V Peak "Rng: 1 V, 0.5 V " the I Range is 1 V Peak and the Q Range is 0.5 V Peak

This is an alternate form of the command to allow entry as a power.

Remote	`[:SENSe]:POWer:IQ:Q:RANGe[:UPPer] <ampl>`

Command	[:SENSe]:POWer:IQ:Q:RANGe[:UPPer]?
Example	Sets the Q Range to 0.5 V Peak when Reference Z is 50 Ω, and to 1.0 V Peak when Reference Z is 75 Ω: :POW:IQ:Q:RANG 4 dBm :POW:IQ:Q:RANG?
Notes	The POWer form of the command is provided for convenience. It maps to the same underlying gain range parameter as the VOLTage form of the command The Reference Z (not the Q channel Input Z) is used to convert the power to peak voltage, which is then used to set the Q Range as with the VOLTage form of the command. The power values of the 4 range states (1V Peak, 0.5V Peak, 0.25V Peak, and 0.125V Peak) will vary with Reference Z. Here are some examples: 50 Ω: 10, 4, -2, -8 75 Ω: 8.2, 2.2, -3.8, -9.8 600 Ω: -0.8, -6.8, -12.8, -18.9
Preset	10.0 dBm
Range	-20 dBm to 10 dBm
Min	-20 dBm
Max	10 dBm

Q Same as I

Many, but not all, usages require the I and Q channels to have an identical setup. To simplify channel setup, **Q Same as I** causes the Q channel range to be mirrored from the I channel. That way you only need to set up one channel (the I channel). The I channel values are copied to the Q channel, so at the time **Q Same as I** is Off, the I and Q channel setups will be identical.

Remote Command	[:SENSe]:VOLTage|POWer:IQ:MIRRored OFF | ON | 0 | 1 [:SENSe]:VOLTage|POWer:IQ:MIRRored?
Example	Turn off the mirroring of I Range to Q Range. :VOLT:IQ:MIRR OFF :POW:IQ:MIRR OFF
Couplings	When ON, the "I Range" on page 1577 value is mirrored (copied) to the "Q Range" on page 1578
Preset	ON
State Saved	Saved in instrument state
Range	OFF|ON

3.6.3.4 Range (Non-attenuator models)

This tab is only available for Keysight's modular signal analyzers and certain other Keysight products. Examples include:

– VXT

– E7760

– M9391A

– M9393A

This tab also does not appear in UXM. In UXM, all Attenuation and Range settings are disabled, as the expected input power level is handled by the Call Processing App that drives the DUT power control.

State Saved	No

Range

Represents the amplitude of the largest sinusoidal signal that could be present within the IF without being clipped by the ADC. For signals with high peak-to-average ratios, the range may need to exceed the rms signal power by a significant amount to avoid clipping.

This is a measurement global setting.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe <real>` `[:SENSe]:POWer[:RF]:RANGe?`
Example	`:POW:RANG 10 dBm` `:POW:RANG?`
Notes	The MIN and MAX values are affected by the External Gain parameters, and by the **Center Frequency** The hardware compensates for frequency response and alters the Range setting
Preset	0 dBm
State Saved	Yes
Min	-100
Max	100
Annotation	Meas Bar

Adjust Range for Min Clipping

Sets the combination of attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an "immediate action" function, that is, it executes once, when the key is pressed.

This key does not appear in measurements that do not support this functionality.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMediate`
Notes	Executing Adjust Range for Min Clipping initiates the measurement
Dependencies	This control does not appear in the Swept SA and Monitor Spectrum measurements This control appears in all measurements in E7760

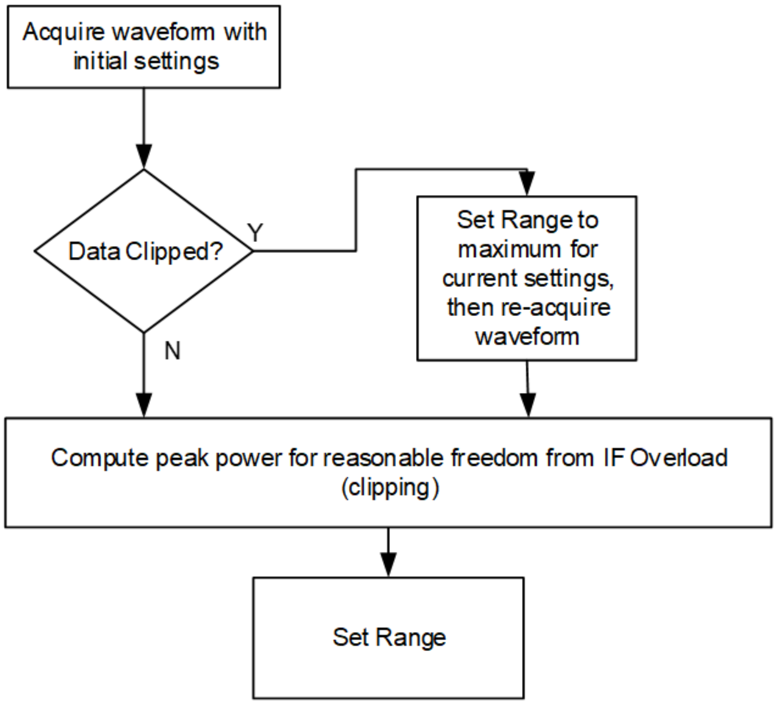
Pre-Adjust for Min Clipping

If this function is ON, it applies the adjustment described under Adjust Range For Min Clipping each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF | ON | ELECtrical | COMBined` `[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?`
Notes	Because there is no attenuator control available in these models, the control displays only ON and OFF choices. However, for SCPI compatibility with other platforms, all three parameters (ELECtrical, COMBined, and ON) are honored and all are mapped to ELECtrical, so if any of these three parameters is sent, a subsequent query will return ELEC
Dependencies	This control does not appear in the Swept SA and Monitor Spectrum measurements This control appears in all measurements in E7760
Preset	OFF for Swept SA measurement; ON for all other measurements that support **Pre-Adjust for Min Clipping**
State Saved	Saved in instrument state

Adjustment Algorithm

The algorithm for the adjustment is documented below:



Peak-to-Average Ratio

Used with "Range (Non-attenuator models)" on page 1864 to optimize the level control in the instrument. The value is the ratio, in dB, of the peak power to the average power of the signal to be measured. A ratio of 0 should be used for sinusoidal signals; for 802.11g OFDM signals use 9 dB.

All Applications (Modes) show the current value of Peak-to-Average ratio on the control. However, some applications do not permit changing the value. In these situations, the control is grayed-out.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:PARatio <real>` `[:SENSe]:POWer[:RF]:RANGe:PARatio?`
Example	`:POW:RANG:PAR 12 dB`
Notes	In some Applications (Modes) this parameter is read-only; meaning the value will appear on the control and query via SCPI, but is not changeable. In such applications the control is grayed-out. Attempting to change the value via SCPI will be ignored but no error message will be generated
Dependencies	This control does not appear in Spectrum Analyzer Mode
Preset	10 dB VXT Models M9410A/11A: 0 dB
State Saved	Saved in instrument state
Min	0 dB
Max	20 dB

	VXT Models M9410A/11A: 50 dB

Mixer Lvl Offset

This is an advanced setting to adjust target Range at the input mixer, which in turn affects the signal level in the instrument's IF. This setting can be used when additional optimization is needed after setting "Peak-to-Average Ratio" on page 1866. Positive values of offset optimize noise performance over distortion, negative values optimize distortion performance over noise.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet <real>` `[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet?`
Example	`:POW:RANG:MIX:OFFS -5 dB`
Preset	0 dB
State Saved	Saved in instrument state
Min	-35 dB VXT Models M9410A/11A: -34 dB
Max	30 dB

3.6.3.5 Signal Path

Contains controls that pertain to the routing of the signal through the frontend of the instrument.

In general, this tab only appears in instruments whose hardware supports this signal routing. For example, this tab does not appear in many of the modular instrument products, including VXT Models M9420/21A. It also does not appear in UXM.

This tab *does* appear in VXT Models M9410A/11A because the Software Preselection control is in this tab, and VXT Models M9410A/11A implement a version of Software Preselection.

Presel Center

Pressing this control adjusts the centering of the preselector filter to optimize the amplitude accuracy at the frequency of the selected marker. If the selected marker is not on when **Presel Center** is pressed, the instrument turns on the selected marker, performs a peak search, and then performs centering on the marker's center frequency. If the selected marker is already on and between the start and stop frequencies of the instrument, the instrument performs the preselector calibration on that marker's frequency. If the selected marker is already on, but outside the frequency range between Start Freq and Stop Freq, the instrument first performs a peak search, and then performs centering on the marker's center frequency.

The value displayed on "Preselector Adjust" on page 1869 will change to reflect the new preselector tuning.

A number of considerations should be observed to ensure proper operation. See "Proper Preselector Operation" on page 744.

Remote Command	`[:SENSe]:POWer[:RF]:PCENter`
Example	`:POW:PCEN`
Notes	Note that the rules outlined above under the control description apply for the remote command as well as the key. The result of the command is dependent on marker position, etc. Any message shown by the control press is also shown in response to the remote command
Dependencies	Does not appear in CXA-m Does not appear in VXT Models M9410A/11A Grayed-out if the microwave preselector is off – If the selected marker's frequency is below Band 1, an advisory message is generated "Preselector not used in this frequency range" and no action is taken – Grayed-out if entirely in Band 0, that is, if Stop Freq is below about 3.6 GHz – Grayed-out if entirely above 50 GHz, that is, if Start Freq is above 50 GHz – Blank in models that do not include a preselector, such as option 503. If the remote command is sent in these instruments, it is accepted without error, and the query always returns 0 – Grayed-out in the Spectrogram View
Couplings	The active marker position determines where the centering will be attempted If the instrument is in a measurement such as averaging when centering is initiated, the act of centering the preselector restarts averaging, but the first average trace will not be taken until the centering is completed The offset applied to do the centering reads out on the "Preselector Adjust" on page 1869 control
Status Bits/OPC dependencies	When centering the preselector, `*OPC` will not return true until the process is complete and a subsequent measurement has completed, nor will results be returned to `:READ` or `:MEASure` queries The Measuring bit should remain set while this command is operating and should not go false until the subsequent sweep/measurement has completed

Proper Preselector Operation

A number of considerations should be observed to ensure proper operation:

1 If the selected marker is off, the instrument turns on a marker, performs a peak search, and adjusts the preselector using the selected marker's frequency. It uses the "highest peak" peak search method unqualified by threshold or excursion, so that there is no chance of a 'no peak found' error. It continues with that peak, even if it is the peak of just noise. Therefore, for this operation to work properly, there should be a signal on screen in a preselected range for the peak search to find

2 If the selected marker is already on, the instrument attempts the centering at that marker's frequency. There is no preselector for signals below about 3.6 GHz, so if the marker is on a signal below 3.6 GHz, no centering will be attempted and an advisory message generated

3 In some models, the preselector can be bypassed. If it is bypassed, no centering will be attempted in that range and a message will be generated

Preselector Adjust

Allows you to manually adjust the preselector filter frequency to optimize its response to the signal of interest. This function is only available when "Presel Center" on page 1868is available.

For general purpose signal analysis, using **Presel Center** is recommended. Centering the filter minimizes the impact of long-term preselector drift. **Preselector Adjust** can be used instead to manually optimize the preselector. One application of manual optimization would be to peak the preselector response, which both optimizes the signal-to-noise ratio and minimizes amplitude variations due to small (short-term) preselector drifting.

When **Presel Center** is performed, the offset applied to do the centering becomes the new value of **Preselector Adjust**.

Remote Command	`[:SENSe]:POWer[:RF]:PADJust <freq>` `[:SENSe]:POWer[:RF]:PADJust?`
Example	`:POW:PADJ 100KHz` `:POW:PADJ?`
Notes	The value on the control reads out to 0.1 MHz resolution
Dependencies	– Does not appear in CXA-m – Does not appear in VXT Models M9410A/11A – Grayed-out if microwave preselector is off – Grayed-out if entirely in Band 0, that is, if Stop Freq is below about 3.6 GHz – Grayed-out if entirely above 50 GHz, that is, if Start Freq is above 50 GHz – Blank in models that do not include a preselector, such as option 503. If the SCPI is sent in these instruments, it is accepted without error, and the query always returns 0 – Grayed-out in the Spectrogram View
Preset	0 MHz
State Saved	The **Preselector Adjust** value set by "Presel Center" on page 1868, or by manually adjusting **Preselector Adjust** It is not saved in instrument state, and does not survive a Preset or power cycle
Min	-500 MHz
Max	500 MHz
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:MW:PADJust` `[:SENSe]:POWer[:RF]:MMW:PADJust`

Notes	PSA had multiple preselectors, and you could select which preselector to adjust. Since the X-Series has only one mm/uW preselector, the preselector selection control is no longer available. However, to provide backward compatibility, we accept the legacy remote commands The command form has no effect, the query always returns `MWAVe`
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:PADJust:PRESelector MWAVe | MMWave | EXTernal` `[:SENSe]:POWer[:RF]:PADJust:PRESelector?`

Internal Preamp

Accesses a menu of controls for the internal preamps. Turning on the preamp gives a better noise figure, but a poorer inter-modulation distortion (TOI) to noise floor dynamic range. You can optimize this setting for your particular measurement.

The instrument takes the preamp gain into account as it sweeps. If you sweep outside of the range of the preamp, the instrument will also account for that. The displayed result always reflects the correct gain.

For some measurements, when the preamp is on and any part of the displayed frequency range is below the lowest frequency for which the preamp has specifications, a warning condition message appears in the status line. For example, for a preamp with a 9 kHz lowest specified frequency: "Preamp: Accy unspec'd below 9 kHz".

Selection	Example	Note
Off	`:POW:GAIN OFF`	
Low Band	`:POW:GAIN ON` `:POW:GAIN:BAND LOW`	Sets the internal preamp to use only the low band. The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Low Band selection in the dropdown
Full Range	`:POW:GAIN ON` `:POW:GAIN:BAND FULL`	Sets the internal preamp to use its full range. The low band (0-3.6 GHz, 0-3.4 GHz, 0-3GHz, depending on the model) is supplied by the low band preamp and the frequencies above low band are supplied by the high band preamp The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Full Range selection in the dropdown. If the high band option is not installed the Full Range selection does not appear

Remote Command	`[:SENSe]:POWer[:RF]:GAIN:BAND LOW | FULL` `[:SENSe]:POWer[:RF]:GAIN:BAND?`

	`[:SENSe]:POWer[:RF]:GAIN[:STATe] OFF | ON | 0 | 1` `[:SENSe]:POWer[:RF]:GAIN[:STATe]?`

Example	`:POW:GAIN:BAND LOW`
	`:POW:GAIN:BAND?`
	`:POW:GAIN OFF`
	`:POW:GAIN?`

Dependencies	Preamp is not available on all hardware platforms. If the preamp is not present or is unlicensed, the control is not shown Does not appear in VXT Models M9410A/11A/15A If `:POW:GAIN:BAND FULL` is sent when a low band preamp is available, the preamp band parameter is set to `LOW` instead of `FULL`, and an "Option not installed" message is generated The preamp is not available when the electronic/soft attenuator is enabled
Preset	`LOW` `OFF`
State Saved	Saved in instrument state
Annotation	When the USB Preamp is not connected to USB, the Preamp annotation in the Meas Bar says “Off” if the preamp is off and displays the frequency range of the low band or full range preamp depending on the setting. For example, if the Preamp is set to Low Band and the Low Band is 3.6 GHz the annotation says “3.6 GHz”. If it is a 13.6 GHz preamp and it is set to Full Range the annotation says “13.6 GHz” When the USB Preamp is connected to USB, the Preamp annotation says “Preamp: USB” if the internal preamp is off or “Preamp: USB, Int” if the internal preamp is on (only for measurements that support the USB preamp)

LNA

Lets you turn the Low Noise Amplifier (**LNA**) on or off.

The LNA is an additional preamplifier that provides superior DANL and frequency range compared to the Internal Preamp. The LNA provides lower system noise figure, especially at frequencies above 100 MHz, and can be operated up to the full range of 50 GHz instruments.

For best possible sensitivity, the LNA can be turned on together with the "Internal Preamp" on page 1870, although if you operate both preamps together, note that the TOI (distortion) specifications are impacted. The sensitivity improvement of this combination is substantial when operating in high band (frequencies above 3.6 GHz).

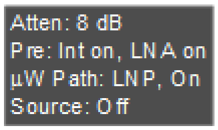
See "More Information" on page 748

Remote Command	`[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe] OFF | ON | 0 | 1` `[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe]?`
Example	`:POW:GAIN:LNA ON`
Dependencies	Requires option LNA

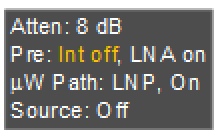
	Option LNA is not required by VXT model M9415A Does not appear in VXT models M9420A/21A/10A/11A May not appear in some measurements
Preset	OFF
State Saved	Saved in State

More Information

When the LNA is installed, the preamp annotation changes to show the state of both the LNA and the Internal Preamp. Below is an example:



Note that when operating entirely in the low band (below about 3.6 GHz), if the LNA is on, the Internal Preamp is switched off (even if you have its switch set to ON). This is because the noise performance is actually degraded in low band if both preamps are on. In this case, the annotation reflects the actual state of the two preamps, but the Internal Preamp annotation displays in amber, to warn you that the actual state of the Internal Preamp does not match the **Internal Preamp** switch control display:



µW Path Control

Options for this control include **µW Preselector Bypass** (Option MPB), **Low Noise Path** (Option LNP) and **Full Bypass Enable** in the High Band path circuits.

When the µW Preselector is bypassed, flatness is improved, but will be subject to spurs from out of band interfering signals. When **Low Noise Path Enable** is selected, the instrument automatically bypasses certain circuitry in the high frequency bands that can contribute to noise, when it is appropriate based on other instrument settings.

For most applications, the preset state is **Standard Path**, which provides the best remote-control throughput, minimizes acoustic noise from switching and minimizes the risk of wear in the hardware switches, particularly in remote test scenarios where both low band and high band setups will follow in rapid succession. In this path, the bypass of the low band/high band switch and microwave preamp is never activated, which can cause some noise degradation but preserves the life of the bypass switch.

For applications that utilize the wideband IF paths, the preset state is **µW Preselector Bypass**, if option MPB is present. This is because, when using a wideband IF such as

the 140 MHz IF, the µW Preselector's bandwidth can be narrower than the available IF bandwidth, causing degraded amplitude flatness and phase linearity, so it is desirable to bypass the preselector in the default case.

You may choose **Low Noise Path Enable** for a lower noise floor, especially in the 21-26.5 GHz region, though without improving many measures of dynamic range, and without giving the best possible noise floor. The preamp, if purchased and used, gives better noise floor than does **Low Noise Path Enable**, but the preamp's compression threshold and third-order intercept are much poorer than that of **Low Noise Path Enable**.

A fourth choice is **Full Bypass Enable**, which combines **µW Preselector Bypass** and **Low Noise Path Enable**. Because this can bypass most of the circuitry between the input and the first mixer, care should be taken when using this setting to avoid damaging the mixer. **Full Bypass Enable** is only available if both options LNP and MPB are present, as well as option FBP.

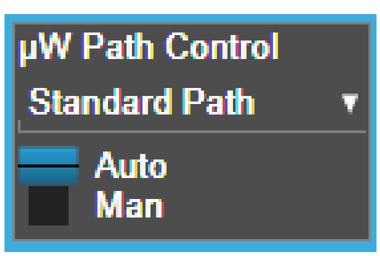
Path	Example	Note
Standard Path	:POW:MW:PATH STD	Normal setting for most measurements. µW Preselector in circuit, Low Noise Path disabled
Low Noise Path Enable	:POW:MW:PATH LNP	See "Low Noise Path Enable" on page 753
µW Preselector Bypass	:POW:MW:PATH MPB	See "µW Preselector Bypass" on page 754
Full Bypass Enable	:POW:MW:PATH FULL	See "Full Bypass Enable" on page 755

Remote Command	[:SENSe]:POWer[:RF]:MW:PATH STD | LNPath | MPBypass | FULL [:SENSe]:POWer[:RF]:MW:PATH?
Example	:POW:MW:PATH LNP Enables the Low Noise path :POW:MW:PATH?
Notes	If "Presel Center" on page 1868 is performed, the instrument will momentarily switch to the Standard Path, regardless of the setting of **µW Path Control** The DC Block will always be switched in when the low noise path is switched in, to protect succeeding circuitry from DC. Note that this does not mean "when the low noise path is enabled" but when, based on the Low Noise Path rules, the path is actually switched in. This can happen when the selection is **Low Noise Path Enable** or **Full Bypass Enable.** In the case where the DC Block is switched in the instrument is now AC coupled. However, if you selected DC coupling, the UI would still behave as though it were DC coupled, including all annunciation, warnings, status bits, and responses to SCPI queries. This is because, based on other settings, the instrument could switch out the low noise path at any time and hence go back to being DC coupled Alignment switching ignores the settings in this menu, and restores them when finished
Dependencies	Does not appear in CXA-m Does not appear in VXT Models M9410A/11A Does not appear in BBIQ and External Mixing

	The **Low Noise Path Enable** selection does not appear unless Option LNP is present and licensed The **µW Preselector Bypass** selection does not appear unless Option MPB is present and licensed The **Full Bypass Enable** selection does not appear unless options LNP and MPB are both present as well as option FBP In any of these cases, if the required options are not present and the SCPI command is sent, error -241, "Hardware missing; Option not installed" is generated **Low Noise Path Enable** and **Full Bypass Enable** are grayed-out if the current measurement does not support them **Low Noise Path Enable** and **Full Bypass Enable** are not supported in Avionics and MMR Modes. In any of these cases (that is, the feature is not supported in either measurement or mode), if the SCPI command is sent, the following error is generated: -221, “Setting Conflict; Feature not supported for this measurement”
Preset	All except modes specified below: `STD` IQ Analyzer, VXA, Pulse and Avionics mode: – MPB option present and licensed: `MPB` – MPB option not present and licensed: `STD`
State Saved	Save in instrument state
Range	Standard Path|Low Noise Path Enable|µW Presel Bypass|Full Bypass Enable
Annotation	In the Meas Bar, if the Standard path is chosen, it says: µW Path: Standard If Low Noise Path is enabled but the LNP switch is not thrown, it shows: µW Path: LNP,Off If the Low Noise Path is enabled and the LNP switch IS thrown, it shows: µW Path: LNP,On If the preselctor is bypassed, it says: µW Path: Bypass If Full Bypass Enable is selected but the LNP switch is not thrown, it shows: µW Path: FByp,Off If Full Bypass Enable is selected and the LNP switch IS thrown, it shows: µW Path: FByp,On

µW Path Control Auto [Mode: VMA, WLAN, NR5G, CQM]

In VMA, WLAN, 5G NR, CQM modes, an Auto/Man switch is added to **µW Path Control**:



This allows the function to automatically switch based on certain Auto Rules as shown below:

VMA Mode

Measurement	When µW Path Control is in Auto:
Digital Demod	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Monitor Spectrum	Always Presel Bypass
IQ Waveform	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Custom OFDM	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Channel Power	Always Presel Bypass
Occupied BW	Always Presel Bypass
CCDF	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
ACP	Always Presel Bypass
SEM	Always Presel Bypass
Spurious Emissions	Always Standard Path

WLAN Mode

Measurement	When µW Path Control is in Auto:
Modulation Analysis	Always Presel Bypass
Spectral Flatness	Always Presel Bypasss
Power vs Time	Always Presel Bypass
Monitor Spectrum	Always Presel Bypass
IQ Waveform	Always Presel Bypass
Channel Power	Always Presel Bypass
Occupied BW	Always Presel Bypass
CCDF	Always Presel Bypass
SEM	1. For 11be 320M, when 'Enabled Wideband IF for FFT' is OFF or 'Sweep Type Rule' is Best Dynamic Range, auto µW path is standard. 2. For other cases, auto µW path is presel bypass if presel bypass is enabled, auto µW path is standard if presel bypass is not enabled.
Spurious Emissions	Always Standard Path

5G NR Mode

Measurement	When µW Path Control is in Auto:
Modulation	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in

Measurement	When µW Path Control is in Auto:
Analysis	which case choose Full Bypass if conditions warrant(FBP Option is available and "Allow Full Bypass in Auto" is On), otherwise choose Preselector Bypass
Monitor Spectrum	Always Standard Path
IQ Waveform	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Full Bypass if conditions warrant(FBP Option is available and "Allow Full Bypass in Auto" is On), otherwise choose Preselector Bypass
Channel Power	Always Standard Path
Occupied BW	Always Standard Path
CCDF	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
ACP	Always Standard Path
SEM	Always Standard Path
Spurious Emissions	Always Standard Path
Transmit On|Off Power	Use Standard Path unless tuned frequency > 3.6 GHz and Info BW > 15 MHz, in which case choose Preselector Bypass

Channel Quality Mode

Measurement	When µW Path Control is in Auto:
Group Delay	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Full Bypass if conditions warrant(FBP Option is available and "Allow Full Bypass in Auto" is On), otherwise choose Preselector Bypass
Monitor Spectrum	Always Standard Path
IQ Waveform	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
CCDF	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass

Remote Command	`[:SENSe]:POWer[:RF]:MW:PATH:AUTO ON | OFF | 1 | 0` `[:SENSe]:POWer[:RF]:MW:PATH:AUTO?`
Example	`:POW:MW:PATH:AUTO ON` `:POW:MW:PATH:AUTO?`
Dependencies	Only appears in VMA, WLAN, 5G NR and CQM modes
Couplings	See the tables above
Preset	ON
Range	ON|OFF

Low Noise Path Enable

You may select **Low Noise Path Enable**, which gives a lower noise floor under some circumstances, particularly when operating in the 21-26.5 GHz region. With the Low Noise Path enabled, the low band/high band switch and microwave preamp are bypassed whenever all of the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz
- the internal preamp is not installed or (if installed) is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Low Noise Path Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the **Low Noise Path Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Low Noise Path Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

For measurements that use IQ acquisition, the low noise path is used when **Center Frequency** is in High Band (> 3.6 GHz) and no preamp is in use. In other words, the rules above are modified to use only the center frequency to qualify which path to switch in. This is not the case for FFTs in the Swept SA measurement; they use the same rules as swept measurements.

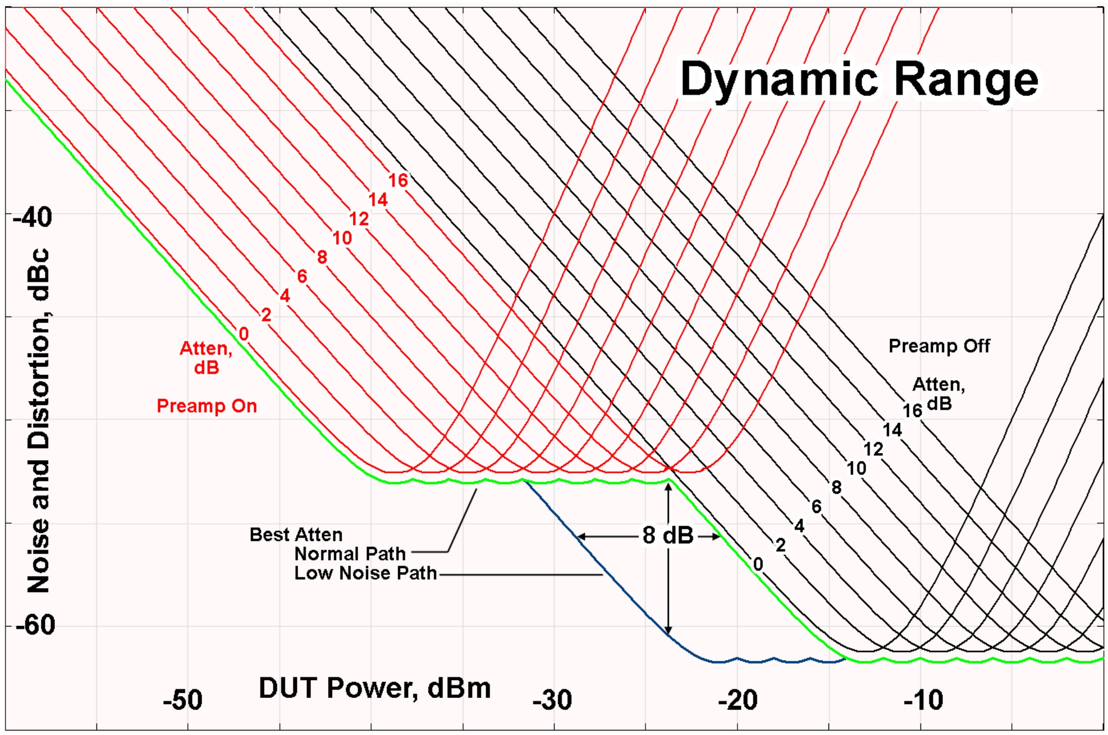
Note that the Low Noise Path, while giving improved DANL, has the disadvantage of decreased TOI performance and decreased gain compression performance relative to the standard path.

Note also that the bypass switch is a mechanical switch and has finite life, so if the **Low Noise Path Enable** is selected, it is possible to cause frequent cycling of this switch by frequently changing instrument settings such that the above conditions hold true only some of the time. A user making tests of this nature should consider opting for the **Standard Path**, which will never throw the bypass switch, at the expense of some degraded noise performance.

The low noise path is useful for situations where the signal level is so low that the instrument performance is dominated by noise even with 0 dB attenuation, but still high enough that the preamp option would have excessive third-order intermodulation or compression. The preamp, if purchased and used, gives better noise floor than does the “Low Noise Path.” However, its compression threshold and third-order intercept are much poorer than that of the non-preamp path.

There are some applications, typically for signals around –30 dBm, for which the third-order dynamic range of the standard path is good enough, but the noise floor is not low enough even with 0 dB input attenuation. When the third-order dynamic range of the preamp path is too little and the noise floor of the standard path is too high, the Low Noise Path can provide the best dynamic range

The graph below illustrates the concept. It shows, in red, the performance of an instrument at different attenuation settings, both with the preamp on and off, in a measurement that is affected by both instrument noise and instrument TOI. The green shows the best available dynamic range, offset by 0.5 dB for clarity. The blue shows how the best available dynamic range improves for moderate signal levels with the low noise path switched in. In this illustration, the preamp improves the noise floor by 15 dB while degrading the third-order intercept by 30 dB, and the low noise path reduces loss by 8 dB. The attenuator step size is 2 dB.



There are other times where selecting the low noise path improves performance, too. Compression-limited measurements such as finding the nulls in a pulsed-RF spectrum can profit from the low noise path in a way similar to the TOI-limited measurement illustrated. Accuracy can be improved when the low noise path allows the optimum attenuation to increase from a small amount like 0, 2 or 4 dB to a larger amount, giving better return loss at the instrument input. Harmonic measurements, such as second and third harmonic levels, are much improved using the low noise path because of the superiority of that path for harmonic (though not intermodulation) distortion performance.

µW Preselector Bypass

Toggles the preselector bypass switch for band 1 and higher. When the microwave presel is on, the signal path is preselected. When the microwave preselector is off, the signal path is not preselected. The preselected path is the normal path for the instrument.

The preselector is a tunable bandpass filter which prevents signals away from the frequency of interest from combining in the mixer to generate in-band spurious signals (images). The consequences of using a preselector filter are its limited bandwidth, the amplitude and phase ripple in its passband, and any amplitude and phase instability due to center frequency drift.

Option MPB or pre-selector bypass provides an unpreselected input mixer path for certain X-Series signal analyzers with frequency ranges above 3.6 GHz. This signal path allows a wider bandwidth and less amplitude variability, which is an advantage when doing modulation analysis and broadband signal analysis. The disadvantage is that, without the preselector, image signals will be displayed. Another disadvantage of bypassing the preselector is increased LO emission levels at the front panel input port.

Image responses are separated from the real signal by twice the 1st IF. For IF Paths of 10 MHz and 25 MHz, the 1st IF is 322.5 MHz, so the image response and the real signal will be separated by 645 MHz. The 1st IF will be different for other IF Path settings. When viewing a real signal and its corresponding image response in internal mixing, the image response will be to the left of the real signal.

Also, the image response and the real signal typically have the same amplitude and exhibit the same shape factor.

However, if Option FS1, Fast Sweep Capability, is enabled, the image response in the Swept SA measurement appears lower in amplitude and has a much wider shape factor compared to the real signal.

Full Bypass Enable

With **Full Bypass Enable** selected, the microwave preselector is bypassed. In addition, the low band/high band switch and microwave preamp are bypassed whenever all of the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz.
- the internal preamp is not installed or (if installed) is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Full Bypass Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

CAUTION When **Full Bypass Enable** is selected, and "Attenuation" on page 1747 is set to 0 dB, there will be a direct AC connection between the input and the first converter

when the Low Noise Path switches in (when Start Freq >3.6 GHz and the Preamp is either not licensed, set to Low Band, or Off). This puts the first converter at high risk to be damaged by high AC power. Consequently, whenever **Full Bypass Enable** is selected, a warning message appears in the status bar:

Full Bypass Enabled, maximum safe input power reduced

Microwave Preselector Bypass Backwards Compatibility

Example	`:POW:MW:PRES OFF` Bypasses the microwave preselector
Notes	Included for Microwave Preselector Bypass backwards compatibility The `ON` parameter sets the `STD` path (`:POW:MW:PATH STD`) The `OFF` parameter sets path `MPB` (`:POW:MW:PATH MPB`)
Preset	`ON`
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe] ON | OFF | 0 | 1` `[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe]?`

Frequency Extender Preselection Bypass

Frequency Extender Preselection Bypass only applies to the high frequency path of the Frequency Extender and only if the Frequency Extender allows it. For example, the V3050A high frequency path is 50 – 110 GHz and does allow control of the preselector bypass.

When the Frequency Extender's preselection is bypassed, flatness is improved, but will be subject to spurs from out of band interfering signals. For bandwidths greater than 2.5 [GHz], it is recommended that the signal bypass the Frequency Extender Preselector since the max bandwidth of the Preselector can be as narrow as 2.5 [GHz].

For most applications, the preset state is `OFF`, which gives the best remote-control throughput, minimizes acoustic noise from switching, minimizes out of band spurs, and minimizes the risk of wear in the hardware switches.

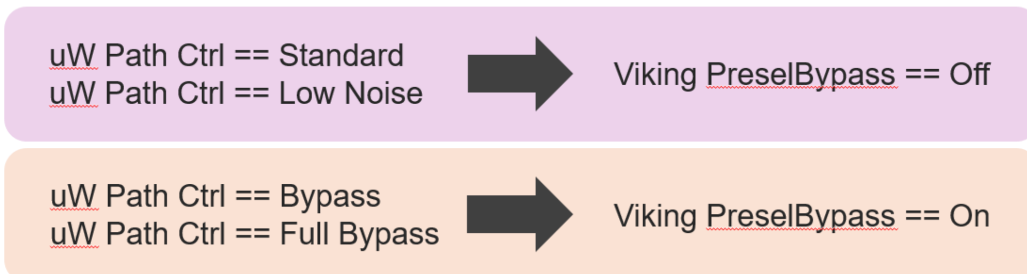
Coupling with Microwave Preselector Control

The control of whether to apply or bypass the Frequency Extender's preselection is dependent on the Microwave Path Control setting.

The coupling between the Microwave Path Control and Frequency Extender Preselector Bypass is described below.

UW PATH CTRL	UW PRESELECTOR	VIKING PRESELECTOR
Standard Path	On	**On**
Low Noise Path Enable	On	**On**
uW Presel Bypass	Off	**Off**
Full Bypass Enable	Off	**Off**

In other words…



For the Frequency Extender Preselector Bypass to take effect, it requires a Frequency Extender device (such as V3050A) be connected and External RF (ERFIN) selected as the input.

The Frequency Extender Preselector is applied or bypassed depending on the Microwave Path Control setting only when the acquisition is above 50 [GHz]. Hence, it will be bypassed only when the acquisition is above 50 [GHz].

Preselector and Bandwidth Conflict

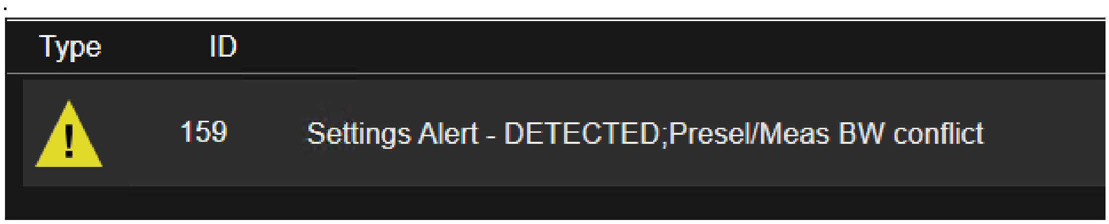
When the Frequency Extender Preselector is applied and the signal bandwidth is greater than 2.5 [GHz], then a settings alert message will show to warn the user that the signal may be distorted due to the limitation of the Frequency Extender Preselector bandwidth.

An example of the settings alert message is shown below.

Settings Alert message in the Status Bar at the bottom of the display.

Settings Alert message in the error queue

.



Software Preselection

Software Preselection is provided in some instruments, either to compensate for issues with provided hardware preselection or to provide the preselection function when there is no hardware preselector.

N9041B

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

In the N9041B, Software Preselection only applies for frequencies above 50 GHz, therefore it is only used for RF Input 2. Even if it is turned on, it will not be used for other inputs and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that in the N9041B, in Swept SA, Software Preselection will work even if the measurement is using an FFT sweep type. In measurements other than Swept SA, Software Preselection will not be used if the measurement is using an FFT sweep type.

N9042B+V3050A

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 88 GHz, software preselection must be used to suppress and separate images above 88 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

For N9042B+V3050A, Software Preselection only applies for frequencies above 88 GHz, therefore it is only used for External RF. Even if it is turned on, it will not be used for other inputs and never for frequencies below 88 GHz. This is why the label of this control contains the parenthetical note “(>~88 GHz)”.

Note that for N9042B+V3050A, in Swept SA, Software Preselection will work even if the measurement is using an FFT sweep type. In measurements other than Swept SA, Software Preselection will not be used if the measurement is using an FFT sweep type.

VXT models M9410A/11A

Software Preselection is used to provide the preselection function, as there is no hardware preselector in these models. Two background traces are taken and compared point by point, and the point with the lowest amplitude from the two traces is used. This provides a method to reduce spurs that are internally generated within the VXT, but the user should note the following when using Software

Preselection:

- There is some speed cost due to the need to take multiple captures
- Taking the point with the lowest amplitude in each trace will make the average noise level lower at all points that do not have a spur. This can reduce the accuracy of the measurement of noise and noise-like signals.

Because of the difficulty in identifying spurs manually, you are encouraged to leave Software Preselection ON at all times in VXT models M9410A/11A. If you turn it off in order to speed up your measurement or improve noise accuracy, be aware of unwanted onscreen spurs.

Remote Command	`[:SENSe]:POWer[:RF]:SWPResel:STATe 0 | 1 | ON | OFF` `[:SENSe]:POWer[:RF]:SWPresel:STAT?`
Example	`:POW:SWPR:STAT 1` `:POW:SWPR:STAT?`
Dependencies	Only appears in N9041B, N9042B+V2050A, and VXT models M9410A/11A. Does not appear in all measurements
Couplings	Sweep Time is affected by SW Preselection. Also Auto Tune supports SW Preselection, so set SW Preselection state and then do Auto Tune
Preset	N9041B: OFF N9042B+V3050A: ON M9410A/11A: ON
State Saved	Saved in instrument state

SW Preselection Type

Specifies the algorithm used for software preselection.

Two hidden sweeps are taken in succession. The second sweep is offset in LO frequency by 2*IF/N. For each point in each trace, the smaller amplitude from the two traces is taken and placed in that point in the selected trace. The Peak detector is auto-selected to improve the image suppression effectiveness. Responses of each trace that lie on top of one another will remain and are valid signals. Other signals are images and are suppressed. The action of taking the smaller of the two traces will make the average noise level lower in all points that do not have an image, thus reducing the accuracy of the measurement of noise and noise-like signals.

- `NORMal` - mathematically removes all image and multiple responses of signals present at the input
- `ADVanced` - any trace processing (such as “max hold” or trace averaging) is performed on the points of both candidate traces before the “select minimum” operation occurs. This form of processing works better for non-stationary signals, such as pulsed-RF signals

Remote Command	`[:SENSe]:POWer[:RF]:SWPResel NORMal | ADVanced` `[:SENSe]:POWer[:RF]:SWPResel?`
Example	`:POW:SWPR NORM` `:POW:SWPR?`
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method When "Software Preselection" on page 1883 is Disabled, this control is grayed-out. Its grayout message is “Unavailable unless SW Presel enabled”
Preset	N9041B: `ADVanced` N9042B+V3050A: `NORMal`
State Saved	Saved in instrument state

SW Preselection BW

Specifies the effective bandwidth to be used for Software Preselection.

The choices are:

- `NORMal` – when making Swept measurements, a software preselection algorithm is used which takes up to 4 background acquisitions, then post-processes the result. This algorithm can remove images from signals with an occupied bandwidth up to around 3 GHz. (Default/Preset setting). When making FFT measurements, this algorithm is not used, instead the same algorithm is used as for `NARRow` (below)
- `NARRow`– a software preselection algorithm is used which takes two background acquisitions, then post-processes the result to detect and remove images from wideband signals with occupied bandwidths up to 2 GHz. This increases the risk of images failing to be rejected, but improves the measurement speed

Remote Command	`[:SENSe]:POWer[:RF]:SWPResel:BW NORMal | NARRow` `[:SENSe]:POWer[:RF]:SWPResel:BW?`
Example	`:POW:SWPR:BW NARR`
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method When "Software Preselection" on page 1883 is Disabled, this control is grayed out. Its grayout message is “Unavailable unless SW Presel enabled” For N9042B+V3050A the parameter is SCPI only and always set to `NARRow` when Software Preselection is enabled
Preset	N9041B: `NORMal` N9042B+V3050A: `NARRow`
State Saved	Saved in instrument state

High Freq Prefilter

Lets you set the state of Prefilter for Center Frequencies above 1310 MHz.

In VXT Models M9410A/11A, the Receiver RF path has a bank of filters that come after the RF Attenuator in the signal path. Since this bank of filters precedes the mixer they are known as the “Prefilter” bank. Their purpose is to eliminate unwanted in-band mixing products by filtering out all but the desired frequencies before the signals get to the mixer. There are 13 prefilter bands to cover the frequencies between 9 kHz and 6000 MHz. The Prefilter provides the necessary rejection of the unwanted signal.

Remote Command	`[:SENSe]:<measurement>:PFILter[:STATe] ON | OFF | 1 | 0` `[:SENSe]:<measurement>:PFILter[:STATe]?`

Example	For example, to enable High Freq Prefilter in IQ Analyzer Mode:
	For the Complex Spectrum Measurement:
	`:SPEC:PFIL ON`
	For the IQ Waveform Measurement:
	`:WAV:PFIL ON`
	`:`

Dependencies	This control only appears in VXT models M9410A/11A with center frequency above 1310 MHz
Preset	See “Prefilter Presets” below
State Saved	Saved in instrument state

Prefilter Presets

Meas	Mode	Preset
SPEC	BASIC	OFF
WAV	BASIC, WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA	OFF
MON	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA	OFF
RHO	WCDMA	OFF
CDP	WCDMA	OFF
PCON	WCDMA	OFF
EVMQ	WCDMA	OFF
CHP	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
OBW	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
ACP	WCDMA, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
SEM	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
PST	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
PVT	WLAN, LTEAFDD, LTEATDD, 5GNR	OFF
EVM	WLAN, LTEAFDD, LTEATDD, 5GNR	OFF

Meas	Mode	Preset
FLAT	WLAN	OFF
EVMM	WLAN	OFF
CEVM	LTEAFDD, LTEATDD	OFF
PAVT	5GNR, VMA	OFF
DDEM	VMA	OFF
OFDM	VMA	OFF
SAN	SA	ON
HARM	SA	ON

3.6.4 BW

The BW key opens the bandwidth menu, which contains controls for the Resolution Bandwidth functions of the instrument.

The Resolution BW functions control filter bandwidth and filter type. There are two filter types, Gaussian and Flattop. The Gaussian filters have a response curve that is parabolic on a log scale. The Flattop filter shape is a close approximation of a rectangular filter.

3.6.4.1 Settings

The Settings tab contains the basic Bandwidth functions. It is the only tab under Bandwidth.

Info BW

Enables you to specify the information bandwidth for the instrument. This is used to set the hardware filter of the ADC.

Remote Command	`[:SENSe]:EVMQpsk:BANDwidth[:RESolution] <freq>` `[:SENSe]:EVMQpsk:BANDwidth[:RESolution]?`
Example	`:EVMQ:BAND 1 kHz` `:EVMQ:BAND?`
Preset	6 MHz
State Saved	Yes
Min	1 kHz
Max	Hardware Dependent RF Input: – No Option = 10 MHz – WB (25 MHz) = 25 MHz

	– WB (wider than 25 MHz) = 30 MHz I/Q Input (for I+jQ): – No Option = 20 MHz – OptionB25 = 30 MHz
Backwards Compatibility SCPI	[:SENSe]:EVMQpsk:BWIDth[:RESolution]

Info BW Filter Type

Selects the type for the information bandwidth filters from either Gaussian or Flat Top filter shape, for varying measurement conditions.

For more information, see the RBW Filter Type control description for the Swept SA measurement.

Remote Command	[:SENSe]:EVMQpsk:BANDwidth:SHAPe GAUSsian | FLATtop [:SENSe]:EVMQpsk:BANDwidth:SHAPe?
Example	:EVMQ:BAND:SHAP GAUS :EVMQ:BAND:SHAP?
Notes	GAUSsian= Gaussian FLATtop = Flattop
Preset	Auto Couple chooses the preset value
State Saved	Saved in instrument state
Annotation	The annotation under RBW in the bottom left of the screen shows the type of filter or bandwidth that is being used. The following examples illustrate this:

–3 dB (Normal) filter BW:	Res BW 300 Hz
–6 dB filter BW:	Res BW (–6 dB) 422 Hz
Noise filter BW:	Res BW (Noise) 317 Hz
Impulse filter BW:	Res BW (Impulse) 444 Hz
CISPR filter BW:	Res BW (CISPR) 200 Hz
MIL filter BW:	Res BW (MIL) 1 kHz
Flattop filter type:	Res BW (Flattop) 300 Hz

Backwards Compatibility SCPI	[:SENSe]:EVMQpsk:BWIDth:SHAPe

3.6.5 Display

The Display Menu lets you configure display items for the current Mode, Measurement View or Window.

3.6.5.1 Meas Display

The Meas Display tab contains controls for setting up the display for the current Measurement, View or Window.

I/Q Polar Vec/Constln

Specifies the format of the polar vector graph display. The following display options are available:

– Vector and Constellation

– Vector Only

– Constellation Only

Remote Command	:DISPlay:EVMQpsk:WINDow2:TRACe:POLar VC | VECTor | CONStln :DISPlay:EVMQpsk:WINDow2:TRACe:POLar?
Example	:DISP:EVMQ:WIND2:TRAC:POL VECT :DISP:EVMQ:WIND2:TRAC:POL?
Notes	Allows to specify the format of the polar vector graph display by: – Vector and Constellation – Vector Only – Constellation Only
Preset	VC
State Saved	Yes
Range	Vec & Constln|Vector|Constellation
Backwards Compatibility SCPI	:DISPlay:EVMQpsk:VIEW[1]:WINDow2:TRACe:POLar

Chip Offset

Sets the chip offset number from the first chip in a measured signal.

Remote Command	`:DISPlay:EVMQpsk:WINDow2:TRACe:COFFset <integer>` `:DISPlay:EVMQpsk:WINDow2:TRACe:COFFset?`
Example	`:DISP:EVMQ:WIND2:TRAC:COFF 1001` `:DISP:EVMQ:WIND2:TRAC:COFF?`
Notes	The number of chip offset from the first chip in a measured signal
Preset	0
State Saved	Yes
Min/Max	0/Meas Interval – I/Q Chips
Backwards Compatibility SCPI	`:DISPlay:EVMQpsk:VIEW[1]:WINDow2:TRACe:COFFset`

I/Q Chips

Specifies the number of I/Q chips used to display the I/Q waveforms.

Remote Command	`:DISPlay:EVMQpsk:WINDow2:TRACe:IQCHips <integer>` `:DISPlay:EVMQpsk:WINDow2:TRACe:IQCHips?`
Example	`:DISP:EVMQ:WIND2:TRAC:IQCH 1001` `:DISP:EVMQ:WIND2:TRAC:IQCH?`
Couplings	This parameter is dependent on Meas Interval and cannot be set to a value greater than Meas Interval
Preset	WCDMA: 2560
State Saved	Yes
Min/Max	1/5120
Backwards Compatibility SCPI	`:DISPlay:EVMQpsk:VIEW[1]:WINDow2:TRACe:IQCHips`

Interpolation

Toggles the interpolation function from On to Off. If set to On, the vector lines between chip dots are converted into smooth curves by the interpolation function.

Remote Command	`:DISPlay:EVMQpsk:WINDow2:TRACe:INTPolation[:STATe] OFF | ON | 0 | 1` `:DISPlay:EVMQpsk:WINDow2:TRACe:INTPolation[:STATe]?`
Example	`:DISP:EVMQ:WIND2:TRAC:INTP ON` `:DISP:EVMQ:WIND2:TRAC:INTP?`
Notes	If set to ON, the vector lines between chip dots are converted into smoothened curves by the interpolation function
Preset	`OFF`

State Saved	Yes
Range	OFF|ON
Backwards Compatibility SCPI	:DISPlay:EVMQpsk:VIEW[1]:WINDow2:TRACe:INTPolation[:STATe]

+45° Rotation

Toggles the state of the rotation of the I/Q polar trace. If set to On, the I/Q polar trace is rotated by 45 degrees to provide a rectangular display.

Remote Command	:DISPlay:EVMQpsk:WINDow2:TRACe:ROTQpi[:STATe] OFF | ON | 0 | 1 :DISPlay:EVMQpsk:WINDow2:TRACe:ROTQpi[:STATe]?
Example	:DISP:EVMQ:WIND2:TRAC:ROTQ ON :DISP:EVMQ:WIND2:TRAC:ROTQ?
Notes	Enables you to toggle whether the I/Q polar trace is rotated by 45 degrees to provide a rectangular display
Preset	OFF
State Saved	Yes
Range	OFF|ON
Backwards Compatibility SCPI	:DISPlay:EVMQpsk:VIEW[1]:WINDow2:TRACe:ROTQpi[:STATe]

Full Vector

Toggles the gray background from On to Off when displaying the full measured trace or the selected vector on the display.

Remote Command	:DISPlay:EVMQpsk:WINDow2:TRACe:FVECtor[:STATe] OFF | ON | 0 | 1 :DISPlay:EVMQpsk:WINDow2:TRACe:FVECtor[:STATe]?
Example	:DISP:EVMQ:WIND2:TRAC:FVEC ON :DISP:EVMQ:WIND2:TRAC:FVEC?
Notes	This is useful when you want to observe the full vector and the selected vector set by I/Q Chips and Chip Offset simultaneously
Preset	OFF
State Saved	Yes
Range	OFF|ON
Backwards Compatibility SCPI	:DISPlay:EVMQpsk:VIEW[1]:WINDow2:TRACe:FVECtor[:STATe]

3.6.5.2 View

Contains controls for selecting the current **View**, and for editing User Views.

Views

The table below shows the Views and Windows used for this Measurement.

These Views are multiple-window Views and you select a window by touching it. The menu controls may sometimes change depending on which window is selected.

Whenever the View changes, the default menu is Frequency, unless otherwise specified in the View description.

View	Result
I/Q Measured Polar Graph	I/Q Measured Polar Graph
	Metrics
I/Q Error	Mag Error Graph
	Phase Error Graph
	EVM Graph
	Small-sized Metrics

The following remote commands are available for view selection:

View Selection by Name

Selects the format for the measurement results view.

Remote Command	`:DISPlay:EVMQpsk:VIEW[:SELect] POLar | ERRor` `:DISPlay:EVMQpsk:VIEW[:SELect]?`
Example	`:DISP:EVMQ:VIEW ERR` `:DISP:EVMQ:VIEW?`
Couplings	Changing parameter of "ViewNum" (`:DISPlay:EVMQpsk:VIEW:NSELect`) also changes this parameter
Preset	`POLar`
State Saved	Yes
Range	I/Q Measured Polar Graph|I/Q Error

View Selection by Number

Displays the numeric values of the measurement results.

Remote Command	`:DISPlay:EVMQpsk:VIEW:NSELect <integer>` `:DISPlay:EVMQpsk:VIEW:NSELect?`

Example	`:DISP:EVMQ:VIEW:NSEL 2` `:DISP:EVMQ:VIEW:NSEL?`
Couplings	Changing parameter of "View" (:DISPlay:EVMQpsk:VIEW[:SELect]) also changes this parameter
Preset	1
State Saved	Yes
Min/Max	1/2

I/Q Measured Polar Graph

Windows: "I/Q Measured Polar Graph" on page 713, "Metrics" on page 713

Combination view of the I/Q demodulated signals using vector lines to connect the chip dots.

Example	`:DISP:EVMQ:VIEW POL`

I/Q Error

Windows: "Mag Error Graph" on page 714, "Phase Error Graph" on page 714, "EVM Graph" on page 714, "Small-sized Metrics" on page 715

Provides a combination view. This view consists of the above four windows.

User View

Lets you choose a View from the saved User Views for the current measurement. This panel only appears if a User View exists for the current measurement.

Remote Command	`:DISPlay:VIEW:ADVanced:SELect <alphanumeric>` `:DISPlay:VIEW:ADVanced:SELect?`
Example	Select Baseband as the current View `:DISP:VIEW:ADV:SEL “Baseband”`
Notes	You must be in the measurement whose View you are trying to set to send the command. You can only set Views for the current measurement using this command For predefined views, the parameter is derived from the view name that is shown in the View list in the user interface. For example, if you are trying to select the Trace Zoom view in the Swept SA measurement, you send: `:DISP:VIEW:ADV:SEL "Trace Zoom"` because “Trace Zoom” is the name of the View as seen in the Mode/Meas dialog or in the Display, View menu You *cannot* use the legacy View parameter (which in this case would be `TZOom`) with `:DISP:VIEW:ADV:SEL`

	<alphanumeric> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case. Thus, both of the following forms work:
	`:DISP:VIEW:ADV:SEL "Trace Zoom"`
	`:DISP:VIEW:ADV:SEL "TRACE ZOOM"`
	If the specified view is not a valid View, the query returns the error message "-224, Illegal parameter value; View with the name <alphanumeric> does not exist"
	If the display is disabled (via `:DISP:ENAB OFF`) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated

Backwards Compatibility SCPI	The legacy node `:DISPlay:VIEW[:SELect]` is retained for backwards compatibility, but it only supports predefined views

Restore Layout to Default

Restores the Layout to the default for Basic.

Modified Views are very temporary; if you exit the current measurement they are discarded, and they are not saved in State. To retain this View for later use, and to be able to return easily to your original Basic View, you can save your edited View as a "User View".

Save Layout as New View

Saves your new View as a User View. An alpha keyboard appears, which lets you name your new View; the default is the old View name plus a number.

Remote Command	`:DISPlay:VIEW:ADVanced:NAME <alphanumeric>`
Example	`:DISP:VIEW:ADV:NAME "Baseband"` Creates a new View named `Baseband` from the current View, and selects it as the current View
Notes	<alphanumeric> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case If <alphanumeric> name already exists as a View, the error message "-224, Illegal parameter value; View <alphanumeric> already exists" is generated If the display is disabled (via `:DISP:ENAB OFF`) then the error message "-221, Settings conflict; User View SCPI cannot be used while Display is disabled" is generated

Re-Save User View

You can re-edit a User View; if you make changes, then an asterisk will appear next to the User View's name. You can then tap **Re-Save User View** to save it back to its existing name, or **Save Layout as New View** to add another, new User View.

This is a front panel function only, there is no remote command available to perform this function. To do this remotely, you must first perform **Save Layout as New View**, then delete the old User View and rename the new one with the name of the View you just deleted.

Rename User View

You can rename the current View by giving it a new unique name. Only User Views can be renamed, if the current View is a Predefined View, an error occurs.

Remote Command	`:DISPlay:VIEW:ADVanced:REName <alphanumeric>`
Example	`:DISP:VIEW:ADV:REN "Baseband"`
Notes	`<alphanumeric>` is case insensitive; you can specify mixed case, however the name will be evaluated on a single case If the `<alphanumeric>` specifying the new name is already present in the list of View names, the error message "-224, Illegal parameter value; View <alphanumeric> already exists" is generated If the current View is a Predefined View, the error message "-224, Illegal parameter value; Cannot rename a Predefined View" is generated If the display is disabled (via `:DISP:ENAB OFF`) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated

Delete User View

You can delete the current View if it is a User View. The default view becomes the current view for the Measurement.

Remote Command	`:DISPlay:VIEW:ADVanced:DELete`
Example	`:DISP:VIEW:ADV:DEL`
Notes	`<alphanumeric>` is case insensitive; you can specify mixed case, however the name will be evaluated on a single case If the `<alphanumeric>` is not present in the list of View names, the error message "-224, Illegal parameter value; View <alphanumeric> does not exist" is generated If the current View is a Predefined View, the error message "-224, Illegal parameter value; Cannot delete a Predefined View" is generated If the display is disabled (via `:DISP:ENAB OFF`) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated

Delete All User Views

Deletes all previously saved User Views. The default view becomes the current view for the Measurement if a User View was the current view when this command was executed.

Remote Command	`:DISPlay:VIEW:ADVanced:DELete:ALL`
Example	`:DISP:VIEW:ADV:DEL:ALL`
Notes	Disabled if there are no User Views

View Editor Remote Commands

The following remote commands help you manage Views and User Views. Note that the SCPI node for User Views handles both Predefined and User Views. The legacy nodes, `:DISPlay:VIEW[:SELect]` and `:DISPlay:VIEW:NSEL`, are retained for backwards compatibility, but they only support predefined views.

View Listing Query

Returns a string containing a comma-separated list of names for *all* the Views, including User Views, available for the current Measurement.

Remote Command	`:DISPlay:VIEW:ADVanced:CATalog?`
Example	`:DISP:VIEW:ADV:CAT?`
Notes	Returns a quoted string of the available Views for the current measurement, separated by commas. The list includes names for *all* the Views, including User Views, available for the current Measurement Example: `"Normal,Trace Zoom,Spectrogram,Baseband,myView1,yourView1"` No distinction is made between Predefined and User Views If you switch measurements with the display disabled (via `:DISP:ENAB OFF`), then query the list of available Views, the result is undefined

User View Listing Query

Returns a string containing a comma-separated list of names for *only* the User Views available for the current Measurement.

Remote Command	`:DISPlay:VIEW:ADVanced:USER:CATalog?`
Example	`:DISP:VIEW:ADV:USER:CAT?`
Notes	Returns a quoted string of the available User Views for the current measurement, separated by commas. Example: `"Baseband,myView1,yourView1"` If you switch measurements with the display disabled (see "Display Enable (Remote Command Only)" on page 1894), then query the list of available Views, the result is undefined

3.6.5.3 Annotation

Contains controls for setting up the annotation for the current Mode or Measurement.

Graticule

Turns the display graticule On or Off for all windows with graticules in all measurements in the current Mode. Also turns the graticule Y-Axis annotation on and off.

Remote Command	`:DISPlay:GRATicule[:STATe] OFF | ON | 0 | 1` `:DISPlay:GRATicule[:STATe]?`
Example	`:DISP:GRAT OFF`
Notes	The graticule is the set of horizontal and vertical lines that make up the grid/divisions for the X-Axis and Y-Axis
Preset	`ON`
State Saved	Saved in instrument state

Backwards Compatibility SCPI	`:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe] OFF | ON | 0 | 1`
	`:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe]?`
	This command is accepted for backwards compatibility with older instruments, but the `WINDow`, `TRACe` and `GRID` parameters are ignored

Screen Annotation

Controls the display of the annunciation and annotation around the graticule, including any annotation on lines (such as the display line, the threshold line, etc.) and the Y-Axis annotation, for all windows with screen annotation in all measurements in the current Mode.

This does *not* include marker annotation (or the N dB result). When `OFF`, the graticule expands to fill the entire graticule area, leaving only the 1.5% gap above the graticule, as described in the **Trace** section.

Remote Command	`:DISPlay:ANNotation:SCReen[:STATe] OFF | ON | 0 | 1` `:DISPlay:ANNotation:SCReen[:STATe]?`
Example	`:DISP:ANN:SCR OFF`
Dependencies	Grayed-out and forced to `OFF` when **System Display Settings**, **Annotation** is `OFF`
Preset	`ON` This remains `OFF` through a Preset when **System Display Settings**, **Annotation** is set to `OFF`
State Saved	Saved in instrument state

Trace Annotation

Turns on and off the labels on the traces, showing their detector (or their Math Mode) as described in the **Trace** section, for all windows in all measurements in the current Mode for which Trace Annotation on/off is supported.

If Trace Math is being performed on a trace, then the Trace Math annotation replaces the detector annotation.

For measurements that support limit lines, this key also turns on and off the labels on the Limit Lines. The label is the Limit number annotation and Limit Comment displayed on the graph. If the length of the comment is greater than 20 characters, the first 8 characters and the last 8 characters are displayed, joined with ….

Remote Command	`:DISPlay:ANNotation:TRACe[:STATe] ON | OFF | 1 | 0` `:DISPlay:ANNotation:TRACe[:STATe]?`
Example	`:DISP:ANN:TRAC OFF`
Preset	`OFF`
State Saved	Saved in instrument state

Control Annotation

Turns on and off the display of values on the Active Function controls for all measurements in the current Mode. This is a security feature.

Remote Command	`:DISPlay:ACTivefunc[:STATe] ON | OFF | 1 | 0` `:DISPlay:ACTivefunc[:STATe]?`
Example	`:DISP:ACT OFF`
Dependencies	Grayed out and forced to `OFF` when **System Display Settings**, **Annotation** is `OFF`
Preset	`ON` This remains `OFF` through a Preset when **System Display Settings**, **Annotation** is set to `OFF`
State Saved	Saved in instrument state

Meas Bar

Turns the Measurement Bar at the top of the screen on and off for all measurements in the current Mode. When `OFF`, the graticule area expands to fill the area formerly occupied by the Measurement Bar.

Remote Command	`:DISPlay:ANNotation:MBAR[:STATe] OFF | ON | 0 | 1` `:DISPlay:ANNotation:MBAR[:STATe]?`
Example	`:DISP:ANN:MBAR OFF`
Dependencies	Grayed out and forced to `OFF` when **System Display Settings**, **Annotation** is `OFF`

Preset	ON This remains OFF through a Preset when **System Display Settings**, **Annotation** is set to OFF
State Saved	Saved in instrument state

Display Enable (Remote Command Only)

Turns the display on/off, including the display drive circuitry. The backlight stays lit to confirm that the instrument is on. The display enable setting is mode global. Theare three reasons for turning the display off:

1. To increase speed as much as possible by freeing the instrument from having to update the display
2. To reduce emissions from the display, drive circuitry
3. For security purposes

If you have turned off the display:

– and you are in local operation, the display can be turned back on by pressing any key or by sending `:SYSTem:DEFaults MISC` or `:DISPlay:ENABle ON` (neither `*RST` nor :SYSTem:PRESet enable the display)

– and you are in remote operation, the display can be turned back on by pressing the **Local** or **Esc** keys, or by sending `:SYSTem:DEFaults MISC` or `:DISPlay:ENABle ON` (neither `*RST` nor `:SYSTem:PRESet` enable the display)

– and you are using either the `:SYSTem:KLOCk` command or GPIB local lockout, then *no* front-panel key press will turn the display back on. You must turn it back on remotely.

If the display is `OFF`, many SCPI commands related to User Views and Multiscreen functionality do not work, and return the error messages "-221, Settings conflict; Screen SCPI cannot be used when Display is disabled" or "221, Settings conflict; View SCPI cannot be used while Display is disabled". These commands include:

Name	Command
Select User View	:DISPlay:VIEW:ADVanced:SELect
Rename User View	:DISPlay:VIEW:ADVanced:REName
Delete User View	:DISPlay:VIEW:ADVanced:DELete
Create User View	:DISPlay:VIEW:ADVanced:NAME
Select Screen	:INSTrument:SCReen:SELect
Delete Screen	:INSTrument:SCReen:DELete
Delete All But This Screen	:INSTrument:SCReen:DELete:ALL
Add Screen	:INSTrument:SCReen:CREate
Rename Screen	:INSTrument:SCReen:REName
Sequencer On/Off	:SYSTem:SEQuencer

Remote Command	:DISPlay:ENABle OFF | ON | 0 | 1 :DISPlay:ENABle?
Example	:DISP:ENAB OFF
Couplings	:DISP:ENAB OFF turns Backlight OFF and :DISP:ENAB ON turns Backlight ON, but changing Backlight settings does *not* change the state of :DISP:ENAB
Preset	ON Set by :SYST:DEF MISC, but not affected by *RST or :SYSTem:PRESet
State Saved	Not saved in instrument state
Backwards Compatibility Notes	:SYST:PRES no longer turns on :DISPlay:ENABle as it did in legacy analyzers

3.6.6 Freq

The Freq key opens the Frequency menu, which contains controls that allow you to control the Frequency and Channel parameters of the instrument.

Some features in the Frequency menu are the same for all measurements in the current Mode – they do not change as you change measurements. Settings like these are called "Meas Global" and are unaffected by Meas Preset. For example, the Center Freq setting is the same for all measurements - it does not change as you change measurements.

3.6.6.1 Settings

The Settings Tab contains controls that pertain to the X axis parameters of the measurement. These parameters control how data on the vertical (X) axis is displayed and control instrument settings that affect the horizontal axis.

Center Frequency

Sets the frequency that corresponds to the horizontal center of the graticule. While adjusting the Center Frequency the Span is held constant.

The center frequency setting is the same for all measurements within a mode, that is, it is Meas Global. Some modes are also able to share a Mode Global center frequency value. If this is the case, the Mode will have a Global tab in its Meas Setup menu.

The Center Freq function sets (and queries) the Center Frequency for the currently selected input. If your instrument has multiple inputs, and you select another input, the Center Freq changes to the value for that input. SCPI commands are available to directly set the Center Freq for a specific input.

Center Freq is remembered as you go from input to input. Thus you can set a Center Freq of 10 GHz with the RF Input selected, change to BBIQ and set a Center Freq of

20 MHz, then switch to External Mixing and set a Center Freq of 60 GHz, and when you go back to the RF Input the Center Freq will go back to 10 GHz; back to BBIQ and it is 20 MHz; back to External Mixing and it is 60 GHz.

– See "RF Center Freq" on page 778

– See "Ext Mix Center Freq" on page 779

– See "I/Q Center Freq" on page 780

– See "Center Frequency Presets" on page 776

Remote Command	`[:SENSe]:FREQuency:CENTer <freq>` `[:SENSe]:FREQuency:CENTer?`

Example	`:FREQ:CENT 50 MHz`
	sets Center Frequency to 50 MHz
	`:FREQ:CENT UP`
	increments the Center Frequency by the value of CF Step
	`:FREQ:CENT?`
	returns the current value of Center Frequency

Notes	This command sets the RF, External Mixing or I/Q Center Frequency depending on the selected input For RF input it is equivalent to `:FREQ:RF:CENT` For I/Q input it is equivalent to `:FREQ:IQ:CENT` For External Mixer it is equivalent to `:FREQ:EMIX:CENT` Preset and Max values are dependent on Hardware Options (5xx) If no terminator (e.g. MHz) is sent the terminator Hz is used. If a terminator with unit other than Frequency is used, an invalid suffix error message is generated
Preset	Depends on instrument maximum frequency, mode, measurement, and selected input See "Center Frequency Presets" on page 776 and "RF Center Freq" on page 778 and "Ext Mix Center Freq" on page 779 and "I/Q Center Freq" on page 780
State Saved	Saved in instrument state
Min	Depends on instrument maximum frequency, mode, measurement, and selected input See "Center Frequency Presets" on page 776 and "RF Center Freq" on page 778 and "Ext Mix Center Freq" on page 779 and "I/Q Center Freq" on page 780
Max	Depends on instrument maximum frequency, mode, measurement, and selected input See "Center Frequency Presets" on page 776 and "RF Center Freq" on page 778 and "Ext Mix Center Freq" on page 779 and "I/Q Center Freq" on page 780
Status Bits/OPC dependencies	Non-overlapped

Center Frequency Presets

The following table provides the Center Frequency Presets for the Spectrum Analyzer mode, and the Max Freq, for the various frequency options:

Freq Option	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
503 (all but CXA)	1.805 GHz	3.6 GHz	3.7 GHz
503 (CXA)	1.505 GHz	3.0 GHz	3.08 GHz
507 (all but CXA)	3.505 GHz	7.0 GHz	7.1 GHz
507 (CXA)	3.755 GHz	7.5 GHz	7.58 GHz
508 (all but MXE)	1.805 GHz	3.6 GHz	8.5 GHz
508 (MXE)	4.205 GHz	8.4 GHz	8.5 GHz
513	6.805 GHz	13.6 GHz	13.8 GHz
526 (except CXA and MXE)	13.255 GHz	26.5 GHz	27.0 GHz*
526 (CXA)	13.255 GHz	26.5 GHz	26.55 GHz
526 (MXE)	1.805 GHz	3.6 GHz	27.0 GHz
532	16.005 GHz	32.0 GHz	32.5 GHz
540	20.005 GHz	40.0 GHz	40.5 GHz
543	21.505 GHz	43.0 GHz	43.0 GHz
544	22.005 GHz	44.0 GHz	45.0 GHz
550	25.005 GHz	50.0 GHz	52 GHz
F03 (CXA-m)	1.505 GHz	3.0 GHz	3.08 GHz
F07 (CXA-m)	3.755 GHz	7.5 GHz	7.575 GHz
F13 (CXA-m)	6.805 GHz	13.6 GHz	13.8 GHz
F26 (CXA-m)	13.255 GHz	26.5 GHz	26.55 GHz
504 (M9420A/21A, M8920A)	2.145 GHz	3.88GHz	3.88 GHz
506 (M9420A/21A, M8920A)	3.245 GHz	6.08GHz	6.08 GHz
F06 (M9410A/11A)	1.0 GHz	6.08 GHz	6.08 GHz
F06 (M9415A)	1 GHz	1.08 GHz	6.6 GHz
F08 (M9415A)	1 GHz	1.08 GHz	8.6 GHz
F12 (M9415A)	1 GHz	1.08 GHz	12.9 GHz

*For option 526, the Max CF in RTSA is 26.999999995 GHz.

N9041B Center Freq Presets

Input	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
Input 1, all models	25.005 GHz	50.0 GHz	52 GHz
Input 2, opt 585	42.505 GHz	85.0 GHz	86 GHz
Input 2, opt 590	45.005 GHz	90.0 GHz	92 GHz
Input 2, opt 5CX	55.005 GHz	110.0 GHz	110 GHz

Input 2, CXA and MXE

Model	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
CXA opt C75	0.7505 GHz	1.5 GHz	1.58 GHz
MXE	505 MHz	1 GHz	1.000025 GHz

Tracking Generator Frequency Limits (CXA only)

Tracking Generator Option	Min Freq (clips to this freq when turn TG on and can't tune below while TG on)	If above this Freq, Stop Freq clipped to this Freq when TG turned on	Max Freq (can't tune above) while TG on
T03	9 kHz	3.0 GHz	3.08 GHz
T06	9 kHz	6.0 GHz	6.05 GHz

Tracking Generator Frequency Limits(CXA-m only)

Tracking Generator Option	Min Freq (clips to this freq when turn TG on and can't tune below while TG on)	If above this Freq, Stop Freq clipped to this Freq when TG turned on	Max Freq (can't tune above) while TG on
T03	2 MHz	3.08 GHz	3.08 GHz
T07	2 MHz	7.575 GHz	7.575 GHz
T13	2 MHz	13.8 GHz	13.8 GHz
T26	2 MHz	26.55 GHz	26.55 GHz

RF Center Freq

SCPI command for specifying the RF Center Frequency. This command will set the Center Frequency to be used when the RF input is selected, even if the RF input is not the input that is selected at the time the command is sent. Note that the Center Freq function in the Frequency menu on the front panel always applies to the currently selected input.

Remote Command	`[:SENSe]:FREQuency:RF:CENTer <freq>` `[:SENSe]:FREQuency:RF:CENTer?`
Example	`:FREQ:RF:CENT 30 MHz` `:FREQ:RF:CENT?`
Notes	This command is the same in all modes, but the parameter is Measurement Global. So the value is independent in each mode and common across all the measurements in the mode
Dependencies	If the electronic/soft attenuator is enabled, any attempt to set Center Frequency such that the Stop Frequency would be >3.6 GHz fails and results in an advisory message. If the equivalent SCPI command is sent, this same message is generated as part of a “-221, Settings conflict” warning
Preset	See table above

State Saved	Saved in instrument state
Min	-79.999995 MHz
Max	See the table above. Basically instrument maximum frequency - 5 Hz

Ext Mix Center Freq

SCPI command for specifying the External Mixer Center Frequency. This command will set the Center Frequency to be used when the External Mixer is selected, even if the External Mixer input is not the input which is selected at the time the command is sent. Note that the Center Freq function in the Frequency menu on the front panel always applies to the currently selected input.

Remote Command	`[:SENSe]:FREQuency:EMIXer:CENTer <freq>` `[:SENSe]:FREQuency:EMIXer:CENTer?`
Example	`:FREQ:EMIX:CENT 60 GHz` `:FREQ:EMIX:CENT?`
Notes	This command is the same in all modes, but the parameter is Measurement Global. So the value is independent in each mode and common across all the measurements in the mode
Couplings	When returning to External Mixing after having been switched to one of the other inputs (e.g., RF), you will come back into the settings that you had when you left External Mixing. So you will come back to the band you were in with the Center Frequency that you had. However, Span is not an input-dependent parameter, therefore you will bring the span over from the other input. Therefore, the instrument comes back with the span from the previous input, limited as necessary by the current mixer setup
Preset	When a Mode Preset is performed while in External Mixing, the Start frequency of the current Mode is set to the nominal Min Freq of the lowest harmonic range in the Harmonic Table for the current mixer setup. Similarly, the Stop frequency of the current Mode is set to the nominal Max Freq of the highest harmonic range in the Harmonic Table. The Center Freq thus presets to the point arithmetically equidistant from these two frequencies Note that if the current measurement has a limited Span available to it, and cannot achieve the Span shown in the table (Span=Stop Freq – Start Freq), the instrument uses the maximum Span the measurement allows, and still sets the Center Freq to the midpoint of the Start and Stop Freq values in the Harmonic Table When Restore Input/Output Defaults is performed, the mixer presets to the 11970A, whose Start and Stop frequencies are 26.5 and 40 GHz respectively. The center of these two frequencies is 33.25 GHz Therefore, after a Restore Input/Output Defaults, if you go into External Mixing and do a Mode Preset while in the Spectrum Analyzer Mode, the resulting Center Freq is 33.25 GHz
State Saved	Yes
Min	The minimum frequency in the currently selected mixer band + 5 Hz
Max	The maximum frequency in the currently selected mixer band - 5 Hz

I/Q Center Freq

SCPI command for specifying the I/Q Center Frequency. This command will set the Center Frequency to be used when the I/Q input is selected, even if the I/Q input is not the input which is selected at the time the command is sent. Note that the Center Freq function in the Frequency menu on the front panel always applies to the currently selected input.

Remote Command	`[:SENSe]:FREQuency:IQ:CENTer <freq>` `[:SENSe]:FREQuency:IQ:CENTer?`
Example	`:FREQ:IQ:CENT 30 MHz`
Notes	This command is the same in all modes, but the parameter is Measurement Global. So the value is independent in each mode and common across all the measurements in the mode
Preset	0 Hz
State Saved	Saved in instrument state
Min	-40.049995 MHz
Max	40.049995 MHz

CF Step

Changes the step size for the center frequency and start and stop frequency functions. Once a step size has been selected and the center frequency function is active, the step keys (and the UP|DOWN parameters for Center Frequency from remote commands) change the center frequency by the step-size value. The step size function is useful for finding harmonics and sidebands beyond the current frequency span of the instrument.

Note that the start and stop frequencies also step by the CF Step value.

Remote Command	`[:SENSe]:FREQuency:CENTer:STEP[:INCRement] <freq>`
	`[:SENSe]:FREQuency:CENTer:STEP[:INCRement]?`
	`[:SENSe]:FREQuency:CENTer:STEP:AUTO OFF | ON | 0 | 1`
	`[:SENSe]:FREQuency:CENTer:STEP:AUTO?`

Example	`:FREQ:CENT:STEP 500 MHz`
	`:FREQ:CENT UP`
	increases the current center frequency value by 500 MHz
	`:FREQ:CENT:STEP?`
	`:FREQ:CENT:STEP:AUTO ON`
	`:FREQ:CENT:STEP:AUTO?`

Notes	Preset and Max values are dependent on Hardware Options (5xx)

Dependencies	Span, RBW, Center frequency If the electronic/soft attenuator is enabled, any attempt to change the value of the center frequency >3.6 GHz by pressing the Up-arrow key, fails and results in an advisory message. If the equivalent SCPI command is sent, this same message is generated as part of a "-221, Settings conflict" warning
Couplings	When auto-coupled in a non-zero span, the center frequency step size is set to 10% of the span. When auto-coupled in zero span, the center frequency step size is set to the equivalent -3 dB RBW value
Preset	Auto ON
State Saved	Saved in instrument state
Min	– (the maximum frequency of the instrument). That is, 27 GHz max freq instrument has a CF step range of +/- 27 GHz. Note that this is the maximum frequency given the current settings of the instrument, so in External Mixing, for example, it is the maximum frequency of the current mixer band
Max	The maximum frequency of the instrument. That is, 27 GHz max freq instrument has a CF step range of +/- 27 GHz. Note that this is the maximum frequency given the current settings of the instrument, so in External Mixing, for example, it is the maximum frequency of the current mixer band
Status Bits/OPC dependencies	non-overlapped

3.6.7 Marker

Accesses a menu that enables you to select, set up and control the markers for the current measurement. If there are no active markers, Marker selects marker 1, sets it to Normal and places it at the center of the display. If the selected marker is Off, it is set to Normal and placed it at the center of the screen on the trace determined by the Marker Trace rules.

For more detailed information on the types of Markers and the interaction between Markers, see the Marker section of the Swept SA measurement.

3.6.7.1 Select Marker

Specifies the selected marker. The term "selected marker" is used throughout this document to specify which marker will be affected when you change marker settings, perform a Peak Search, etc.

The Select Marker control appears above the menu panel, indicating that it applies to all controls in the Marker menu panels. Select Marker is blanked if you select a tab whose controls do NOT depend on the selected marker (e.g., Counter).

On any menu tab for which **Select Marker** displays, the first control is always **Marker Frequency|Time**.

Notes	The selected marker is remembered even when not in the Marker menu and is used if a Search is done or a Band Function is turned on or for Signal Track or Continuous Peak
Preset	Marker 1

State Saved	The number of the selected marker is saved in instrument state
Annunciation	Appears in the marker results block label for Normal and Delta markers

3.6.7.2 Settings

The controls on the Settings tab include the Marker active function and a radio button selection of the marker control mode (Normal, Delta, or Off) for the selected marker, as well as additional functions that help you use markers.

Marker Chip Time

Marker Trace: I/Q Polar

Sets the marker Chip value in the current marker for the I/Q Polar trace. It has no effect if the control mode is **Off**, but if the control mode is Normal, this is the SCPI equivalent of entering a Chip value.

This command is valid only when Marker Trace ‘POLar’(I/Q Polar) is active. For any other Marker Trace, the command is ignored.

Remote Command	`:CALCulate:EVMQpsk:MARKer[1]|2|...|12:CHIP <real>` `:CALCulate:EVMQpsk:MARKer[1]|2|...|12:CHIP?`
Example	`:CALC:EVMQ:MARK3:CHIP 0` `:CALC:EVMQ:MARK3:CHIP?`
Notes	If no suffix is sent, ‘chips’ is used. If a suffix is sent that does not match ‘chips’, an error “Invalid suffix” is generated The query returns the marker’s ‘chips’ value in the trace if the control mode is Normal. The query is returned in ‘chips’. If the marker is Off the response is not a number (NAN)
Preset	Start point of the trace in the display window
State Saved	No
Min	-9.9E+37
Max	9.9E+37
Annotation	Mkr # <Chip Value>, <X value> and <Y value> upper right on graph.

Marker Trace: EVM, Mag Error, Phase Error

Sets the marker X Axis value in the current marker X Axis Scale unit. It has no effect if the control mode is Off, but is the SCPI equivalent of entering an X value if the control mode is Normal or Delta.

NOTE This command is not valid when Marker Trace is `POLar` and ignored. Marker Chip Time is supported instead.

Remote Command	`:CALCulate:EVMQpsk:MARKer[1]|2|...|12:X <real>` `:CALCulate:EVMQpsk:MARKer[1]|2|...|12:X?`
Example	`:CALC:EVMQ:MARK3:X 0.0` `:CALC:EVMQ:MARK3:X?`
Notes	If no suffix is sent, uses the fundamental units for the current marker X Axis Scale. If a suffix is sent that does not match the current marker X Axis Scale unit, an error “Invalid suffix” is generated The query returns the marker’s absolute X Axis value if the control mode is **Normal**, or the offset from the marker’s reference marker if the control mode is **Delta**. The query is returned in the fundamental units for the current marker X Axis scale: Hz for **Frequency** and **Inverse Time**, seconds for **Period** and **Time**. If the marker is **Off** the response is not a number
Preset	After a preset, all Markers are turned OFF, so Marker X Axis Value query returns a Not A Number (NAN)
State Saved	No
Min	–9.9E+37
Max	9.9E+37
Annotation	Mkr # <X value> and <Marker value> upper right on graph

Marker X Axis Position (Remote Command only)

Sets the marker X position in trace points. It has no effect if the control mode is **Off,** but is the SCPI equivalent of entering a value if the control mode is Normal or Delta - except in trace points rather than X Axis Scale units. The entered value is immediately translated into the current X Axis Scale units for setting the value of the marker.

Remote Command	`:CALCulate:EVMQpsk:MARKer[1]|2|...|12:X:POSition <real>` `:CALCulate:EVMQpsk:MARKer[1]|2|...|12:X:POSition?`
Example	`:CALC:EVMQ:MARK:X:POS 0.0` `:CALC:EVMQ:MARK10:X:POS?`
Notes	The query returns the marker’s absolute X Axis value in trace points if the control mode is Normal, or the offset from the marker’s reference marker in trace points if the control mode is Delta. The value is returned as a real number, not an integer, corresponding to the translation from X Axis Scale units to trace points. If the marker is **Off** the response is *Not A Number (NAN)* This command is not available when Marker Trace of the selected marker (`:CALCulate:EVMQpsk:MARKer[1]|2|3|4|5|6|7|8|9|10|11|12:TRACe?`) is set to POLar. In this case, this command is ignored
Preset	After a preset, all Markers are turned OFF, so Marker X Axis Value query returns a Not A Number (NAN)
State Saved	No
Min	-9.9E+37
Max	9.9E+37

Marker Y Axis Value (Remote Command only)

Queries the marker Y Axis value in the current marker Y Axis unit.

Remote Command	`:CALCulate:EVMQpsk:MARKer[1]|2|...|12:Y?`
Example	`:CALC:EVMQ:MARK11:Y?`
Notes	The query returns the marker Y-axis result if the control mode is Normal or **Delta**. If the marker is **Off**, the response is not a number (NAN)
Preset	Result dependent on markers setup and signal source
State Saved	No
Backwards Compatibility SCPI	`:CALCulate:EVMQpsk:MARKer[1]|2|...|12:FUNCtion:RESult?`

Marker Mode

Sets the marker control mode to Normal, Delta, or Off. All interactions and dependencies detailed under the control description are enforced when the remote command is sent. If the selected marker is Off, pressing Marker sets it to Normal and places it at the center of the screen on the trace determined by the Marker Trace rules. At the same time, Marker X Axis Value appears on the Active Function area.

The default active function is the active function for the currently selected marker control mode. If the current control mode is Off, there is no active function and the active function is turned off.

Remote Command	`:CALCulate:EVMQpsk:MARKer[1]|2|...|12:MODE POSition | DELTa | OFF` `:CALCulate:EVMQpsk:MARKer[1]|2|...|12:MODE?`
Example	`:CALC:EVMQ:MARK:MODE POS` `:CALC:EVMQ:MARK:MODE?`
Preset	`OFF`
State Saved	Saved in instrument state
Range	`POSition|DELTa|OFF`
Annotation	Mkr # <X value> and <Marker value> upper right on graph When Marker Trace is Polar in WCDMA mode: Mkr # <Symbol Value>, <X value> and <Y value> upper right on graph

Backward Compatibility SCPI Commands

Sets or queries the state of a marker. Setting a marker which is OFF to state ON or 1 puts it in Normal mode and places it at the center of the screen.

Remote	`:CALCulate:EVMQpsk:MARKer[1]|2|...|12:STATe OFF | ON | 0 | 1`

Command	:CALCulate:EVMQpsk:MARKer[1]|2|...|12:STATe?
Example	:CALC:EVMQ:MARK3:STAT ON :CALC:EVMQ:MARK3:STAT?
Preset	OFF
State Saved	Saved in instrument state
Range	OFF|ON

Delta Marker (Reset Delta)

Pressing this button is exactly the same as pressing the "Delta" selection on the Marker Mode radio button. The selected marker becomes a Delta Marker. If the selected marker is already a Delta marker, the reference marker is moved to the current position of the selected marker, thus resetting the Delta to zero.

Marker Settings Diagram

The Marker Settings Diagram lets you configure the Marker system using a visual utility.

All Markers Off

Turns off all markers.

Remote Command	:CALCulate:EVMQpsk:MARKer:AOFF
Example	:CALC:EVMQ:MARK:AOFF

Couple Markers

When this function is On, moving any marker causes an equal X Axis movement of every other marker which is not Fixed or Off. By "equal X Axis movement" we mean that we preserve the difference between each marker's X Axis value (in the fundamental x-axis units of the trace that marker is on) and the X Axis value of the marker being moved (in the same fundamental x-axis units).

When the marker is assigned to the Polar graph, a chip value is coupled instead of an X axis value.

This may result in markers going off screen.

Remote Command	:CALCulate:EVMQpsk:MARKer:COUPle[:STATe] ON | OFF | 1 | 0 :CALCulate:EVMQpsk:MARKer:COUPle[:STATe]?
Example	:CALC:EVMQ:MARK:COUP ON

	:CALC:EVMQ:MARK:COUP?
Preset	OFF Presets on Mode Preset and All Markers Off
State Saved	Saved in instrument state

3.6.7.3 Peak Search

The controls on the Peak Search tab allow you to move the marker to selected peaks of the signal, giving you enormous analysis capabilities, particularly when combined with the Delta Marker function.

NOTE Pressing the **Peak Search** hardkey automatically moves you to the **Peak Search** page of the **Marker** menu *and* performs a Peak Search.

Pressing the **Peak Search** tab once you are already *in* the **Marker** menu does *not* perform a Peak Search.

Marker Chip Time

The Marker Chip Time control is the fundamental control that you use to move a marker around on the trace. This is the same as the Marker Chip Time control on the Settings tab.

Peak Search

Pressing the **Peak Search** control moves the selected marker to the trace point which has the maximum y-axis value for that marker's trace.

NOTE Pressing the **Peak Search** hardkey automatically moves you to the **Peak Search** page of the **Marker** menu *and* performs a Peak Search.

Remote Command	:CALCulate:EVMQpsk:MARKer[1]|2|...|12:MAXimum
Example	:CALC:EVMQ:MARK2:MAX :SYST:ERR? can be used to query the errors to determine if a peak is found. The message "No peak found" will be returned after an unsuccessful search
Notes	Sending this command selects the subopcoded marker This command does not work when the selected marker is located on the polar trace. In this case, the command is ignored

Next Peak

Pressing Next Peak moves the selected marker to the peak that is next lower in amplitude than the current marker value. Only peaks which meet all enabled peak criteria are considered. If there is no valid peak lower than the current marker position, a “No peak found” message is generated and the marker is not moved.

If the selected marker was off, then it is turned on as a normal marker and a peak search is performed.

Remote Command	`:CALCulate:EVMQpsk:MARKer[1]|2|...|12:MAXimum:NEXT`
Example	`:CALC:EVMQ:MARK2:MAX:NEXT`
Notes	Sending this command selects the subopcoded marker
State Saved	Not part of saved state

Next Peak Right

Pressing Next Pk Right moves the selected marker to the nearest peak right of the current marker that meets all enabled peak criteria. If there is no valid peak to the right of the current marker position, a “No peak found” message is generated and the marker is not moved.

If the selected marker was off, then it is turned on as a normal marker and a peak search is performed.

Remote Command	`:CALCulate:EVMQpsk:MARKer[1]|2|...|12:MAXimum:RIGHt`
Example	`:CALC:EVMQ:MARK2:MAX:RIGH`
Notes	Sending this command selects the subopcoded marker
State Saved	Not part of saved state

Next Peak Left

Pressing Next Pk Left moves the selected marker to the nearest peak left of the current marker that meets all enabled peak criteria. If there is no valid peak to the left of the current marker position, a “No peak found” message is generated and the marker is not moved.

If the selected marker was off, then it is turned on as a normal marker and a peak search is performed.

Remote Command	`:CALCulate:EVMQpsk:MARKer[1]|2|...|12:MAXimum:LEFT`
Example	`:CALC:EVMQ:MARK2:MAX:LEFT`
State Saved	Not part of saved state

Minimum Peak

Moves the selected marker to the minimum y-axis value on the current trace. Minimum (negative) peak searches do not have to meet the peak search criteria. It just looks for the lowest y-axis value. If the selected marker is Off, it is turned on before the minimum search is performed.

Remote Command	`:CALCulate:EVMQpsk:MARKer[1]|2|...|12:MINimum`
Example	`:CALC:EVMQ:MARK:MIN`
Notes	Sending this command selects the subopcoded marker
State Saved	Not part of saved state

Pk-Pk Search

Finds and displays the amplitude and frequency (or time, if in zero span) differences between the highest and lowest y-axis value. It places the selected marker on the minimum value on its selected trace. And it places that marker’s reference marker on the peak of its selected trace.

This function turns on the reference marker and sets its mode to Normal if it is not already on. (These markers may be on two different traces.)

The rules for finding the maximum peak are exactly the same as for Peak Search, including the use of the peak criteria rules. However, the minimum trace value is not required to meet any criteria other than being the minimum y-axis value in the trace.

If the selected marker is off, a delta type marker is turned on and the peak-to-peak search is done. If the selected marker is on, but it is not a delta marker, then it is changed to delta which turns on the reference marker if needed, and then it performs the peak-to-peak function.

Remote Command	`:CALCulate:EVMQpsk:MARKer[1]|2|...|12:PTPeak`
Example	`:CALC:EVMQ:MARK:PTP`
Notes	Turns on the Marker D active function Sending this command selects the subopcoded marker
Dependencies	Pk-Pk Search is not available when Coupled Markers is on
Couplings	The selected marker becomes a delta marker if not already in delta mode
State Saved	Not part of saved state

Marker Delta

Pressing this button is exactly the same as pressing the “Delta” selection on the Marker Mode radio button on the Settings tab. The selected marker becomes a Delta Marker. If the selected marker is already a Delta marker, the reference marker is moved to the current position of the selected marker, thus resetting the Delta to zero.

The control is duplicated here in the Peak Search Menu to allow you to conveniently perform a peak search and change the marker's control mode to Delta without having to access two separate menus.

3.6.7.4 Properties

The controls on the Properties tab are used to set certain properties of the selected marker.

Marker Chip Time

The Marker Chip Time control is the fundamental control that you use to move a marker around on the trace. This is the same as the Marker Chip Time control on the Settings tab.

Relative To

Selects the marker to which the selected marker is relative (its reference marker).

Every marker has another marker to which it is relative. This marker is referred to as the "reference marker" for that marker. This attribute is set by the Marker, Properties, Relative To key. The marker must be a Delta marker to make this attribute relevant. If it is a Delta marker, the reference marker determines how the marker is controlled and how its value is displayed. A marker cannot be relative to itself.

Remote Command	`:CALCulate:EVMQpsk:MARKer[1]|2|...|12:REFerence <integer>` `:CALCulate:EVMQpsk:MARKer[1]|2|...|12:REFerence?`
Example	`:CALC:EVMQ:MARK:REF 5` `:CALC:EVMQ:MARK:REF?`
Notes	This command causes the marker specified with the subopcode to become selected Range (for SCPI command): 1 to 12. If the range is exceeded the value is clipped A marker cannot be relative to itself so that choice is not available, and if sent from SCPI generates error -221: "Settings conflict; marker cannot be relative to itself" When queried a single value is returned (the specified marker numbers relative marker)
Couplings	The act of specifying the selected marker's reference marker makes the selected marker a Delta marker If the reference marker is off it is turned on in Normal mode at the delta marker location
Preset	The preset default "Relative To" marker (reference marker) is the next higher numbered marker (current marker +1). For example, if marker 2 is selected, then it's default reference marker is marker 3. The exception is marker 12, which has a default reference of marker 1 Set to the defaults by using Restore Mode Defaults. This is not reset by Marker Off, All Markers Off, or Preset
State Saved	Saved in instrument state. Not affected by Marker Off and hence not affected by Preset or power cycle

Min	1
Max	12
Annunciation	Appears in the marker label of a **Delta** marker

Marker Trace

Assigns the specified marker to the designated trace.

Remote Command	`:CALCulate:EVMQpsk:MARKer[1]|2|...|12:TRACe POLar | EVM | PERRor | MERRor` `:CALCulate:EVMQpsk:MARKer[1]|2|...|12:TRACe?`
Example	`:CALC:EVMQ:MARK:TRAC MERR` `:CALC:EVMQ:MARK:TRAC?`
Notes	Assigns the specified marker to the designated trace
Preset	`POLar`
State Saved	Yes
Range	I/Q Polar|EVM|Phase Error|Mag Error

Marker Settings Diagram

The Marker Settings Diagram lets you configure the Marker system using a visual utility. This is the same as the"Marker Settings Diagram" on page 785 control on the Settings tab.

3.6.8 Meas Setup

The Meas Setup menu panel contains functions for setting up the measurement parameters.

3.6.8.1 Settings

This tab enables you to set measurement parameters.

Avg|Hold Number

Specifies the number of N averages that will be used for the measurement. After the specified number (average counts) have been averaged, the averaging mode (termination control) setting determines the averaging action.

Remote Command	`[:SENSe]:EVMQpsk:AVERage:COUNt <integer>` `[:SENSe]:EVMQpsk:AVERage:COUNt?`

Example	`:EVMQ:AVER:COUN 1001` `:EVMQ:AVER:COUN?`
Preset	10
State Saved	Yes
Min/Max	1/10000

Averaging On/Off

Turns averaging on or off.

Remote Command	`[:SENSe]:EVMQpsk:AVERage[:STATe] OFF | ON | 0 | 1` `[:SENSe]:EVMQpsk:AVERage[:STATe]?`
Example	`:EVMQ:AVER OFF` `:EVMQ:AVER?`
Preset	ON
State Saved	Yes
Range	OFF|ON

Averaging Mode

Toggles the averaging mode between Exp (exponential) and Repeat. This selection only affects the averaging result after the number of N averages is reached. The N is set using the control “Avg|Hold Number.”

EXPonential	Each successive data acquisition after the average count is reached, is exponentially weighted and then combined with the existing average
REPeat	After reaching the average count, the averaging is reset and a new average is started

Remote Command	`[:SENSe]:EVMQpsk:AVERage:TCONtrol EXPonential | REPeat` `[:SENSe]:EVMQpsk:AVERage:TCONtrol?`
Example	`:EVMQ:AVER:TCON REP` `:EVMQ:AVER:TCON?`
Notes	Selects the type of termination control used for averaging. This determines the averaging action after the specified number of frames (average count) is reached Exponential - Each successive data acquisition after the average count is reached, is exponentially weighted and combined with the existing average Repeat - After reaching the average count, the averaging is reset and a new average is started
Preset	REPeat

State Saved	Yes
Range	EXPonential|REPeat

IF Gain

In order to take full advantage of the RF dynamic range of the instrument, we will offer a switched IF amplifier with approximately 10 dB of gain. When it can be turned on without an overload, the dynamic range is always better with it on than off. The control “IF Gain” can be used to set the IF Gain function to Auto, or to On (the extra 10 dB) or Off. These settings affect sensitivity and IF overloads.

Sets the IF Gain function to Auto, Low Gain or High Gain. These settings affect sensitivity and IF overloads.

Remote Command	`[:SENSe]:EVMQpsk:IF:GAIN[:STATe] ON | OFF | 1 | 0`
	`[:SENSe]:EVMQpsk:IF:GAIN[:STATe]?`
	`[:SENSe]:EVMQpsk:IF:GAIN:AUTO[:STATe] ON | OFF | 1 | 0`
	`[:SENSe]:EVMQpsk:IF:GAIN:AUTO[:STATe]?`

Example	`:EVMQ:IF:GAIN ON`
	`:EVMQ:IF:GAIN?`
	`:EVMQ:IF:GAIN:AUTO OFF`
	`:EVMQ:IF:GAIN:AUTO?`

Notes	This only applies to the RF input. It does not apply to baseband I/Q input where: – ON = high gain – OFF = low gain
Dependencies	This control does not appear in VXT, M9393A, M9391A, or UXM
Couplings	Auto sets IF Gain to High Gain under any of the following conditions: 1. The input attenuator is set to 0 dB, *or*, 2. The preamp is turned on, *or*, 3. The Max Mixer Level is –20 dBm or lower For other settings, ‘auto’ sets IF Gain to ‘Low Gain’
Preset	OFF ON
State Saved	Yes
Range	Low Gain|High Gain

Meas Interval

Sets the length of the measurement interval (number of data points) that are used.

Remote Command	`[:SENSe]:EVMQpsk:SWEep:POINts <integer>` `[:SENSe]:EVMQpsk:SWEep:POINts?`
Example	`:EVMQ:SWE:POIN 1001` `:EVMQ:SWE:POIN?`
Preset	WCDMA: 2560
State Saved	Yes
Min/Max	128/5120

Advanced Setup

The Advanced Setup enables you to access advanced parameters in the **Meas Setup** menus on one screen.

Chip Rate

Changes the chip rate for the measurement.

Remote Command	`[:SENSe]:EVMQpsk:CRATe <freq>` `[:SENSe]:EVMQpsk:CRATe?`
Example	`:EVMQ:CRAT 2.5 MHz` `:EVMQ:CRAT?`
Notes	Enter a frequency value to set the chip rate
Preset	WCDMA: 3.84 MHz
State Saved	Yes
Min/Max	100 kHz/20 MHz

RRC Filter Control

Specifies the alpha value of the Root Raised Cosine (RRC) filter and changes its status (ON/OFF). This ON/OFF state change involves a measurement restart. This control is available only in the WCDMA mode and while employing an RRC filter.

Remote Command	`[:SENSe]:EVMQpsk:FILTer:ALPHa <real>`
	`[:SENSe]:EVMQpsk:FILTer:ALPHa?`
	`[:SENSe]:EVMQpsk:FILTer[:RRC][:STATe] OFF | ON | 0 | 1`
	`[:SENSe]:EVMQpsk:FILTer[:RRC][:STATe]?`

Example	:EVMQ:FILT:ALPH 0.5 :EVMQ:FILT:ALPH? :EVMQ:FILT ON :EVMQ:FILT?
Preset	0.22 ON
State Saved	Yes
Min/Max	0.01/0.5
Backwards Compatibility SCPI	[:SENSe]:EVMQpsk:ALPHa

Spectrum

Toggles the spectrum function between Normal and Invert. If set to Invert, this function conjugates the spectrum. It is equivalent to taking the negative of the quadrature component in demodulation.

Remote Command	[:SENSe]:EVMQpsk:SPECtrum NORMal | INVert [:SENSe]:EVMQpsk:SPECtrum?
Example	:EVMQ:SPEC NORM :EVMQ:SPEC?
Preset	NORMal
State Saved	Yes
Range	NORMal|INVert

EVM Result I/Q Offset

Toggles the I/Q Offset to be included or excluded in the measurement result. When it is set as "Standard" (ON), EVM is calculated without any compensation of I/Q offset. When it is set as "Exclude" (OFF), I/Q offset is compensated.

Remote Command	:CALCulate:EVMQpsk:IQOFfset:INCLude OFF | ON | 0 | 1 :CALCulate:EVMQpsk:IQOFfset:INCLude?
Example	:CALC:EVMQ:IQOF:INCL OFF :CALC:EVMQ:IQOF:INCL?
Preset	ON
State Saved	Yes
Range	Standard|Exclude

Spur Avoidance

Because the VXT models M9410A/11A/15A are direct-conversion (zero-IF) receivers, feedthrough leakage from the local oscillator appears as a spurious signal (spur) at the center frequency. The Spur Avoidance function is provided to eliminate this spur, at the expense of some measurement speed.

When Spur Avoidance is enabled (the default), the instrument uses a software algorithm to remove this spur from the displayed measurement data, but the algorithm only operates under certain conditions. Specifically, it only operates when the Info BW <= maxBW/2.5. See "More Information" on page 795.

You can disable this function to speed up your measurement by setting Spur Avoidance to “Disabled.”

Note that when Spur Avoidance is not in effect, either because you have disabled it or because the Info BW > maxBW/2.5, the following warning message will appear in the status bar: “Settings Alert;Spur Avoidance Off”. This is to alert you that measurement accuracy might be impacted by the fact that Spur Avoidance is not in effect.

Remote Command	`[:SENSe]:EVMQpsk:SAVoid[:STATe] ON | OFF | 0 | 1` `[:SENSe]:EVMQpsk:SAVoid[:STATe]?`
Example	`:EVMQpsk:SAVoid ON` `:EVMQpsk:SAVoid?`
Dependencies	This control only appears in VXT models M9410A/11A/15A
Preset	ON
State Saved	Saved in instrument state
Range	ON|OFF

More Information

Maximum digital IF BW is limited by both Option and Center frequency.

VXT models M9410A/11A

Option limitation

Option	Max Digital IF BW
B40	40 MHz
B3X	300 MHz
B6X	600 MHz
B12	1200 MHz

Center frequency limitation

Center Frequency	Max Digital IF BW
330 MHz ~ 380 MHz	(CF – 330 MHz) * 2
380 MHz ~ 550 MHz	100 MHz
550 MHz ~ 1310 MHz	200 MHz
1310 MHz ~ 2000 MHz (without Option EP6)	600 MHz
2000 MHz ~ 5480 MHz (without Option EP6)	1200 MHz
5480 MHz ~ 6080 MHz (without Option EP6)	(6080 MHz – CF) * 2
1310 MHz ~ 1900 MHz (Option EP6)	600 MHz
1900 MHz ~ 6000 MHz (Option EP6)	1200 MHz
6000 MHz ~ 6600 MHz (Option EP6)	(6600 MHz – CF) * 2

VXT model M9415A

Option limitation

Option	Max Digital IF BW
B4X	400 MHz
B8X	800 MHz
B12	1200 MHz

Center frequency limitation

Center Frequency	Max Digital IF BW
330 MHz ~ 380 MHz	(CF – 330 MHz) * 2
380 MHz ~ 550 MHz	100 MHz
550 MHz ~ 1310 MHz	200 MHz
1310 MHz ~ 2000 MHz	600 MHz
2000 MHz ~ 12300 MHz	1200 MHz
12300 MHz ~ 12900 MHz	(12900 MHz – CF) * 2

Auto Couple

Immediately puts all Auto/Man functions into Auto. The **Auto Couple** action is confined to the current measurement only. It does not affect other measurements in the mode.

In the Auto state, Auto/Man functions are said to be “coupled”, meaning their values change as you make changes to other values in the measurement. This helps ensure accurate measurements and optimum dynamic range. Auto Couple is an immediate action function, and when it is executed, all the Auto/Man controls for the current measurement are set to Auto, and all measurement settings coupled to the Auto/Man parameters are automatically set to their optimal value.

For further details of measurement-specific settings (if any), see "Measurement-Specific Details" on page 797 below.

Remote Command	`:COUPle ALL`
Example	`:COUP ALL`
Backwards Compatibility SCPI	`:COUPLE ALL | NONE`
Backwards Compatibility Notes	`:COUP:NONE` puts all Auto/Man parameters in manual mode, decoupling all the coupled instrument parameters. It is retained for backwards compatibility and is *not* recommended for making measurements or new designs

All Auto/Man parameter couplings in the measurement are set to Auto. This includes couplings that may be unavailable or grayed-out due to the current state. For example, in the Swept SA measurement, there is no Auto/Man coupling for RBW while in Zero Span. Nonetheless, if **Auto Couple** were executed while in Zero Span it would set RBW to Auto "behind the scenes" so that, on exit from Zero Span, it would be in Auto.

Any Auto/Man selection specific (local) to the other measurements in the current Mode will not be affected by **Auto Couple**. Any functions that are *not* coupled with other instrument parameters, such as ranging or leveling variables, such as "AutoRange" or "AutoScale", will not be affected.

Executing the **Auto Couple** command generates the informational message, "All Auto/Man functions have been set to Auto".

Each parameter, upon being set to Auto, selects and sets the appropriate auto-coupled value based on that parameter's coupling rules. The Dependency Resolver orchestrates the couplings for parameters that are dependent on one or more other parameters. The coupling and dependency rules for each parameter are defined in the chapter describing that parameter.

Executing the **Auto Couple** command *does not* affect markers, marker functions, trace or display attributes, or any other instrument setting other than those specifically mentioned above.

Measurement-Specific Details

TOI

Parameters affected by Auto Couple are:

- Center Frequency Step
- Resolution Bandwidth
- Span/RBW Ratio

– Sweep Time
– Video BandwidthVBW/RBW ratio
– Upper and Lower Tone (set to Sense
–)Zero span measurement Resolution Bandwidth
– Zero span measurement Dwell Time

Harmonics

For Harmonics, these parameters are:

– Resolution Bandwidth
– Fundamental Frequency
– Dwell Time
– Range Table Resolution Bandwidths
– Range Table Dwell Times

Meas Preset

Restores all the measurement parameters to their default values.

Remote Command	`:CONFigure:EVMQpsk`
Example	`:CONF:EVMQ`
Notes	Restore all defaults of parameters

3.6.8.2 Radio

The Radio tab contains controls to select the Radio Device, and enable or disable HSPA/HSPA+ options.

Radio Device

Allows you to specify the device to be used.

Remote Command	`[:SENSe]:RADio:STANdard:DEVice BTS | MS` `[:SENSe]:RADio:STANdard:DEVice?`
Example	`:RAD:STAN:DEV MS` `:RAD:STAN:DEV?`

Preset	BTS
State Saved	Saved in instrument state.
Range	BTS | MS
Backwards Compatibility SCPI	[:SENSe]:RADio:DEVice

HSPA Enable

Allows you to turn on or off the HSDPA/HSUPA option enable. This selection is necessary because some of the auto detection functions that expect an HSPA signal are less tolerant when the signal is noisy or distorted. When the HSPA signal is not expected, turn HSPA Enable off.

Remote Command	[:SENSe]:RADio:CONFigure:HSDPa[:STATe] 0 | 1 | OFF | ON [:SENSe]:RADio:CONFigure:HSDPa[:STATe]?
Example	:RAD:CONF:HSDP 0 :RAD:CONF:HSDP?
Preset	ON
State Saved	Saved in instrument state.
Range	On|Off

HSPA+ Enable

Allows you to turn on or off the HSPA+ option enable. This selection is necessary because some of the auto detection functions that expect an HSPA+ signal are less tolerant when the signal is noisy or distorted. When the HSPA+ signal is not expected, turn HSPA+ Enable off.

Remote Command	[:SENSe]:RADio:CONFigure:EHSPa[:STATe] OFF | ON | 0 | 1 [:SENSe]:RADio:CONFigure:EHSPa[:STATe]?
Example	:RAD:CONF:EHSP 0 :RAD:CONF:EHSP?
Notes	When HSPA enable is OFF, HSPA+ function is disabled too.
Preset	ON
State Saved	Saved in instrument state.
Range	On|Off

3.6.8.3 Limits

This tab enables you to change the RMS EVM and Frequency Error limits settings.

RMS EVM

Sets the limit for the RMS EVM measurement. This value is used to judge whether the measurement passes or fails the RMS EVM limit.

Remote Command	`:CALCulate:EVMQpsk:LIMit:RMS <real>` `:CALCulate:EVMQpsk:LIMit:RMS?`
Example	`:CALC:EVMQ:LIM:RMS 50` `:CALC:EVMQ:LIM:RMS?`
Notes	Sets the limits of RMS EVM which is used to judge the result of RMS EVM passes or fails If a measured RMS EVM value is not larger than the limit value, the result is PASS Otherwise, the result is FAIL
Preset	WCDMA: 17.5 1xEVDO: 100.0
Min/Max	0.0/100.0

Frequency Error

Sets the limit, in Hz, for the frequency error measurement. This value is used to judge whether the measurement passes or fails the Frequency Error limit.

Remote Command	`:CALCulate:EVMQpsk:LIMit:FERRor <freq>` `:CALCulate:EVMQpsk:LIMit:FERRor?`
Example	`:CALC:EVMQ:LIM:FERR 100` `:CALC:EVMQ:LIM:FERR?`
Notes	Sets the limits of the Frequency Error, which is used to judge the result of the Frequency Error, whether it passes or fails If the measured Frequency Error value is not larger than the limit value, the result is PASS. Otherwise, the result is FAIL
Preset	100.0
State Saved	Yes
Min/Max	0.0/300000

3.6.8.4 Global

The controls in this menu apply to all Modes in the instrument.

Some controls (e.g., Global center Freq) allow you to switch certain Meas Global parameters to a Mode Global state. These switches apply to all Modes that support global settings. For example, no matter what Mode you are in when you set the "Global Center Frequency" switch to on, it applies to all Modes that support Global Settings.

Other controls (e.g., Extend Low Band) are actually set in this menu but apply to all Modes.

Global Center Freq

The software maintains a Mode Global value called "Global Center Freq".

When the **Global Center Freq** control is switched to **On** in any mode, the current mode's center frequency is copied into the Global Center Frequency, and from then on all modes that support global settings use the Global Center Frequency. So you can switch between any of these modes and the Center Freq will remain unchanged.

Adjusting the Center Freq of any mode which supports Global Settings, while **Global Center Freq** is **On**, will modify the Global Center Frequency.

When **Global Center Freq** is turned **Off**, the Center Freq of the current mode is unchanged, but now the Center Freq of each mode is once again independent.

When **Mode Preset** is pressed while **Global Center Freq** is **On**, the Global Center Freq is preset to the preset Center Freq of the current mode.

This function is reset to Off when the Restore Defaults control is pressed in the Global Settings menu, or when **System**, **Restore Defaults**, **All Modes** is pressed.

Remote Command	`:INSTrument:COUPle:FREQuency:CENTer ALL | NONE` `:INSTrument:COUPle:FREQuency:CENTer?`
Example	`:INST:COUP:FREQ:CENT ALL` `:INST:COUP:FREQ:CENT?`
Preset	Set to Off on Global Settings, Restore Defaults and System, Restore Defaults, All Modes
Range	On|Off

Remote Command	`:GLOBal:FREQuency:CENTer[:STATe] 1 | 0 | ON | OFF` `:GLOBal:FREQuency:CENTer[:STATe]?`
Preset	Off

Extend Low Band

The software maintains a Mode Global value called "Extend Low Band."

Under the current sweep configuration crossing over two bands, when Extend Low Band is turned on, the analyzer checks whether one band can cover the whole sweep frequency range or not. If it's true, the analyzer locks the band; otherwise, does nothing (the band crossover occurs).

This function doesn't work when Band Lock under [System]-[Service]-[Lock Functions] is not -1 (no band lock). In that case, Band Lock takes priority of Extend Low Band.

This function is reset to Off when the Restore Defaults control is pressed in the Global Settings menu, or when **System**, **Restore Defaults**, **All Modes** is pressed.

This parameter is available for SA, RTSA, WCDMA, WIMAX OFDMA, LTEAFDD, LTEATDD modes.

Remote Command	`:INSTrument:COUPle:FREQuency:BAND:EXTend 0 | 1 | ON | OFF` `:INSTrument:COUPle:FREQuency:BAND:EXTend?`
Example	`:INST:COUP:FREQ:BAND:EXT 1` `:INST:COUP:FREQ:BAND:EXT?`
Dependencies	Only applies to UXA, PXA, MXA and EXA.
Preset	Set to Off by pressing Global Settings > Restore Defaults and System > Restore Defaults > All Modes
Range	On|Off

Restore Defaults

This control resets all of the functions in the Global Settings menu to Off. This also occurs when **System**, **Restore Defaults**, **All Modes** is pressed.

Remote Command	`:INSTrument:COUPle:DEFault`
Example	`:INST:COUP:DEF`
Backwards Compatibility SCPI	`:GLOBal:DEFault`

3.6.9 Sweep

The Sweep key contains controls which allow you to control the sweep and measurement functions of the instrument, such as the sweep or measurement time and whether in Single sweep/measure or Continuous sweep/measure mode.

3.6.9.1 Sweep/Control

Contains controls for the Sweep and Control functions of the instrument, such as Sweep Time and Continuous/Single.

Sweep/Measure

Allows you to toggle between Continuous and Single sweep or measurement operation. The Single/Continuous state is Meas Global, so the setting affects *all* measurements.

The front-panel key **Single/Cont** performs exactly the same function

NOTE In the `WAVeform` measurement, this control only appears in the Meas Bar, and not in the **Sweep/Control** tab.

See "More Information" on page 803

Remote Command	`:INITiate:CONTinuous OFF | ON | 0 | 1` `:INITiate:CONTinuous?`

Example	`:INIT:CONT 0`
	`:INIT:CONT OFF`
	puts instrument into Single measurement operation
	`:INIT:CONT 1`
	`:INIT:CONT ON`
	puts instrument into Continuous measurement operation

Preset	ON Note that `:SYST:PRES` sets `:INIT:CONT` to `ON` but `*RST` sets `:INIT:CONT` to `OFF`
State Saved	Saved in instrument state
Annunciation	The **Single/Continuous** icon in the Meas Bar changes depending on the setting: – A line with an arrow is Single – A loop with an arrow is Continuous

More Information

With **Avg/Hold Num** (in the **Meas Setup** menu) set to **Off** or set to **On** with a value of 1, a sweep is taken after the trigger condition is met; and the instrument continues to take new sweeps after the current sweep has completed and the trigger condition is again met. However, with **Avg/Hold Num** set to On with a value >1, multiple sweeps (data acquisitions) are taken for the measurement. The trigger condition must be met prior to each sweep. The sweep is not stopped when the average count k equals the number N set for Avg/Hold Num is reached, but the number k stops incrementing. A measurement average usually applies to all traces, marker results, and numeric results, but sometimes only applies to the numeric results.

If the instrument is in Single measurement, pressing the **Cont/Single** toggle control does not change k and does not cause the sweep to be reset; the only action is to put the instrument into Continuous measurement operation.

If it is already in Continuous sweep:

- the `:INIT:CONT 1` command has no effect
- the `:INIT:CONT 0` command will place the instrument in Single Sweep but will have no effect on the current sequence until k = N, at which point the current sequence will stop and the instrument will go to the idle state.

See "Restart" on page 1738 control description for details on the `:INIT:IMM` (Restart) function.

If you are already in Single sweep, the `:INIT:CONT OFF` command has no effect.

If you are already in Single Sweep, then pressing the **Cont/Single** toggle control in the middle of a sweep does not restart the sweep or sequence. Similarly, pressing the **Cont/Single** toggle control does not restart the sweep or sequence if the sweep is not in the idle state (for example, if you are taking a very slow sweep, or the instrument is waiting for a trigger). Even though pressing the **Cont/Single** toggle control in the middle of a sweep does *not* restart the sweep, sending `:INIT:IMM` *does* reset it.

Restart

The **Restart** function restarts the current sweep, or measurement, or set of averaged/held sweeps or measurements. In measurements that support pausing, if you are Paused, pressing **Restart** performs a **Resume**.

The Restart function is accessed in several ways:

- Pressing the **Restart** key
- Sending the remote command `:INIT:IMM`
- Sending the remote command `:INIT:REST`

See "More Information" on page 805

Remote Command	`:INITiate[:IMMediate]` `:INITiate:RESTart`
Example	`:INIT:IMM` `:INIT:REST`
Notes	`:INIT:REST` and `:INIT:IMM` and the front-panel **Restart** key perform exactly the same function
Couplings	Resets average/hold count k For the first sweep, overwrites all active (update=on) traces with new current data For application modes, resets other parameters as required by the measurement

Status Bits/OPC dependencies	This is an Overlapped command The `:STATus:OPERation` register bits 0 through 8 are cleared The `:STATus:QUEStionable` register bit 9 (INTegrity sum) is cleared The `SWEEPING` bit is set The `MEASURING` bit is set
Backwards Compatibility Notes	For Spectrum Analysis mode in ESA and PSA, the **Restart** hardkey and the `:INIT:REST` command restart trace averages (displayed average count reset to 1) for a trace in **Clear Write**, but did not restart **Max Hold** and **Min Hold** In the X-Series, the **Restart** hardkey and the `:INIT:REST` command restart not only **Trace Average**, but **Max Hold** and **Min Hold** traces as well For wireless comms modes in ESA and PSA, the **Restart** hardkey and the `:INIT:REST` command restarted every measurement, including all traces and numeric results. There is no change to this operation

More Information

The **Restart** function first aborts the current sweep or measurement as quickly as possible. It then resets the sweep and trigger systems, sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is in the process of aligning when a Restart is executed, the alignment finishes before the restart function is performed.

Even when set for Single operation, multiple sweeps may be taken when **Restart** is pressed (for example, when averaging/holding is on). Thus when we say that Restart "restarts a measurement," depending on the current settings, we may mean:

- It restarts the current sweep
- It restarts the current measurement
- It restarts the current set of sweeps if any trace is in Trace Average, Max Hold or Min Hold
- It restarts the current set of measurements if Averaging, or Max Hold, or Min Hold is on for the measurement

With Average/Hold Number (in Meas Setup menu) set to 1, or Averaging off, or no trace in Trace Average or Hold, a single sweep is equivalent to a single measurement. A single sweep is taken after the trigger condition is met; and the instrument stops sweeping once that sweep has completed. However, with Average/Hold Number >1 and at least one trace set to Trace Average, Max Hold, or Min Hold (SA Measurement) or Averaging on (most other measurements), multiple sweeps/data acquisitions are taken for a single measurement. The trigger condition must be met prior to each sweep. The sweep is stopped when the average count k equals the number N set for Average/Hold Number. A measurement average usually applies to all traces, marker results, and numeric results, but sometimes only applies to the numeric results.

Once the full set of sweeps has been taken, the instrument will go to the idle state. To take one more sweep without resetting the average count, increment the average count by 1, by pressing the step up key while Average/Hold Number is the active function, or by sending the remote command `:CALC:AVER:TCON UP`.

Pause/Resume

Pauses a measurement after the current data acquisition is complete.

When a measurement is paused:

- The label on this control changes to **Resume**. Pressing **Resume** un-pauses the measurement.
- Pressing **Restart** also performs a **Resume**.

Remote Command	`:INITiate:PAUSe` `:INITiate:RESume`
Example	`:INIT:PAUS` `:INIT:RES`
Dependencies	Not displayed in Modes that do not support pausing
Couplings	When Averaging is On, if the measurement is paused no more updates will occur until either a Resume or Restart occurs If the measurement is resumed, the averaging continues to use the traces from before the Pause occurred and continues to use the traces from the point where the Resume occurred. This still provides real-time traces, but they will no longer be gap free In a view with a Waterfall window, when the measurement is paused, the Waterfall stops updating. When Resume is selected, the Waterfall will retain the existing traces and continue updating using traces from the point at which Resume was selected. The time stamp of the individual Waterfall traces will show the time from the beginning of the measurement the trace relates to, showing there was a gap in the Waterfall capture In Density view, when the measurement is paused, the Density Display stops updating. When the measurement is resumed, if Persistence is `ON`, the persistence fading will continue from the point when the measurement was paused If a Restart occurs, the average counter is reset and all results are discarded. The measurement begins again, using traces after the Restart occurred

Abort (Remote Command Only)

This command stops the current measurement. It aborts the current measurement as quickly as possible, resets the sweep and trigger systems, and puts the measurement into an "idle" state. If the instrument is in the process of aligning when `:ABORt` is sent, the alignment finishes before the abort function is performed, so `:ABORt` does *not* abort an alignment.

If the instrument is set for Continuous measurement, it sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is set for Single measurement, it remains in the "idle" state until an `:INIT:IMM` command is received.

Remote Command	`:ABORt`
Example	`:ABOR`
Notes	If `:INIT:CONT` is `ON`, then a new continuous measurement will start immediately, with sweep (data acquisition) occurring once the trigger condition has been met If `:INIT:CONT` is `OFF`, then `:INIT:IMM` is used to start a single measurement, with sweep (data acquisition) occurring once the trigger condition has been met
Dependencies	For continuous measurement, `:ABORt` is equivalent to the **Restart** key Not all measurements support the abort command
Status Bits/OPC dependencies	The `:STATus:OPERation` register bits 0 through 8 are cleared The `:STATus:QUEStionable` register bit 9 (INTegrity sum) is cleared Since all the bits that feed into OPC are cleared by `:ABORt`, the `:ABORt` will cause the *OPC query to return true

3.6.9.2 X Scale

This tab accesses controls that enable you to set the horizontal scale parameters.

Ref Value

Controls the reference value of the X scale of the current measurement

Remote Command	`:DISPlay:EVMQpsk:WINDow3|4|5:TRACe:X[:SCALe]:RLEVel <real>`
	`:DISPlay:EVMQpsk:WINDow3|4|5:TRACe:X[:SCALe]:RLEVel?`
	Window numbers are as follows:
	– Mag Error: 3
	– Phase Error: 4
	– EVM: 5

Example	3-Mag Error
	`:DISP:EVMQ:WIND3:TRAC:X:RLEV 0`
	4-Phase Error
	`:DISP:EVMQ:WIND4:TRAC:X:RLEV 0`
	5-EVM
	`:DISP:EVMQ:WIND5:TRAC:X:RLEV 0`

Notes	This parameter is for control of the reference value of the X scale of the focused window

Couplings	When this parameter has been set, XScaleAuto turns off
Preset	0
State Saved	Yes
Min/Max	-5000000/5000000

Backwards Compatibility SCPI

Window Numbers used to be a combination of View and Window, now only Window number is sent. For backwards compatibility the old View and Window numbers are honored as below:

Window	Old SCPI Command	New SCPI Command
Mag Error	DISP:EVMQ:VIEW2:WIND:TRAC:X:RLEV 0.0	DISP:EVMQ:WIND3:TRAC:X:RLEV 0.0
Phase Error	DISP:EVMQ:VIEW2:WIND2:TRAC:X:RLEV 0.0	DISP:EVMQ:WIND4:TRAC:X:RLEV 0.0
EVM	DISP:EVMQ:VIEW2:WIND3:TRAC:X:RLEV 0.0	DISP:EVMQ:WIND5:TRAC:X:RLEV 0.0

X Scale/Div

Sets the horizontal scale by changing a value per division.

Remote Command	`:DISPlay:EVMQpsk:WINDow3|4|5:TRACe:X[:SCALe]:PDIVision <real>`
	`:DISPlay:EVMQpsk:WINDow3|4|5:TRACe:X[:SCALe]:PDIVision?`
	Window numbers are as follows:
	– Mag Error: 3
	– Phase Error: 4
	– EVM: 5

Example	3-Mag Error
	`:DISP:EVMQ:WIND3:TRAC:X:PDIV 1001`
	4-Phase Error
	`:DISP:EVMQ:WIND4:TRAC:X:PDIV 1001`
	5-EVM
	`:DISP:EVMQ:WIND5:TRAC:X:PDIV 1001`

Couplings	When this parameter has been set, XScaleAuto turns off
Preset	256
State Saved	Yes
Min/Max	1/500000

Backwards Compatibility SCPI

Window Numbers used to be a combination of View and Window, now only Window number is sent. For backwards compatibility the old View and Window numbers are honored as below:

Window	Old SCPI Command	New SCPI Command
Mag Error	DISP:EVMQ:VIEW2:WIND:TRAC:X:PDIV 1001	DISP:EVMQ:WIND3:TRAC:X:PDIV 1001
Phase Error	DISP:EVMQ:VIEW2:WIND2:TRAC:X:PDIV 1001	DISP:EVMQ:WIND4:TRAC:X:PDIV 1001
EVM	DISP:EVMQ:VIEW2:WIND3:TRAC:X:PDIV 1001	DISP:EVMQ:WIND5:TRAC:X:PDIV 1001

X Ref Position

Sets the reference position of the X axis on the display. The reference position can be set to Left, Ctr (center) or Right.

Remote Command	`:DISPlay:EVMQpsk:WINDow3|4|5:TRACe:X[:SCALe]:RPOSition LEFT | CENTer | RIGHt`
	`:DISPlay:EVMQpsk:WINDow3|4|5:TRACe:X[:SCALe]:RPOSition?`
	Window numbers are as follows:
	– Mag Error: 3
	– Phase Error: 4
	– EVM: 5

Example	3-Mag Error
	`:DISP:EVMQ:WIND3:TRAC:X:RPOS CENT`
	4-Phase Error
	`:DISP:EVMQ:WIND4:TRAC:X:RPOS CENT`
	5-EVM
	`:DISP:EVMQ:WIND5:TRAC:X:RPOS CENT`

Couplings	If X Scale Auto Mag is On and the parameter is changed, X Scale Ref Mag changes to automatically adjust the trace to one that is most suitable for the window
Preset	LEFT
State Saved	Yes
Range	LEFT|CENTer|RIGHt

Backwards Compatibility SCPI

Window Numbers used to be a combination of View and Window, now only Window number is sent. For backwards compatibility the old View and Window numbers are honored as below:

Window	Old SCPI Command	New SCPI Command
Mag Error	DISP:EVMQ:VIEW2:WIND:TRAC:X:RPOS CENT	DISP:EVMQ:WIND3:TRAC:X:RPOS CENT
Phase Error	DISP:EVMQ:VIEW2:WIND2:TRAC:X:RPOS CENT	DISP:EVMQ:WIND4:TRAC:X:RPOS CENT
EVM	DISP:EVMQ:VIEW2:WIND3:TRAC:X:RPOS CENT	DISP:EVMQ:WIND5:TRAC:X:RPOS CENT

Auto Scaling

Determines the scale per division and reference value for the X axis based on the current measurement results.

Remote Command	`:DISPlay:EVMQpsk:WINDow3|4|5:TRACe:X[:SCALe]:COUPle ON	OFF	0	1` `:DISPlay:EVMQpsk:WINDow3|4|5:TRACe:X[:SCALe]:COUPle?` Window numbers are as follows: – Mag Error: 3 – Phase Error: 4 – EVM: 5

Example	3-Mag Error
	`:DISP:EVMQ:WIND3:TRAC:X:COUP ON`
	4-Phase Error
	`:DISP:EVMQ:WIND4:TRAC:X:COUP ON`
	5-EVM
	`:DISP:EVMQ:WIND5:TRAC:X:COUP ON`

Notes	When On, the Scale/Div, Ref Value, and Ref Position are reset to the default value
Couplings	Upon pressing the Restart front-panel key, the scale coupling function automatically determines the scale per division and reference values based on the measurement results if this parameter is set to On. When you set a value to either Scale/Div or Ref Value manually, Scale Coupling automatically changes to Off
Preset	ON
State Saved	Yes
Range	ON|OFF

Backwards Compatibility SCPI

Window Numbers used to be a combination of View and Window, now only Window number is sent. For backwards compatibility the old View and Window numbers are honored as below:

Window	Old SCPI Command	New SCPI Command
Mag Error	DISP:EVMQ:VIEW2:WIND:TRAC:X:COUP ON	DISP:EVMQ:WIND3:TRAC:X:COUP ON
Phase Error	DISP:EVMQ:VIEW2:WIND2:TRAC:X:COUP ON	DISP:EVMQ:WIND4:TRAC:X:COUP ON
EVM	DISP:EVMQ:VIEW2:WIND3:TRAC:X:COUP ON	DISP:EVMQ:WIND5:TRAC:X:COUP ON

3.6.10 Trace

Trace is not supported in the QPSK EVM Measurement.

3.7 Channel Power Measurement

The Channel Power measurement is used to find the total power present in a specified bandwidth. The power spectral density (the power in the signal normalized to 1 Hz) is also reported.

When in WLAN mode, or when WLAN radio standard is selected in SA mode, the peak power spectral density for 1 MHz is reported.

Channel Power Measurement Commands

The table below lists the measurement commands and their responses for the Channel Power measurement

Command	Return Value
:FETCh:CHPower[n]? :MEASure:CHPower[n]? :READ:CHPower[n]?	The results returned depend on the currently-selected Mode and the value of n Refer to the mode-specific Measurement Results tables below
:FETCh:CHPower:CHPower? :MEASure:CHPower:CHPower? :READ:CHPower:CHPower?	Returns the Channel Power (dBm) (Backwards compatibility functionality)
:FETCh:CHPower:DENSity? :MEASure:CHPower:DENSity? :READ:CHPower:DENSity?	Returns the Power Spectral Density (dBm/Hz) (Backwards compatibility functionality)

The results returned by the queries depend on the currently-selected Mode and the value of n (where required). The sections below provide mode-specific details for each Mode.

SA Mode Measurement Results

n	Results Returned
n=1 (or not specified)	Returns scalar results: 1. Channel Power is a floating point number representing the total channel power in the specified integration bandwidth 2. PSD (Power Spectral Density) is the power in the specified unit bandwidth. The unit bandwidth is selected by the PSD Unit parameter in either dBm/Hz or dBm/MHz
2	Returns floating point numbers that are the captured trace data of the power (in dBm/resolution BW) of the signal for Trace 1. The frequency span of the captured trace data is specified by the Span control
3	n/a
4	n/a
5	Returns floating point numbers that are the captured trace data of the power (in

n	Results Returned
	dBm/resolution BW) of the signal for Trace 2. The frequency span of the captured trace data is specified by the Span control
6	Returns floating point numbers that are the captured trace data of the power (in dBm/resolution BW) of the signal for Trace 3. The frequency span of the captured trace data is specified by the Span control

MSR Mode Measurement Results

n	Results Returned
n=1 (or not specified)	Returns scalar results: 1. Channel Power is a floating point number representing the total channel power in the specified integration bandwidth 2. PSD (Power Spectral Density) is the power in the specified unit bandwidth. The unit bandwidth is selected by the PSD Unit parameter in either dBm/Hz or dBm/MHz
2	Returns floating point numbers that are the captured trace data of the power (in dBm/resolution BW) of the signal for Trace 1. The frequency span of the captured trace data is specified by the Span control
3	Returns [Carriers] comma-separated scalar results, in the following order – Total Power of Carrier 1 (dBm) – Total Power of Carrier 2 (dBm) – ... – [Carriers]. Total Power of Carrier [Carriers] (dBm) If the result is not available, NaN (9.91E+37) is returned. Number of returned values might be changed in future releases
4	Returns comma-separated scalar results, in the following order 1. Total Power of LTE FDD carriers (dBm) 2. Total Power of W-CDMA carriers (dBm) 3. Total Power of GSM/EDGE carriers (dBm) 4. Total Power of cdma2000 carriers (dBm) 5. Total Power of 1xEV-DO carriers (dBm) 6. ... The number of results is incremented by one when a new format is supported If the result is not available, NaN (9.91E+37) is returned. Number of returned values will be changed in future releases if the number of supported radio format is increased
5	Returns floating point numbers that are the captured trace data of the power (in dBm/resolution BW) of the signal for Trace 2. The frequency span of the captured

n	Results Returned
	trace data is specified by the Span control
6	Returns floating point numbers that are the captured trace data of the power (in dBm/resolution BW) of the signal for Trace 3. The frequency span of the captured trace data is specified by the Span control

LTE-Advanced FDD/TDD Mode Measurement Results

n	Results Returned
n=1 (or not specified)	Returns scalar results: 1. Channel Power is a floating point number representing the total channel power in the specified integration bandwidth 2. PSD (Power Spectral Density) is the power in the specified unit bandwidth. The unit bandwidth is selected by the PSD Unit parameter in either dBm/Hz or dBm/MHz
2	Returns floating point numbers that are the captured trace data of the power (in dBm/resolution BW) of the signal for Trace 1. The frequency span of the captured trace data is specified by the Span control
3	Returns comma-separated scalar results, in the following order 1. Total Power of Component Carrier 0 (dBm) 2. Total Power of Component Carrier 1 (dBm) 3. Total Power of Component Carrier 2 (dBm) 4. Total Power of Component Carrier 3 (dBm) 5. Total Power of Component Carrier 4 (dBm) If the result is not available, NaN (9.91E+37) is returned
4	Returns comma-separated scalar results, in the following order. The unit bandwidth is selected by the PSD Unit parameter in either dBm/Hz or dBm/MHz 1. Total Power Spectral Density of Component Carrier 0 (PSD Unit) 2. Total Power Spectral Density of Component Carrier 1 (PSD Unit) 3. Total Power Spectral Density of Component Carrier 2 (PSD Unit) 4. Total Power Spectral Density of Component Carrier 3 (PSD Unit) 5. Total Power Spectral Density of Component Carrier 4 (PSD Unit) If the result is not available, NaN (9.91E+37) is returned
5	Returns floating point numbers that are the captured trace data of the power (in dBm/resolution BW) of the signal for Trace 2. The frequency span of the captured trace data is specified by the Span control
6	Returns floating point numbers that are the captured trace data of the power (in dBm/resolution BW) of the signal for Trace 3. The frequency span of the captured trace data is specified by the Span control

5G NR Mode Measurement Results

n	Results Returned
n=1 (or not specified)	Returns scalar results: 1. Channel Power is a floating point number representing the total channel power in the specified integration bandwidth 2. PSD (Power Spectral Density) is the power in the specified unit bandwidth. The unit bandwidth is selected by the PSD Unit parameter in either dBm/Hz or dBm/MHz
2	Returns floating point numbers that are the captured trace data of the power (in dBm/resolution BW) of the signal for Trace 1. The frequency span of the captured trace data is specified by the Span control
3	Returns comma-separated scalar results, in the following order – Total Power of Component Carrier 0 (dBm) – Total Power of Component Carrier 1 (dBm) – Total Power of Component Carrier 2 (dBm) – ... – 16. Total Power of Component Carrier 15 (dBm) If the result is not available, NaN (9.91E+37) is returned
4	Returns comma-separated scalar results, in the following order. The unit bandwidth is selected by the PSD Unit parameter in either dBm/Hz or dBm/MHz – Total Power Spectral Density of Component Carrier 0 (PSD Unit) – Total Power Spectral Density of Component Carrier 1 (PSD Unit) – Total Power Spectral Density of Component Carrier 2 (PSD Unit) – ... – 16. Total Power Spectral Density of Component Carrier 5 (PSD Unit) If the result is not available, NaN (9.91E+37) is returned
5	Returns floating point numbers that are the captured trace data of the power (in dBm/resolution BW) of the signal for Trace 2. The frequency span of the captured trace data is specified by the Span control
6	Returns floating point numbers that are the captured trace data of the power (in dBm/resolution BW) of the signal for Trace 3. The frequency span of the captured trace data is specified by the Span control

WLAN Channel Power Measurement Results

n	Results Returned
n=1 (or not	Returns scalar results:

n	Results Returned
specified)	When the radio standard is NOT 802.11ac 80 + 80 MHz or 802.11ax 80 + 80 MHz: Channel Power is a floating point number representing the total channel power in the specified integration bandwidth Peak PSD (Power Spectral Density) is the peak PSD over the integration bandwidth. The unit bandwidth is selected by the PSD Unit parameter in either dBm/Hz or dBm/MHz Mean PSD (Power Spectral Density) is the mean PSD over the integration bandwidth. The unit bandwidth is selected by the PSD Unit parameter in either dBm/Hz or dBm/MHz When the radio standard is 802.11ac 80 + 80 MHz or 802.11ax 80 + 80 MHz: 1. Channel Power of the carrier of which the center frequency is indicated by Freq Segment 1 is a floating point number representing the total channel power of the first segment in the specified integration bandwidth Peak PSD (Power Spectral Density) of the carrier of which the center frequency is indicated by Freq Segment 1 is the power in the specified unit bandwidth of the first segment. The unit bandwidth is selected by the PSD Unit parameter in either dBm/Hz or dBm/MHz Channel Power of the carrier of which the center frequency is indicated by Freq Segment 2is a floating point number representing the total channel power of the second segment in the specified integration bandwidth Peak PSD (Power Spectral Density) of the carrier of which the center frequency is indicated by Freq Segment 2 is the power in the specified unit bandwidth of the second segment. The unit bandwidth is selected by the PSD Unit parameter in either dBm/Hz or dBm/MHz Mean PSD (Power Spectral Density) of the carrier of which the center frequency is indicated by Freq Segment 1 is the power in the specified unit bandwidth of the first segment. The unit bandwidth is selected by the PSD Unit parameter in either dBm/Hz or dBm/MHz 6. Mean PSD (Power Spectral Density) of the carrier of which the center frequency is indicated by Freq Segment 2 is the power in the specified unit bandwidth of the second segment. The unit bandwidth is selected by the PSD Unit parameter in either dBm/Hz or dBm/MHz
2	Returns floating point numbers that are the captured trace data of the power (in dBm/resolution BW) of the signal for Trace 1. The frequency span of the captured trace data is specified by the Span control
3	n/a
4	n/a
5	Returns floating point numbers that are the captured trace data of the power (in dBm/resolution BW) of the signal for Trace 2. The frequency span of the captured trace data is specified by the Span control
6	Returns floating point numbers that are the captured trace data of the power (in dBm/resolution BW) of the signal for Trace 3. The frequency span of the captured trace data is specified by the Span control

Additionally, WLAN Mode supports an n parameter for the following queries:

`:FETCh:CHPower:DENSity[n]?`

`:MEASure:CHPower:DENSity[n]?`

`:READ:CHPower:DENSity[n]?`

For these queries *in WLAN Mode only*, the results returned depend on the value of n as follows:

n	Radio Standard	Results Returned
1 (or not specified)	*Not* 802.11ac 80 +80 MHz or 802.11ax80 +80 MHz	Peak PSD (Power Spectral Density) is the peak PSD over the integration bandwidth. The unit bandwidth is selected by the PSD Unit parameter in either dBm/Hz or dBm/MHz
	802.11ac 80 +80 MHz or 802.11ax80 +80 MHz	The first value is the peak PSD for segment 1, the second value is the peak PSD for segment 2
2	*Not* 802.11ac 80 +80 MHz or 802.11ax80 +80 MHz	Mean PSD (Power Spectral Density) is the Mean PSD over the integration bandwidth. The unit bandwidth is selected by the PSD Unit parameter in either dBm/Hz or dBm/MHz
	802.11ac 80 +80 MHz or 802.11ax80 +80 MHz	The first value is the mean PSD for segment 1, the second value is the mean PSD for segment 2

3.7.1 Views

In the SA mode, there is only one Predefined view for the Channel Power measurement.

In the MSR, LTE-Advanced FDD/TDD, and 5G NR modes, there are two Predefined views:

1. Normal View

2. Carrier Info View

If you have modified the current View, using the "View Editor" on page 128, an asterisk appears next to that View in the radio button panel. You can save the modified View as a User View (see "Save Layout as New View" on page 1890).

View selection by name (MSR, LTEAFDD, LTEATDD, 5GNR)

Selects the results view. The following SCPI command allows you to select the desired measurement view by enumeration.

Remote Command	`:DISPlay:CHPower:VIEW[:SELect] PRESult | CINFormation` `:DISPlay:CHPower:VIEW[:SELect]?`
Example	`:DISP:CHP:VIEW PRES` `:DISP:CHP:VIEW?`
Preset	`PRESult`
State Saved	Saved in instrument state
Range	Power Results|Carrier Info

View selection by number (MSR, LTEAFDD, LTEATDD, 5GNR)

Selects the results view. The following command allows you to select the desired measurement view by enumeration.

Remote Command	`:DISPlay:CHPower:VIEW:NSELect <integer>` `:DISPlay:CHPower:VIEW:NSELect?`
Example	`:DISP:CHP:VIEW:NSEL 1` `:DISP:CHP:VIEW:NSEL?`
Preset	1
State Saved	Saved in instrument state
Min/Max	1/2

3.7.1.1 Normal

Windows: "Graph" on page 818, "Metrics" on page 819

Dual window view of the Channel Power graph and the Channel Power metrics.

Example	`:DISP:CHP:VIEW PRES`

3.7.2 Windows

This section describes the windows that are available in the Channel Power measurement.

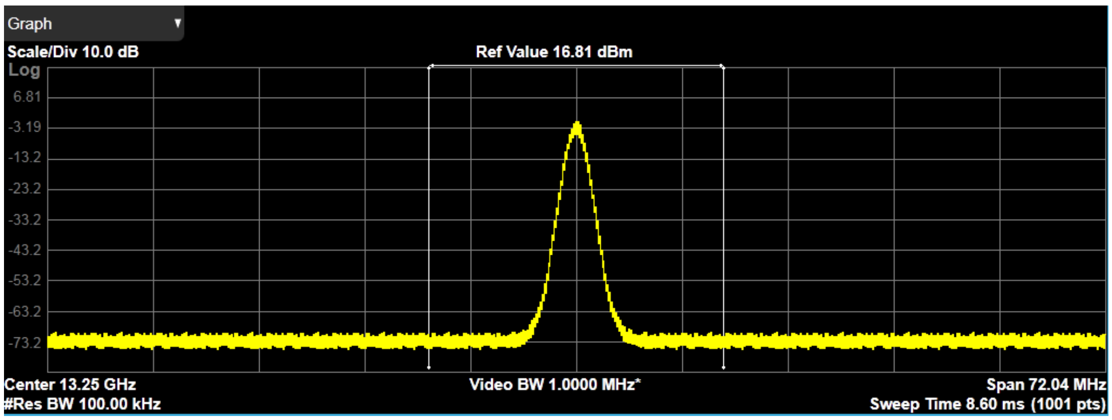
3.7.2.1 Graph

The Graph window is used to display the spectrum trace and power bars.

The results of the measurement can be displayed as a single spectrum trace view or displayed with a Bar Graph trace on the spectrum trace. The Bar Graph appears between the markers that indicate the measured output power level. The bar graph is activated when the “Bar Graph” control is set to ON under the Display menu. The Graph window appears in the following views.

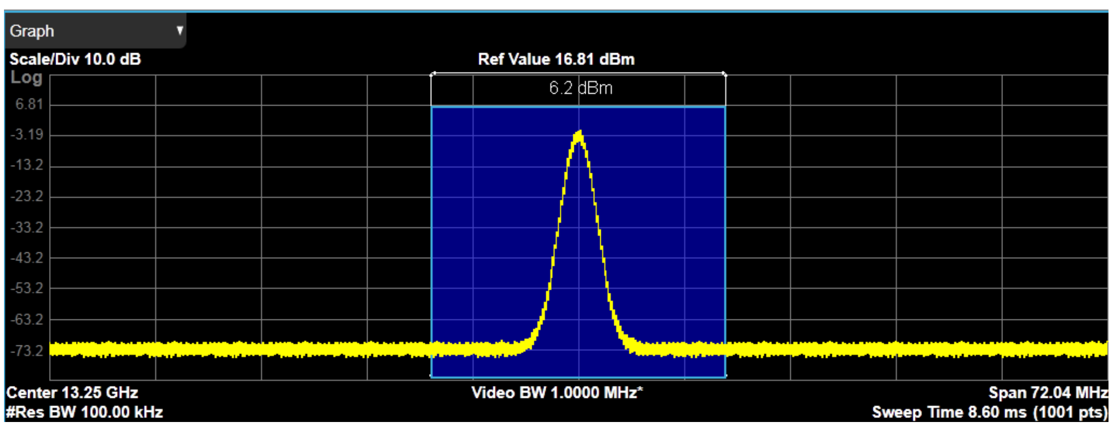
View	Size	Position
Normal	Two thirds, full width	Top
Gate View	One third, full width	Middle

Spectrum View with Bar Graph off



Spectrum View with Bar Graph on

This View is the same as the ‘Spectrum’ view, but has a blue bar between the markers that indicates the measured output power level. The bar graph is activated when the “Bar Graph” control is set to ON under the Display hardkey. The actual measured output power level is displayed on the display at the top of the bar.



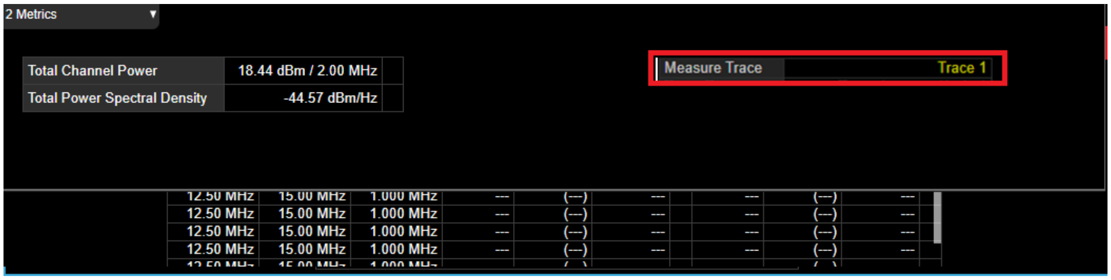
If the current mode is WLAN and the format is WLAN 802.11ac 80+80 MHz, the spectrum view is changed a little so that the results of both carrier segments can be displayed.

3.7.2.2 Metrics

The actual measured output power level is displayed in the Metrics window

The Metrics window appears in the following Views.

View	Size	Position
Normal	One third, full width	Bottom
Gate View	One third, full width	Bottom



Measure Trace

See "Measure Trace" on page 940

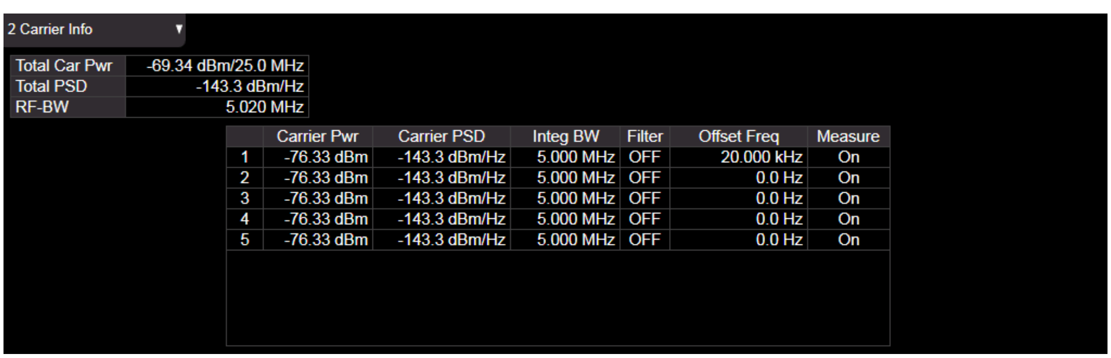
Power Results

Total carrier power, total PSD and total format carrier power are displayed in the lower window. Total format carrier power is total power of carriers of the same Radio Format. If there is no carrier of the corresponding format, it is not displayed. Thus items in the total format power table changes depending on the carrier configuration. Since the metrics window of MSR, LTE-Advanced FDD/TDD and 5G NR is slightly denser than that for common CHP, the vertical positions of total power and power spectral density are raised.

Carrier Info

LTE-Advanced FDD/TDD and 5G NR

The following diagram shows the Metrics Window in the Carrier Info view for LTE-Advanced FDD/TDD and 5G NR. The Power Results window is replaced by the carrier info table.



2 Carrier Info

Total Car Pwr	-69.34 dBm/25.0 MHz
Total PSD	-143.3 dBm/Hz
RF-BW	5.020 MHz

	Carrier Pwr	Carrier PSD	Integ BW	Filter	Offset Freq	Measure
1	-76.33 dBm	-143.3 dBm/Hz	5.000 MHz	OFF	20.000 kHz	On
2	-76.33 dBm	-143.3 dBm/Hz	5.000 MHz	OFF	0.0 Hz	On
3	-76.33 dBm	-143.3 dBm/Hz	5.000 MHz	OFF	0.0 Hz	On
4	-76.33 dBm	-143.3 dBm/Hz	5.000 MHz	OFF	0.0 Hz	On
5	-76.33 dBm	-143.3 dBm/Hz	5.000 MHz	OFF	0.0 Hz	On

The text window displays the following results:

Total Carrier Power

This is the total power of all the carriers with carrier measure state setting to On. The power is calculated by integrating across the bandwidth declared by the Carrier Integ Bw parameter for each carrier and then totaling the sums. The total integration bandwidth is shown as part of the result. This will be the total of the Carrier Integ Bw of the carriers used in calculating the total carrier power. If the RRC Filter is on, then the integration bandwidth used is (1 + alpha)/T where T = 1/(Carrier Integ Bw) multiplied by the number of carriers with carrier measure state setting to yes.

RF-BW

Displays the total bandwidth from the lowest carrier to the highest carrier, whether their measurement states are on or off.

Carrier Power

This is the power in all the currently defined carriers. If the carrier is with measurement state being on, the power will be absolute. If the carrier is defined as not having power present, the power will be shown up as dash. The power is calculated by integrating across the bandwidth declared by the Carrier Integ Bw parameter. The integration bandwidth is shown as part of the result. This is the value of the Carrier Integ Bw for the carrier unless the RRC Filter is on, then the integration.

Integration Bandwidth

It displays the channel bandwidth of each carrier.

Filter

It displays whether RRC filter is used or not.

Offset Frequency

It shows the offset frequency from the carrier reference frequency in multi-carrier measurements. The carrier frequency display type determines whether the relative frequency or absolute frequency will be displayed.

Sub-block (LTE-Advanced FDD/TDD only)

For intra-band non-contiguous spectrum operation, the sub-block concept is introduced, which refers to one contiguous allocated block of spectrum for transmission and reception in the intra-band non-contiguous aggregation mode. We support two sub-blocks. It displays which sub-block the carrier belongs to in the intra-band non-contiguous aggregation mode. The column is displayed when the carrier allocation mode is non-contiguous.

Measure

Shows whether the carrier power presents or not.

The highlighted row changes as either Carrier Result or Select Carrier is changed. The highlighted row and these keys are not coupled.

MSR

The text window displays the following results:

Total Carrier Power

This is the total power of all the carriers with carrier measure state setting to On. The power is calculated by integrating across the bandwidth declared by the Carrier Integ Bw parameter for each carrier and then totaling the sums. The total integration bandwidth is shown as part of the result. This will be the total of the Carrier Integ Bw of the carriers used in calculating the total carrier power. If the RRC Filter is on, then the integration bandwidth used is (1 + alpha)/T where T = 1/(Carrier Integ Bw) multiplied by the number of carriers with carrier measure state setting to yes.

RF-BW

Displays the total bandwidth from the lowest carrier to the highest carrier, whether their measurement states are on or off.

Carrier Power

This is the power in all the currently defined carriers. If the carrier is with measurement state being on, the power will be absolute. If the carrier is defined as not having power present, the power will be shown up as dash. The power is calculated by integrating across the bandwidth declared by the Carrier Integ Bw parameter. The integration bandwidth is shown as part of the result. This is the value of the Carrier Integ Bw for the carrier unless the RRC Filter is on, then the integration.

Integration Bandwidth

Displays the channel bandwidth of each carrier.

Filter

Displays whether RRC filter is used or not.

Offset Frequency

It shows the offset frequency from the carrier reference frequency in multi-carrier measurements. The carrier frequency display type determines whether the relative frequency or absolute frequency will be displayed.

Sub-block

For intra-band non-contiguous spectrum operation, the sub-block concept is introduced, which refers to one contiguous allocated block of spectrum for transmission and reception in the intra-band non-contiguous aggregation mode. We support two sub-blocks. It displays which sub-block the carrier belongs to in the intra-band non-contiguous aggregation mode. The column is displayed when the carrier allocation mode is non-contiguous.

Measure

Shows whether the carrier power presents or not.

The highlighted row changes according to whether Carrier Result or Select Carrier is changed. The highlighted row and these keys are not coupled.

Parameter Set

Displays which format parameter set is selected.

3.7.2.3 Gate

Turning on Gate View shows the Gate Window, which allows you to see your Gating signal at the same time as the measured data. See the description under Gate View in the Trigger, Gate Settings section.

View	Size	Position
Gate View	One third, full width	Top

3.7.3 Amplitude

Activates the **Amplitude** menu and selects **Reference Level** or **Reference Value** as the active function, depending on the measurement.

Some features in this menu apply to multiple measurements. Some other features apply only to specific measurements and their controls are blanked or grayed-out in measurements that do not support the feature.

3.7.3.1 Y Scale

The Y Scale Tab contains controls that pertain to the Y axis parameters of the measurement. These parameters control how data on the vertical (Y) axis is displayed and control instrument settings that affect the vertical axis.

Ref Value

Sets the value for the absolute power reference. The reference line is at the top, center, or bottom of the graticule, depending on the value of the Ref Position function.

Remote Command	`:DISPlay:CHPower:WINDow[1]:TRACe:Y[:SCALe]:RLEVel <real>` `:DISPlay:CHPower:WINDow[1]:TRACe:Y[:SCALe]:RLEVel?`
Example	`:DISP:CHP:WIND:TRAC:Y:RLEV 10 dBm` `:DISP:CHP:WIND:TRAC:Y:RLEV?`
Couplings	When Auto Scaling is On (default), this value is automatically determined by the measurement result. When you set a value manually, Auto Scaling changes to Off Attenuation is not coupled to Ref Value
Preset	10.00 dBm

State Saved	Saved in instrument state
Min/Max	-250.00 dBm / 250.00 dBm
Annotation	Ref <value> top left of graph
Backwards Compatibility SCPI	`:DISPlay:CHPower:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:RLEVel`

Scale/Div

For measurements that support a logarithmic Y-Axis, Scale/Div sets the height of one division of the graticule in the current Y-Axis unit.

Scale/Div also determines the displayed amplitude range in the log plot graph. Since there are usually 10 vertical graticule divisions on the display, the total amplitude range of the graph is typically 10x this amount. For example, if Scale/Div is 10 dB, then the total range of the graph is 100 dB.

Remote Command	`:DISPlay:CHPower:WINDow[1]:TRACe:Y[:SCALe]:PDIVision <rel_ampl>` `:DISPlay:CHPower:WINDow[1]:TRACe:Y[:SCALe]:PDIVision?`
Example	`:DISP:CHP:WIND:TRAC:Y:PDIV 5` `:DISP:CHP:WIND:TRAC:Y:PDIV?`
Couplings	When the Auto Scaling is On, this value is automatically determined by the measurement result. When you set a value manually, Auto Scaling automatically changes to Off
Preset	10.00 dB / Div
State Saved	Saved in instrument state
Min	0.10 dB
Max	20 dB
Annotation	<value> dB/ left upper of graph
Backwards Compatibility SCPI	`:DISPlay:CHPower:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:PDIVision`

Ref Position

Positions the reference level at the top, center, or bottom of the Y Scale display. Changing the reference position does not change the reference level value.

Remote Command	`:DISPlay:CHPower:WINDow[1]:TRACe:Y[:SCALe]:RPOSition TOP | CENTer | BOTTom` `:DISPlay:CHPower:WINDow[1]:TRACe:Y[:SCALe]:RPOSition?`
Example	`:DISP:CHP:WIND:TRAC:Y:RPOS CENT` `:DISP:CHP:WIND:TRAC:Y:RPOS?`

Preset	TOP
State Saved	Saved in instrument state
Range	TOP|CENTer|BOTTom
Annotation	The greater than (>) and less than (<) symbols are displayed on both sides of the graph to indicate the Reference Position
Backwards Compatibility SCPI	:DISPlay:CHPower:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:RPOSition

Auto Scaling

Toggles the Auto Scaling function between On and Off.

Remote Command	:DISPlay:CHPower:WINDow[1]:TRACe:Y[:SCALe]:COUPle 0 | 1 | OFF | ON :DISPlay:CHPower:WINDow[1]:TRACe:Y[:SCALe]:COUPle?
Example	:DISP:CHP:WIND:TRAC:Y:COUP OFF :DISP:CHP:WIND:TRAC:Y:COUP?
Couplings	When Auto Scaling is ON, and the **Restart** front-panel key is pressed, this function automatically sets the scale per division to 10 dB and determines the reference values based on the measurement results When you set a value to either Scale/Div or Ref Value manually, Auto Scaling automatically changes to OFF
Preset	1
State Saved	Saved in instrument state
Range	OFF|ON
Backwards Compatibility SCPI	:DISPlay:CHPower:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:COUPle

3.7.3.2 Attenuation

Controls the attenuator functions and interactions between the attenuation system components.

There are two attenuator configurations in the X-Series. One is a Dual-Attenuator configuration consisting of a mechanical attenuator and an optional electronic attenuator. The other configuration uses a single attenuator with combined mechanical and electronic sections thatcontrols all the attenuation functions. Different models in the X-Series come with different configurations.

- See "Dual-Attenuator Configurations" on page 826
- See "Single-Attenuator Configuration" on page 827

Most attenuation settings are the same for all measurements – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by Meas Preset.

This tab is only available when the hardware set includes an input attenuator, which is typically only the case when using Keysight’s box instruments. For example, this tab does not appear in:

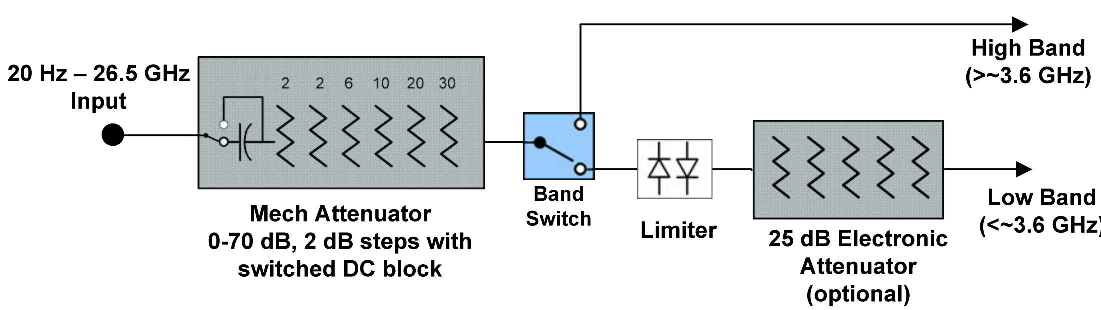
- VXT models M9420A/21A/10A/11A
- E7760
- M9391A
- M9393A

This tab also does not appear in UXM. In UXM all Attenuation and Range settings are disabled, as the expected input power level is handled by the Call Processing App that drives the DUT power control.

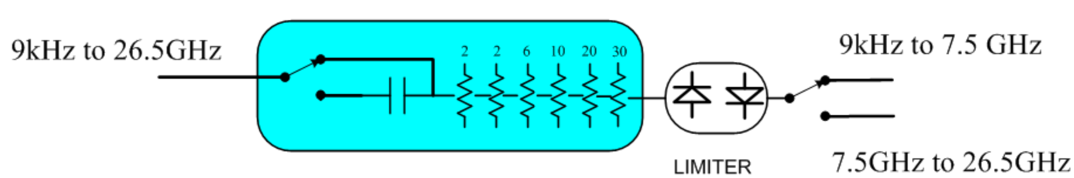
Dependencies	In measurements that support the I/Q inputs, this tab is unavailable when I/Q is the selected input, and is replaced by the Range tab in that case

Dual-Attenuator Configurations

Configuration 1: Mechanical attenuator + optional electronic attenuator

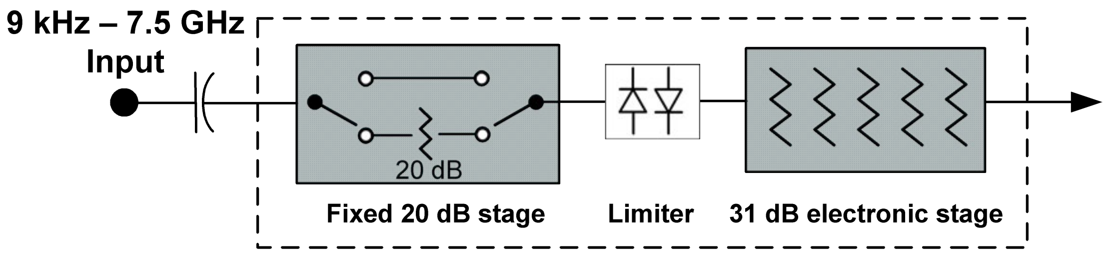


Configuration 2: Mechanical attenuator, no optional electronic attenuator



(note that Configuration 2 is not strictly speaking a dual-section attenuator, since there is no electronic section available. However, it behaves exactly like Configuration 1 without the Electronic Attenuator option EA3, therefore for the sake of this document it is grouped into the “Dual-Attenuator” configuration)

Single-Attenuator Configuration



You can tell which attenuator configuration you have by pressing the Attenuation tab, which (in most Modes) opensthe Attenuation menu. If the first control in the Attenuation menu says **Mech Atten** you have the Dual-Attenuator configuration. If the first control says **Atten** you have the Single-Attenuator configuration.

Dual Attenuator **Single Attenuator**

(Note that depending on the measurement, there may be no Auto/Man functionality on the Mech Atten control).

In the Single-Attenuator configuration, youcontrol the attenuation with a single control, as the fixed stage has only two states. In the Dual-Attenuator configuration, both stages have significant range so you are given separate control of the mechanical and electronic attenuator stages.

When you have the Dual-Attenuator configuration, you may still have only a Single-Attenuator, because unless option EA3 (the Electronic Attenuator option) is available, and you purchase it, you will have only the mechanical attenuator.

Full Range Atten

The **Full Range Atten** control and **Attenuator Summary** only appear in N9041B, when the RF input is selected and the RF Input Port is set to RF Input 2, and the Full Range Attenuator is installed. The Full Range Attenuator adds a second input attenuator at the beginning of the RF Input 2, which enhances the protection and optimizes the performance of the extra internal mixers used by RF Input 2.

Remote Command	`[:SENSe]:POWer[:RF]:FRATten <rel_ampl>` `[:SENSe]:POWer[:RF]:FRATten?`
Example	`:POW:FRAT 14` `:POW:FRAT?`
Notes	When you enter an amplitude value that falls between valid values, the value will be incremented to the

	next smallest valid value
Dependencies	Only appears if input RF is selected, and RF Input Port 2 is selected, and the Full Range Attenuator exists
Couplings	This value is never changed by any coupling, however other couplings use this value. See the **Reference Level** and "Mech Atten" on page 1750 command descriptions
Preset	20 dB
State Saved	Saved in instrument state
Min	0 dB
Max	Only valid values are 0, 6, 14, 20 dB
Annotation	When the Input is RF, and the Input Port is RF Input 2, and the Full Range Attenuator is installed: On the Meas Bar, the field “Atten” displays as follows: – If the sweep is entirely < 50 GHz, the value shown after “Atten:” is equal to Mech Atten + Elec Atten + Full Range Atten – If the sweep is entirely > 50 GHz, the value shown after “Atten:” is equal to Full Range Atten – If the sweep straddles 50 GHz, the value shown after “Atten:” is preceded by the symbol “>=” and is equal to Full Range Atten In the **Amplitude**, "Attenuation" on page 1747 menu, and the Atten Meas Bar dropdown menu panel, a summary is displayed as follows: “Total Atten below 50 GHz” followed by the value of Full Range Atten + Mech Atten + Elec Atten “Total Atten above 50 GHz” followed by the value of Full Range Atten For example, if Mech Atten = 6 dB, Elec Atten = 4 dB, and Full Range Atten = 20 dB, the summary below is shown: – Attenuator summary: – Total Atten below 50 GHz: 30 dB – Total Atten above 50 GHz: 20 dB

Mech Atten

This control is labeled **Mech Atten** in Dual-Attenuator models and **Atten** in Single-Attenuator models. In the Dual-Attenuator configuration, this control only affects the mechanical attenuator.

This control lets you modify the attenuation applied to the RF input signal path. This value is normally auto coupled to the Ref Level, the Internal Preamp Gain, any External Gain that is entered, and the Max Mixer Level, as described in the table below.

See "Attenuator Configurations and Auto/Man" on page 830

Remote Command	`[:SENSe]:POWer[:RF]:ATTenuation <rel_ampl>` `[:SENSe]:POWer[:RF]:ATTenuation?`

	`[:SENSe]:POWer[:RF]:ATTenuation:AUTO OFF | ON | 0 | 1` `[:SENSe]:POWer[:RF]:ATTenuation:AUTO?`

Example	`:POW:ATT 20`
	Dual-Attenuator configuration: sets the mechanical attenuator to 20 dB
	Single-Attenuator mode: sets the main attenuation to 20 dB (see below for definition of "main" attenuation)
	In either case, if the attenuator was in Auto, it is set to Manual
	`:POW:ATT:AUTO ON`
	Turn Auto Mech Atten ON

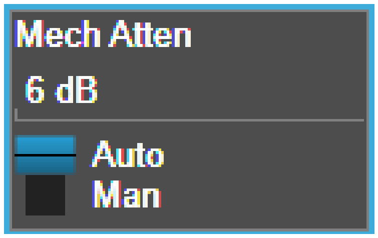
Dependencies	Some measurements do not support the Auto setting of "Mech Atten" on page 828. In these measurements, the Auto/Man selection is not available, and the Auto/Man toggle function is not available In Dual-Attenuator configurations, when the electronic attenuator is enabled, the mechanical attenuator has no auto setting and the Auto/Man toggle function is not available. The state of Auto/Man is remembered and restored when the electronic attenuator is once again disabled. This is described in more detail in "Elec Atten" on page 1753 See "Attenuator Configurations and Auto/Man" on page 830 for more information on the Auto/Man functionality `:POW:ATT:AUTO` is only available in measurements that support Mech Atten Auto, such as Swept SA
Couplings	If the RF Input Port is the RF Input: – If the USB Preamp is connected to USB, use 0 dB for Mech Atten – Otherwise compute the auto-selected value of Mech Atten based on **Reference Level**, Int Preamp, External Gain, Ref Level Offset, Max Mixer Level, µW Path Control and IF Gain settings. Limit this value to be no less than 6 dB (total attenuation below 6 dB can never be chosen by Auto) – In the N9041B, if the RF Input Port is RF Input 2, use the formula above and subtract the Full Range Atten value from the result to determine the Mech Atten. Limit the value so that it is never lower than 0 dB and so that total attenuation, including Full Range Atten, is never less than 6 dB (total attenuation, including Full Range Atten below 6 dB, can never be chosen by Auto) In External Mixingand BBIQ, where the Attenuator is not in the signal path, the Attenuator setting changes as described above when "Mech Atten" on page 828 is in Auto, but no changes are made to the actual attenuator hardware setting until the input is changed back to the RF Input For CXA-m with option FSA (Fine-Step Attenuator or 2 dB steps), the FSA-like behavior is only available when the frequency setting is <= 7.5GHz. So, when the frequency is changed from below 7.5GHz to above 7.5GHz, the attenuation setting will be changed to a multiple of 10dB which will be no smaller than the previous setting. For example, 4dB attenuation will be changed to 10dB
Preset	The preset for Mech Attenuation is "Auto" The Auto value of attenuation is 10 dB ON
State Saved	Saved in instrument state
Min	0 dB The attenuation set by this control cannot be decreased below 6 dB with the knob or step keys. Values below 6 dB must be directly entered from the keypad or via SCPI. This protects against setting a

	dangerously small attenuation value, which can put the instrument at risk of damage to input circuitry. If the current mechanical attenuation is below 6 dB, it can be increased with the knob and step keys, but not decreased
Max	CXA Option 503 or 507: 50 dB EXA: 60 dB All other models: 70 dB Note that in the Single-Attenuator configuration, the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB.
Annotation	The current value for Total Atten is displayed in the Measurement Bar at the top of the display. A value appears for Electronic Attenuation only if the Electronic Attenuator is enabled. The annotation appears as Atten: <total> dB (e<elec>) The e letter is in amber in Single-Attenuator configurations For example: Dual-Attenuator configuration: Atten: 24 dB (e14) Indicating the total attenuation is at 24 dB and the electronic attenuation is at 14 dB Single-Attenuator configuration: A: 24 dB (e14) Indicating the total attenuation is at 24 dB and the “soft” attenuation is at 14 dB (see below for definition of “soft” attenuation) When in Manual, a # sign appears in front of Atten in the annotation

Attenuator Configurations and Auto/Man

As described in "Attenuation" on page 1747 , there are two distinct attenuator configurations available in the X-Series, the single attenuator and Dual-Attenuator configurations. In Dual-Attenuator configurations, we have the mechanical attenuation and the electronic attenuation, and the current total attenuation is the sum of the electronic + mechanical attenuation. In Single-Attenuator configurations, we refer to the attenuation set using "Mech Atten" on page 828 (or `:POW:ATT`) as the “main” attenuation; and the attenuation that is set by `:POW:EATT` as the “soft” attenuation (`:POW:EATT` is honored even in the Single-Attenuator configuration, for compatibility purposes). Then the current total attenuation is the sum of the main + soft attenuation. See "Elec Atten" on page 1753 for more on “soft” attenuation.

NOTE: In some measurements, the **Mech Atten** control has an Auto/Man function. In these measurements, an Auto/Man switch is shown on the **Mech Atten** control:



Note that in configurations that include an Electronic Attenuator, this switch is only shown when the Electronic Attenuator is disabled.

In other measurements, **Mech Atten** has no Auto/Man function. In these measurements, no switch is shown on the **Mech Atten** control:

Mech Atten also appears with no switch, as above, in configurations that include an Electronic Attenuator but when the Electronic Attenuator is enabled.

Elec Atten

Controls the Electronic Attenuator in Dual-Attenuator configurations. This control does not appear in Single-Attenuator configurations, as the control of both the mechanical and electronic stages of the Single-Attenuator is integrated into the single **Atten** control.

This control includes an Enable/Disable toggle switch; it is only possible to enter a value for the Electronic Attenuator when this switch is in the “Enable” position.

See "More Information" on page 832

Remote Command	`[:SENSe]:POWer[:RF]:EATTenuation <rel_ampl>`
	`[:SENSe]:POWer[:RF]:EATTenuation?`
	`[:SENSe]:POWer[:RF]:EATTenuation:STATe OFF | ON | 0 | 1`
	`[:SENSe]:POWer[:RF]:EATTenuation:STATe?`

Example	`:POW:EATT 10`
	`:POW:EATT?`
	`:POW:EATT:STAT ON`
	`:POW:EATT:STAT?`

Notes	Electronic Attenuation’s specification is defined only when Mechanical Attenuation is 6 dB
Dependencies	This control only appears in Dual-Attenuator models with an Electronic Attenuator installed and licensed. It does not appear in models with the Single-Attenuator configuration, as in the Single-Attenuator configuration there is no “electronic attenuator” there is only a single integrated attenuator

	(which has both a mechanical and electronic stage). However, in the Single-Attenuator configuration, EATT SCPI commands are accepted for compatibility with other X-series instruments and set a “soft” attenuation as described in . The “soft” attenuation is treated as an addition to the “main” attenuation value set by the Atten control or the POW:ATT SCPI command and affects the total attenuation displayed on the Atten control and the Meas Bar The electronic attenuator (and the “soft” attenuation function provided in Single-Attenuator configurations) is unavailable above the low band (0-3.6 GHz, 0-3.4 GHz 0-3GHz, depending on the model). If the low band ranges from 0-3.6GHz, and Stop Frequency of the instrument is > 3.6 GHz, then the **Enabled/Disabled** section of the **Elec Atten** control will be OFF and grayed out If the Internal Preamp is on, meaning it is set to Low Band or Full, the electronic attenuator (and the “soft” attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the **Enabled/Disabled** section of the **Elec Atten** control will be OFF and grayed out If either of the above is true, if the SCPI command is sent, an error indicating that the electronic attenuator is unavailable will be sent If both of the above are true, pressing the control will generate error message -221, in other words, the frequency range lockout takes precedence If the electronic/soft Attenuator is enabled, then the Stop Freq of the instrument is limited to 3.6 GHz and the Internal Preamp is unavailable The SCPI-only “soft” electronic attenuation for the single-attenuator configuration is not available in all measurements; in particular, it is not available in the Swept SA measurement
Couplings	Enabling and disabling the Electronic Attenuator affects the setting of the Mechanical Attenuator (in Dual-Attenuator configurations). This is described in more detail below and in the section "Attenuator Configurations and Auto/Man" on page 1752
Preset	`OFF` (Disabled) for Swept SA measurement `ON` (Enabled) for all other measurements that support the electronic attenuator
State Saved	Saved in instrument state
Min	0 dB
Max	Dual-Attenuator configuration: 24 dB Single-Attenuator configuration: the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB
Annotation	See Annotation under the **Mech Atten** control description

More Information

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear. These advantages primarily aid in remote operation and are negligible for front panel use. See "Using the Electronic Attenuator: Pros and Cons" on page 833 for a detailed discussion of the pros and cons of using the electronic attenuator.

For the Single-Attenuator configuration, for SCPI backwards compatibility, the “soft” attenuation feature replaces the Dual-Attenuator configuration’s electronic attenuator. All the same couplings and limitations apply. See "Attenuator Configurations and Auto/Man" on page 1752

Mechanical Attenuator Transition Rules

When the Electronic Attenuator is enabled, the Mechanical Attenuator transitions to a state that has no Auto function. Below are the rules for transitioning the Mechanical Attenuator. Note that the information below ONLY applies to the Dual-Attenuator configurations, and ONLY when the Electronic Attenuator is installed:

When the Electronic Attenuation is enabled from a disabled state:

The Mechanical Attenuator is initialized to 10 dB (this is its optimal performance setting). You can then set it as desired with SCPI, numeric keypad, step keys, or knob, and it behaves as it normally would in manual mode

The Auto/Man state of (Mech) Atten is saved

The Auto/Man toggle on the (Mech) Atten control disappears and the auto rules are disabled

The Electronic Attenuator is set to 10 dB less than the previous value of the Mechanical Attenuator, within the limitation that it must stay within the range of 0 to 24 dB of attenuation

Examples in the Dual-Attenuator configuration:

Mech Atten at 20 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 10 dB. New total attenuation equals the value before Elec Atten enabled

Mech Atten at 0 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 0 dB. New total attenuation does not equal the value before Elec Atten enabled

Mech Atten at 40 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 24 dB. New total attenuation does not equal the value before Elec Atten enabled

When the Electronic Attenuation is disabled from an enabled state:

The Elec Atten control is grayed out

- The Auto/Man state of (Mech) Atten is restored

If now in Auto, (Mech) Atten recouples

If now in Man, (Mech) Atten is set to the value of total attenuation that existed before the Elec Atten was disabled. The resulting value is rounded up to the smallest value possible given the (Mech) Atten Step setting - (That is, 57 dB changes to 58 dB when (Mech) Atten Step is 2 dB)

Using the Electronic Attenuator: Pros and Cons

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear.

The “finer steps” advantage of the electronic attenuator is beneficial in optimizing the alignment of the instrument dynamic range to the signal power in the front panel as well as remote use. Thus, you can achieve improved relative signal measurement accuracy. Compared to a mechanical attenuator with 2 dB steps, the 1 dB resolution

of the electronic attenuator only gives better resolution when the odd-decibel steps are used. Those odd-decibel steps are less accurately calibrated than the even-decibel steps, so one tradeoff for this superior relative accuracy is reduced absolute amplitude accuracy.

Another disadvantage of the electronic attenuator is that the spectrum analyzer loses its “Auto” setting, making operation less convenient.

Also, the relationship between the dynamic range specifications (TOI, SHI, compression, and noise) and instrument performance are less well-known with the electrical attenuator. With the mechanical attenuator, TOI, SHI, and compression threshold levels increase dB-for-dB with increasing attenuation, and the noise floor does as well. With the electronic attenuator, there is an excess attenuation of about 1 to 3 dB between 0 and 3.6 GHz, making the effective TOI, SHI, and so forth, less well known. Excess attenuation is the actual attenuation relative to stated attenuation. Excess attenuation is accounted for in the instrument calibration

Adjust Atten for Min Clipping

Sets the combination of mechanical and electronic attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an "immediate action" function, that is, it executes once, when the control is pressed.

The algorithms that are used for the adjustment are documented under "Pre-Adjust for Min Clipping" on page 1757.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMediate`
Example	`:POW:RANG:OPT IMM`
Notes	Executing Adjust Atten for Min Clipping initiates the measurement.
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements For the Waveform measurement, this control is available only in 5G NR Mode

Adjust Atten

Allows you to select;

– Electric attenuator only

– Combination of Electric attenuator and Mechanical attenuator

when the command `[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMediate` is executed.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE EONLy | COMBined` `[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE?`

Example	:POW:RANG:OPT:TYPE EONL :POW:RANG:OPT:TYPE?
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements For the Waveform measurement, this control is available only in 5G NR Mode
Preset	COMBined
State Saved	Saved in instrument state

Pre-Adjust for Min Clipping

If this function is ON, it applies the adjustment described under "Adjust Atten for Min Clipping" on page 1756 each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

In Dual-Attenuator models, you can set **Elec+Mech Atten**, in which case both attenuators participate in the autoranging, or **Elec Atten Only**, in which case the mechanical attenuator does not participate in the autoranging. This latter case results in less wear on the mechanical attenuator and is usually faster.

See "Adjustment Algorithm" on page 836

Selection	Example	Note
Off	:POW:RANGe:OPT:ATT OFF	This is the default setting
Elec Atten Only	:POW:RANGe:OPT:ATT ELEC	Selects only the electric attenuator to participate in auto ranging. This offers less wear on the mechanical attenuator and is usually faster
Mech + Elec Atten	:POW:RANGe:OPT:ATT COMB	In Dual-Attenuator models, this selects both attenuators to participate in the autoranging

Remote Command	[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF | ON | ELECtrical | COMBined [:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?
Example	:POW:RANG:OPT:ATT OFF :POW:RANG:OPT:ATT?
Notes	The parameter option ELECtrical sets this function to ON in Single-Attenuator models The parameter option COMBined is mapped to ELECtrical in Single-Attenuator models. If you send COMBined, it sets the function to ON and returns ELEC to a query For SCPI compatibility with models that do not have an input attenuator, the ON parameter is honored and mapped to COMBined
Dependencies	This control only appears in Dual-Attenuator models with an Electronic Attenuator installed In instruments with Dual-Attenuator model, when **Enable** "Elec Atten" on page 1753 is OFF or grayed-out, "Pre-Adjust for Min Clipping" on page 835 is grayed-out This control does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum

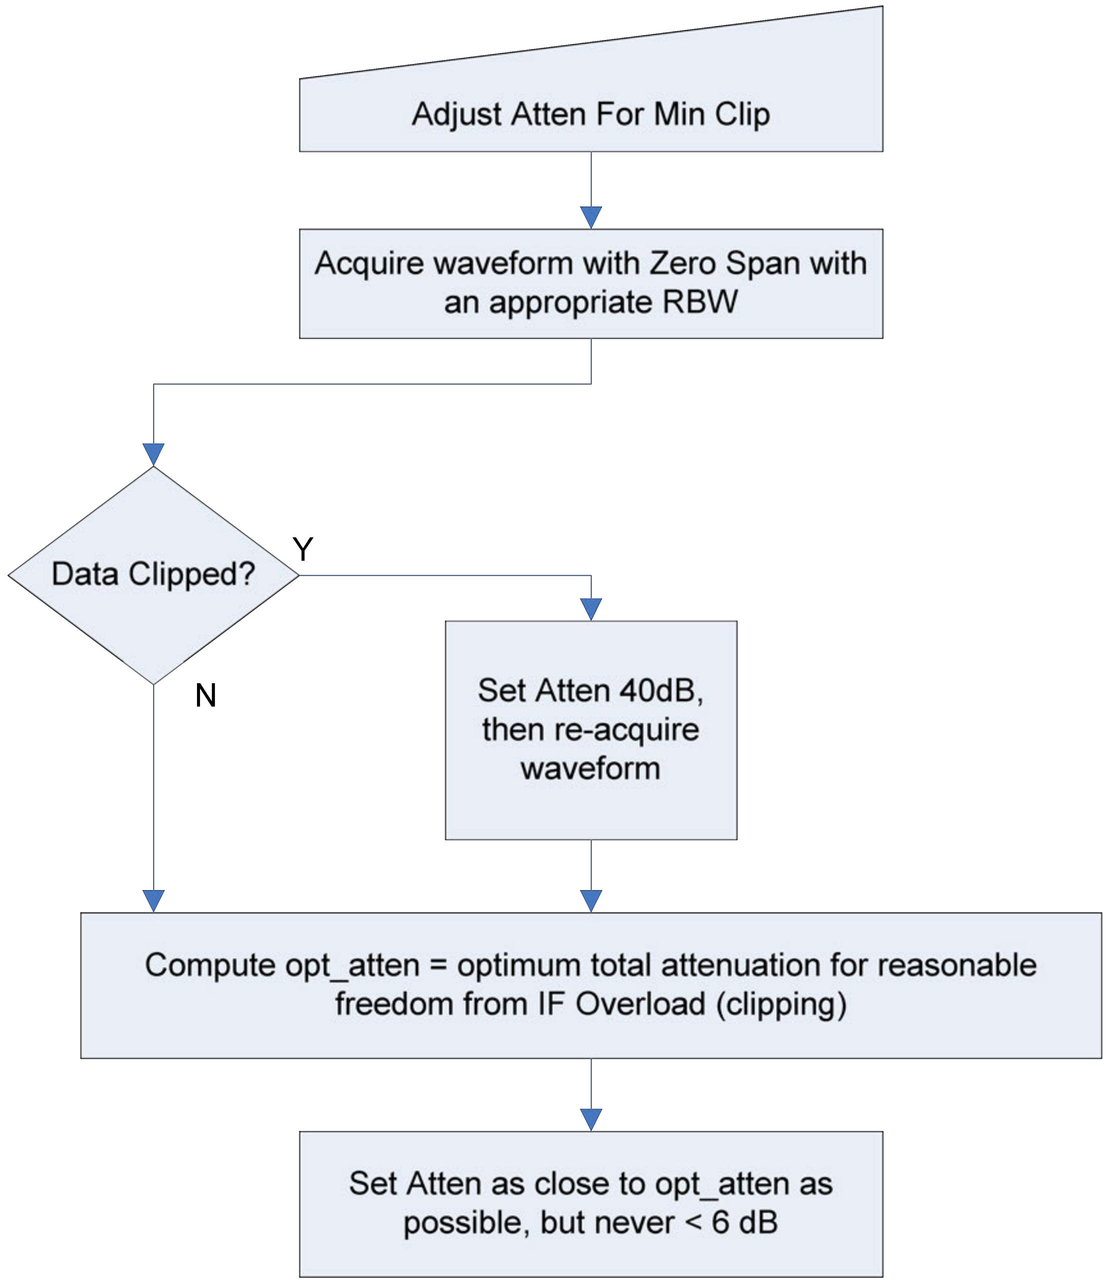
	measurements For the Waveform measurement, this control is available only in 5G NR Mode
Preset	OFF when Elec Atten is Disabled at preset, otherwise ELEC
State Saved	Saved in instrument state
Range	Dual-Attenuator models: Off | Elec Atten Only | Mech + Elec Atten Single-Attenuator models: Off | On

Notes	ON aliases to "Elec Atten Only" (:POW:RANG:OPT:ATT ELEC) OFF aliases to "Off" (:POW:RANG:OPT:ATT OFF) :POW:RANG:AUTO? returns true if :POW:RANG:OPT:ATT is not OFF
Backwards Compatibility SCPI	[:SENSe]:POWer[:RF]:RANGe:AUTO ON | OFF | 1 | 0 [:SENSe]:POWer[:RF]:RANGe:AUTO?

Adjustment Algorithm

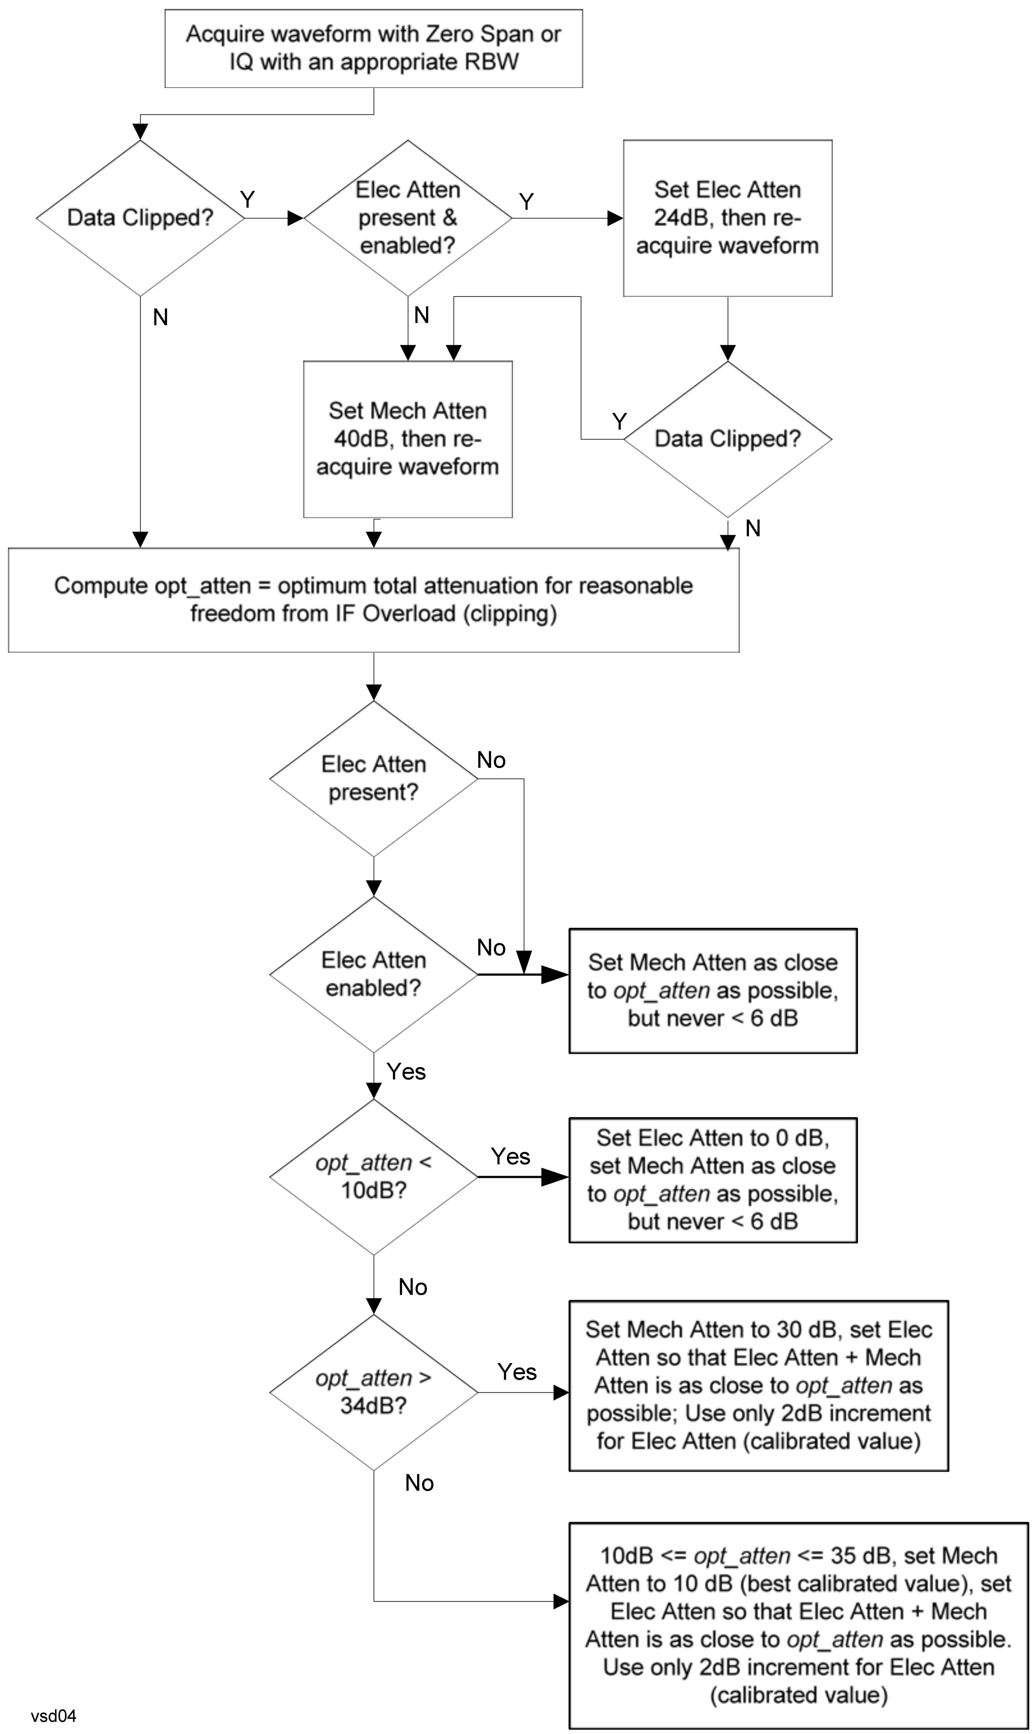
The algorithms for the adjustment are documented below:

Single-Attenuator Models



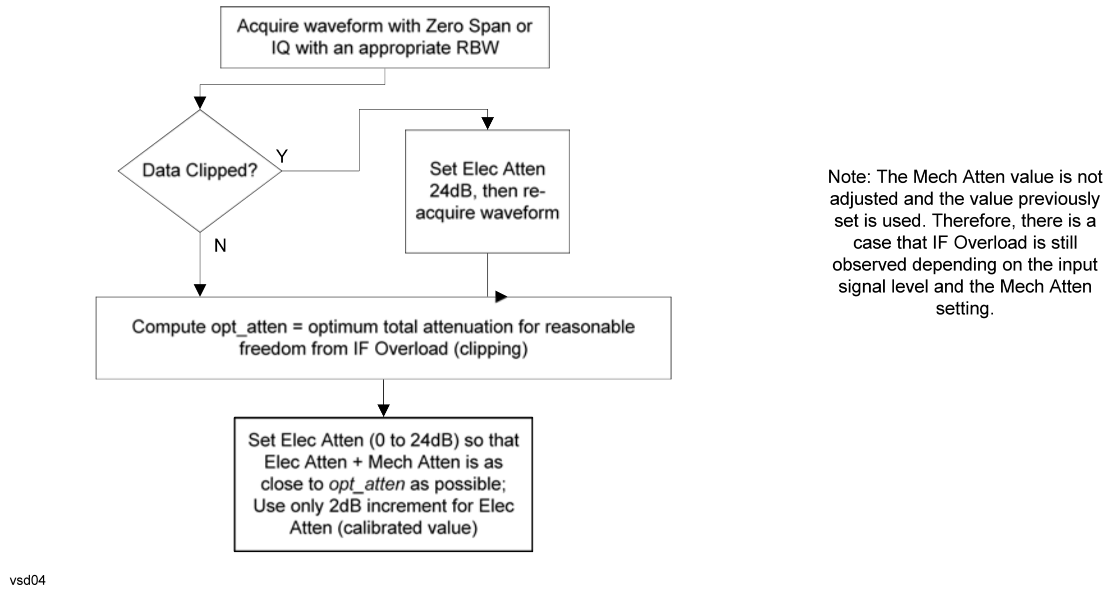
Dual-Attenuator models

"Adjust Atten for Min Clipping" on page 1756 or "Pre-Adjust for Min Clipping" on page 835 selection is Mech + Elec Atten:



Acquire waveform with Zero Span or IQ with an appropriate RBW
Data Clipped?
Y
N
Elec Atten present & enabled?
Y
N
Set Elec Atten 24dB, then re-acquire waveform
Set Mech Atten 40dB, then re-acquire waveform
Y
Data Clipped?
N
Compute opt_atten = optimum total attenuation for reasonable freedom from IF Overload (clipping)
Elec Atten present?
No
Elec Atten enabled?
No
Set Mech Atten as close to opt_atten as possible, but never < 6 dB
Yes
opt_atten < 10dB?
Yes
Set Elec Atten to 0 dB, set Mech Atten as close to opt_atten as possible, but never < 6 dB
No
opt_atten > 34dB?
Yes
Set Mech Atten to 30 dB, set Elec Atten so that Elec Atten + Mech Atten is as close to opt_atten as possible; Use only 2dB increment for Elec Atten (calibrated value)
No
10dB <= opt_atten <= 35 dB, set Mech Atten to 10 dB (best calibrated value), set Elec Atten so that Elec Atten + Mech Atten is as close to opt_atten as possible. Use only 2dB increment for Elec Atten (calibrated value)
vsd04

"Pre-Adjust for Min Clipping" on page 835 selection is Elec Only:



Mech Atten Step

Controls thestep size used when making adjustments to the input attenuation.

This control is labeled **Mech Atten Step** in Dual-Attenuator models and **Atten Step** in Single-Attenuator models. In the Dual-Attenuator configuration, this control only affects the step size of the mechanical attenuator.

Remote Command	`[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement] 10 dB | 2 dB` `[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement]?`
Example	`:POW:ATT:STEP 2` `:POW:ATT:STEP?`
Notes	This feature has a toggle choice from the front panel, but it takes a specific value (in dB) when used remotely. The only valid values are 2 and 10
Dependencies	Blanked in EXA, CXA and CXA-m if option FSA (2 dB steps) is not present. If blanked, attempts to set it via SCPI yield an error
Couplings	When the attenuation step size changes, the current mechanical attenuation value is adjusted (if necessary) to be quantized to the new step size. That is, if step is set to 10 dB, mech atten is increased if necessary so it is a multiple of 10 dB
Preset	EXA, CXA and CXA-m: 10 dB (2 dB with option FSA) All other models: 2 dB
State Saved	Saved in instrument state

3.7.3.3 Range (Non-attenuator models)

This tab is only available for Keysight's modular signal analyzers and certain other Keysight products. Examples include:

- VXT
- E7760
- M9391A
- M9393A

This tab also does not appear in UXM. In UXM, all Attenuation and Range settings are disabled, as the expected input power level is handled by the Call Processing App that drives the DUT power control.

State Saved	No

Range

Represents the amplitude of the largest sinusoidal signal that could be present within the IF without being clipped by the ADC. For signals with high peak-to-average ratios, the range may need to exceed the rms signal power by a significant amount to avoid clipping.

This is a measurement global setting.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe <real>` `[:SENSe]:POWer[:RF]:RANGe?`
Example	`:POW:RANG 10 dBm` `:POW:RANG?`
Notes	The MIN and MAX values are affected by the External Gain parameters, and by the **Center Frequency** The hardware compensates for frequency response and alters the Range setting
Preset	0 dBm
State Saved	Yes
Min	-100
Max	100
Annotation	Meas Bar

Adjust Range for Min Clipping

Sets the combination of attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an "immediate action" function, that is, it executes once, when the key is pressed.

This key does not appear in measurements that do not support this functionality.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMediate`
Notes	Executing Adjust Range for Min Clipping initiates the measurement
Dependencies	This control does not appear in the Swept SA and Monitor Spectrum measurements This control appears in all measurements in E7760

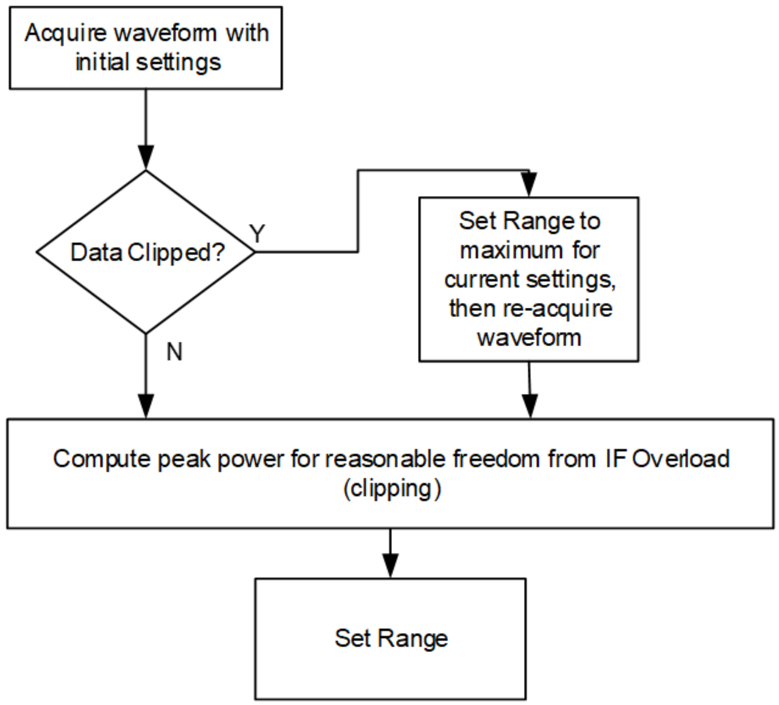
Pre-Adjust for Min Clipping

If this function is `ON`, it applies the adjustment described under Adjust Range For Min Clipping each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF | ON | ELECtrical | COMBined` `[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?`
Notes	Because there is no attenuator control available in these models, the control displays only `ON` and `OFF` choices. However, for SCPI compatibility with other platforms, all three parameters (`ELECtrical`, `COMBined`, and `ON`) are honored and all are mapped to `ELECtrical`, so if any of these three parameters is sent, a subsequent query will return `ELEC`
Dependencies	This control does not appear in the Swept SA and Monitor Spectrum measurements This control appears in all measurements in E7760
Preset	`OFF` for Swept SA measurement; `ON` for all other measurements that support **Pre-Adjust for Min Clipping**
State Saved	Saved in instrument state

Adjustment Algorithm

The algorithm for the adjustment is documented below:



Peak-to-Average Ratio

Used with "Range (Non-attenuator models)" on page 1864 to optimize the level control in the instrument. The value is the ratio, in dB, of the peak power to the average power of the signal to be measured. A ratio of 0 should be used for sinusoidal signals; for 802.11g OFDM signals use 9 dB.

All Applications (Modes) show the current value of Peak-to-Average ratio on the control. However, some applications do not permit changing the value. In these situations, the control is grayed-out.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:PARatio <real>` `[:SENSe]:POWer[:RF]:RANGe:PARatio?`
Example	`:POW:RANG:PAR 12 dB`
Notes	In some Applications (Modes) this parameter is read-only; meaning the value will appear on the control and query via SCPI, but is not changeable. In such applications the control is grayed-out. Attempting to change the value via SCPI will be ignored but no error message will be generated
Dependencies	This control does not appear in Spectrum Analyzer Mode
Preset	10 dB VXT Models M9410A/11A: 0 dB
State Saved	Saved in instrument state
Min	0 dB
Max	20 dB

	VXT Models M9410A/11A: 50 dB

Mixer Lvl Offset

This is an advanced setting to adjust target Range at the input mixer, which in turn affects the signal level in the instrument's IF. This setting can be used when additional optimization is needed after setting "Peak-to-Average Ratio" on page 1866. Positive values of offset optimize noise performance over distortion, negative values optimize distortion performance over noise.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet <real>` `[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet?`
Example	`:POW:RANG:MIX:OFFS -5 dB`
Preset	0 dB
State Saved	Saved in instrument state
Min	-35 dB VXT Models M9410A/11A: -34 dB
Max	30 dB

3.7.3.4 Signal Path

Contains controls that pertain to the routing of the signal through the frontend of the instrument.

In general, this tab only appears in instruments whose hardware supports this signal routing. For example, this tab does not appear in many of the modular instrument products, including VXT Models M9420/21A. It also does not appear in UXM.

This tab *does* appear in VXT Models M9410A/11A because the Software Preselection control is in this tab, and VXT Models M9410A/11A implement a version of Software Preselection.

Presel Center

Pressing this control adjusts the centering of the preselector filter to optimize the amplitude accuracy at the frequency of the selected marker. If the selected marker is not on when **Presel Center** is pressed, the instrument turns on the selected marker, performs a peak search, and then performs centering on the marker's center frequency. If the selected marker is already on and between the start and stop frequencies of the instrument, the instrument performs the preselector calibration on that marker's frequency. If the selected marker is already on, but outside the frequency range between Start Freq and Stop Freq, the instrument first performs a peak search, and then performs centering on the marker's center frequency.

The value displayed on "Preselector Adjust" on page 1869 will change to reflect the new preselector tuning.

A number of considerations should be observed to ensure proper operation. See "Proper Preselector Operation" on page 844.

Remote Command	`[:SENSe]:POWer[:RF]:PCENter`
Example	`:POW:PCEN`
Notes	Note that the rules outlined above under the control description apply for the remote command as well as the key. The result of the command is dependent on marker position, etc. Any message shown by the control press is also shown in response to the remote command
Dependencies	Does not appear in CXA-m Does not appear in VXT Models M9410A/11A Grayed-out if the microwave preselector is off – If the selected marker's frequency is below Band 1, an advisory message is generated "Preselector not used in this frequency range" and no action is taken – Grayed-out if entirely in Band 0, that is, if Stop Freq is below about 3.6 GHz – Grayed-out if entirely above 50 GHz, that is, if Start Freq is above 50 GHz – Blank in models that do not include a preselector, such as option 503. If the remote command is sent in these instruments, it is accepted without error, and the query always returns 0 – Grayed-out in the Spectrogram View
Couplings	The active marker position determines where the centering will be attempted If the instrument is in a measurement such as averaging when centering is initiated, the act of centering the preselector restarts averaging, but the first average trace will not be taken until the centering is completed The offset applied to do the centering reads out on the "Preselector Adjust" on page 1869 control
Status Bits/OPC dependencies	When centering the preselector, `*OPC` will not return true until the process is complete and a subsequent measurement has completed, nor will results be returned to `:READ` or `:MEASure` queries The Measuring bit should remain set while this command is operating and should not go false until the subsequent sweep/measurement has completed

Proper Preselector Operation

A number of considerations should be observed to ensure proper operation:

1 If the selected marker is off, the instrument turns on a marker, performs a peak search, and adjusts the preselector using the selected marker's frequency. It uses the "highest peak" peak search method unqualified by threshold or excursion, so that there is no chance of a 'no peak found' error. It continues with that peak, even if it is the peak of just noise. Therefore, for this operation to work properly, there should be a signal on screen in a preselected range for the peak search to find

2 If the selected marker is already on, the instrument attempts the centering at that marker's frequency. There is no preselector for signals below about 3.6 GHz, so if the marker is on a signal below 3.6 GHz, no centering will be attempted and an advisory message generated

3 In some models, the preselector can be bypassed. If it is bypassed, no centering will be attempted in that range and a message will be generated

Preselector Adjust

Allows you to manually adjust the preselector filter frequency to optimize its response to the signal of interest. This function is only available when "Presel Center" on page 1868is available.

For general purpose signal analysis, using **Presel Center** is recommended. Centering the filter minimizes the impact of long-term preselector drift. **Preselector Adjust** can be used instead to manually optimize the preselector. One application of manual optimization would be to peak the preselector response, which both optimizes the signal-to-noise ratio and minimizes amplitude variations due to small (short-term) preselector drifting.

When **Presel Center** is performed, the offset applied to do the centering becomes the new value of **Preselector Adjust**.

Remote Command	`[:SENSe]:POWer[:RF]:PADJust <freq>` `[:SENSe]:POWer[:RF]:PADJust?`
Example	`:POW:PADJ 100KHz` `:POW:PADJ?`
Notes	The value on the control reads out to 0.1 MHz resolution
Dependencies	– Does not appear in CXA-m – Does not appear in VXT Models M9410A/11A – Grayed-out if microwave preselector is off – Grayed-out if entirely in Band 0, that is, if Stop Freq is below about 3.6 GHz – Grayed-out if entirely above 50 GHz, that is, if Start Freq is above 50 GHz – Blank in models that do not include a preselector, such as option 503. If the SCPI is sent in these instruments, it is accepted without error, and the query always returns 0 – Grayed-out in the Spectrogram View
Preset	0 MHz
State Saved	The **Preselector Adjust** value set by "Presel Center" on page 1868, or by manually adjusting **Preselector Adjust** It is not saved in instrument state, and does not survive a Preset or power cycle
Min	-500 MHz
Max	500 MHz
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:MW:PADJust` `[:SENSe]:POWer[:RF]:MMW:PADJust`

Notes	PSA had multiple preselectors, and you could select which preselector to adjust. Since the X-Series has only one mm/uW preselector, the preselector selection control is no longer available. However, to provide backward compatibility, we accept the legacy remote commands The command form has no effect, the query always returns MWAVe
Backwards Compatibility SCPI	[:SENSe]:POWer[:RF]:PADJust:PRESelector MWAVe | MMWave | EXTernal [:SENSe]:POWer[:RF]:PADJust:PRESelector?

Internal Preamp

Accesses a menu of controls for the internal preamps. Turning on the preamp gives a better noise figure, but a poorer inter-modulation distortion (TOI) to noise floor dynamic range. You can optimize this setting for your particular measurement.

The instrument takes the preamp gain into account as it sweeps. If you sweep outside of the range of the preamp, the instrument will also account for that. The displayed result always reflects the correct gain.

For some measurements, when the preamp is on and any part of the displayed frequency range is below the lowest frequency for which the preamp has specifications, a warning condition message appears in the status line. For example, for a preamp with a 9 kHz lowest specified frequency: "Preamp: Accy unspec'd below 9 kHz".

Selection	Example	Note
Off	:POW:GAIN OFF	
Low Band	:POW:GAIN ON :POW:GAIN:BAND LOW	Sets the internal preamp to use only the low band. The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Low Band selection in the dropdown
Full Range	:POW:GAIN ON :POW:GAIN:BAND FULL	Sets the internal preamp to use its full range. The low band (0-3.6 GHz, 0-3.4 GHz, 0-3GHz, depending on the model) is supplied by the low band preamp and the frequencies above low band are supplied by the high band preamp The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Full Range selection in the dropdown. If the high band option is not installed the Full Range selection does not appear

Remote Command	[:SENSe]:POWer[:RF]:GAIN:BAND LOW | FULL [:SENSe]:POWer[:RF]:GAIN:BAND?

	`[:SENSe]:POWer[:RF]:GAIN[:STATe] OFF | ON | 0 | 1` `[:SENSe]:POWer[:RF]:GAIN[:STATe]?`

Example	`:POW:GAIN:BAND LOW`
	`:POW:GAIN:BAND?`
	`:POW:GAIN OFF`
	`:POW:GAIN?`

Dependencies	Preamp is not available on all hardware platforms. If the preamp is not present or is unlicensed, the control is not shown Does not appear in VXT Models M9410A/11A/15A If `:POW:GAIN:BAND FULL` is sent when a low band preamp is available, the preamp band parameter is set to `LOW` instead of `FULL`, and an "Option not installed" message is generated The preamp is not available when the electronic/soft attenuator is enabled
Preset	`LOW` `OFF`
State Saved	Saved in instrument state
Annotation	When the USB Preamp is not connected to USB, the Preamp annotation in the Meas Bar says "Off" if the preamp is off and displays the frequency range of the low band or full range preamp depending on the setting. For example, if the Preamp is set to Low Band and the Low Band is 3.6 GHz the annotation says "3.6 GHz". If it is a 13.6 GHz preamp and it is set to Full Range the annotation says "13.6 GHz" When the USB Preamp is connected to USB, the Preamp annotation says "Preamp: USB" if the internal preamp is off or "Preamp: USB, Int" if the internal preamp is on (only for measurements that support the USB preamp)

LNA

Lets you turn the Low Noise Amplifier (**LNA**) on or off.

The LNA is an additional preamplifier that provides superior DANL and frequency range compared to the Internal Preamp. The LNA provides lower system noise figure, especially at frequencies above 100 MHz, and can be operated up to the full range of 50 GHz instruments.

For best possible sensitivity, the LNA can be turned on together with the "Internal Preamp" on page 1870, although if you operate both preamps together, note that the TOI (distortion) specifications are impacted. The sensitivity improvement of this combination is substantial when operating in high band (frequencies above 3.6 GHz).

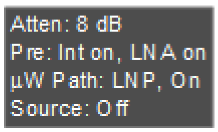
See "More Information" on page 848

Remote Command	`[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe] OFF | ON | 0 | 1` `[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe]?`
Example	`:POW:GAIN:LNA ON`
Dependencies	Requires option LNA

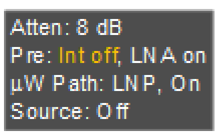
	Option LNA is not required by VXT model M9415A Does not appear in VXT models M9420A/21A/10A/11A May not appear in some measurements
Preset	OFF
State Saved	Saved in State

More Information

When the LNA is installed, the preamp annotation changes to show the state of both the LNA and the Internal Preamp. Below is an example:



Note that when operating entirely in the low band (below about 3.6 GHz), if the LNA is on, the Internal Preamp is switched off (even if you have its switch set to ON). This is because the noise performance is actually degraded in low band if both preamps are on. In this case, the annotation reflects the actual state of the two preamps, but the Internal Preamp annotation displays in amber, to warn you that the actual state of the Internal Preamp does not match the **Internal Preamp** switch control display:



µW Path Control

Options for this control include **µW Preselector Bypass** (Option MPB), **Low Noise Path** (Option LNP) and **Full Bypass Enable** in the High Band path circuits.

When the µW Preselector is bypassed, flatness is improved, but will be subject to spurs from out of band interfering signals. When **Low Noise Path Enable** is selected, the instrument automatically bypasses certain circuitry in the high frequency bands that can contribute to noise, when it is appropriate based on other instrument settings.

For most applications, the preset state is **Standard Path**, which provides the best remote-control throughput, minimizes acoustic noise from switching and minimizes the risk of wear in the hardware switches, particularly in remote test scenarios where both low band and high band setups will follow in rapid succession. In this path, the bypass of the low band/high band switch and microwave preamp is never activated, which can cause some noise degradation but preserves the life of the bypass switch.

For applications that utilize the wideband IF paths, the preset state is **µW Preselector Bypass**, if option MPB is present. This is because, when using a wideband IF such as

the 140 MHz IF, the µW Preselector's bandwidth can be narrower than the available IF bandwidth, causing degraded amplitude flatness and phase linearity, so it is desirable to bypass the preselector in the default case.

You may choose **Low Noise Path Enable** for a lower noise floor, especially in the 21-26.5 GHz region, though without improving many measures of dynamic range, and without giving the best possible noise floor. The preamp, if purchased and used, gives better noise floor than does **Low Noise Path Enable**, but the preamp's compression threshold and third-order intercept are much poorer than that of **Low Noise Path Enable**.

A fourth choice is **Full Bypass Enable**, which combines **µW Preselector Bypass** and **Low Noise Path Enable**. Because this can bypass most of the circuitry between the input and the first mixer, care should be taken when using this setting to avoid damaging the mixer. **Full Bypass Enable** is only available if both options LNP and MPB are present, as well as option FBP.

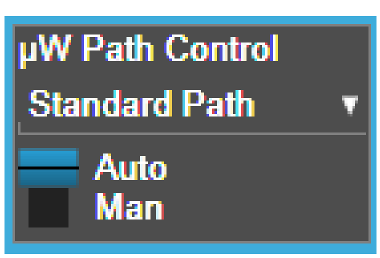
Path	Example	Note
Standard Path	:POW:MW:PATH STD	Normal setting for most measurements. µW Preselector in circuit, Low Noise Path disabled
Low Noise Path Enable	:POW:MW:PATH LNP	See "Low Noise Path Enable" on page 853
µW Preselector Bypass	:POW:MW:PATH MPB	See "µW Preselector Bypass" on page 854
Full Bypass Enable	:POW:MW:PATH FULL	See "Full Bypass Enable" on page 855

Remote Command	[:SENSe]:POWer[:RF]:MW:PATH STD | LNPath | MPBypass | FULL [:SENSe]:POWer[:RF]:MW:PATH?
Example	:POW:MW:PATH LNP Enables the Low Noise path :POW:MW:PATH?
Notes	If "Presel Center" on page 1868 is performed, the instrument will momentarily switch to the Standard Path, regardless of the setting of **µW Path Control** The DC Block will always be switched in when the low noise path is switched in, to protect succeeding circuitry from DC. Note that this does not mean "when the low noise path is enabled" but when, based on the Low Noise Path rules, the path is actually switched in. This can happen when the selection is **Low Noise Path Enable** or **Full Bypass Enable.** In the case where the DC Block is switched in the instrument is now AC coupled. However, if you selected DC coupling, the UI would still behave as though it were DC coupled, including all annunciation, warnings, status bits, and responses to SCPI queries. This is because, based on other settings, the instrument could switch out the low noise path at any time and hence go back to being DC coupled Alignment switching ignores the settings in this menu, and restores them when finished
Dependencies	Does not appear in CXA-m Does not appear in VXT Models M9410A/11A Does not appear in BBIQ and External Mixing

	The **Low Noise Path Enable** selection does not appear unless Option LNP is present and licensed The **µW Preselector Bypass** selection does not appear unless Option MPB is present and licensed The **Full Bypass Enable** selection does not appear unless options LNP and MPB are both present as well as option FBP In any of these cases, if the required options are not present and the SCPI command is sent, error -241, "Hardware missing; Option not installed" is generated **Low Noise Path Enable** and **Full Bypass Enable** are grayed-out if the current measurement does not support them **Low Noise Path Enable** and **Full Bypass Enable** are not supported in Avionics and MMR Modes. In any of these cases (that is, the feature is not supported in either measurement or mode), if the SCPI command is sent, the following error is generated: -221, “Setting Conflict; Feature not supported for this measurement”
Preset	All except modes specified below: `STD` IQ Analyzer, VXA, Pulse and Avionics mode: – MPB option present and licensed: `MPB` – MPB option not present and licensed: `STD`
State Saved	Save in instrument state
Range	Standard Path|Low Noise Path Enable|µW Presel Bypass|Full Bypass Enable
Annotation	In the Meas Bar, if the Standard path is chosen, it says: µW Path: Standard If Low Noise Path is enabled but the LNP switch is not thrown, it shows: µW Path: LNP,Off If the Low Noise Path is enabled and the LNP switch IS thrown, it shows: µW Path: LNP,On If the preselctor is bypassed, it says: µW Path: Bypass If Full Bypass Enable is selected but the LNP switch is not thrown, it shows: µW Path: FByp,Off If Full Bypass Enable is selected and the LNP switch IS thrown, it shows: µW Path: FByp,On

µW Path Control Auto [Mode: VMA, WLAN, NR5G, CQM]

In VMA, WLAN, 5G NR, CQM modes, an Auto/Man switch is added to **µW Path Control**:



This allows the function to automatically switch based on certain Auto Rules as shown below:

VMA Mode

Measurement	When µW Path Control is in Auto:
Digital Demod	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Monitor Spectrum	Always Presel Bypass
IQ Waveform	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Custom OFDM	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Channel Power	Always Presel Bypass
Occupied BW	Always Presel Bypass
CCDF	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
ACP	Always Presel Bypass
SEM	Always Presel Bypass
Spurious Emissions	Always Standard Path

WLAN Mode

Measurement	When µW Path Control is in Auto:
Modulation Analysis	Always Presel Bypass
Spectral Flatness	Always Presel Bypasss
Power vs Time	Always Presel Bypass
Monitor Spectrum	Always Presel Bypass
IQ Waveform	Always Presel Bypass
Channel Power	Always Presel Bypass
Occupied BW	Always Presel Bypass
CCDF	Always Presel Bypass
SEM	1. For 11be 320M, when 'Enabled Wideband IF for FFT' is OFF or 'Sweep Type Rule' is Best Dynamic Range, auto µW path is standard. 2. For other cases, auto µW path is presel bypass if presel bypass is enabled, auto µW path is standard if presel bypass is not enabled.
Spurious Emissions	Always Standard Path

5G NR Mode

Measurement	When µW Path Control is in Auto:
Modulation	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in

Measurement	When µW Path Control is in Auto:
Analysis	which case choose Full Bypass if conditions warrant(FBP Option is available and "Allow Full Bypass in Auto" is On), otherwise choose Preselector Bypass
Monitor Spectrum	Always Standard Path
IQ Waveform	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Full Bypass if conditions warrant(FBP Option is available and "Allow Full Bypass in Auto" is On), otherwise choose Preselector Bypass
Channel Power	Always Standard Path
Occupied BW	Always Standard Path
CCDF	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
ACP	Always Standard Path
SEM	Always Standard Path
Spurious Emissions	Always Standard Path
Transmit On|Off Power	Use Standard Path unless tuned frequency > 3.6 GHz and Info BW > 15 MHz, in which case choose Preselector Bypass

Channel Quality Mode

Measurement	When µW Path Control is in Auto:
Group Delay	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Full Bypass if conditions warrant(FBP Option is available and "Allow Full Bypass in Auto" is On), otherwise choose Preselector Bypass
Monitor Spectrum	Always Standard Path
IQ Waveform	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
CCDF	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass

Remote Command	`[:SENSe]:POWer[:RF]:MW:PATH:AUTO ON | OFF | 1 | 0` `[:SENSe]:POWer[:RF]:MW:PATH:AUTO?`
Example	`:POW:MW:PATH:AUTO ON` `:POW:MW:PATH:AUTO?`
Dependencies	Only appears in VMA, WLAN, 5G NR and CQM modes
Couplings	See the tables above
Preset	ON
Range	ON|OFF

Low Noise Path Enable

You may select **Low Noise Path Enable**, which gives a lower noise floor under some circumstances, particularly when operating in the 21-26.5 GHz region. With the Low Noise Path enabled, the low band/high band switch and microwave preamp are bypassed whenever all of the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz
- the internal preamp is not installed or (if installed) is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Low Noise Path Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the **Low Noise Path Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Low Noise Path Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

For measurements that use IQ acquisition, the low noise path is used when **Center Frequency** is in High Band (> 3.6 GHz) and no preamp is in use. In other words, the rules above are modified to use only the center frequency to qualify which path to switch in. This is not the case for FFTs in the Swept SA measurement; they use the same rules as swept measurements.

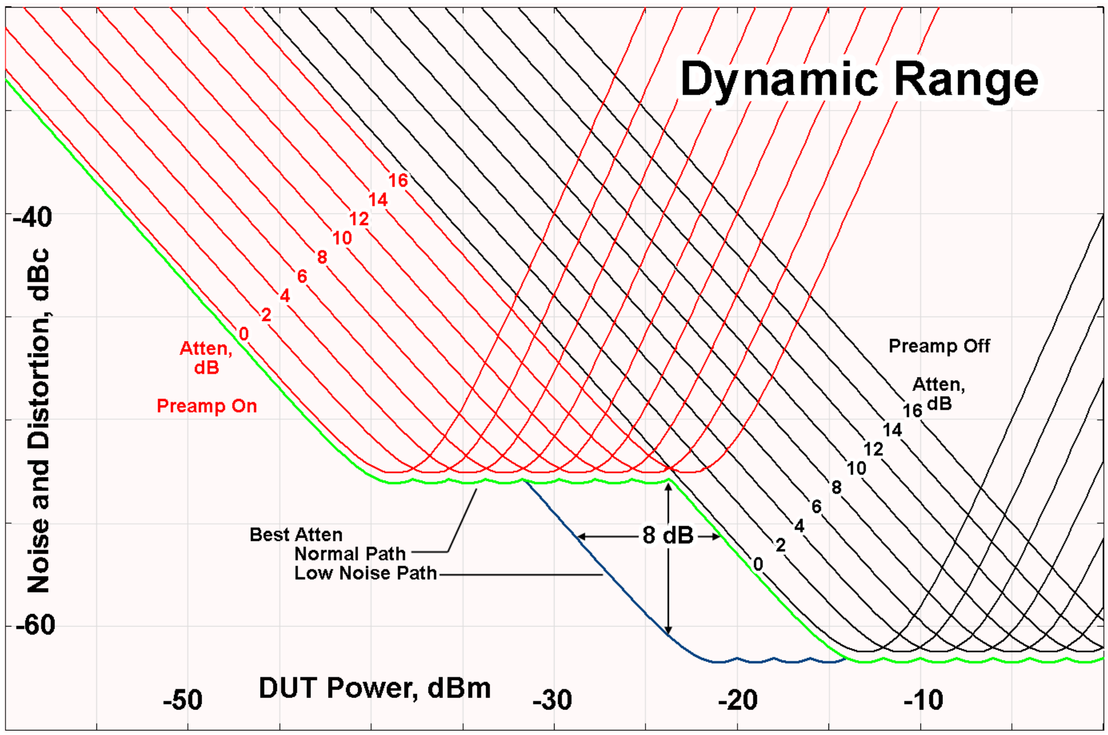
Note that the Low Noise Path, while giving improved DANL, has the disadvantage of decreased TOI performance and decreased gain compression performance relative to the standard path.

Note also that the bypass switch is a mechanical switch and has finite life, so if the **Low Noise Path Enable** is selected, it is possible to cause frequent cycling of this switch by frequently changing instrument settings such that the above conditions hold true only some of the time. A user making tests of this nature should consider opting for the **Standard Path**, which will never throw the bypass switch, at the expense of some degraded noise performance.

The low noise path is useful for situations where the signal level is so low that the instrument performance is dominated by noise even with 0 dB attenuation, but still high enough that the preamp option would have excessive third-order intermodulation or compression. The preamp, if purchased and used, gives better noise floor than does the “Low Noise Path.” However, its compression threshold and third-order intercept are much poorer than that of the non-preamp path.

There are some applications, typically for signals around –30 dBm, for which the third-order dynamic range of the standard path is good enough, but the noise floor is not low enough even with 0 dB input attenuation. When the third-order dynamic range of the preamp path is too little and the noise floor of the standard path is too high, the Low Noise Path can provide the best dynamic range

The graph below illustrates the concept. It shows, in red, the performance of an instrument at different attenuation settings, both with the preamp on and off, in a measurement that is affected by both instrument noise and instrument TOI. The green shows the best available dynamic range, offset by 0.5 dB for clarity. The blue shows how the best available dynamic range improves for moderate signal levels with the low noise path switched in. In this illustration, the preamp improves the noise floor by 15 dB while degrading the third-order intercept by 30 dB, and the low noise path reduces loss by 8 dB. The attenuator step size is 2 dB.



There are other times where selecting the low noise path improves performance, too. Compression-limited measurements such as finding the nulls in a pulsed-RF spectrum can profit from the low noise path in a way similar to the TOI-limited measurement illustrated. Accuracy can be improved when the low noise path allows the optimum attenuation to increase from a small amount like 0, 2 or 4 dB to a larger amount, giving better return loss at the instrument input. Harmonic measurements, such as second and third harmonic levels, are much improved using the low noise path because of the superiority of that path for harmonic (though not intermodulation) distortion performance.

µW Preselector Bypass

Toggles the preselector bypass switch for band 1 and higher. When the microwave presel is on, the signal path is preselected. When the microwave preselector is off, the signal path is not preselected. The preselected path is the normal path for the instrument.

The preselector is a tunable bandpass filter which prevents signals away from the frequency of interest from combining in the mixer to generate in-band spurious signals (images). The consequences of using a preselector filter are its limited bandwidth, the amplitude and phase ripple in its passband, and any amplitude and phase instability due to center frequency drift.

Option MPB or pre-selector bypass provides an unpreselected input mixer path for certain X-Series signal analyzers with frequency ranges above 3.6 GHz. This signal path allows a wider bandwidth and less amplitude variability, which is an advantage when doing modulation analysis and broadband signal analysis. The disadvantage is that, without the preselector, image signals will be displayed. Another disadvantage of bypassing the preselector is increased LO emission levels at the front panel input port.

Image responses are separated from the real signal by twice the 1st IF. For IF Paths of 10 MHz and 25 MHz, the 1st IF is 322.5 MHz, so the image response and the real signal will be separated by 645 MHz. The 1st IF will be different for other IF Path settings. When viewing a real signal and its corresponding image response in internal mixing, the image response will be to the left of the real signal.

Also, the image response and the real signal typically have the same amplitude and exhibit the same shape factor.

However, if Option FS1, Fast Sweep Capability, is enabled, the image response in the Swept SA measurement appears lower in amplitude and has a much wider shape factor compared to the real signal.

Full Bypass Enable

With **Full Bypass Enable** selected, the microwave preselector is bypassed. In addition, the low band/high band switch and microwave preamp are bypassed whenever all of the following are true:

– The instrument is not in the Low Band, meaning:

– the start frequency is above 3.5 GHz and

– the stop frequency is above 3.6 GHz.

– the internal preamp is not installed or (if installed) is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Full Bypass Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

CAUTION When **Full Bypass Enable** is selected, and "Attenuation" on page 1747 is set to 0 dB, there will be a direct AC connection between the input and the first converter

when the Low Noise Path switches in (when Start Freq >3.6 GHz and the Preamp is either not licensed, set to Low Band, or Off). This puts the first converter at high risk to be damaged by high AC power. Consequently, whenever **Full Bypass Enable** is selected, a warning message appears in the status bar:

Full Bypass Enabled, maximum safe input power reduced

Microwave Preselector Bypass Backwards Compatibility

Example	`:POW:MW:PRES OFF` Bypasses the microwave preselector
Notes	Included for Microwave Preselector Bypass backwards compatibility The `ON` parameter sets the `STD` path (`:POW:MW:PATH STD`) The `OFF` parameter sets path `MPB` (`:POW:MW:PATH MPB`)
Preset	`ON`
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe] ON | OFF | 0 | 1` `[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe]?`

Frequency Extender Preselection Bypass

Frequency Extender Preselection Bypass only applies to the high frequency path of the Frequency Extender and only if the Frequency Extender allows it. For example, the V3050A high frequency path is 50 – 110 GHz and does allow control of the preselector bypass.

When the Frequency Extender's preselection is bypassed, flatness is improved, but will be subject to spurs from out of band interfering signals. For bandwidths greater than 2.5 [GHz], it is recommended that the signal bypass the Frequency Extender Preselector since the max bandwidth of the Preselector can be as narrow as 2.5 [GHz].

For most applications, the preset state is `OFF`, which gives the best remote-control throughput, minimizes acoustic noise from switching, minimizes out of band spurs, and minimizes the risk of wear in the hardware switches.

Coupling with Microwave Preselector Control

The control of whether to apply or bypass the Frequency Extender's preselection is dependent on the Microwave Path Control setting.

The coupling between the Microwave Path Control and Frequency Extender Preselector Bypass is described below.

UW PATH CTRL	UW PRESELECTOR	VIKING PRESELECTOR
Standard Path	On	**On**
Low Noise Path Enable	On	**On**
uW Presel Bypass	Off	**Off**
Full Bypass Enable	Off	**Off**

In other words…

uW Path Ctrl == Standard
uW Path Ctrl == Low Noise → Viking PreselBypass == Off

uW Path Ctrl == Bypass
uW Path Ctrl == Full Bypass → Viking PreselBypass == On

For the Frequency Extender Preselector Bypass to take effect, it requires a Frequency Extender device (such as V3050A) be connected and External RF (ERFIN) selected as the input.

The Frequency Extender Preselector is applied or bypassed depending on the Microwave Path Control setting only when the acquisition is above 50 [GHz]. Hence, it will be bypassed only when the acquisition is above 50 [GHz].

Preselector and Bandwidth Conflict

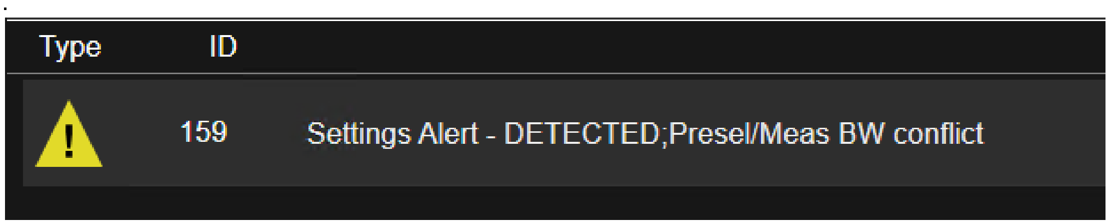
When the Frequency Extender Preselector is applied and the signal bandwidth is greater than 2.5 [GHz], then a settings alert message will show to warn the user that the signal may be distorted due to the limitation of the Frequency Extender Preselector bandwidth.

An example of the settings alert message is shown below.

Settings Alert message in the Status Bar at the bottom of the display.

Settings Alert message in the error queue

.



Software Preselection

Software Preselection is provided in some instruments, either to compensate for issues with provided hardware preselection or to provide the preselection function when there is no hardware preselector.

N9041B

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

In the N9041B, Software Preselection only applies for frequencies above 50 GHz, therefore it is only used for RF Input 2. Even if it is turned on, it will not be used for other inputs and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that in the N9041B, in Swept SA, Software Preselection will work even if the measurement is using an FFT sweep type. In measurements other than Swept SA, Software Preselection will not be used if the measurement is using an FFT sweep type.

N9042B+V3050A

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 88 GHz, software preselection must be used to suppress and separate images above 88 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

For N9042B+V3050A, Software Preselection only applies for frequencies above 88 GHz, therefore it is only used for External RF. Even if it is turned on, it will not be used for other inputs and never for frequencies below 88 GHz. This is why the label of this control contains the parenthetical note “(>~88 GHz)”.

Note that for N9042B+V3050A, in Swept SA, Software Preselection will work even if the measurement is using an FFT sweep type. In measurements other than Swept SA, Software Preselection will not be used if the measurement is using an FFT sweep type.

VXT models M9410A/11A

Software Preselection is used to provide the preselection function, as there is no hardware preselector in these models. Two background traces are taken and compared point by point, and the point with the lowest amplitude from the two traces is used. This provides a method to reduce spurs that are internally generated within the VXT, but the user should note the following when using Software

Preselection:

- There is some speed cost due to the need to take multiple captures
- Taking the point with the lowest amplitude in each trace will make the average noise level lower at all points that do not have a spur. This can reduce the accuracy of the measurement of noise and noise-like signals.

Because of the difficulty in identifying spurs manually, you are encouraged to leave Software Preselection ON at all times in VXT models M9410A/11A. If you turn it off in order to speed up your measurement or improve noise accuracy, be aware of unwanted onscreen spurs.

Remote Command	`[:SENSe]:POWer[:RF]:SWPResel:STATe 0 | 1 | ON | OFF` `[:SENSe]:POWer[:RF]:SWPresel:STAT?`
Example	`:POW:SWPR:STAT 1` `:POW:SWPR:STAT?`
Dependencies	Only appears in N9041B, N9042B+V2050A, and VXT models M9410A/11A. Does not appear in all measurements
Couplings	Sweep Time is affected by SW Preselection. Also Auto Tune supports SW Preselection, so set SW Preselection state and then do Auto Tune
Preset	N9041B: OFF N9042B+V3050A: ON M9410A/11A: ON
State Saved	Saved in instrument state

SW Preselection Type

Specifies the algorithm used for software preselection.

Two hidden sweeps are taken in succession. The second sweep is offset in LO frequency by 2*IF/N. For each point in each trace, the smaller amplitude from the two traces is taken and placed in that point in the selected trace. The Peak detector is auto-selected to improve the image suppression effectiveness. Responses of each trace that lie on top of one another will remain and are valid signals. Other signals are images and are suppressed. The action of taking the smaller of the two traces will make the average noise level lower in all points that do not have an image, thus reducing the accuracy of the measurement of noise and noise-like signals.

- `NORMal` - mathematically removes all image and multiple responses of signals present at the input
- `ADVanced` - any trace processing (such as “max hold” or trace averaging) is performed on the points of both candidate traces before the “select minimum” operation occurs. This form of processing works better for non-stationary signals, such as pulsed-RF signals

Remote Command	`[:SENSe]:POWer[:RF]:SWPResel NORMal | ADVanced` `[:SENSe]:POWer[:RF]:SWPResel?`
Example	`:POW:SWPR NORM` `:POW:SWPR?`
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method When "Software Preselection" on page 1883 is Disabled, this control is grayed-out. Its grayout message is "Unavailable unless SW Presel enabled"
Preset	N9041B: `ADVanced` N9042B+V3050A: `NORMal`
State Saved	Saved in instrument state

SW Preselection BW

Specifies the effective bandwidth to be used for Software Preselection.

The choices are:

- `NORMal` – when making Swept measurements, a software preselection algorithm is used which takes up to 4 background acquisitions, then post-processes the result. This algorithm can remove images from signals with an occupied bandwidth up to around 3 GHz. (Default/Preset setting). When making FFT measurements, this algorithm is not used, instead the same algorithm is used as for `NARRow` (below)
- `NARRow`– a software preselection algorithm is used which takes two background acquisitions, then post-processes the result to detect and remove images from wideband signals with occupied bandwidths up to 2 GHz. This increases the risk of images failing to be rejected, but improves the measurement speed

Remote Command	`[:SENSe]:POWer[:RF]:SWPResel:BW NORMal | NARRow` `[:SENSe]:POWer[:RF]:SWPResel:BW?`
Example	`:POW:SWPR:BW NARR`
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method When "Software Preselection" on page 1883 is Disabled, this control is grayed out. Its grayout message is "Unavailable unless SW Presel enabled" For N9042B+V3050A the parameter is SCPI only and always set to `NARRow` when Software Preselection is enabled
Preset	N9041B: `NORMal` N9042B+V3050A: `NARRow`
State Saved	Saved in instrument state

High Freq Prefilter

Lets you set the state of Prefilter for Center Frequencies above 1310 MHz.

In VXT Models M9410A/11A, the Receiver RF path has a bank of filters that come after the RF Attenuator in the signal path. Since this bank of filters precedes the mixer they are known as the “Prefilter” bank. Their purpose is to eliminate unwanted in-band mixing products by filtering out all but the desired frequencies before the signals get to the mixer. There are 13 prefilter bands to cover the frequencies between 9 kHz and 6000 MHz. The Prefilter provides the necessary rejection of the unwanted signal.

Remote Command	`[:SENSe]:<measurement>:PFILter[:STATe] ON | OFF | 1 | 0` `[:SENSe]:<measurement>:PFILter[:STATe]?`

Example	For example, to enable High Freq Prefilter in IQ Analyzer Mode:
	For the Complex Spectrum Measurement:
	`:SPEC:PFIL ON`
	For the IQ Waveform Measurement:
	`:WAV:PFIL ON`
	`:`

Dependencies	This control only appears in VXT models M9410A/11A with center frequency above 1310 MHz
Preset	See “Prefilter Presets” below
State Saved	Saved in instrument state

Prefilter Presets

Meas	Mode	Preset
SPEC	BASIC	OFF
WAV	BASIC, WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA	OFF
MON	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA	OFF
RHO	WCDMA	OFF
CDP	WCDMA	OFF
PCON	WCDMA	OFF
EVMQ	WCDMA	OFF
CHP	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
OBW	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
ACP	WCDMA, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
SEM	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
PST	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
PVT	WLAN, LTEAFDD, LTEATDD, 5GNR	OFF
EVM	WLAN, LTEAFDD, LTEATDD, 5GNR	OFF

Meas	Mode	Preset
FLAT	WLAN	OFF
EVMM	WLAN	OFF
CEVM	LTEAFDD, LTEATDD	OFF
PAVT	5GNR, VMA	OFF
DDEM	VMA	OFF
OFDM	VMA	OFF
SAN	SA	ON
HARM	SA	ON

3.7.4 BW

The BW key opens the bandwidth menu, which contains controls for the Resolution Bandwidth and Video Bandwidth functions of the instrument.

The Resolution BW functions control filter bandwidth and filter type. There are two filter types, Gaussian and Flattop. The Gaussian filters have a response curve that is parabolic on a log scale. The Flattop filter shape is a close approximation of a rectangular filter.

3.7.4.1 Settings

The **Settings** tab contains the basic Bandwidth functions. In most measurements it is the only tab under Bandwidth.

Res BW

Activates the resolution bandwidth active function, which allows you to manually set the resolution bandwidth (RBW) of the instrument.

Normally, **Res BW** (Auto) selects automatic coupling of the Res BW to Span using the ratio set by the Span:3 dB RBW control (some measurements do not have a Span:3 dB RBW control, in which case the measurement chooses the optimal ratio). To decouple the resolution bandwidth, press the **Auto/Man** toggle on the **Res BW** control, or simply enter a different value for **Res BW**.

When the **Res BW** is manually selected, it may be returned to the coupled state by pressing the **Auto/Man** toggle on the **Res BW** control. This may also be done by pressing Auto Couple or by performing a **Preset**.

See:

"RBW Presets" on page 863

"More Information" on page 864.

Remote Command	`[:SENSe]:CHPower:BANDwidth[:RESolution] <bandwidth>`
	`[:SENSe]:CHPower:BANDwidth[:RESolution]?`
	`[:SENSe]:CHPower:BANDwidth[:RESolution]:AUTO ON | OFF | 1 | 0`
	`[:SENSe]:CHPower:BANDwidth[:RESolution]:AUTO?`

Example	`:CHP:BAND 5 MHz`
	`:CHP:BAND?`
	`:CHP:BAND:AUTO ON`
	`:CHP:BAND:AUTO?`

Notes	For numeric entries, all RBW Types choose the nearest (arithmetically, on a linear scale, rounding up) available RBW to the value entered The setting and querying of values depend on the current bandwidth type This parameter is preset by the Meas Method selection. Preset values are as follows: IBW: 100 kHz IBWR: 27 kHz FAST (WCDMA): 390 kHz When Meas Method is "Fast Power" and Fast Power RBW mode is "Speed," RBW is calculated as follows: RBW = Span × 2.442 × 10^{-3}
Couplings	Sweep time is coupled to the RBW. As the RBW changes, the sweep time (if set to Auto) is changed to maintain amplitude calibration Video bandwidth (VBW) is coupled to the RBW. As the resolution bandwidth changes, the video bandwidth (if set to Auto) changes to maintain the ratio of VBW/RBW (10:1) When the Res BW is set to Auto, the resolution bandwidth is auto-coupled to the span. The ratio of Span/RBW is approximately 106:1 when auto coupled. When Res BW is set to Man, and the bandwidths are entered manually, these bandwidths are used regardless of other instrument settings
Preset	Auto (unless noted in the table below)
State Saved	Saved in instrument state
Min	1 Hz
Max	8 MHz is the max equivalent –3 dB RBW, which means that the named RBW (the one shown on the control etc.) can actually exceed 8 MHz if using a filter other than –3 dB Gaussian
Annotation	A "#" mark appears before "RBW" in the annotation when it is switched from Auto to Manual coupling
Backwards Compatibility Notes	For backwards compatibility this command obeys both the `BANDwidth` and `BWIDth` forms For ESA, the maximum Res BW was 5 MHz; on X-Series it is 8 MHz

RBW Presets

Unless noted in the table below, the Preset value of RBW is Auto.

Mode	Preset Value
WCDMA	240 kHz

Mode	Preset Value
WLAN	100 kHz
MSR	100 kHz

More Information

When **Res BW** is set to **Auto**, the bandwidth selected depends on the Filter Type (see “Filter Type” below).

Only certain discrete resolution bandwidths are available. The available bandwidths are dependent on the **Filter Type** or the **EMC Standard**. If an unavailable bandwidth is entered with the numeric keypad, the closest available bandwidth is selected.

In some Power Suite measurements, in the LTE-Advanced applications (both FDD and TDD), when Res BW is in Auto, the resolution bandwidth is predefined based on the corresponding bandwidth of the single LTE carrier, as shown in the table below. In the Multi-carrier case, the narrowest RBW among the active carriers is used.

LTE-A FDD/TDD

Carrier BW	Auto RBW, kHz	
	CHP	ACP
1.4 MHz	20	51
3 MHz	43	51
5 MHz	68	100
10 MHz	150	100
15 MHz	220	100
20 MHz	270	100
200 kHz (NB-IoT, only available in FDD)	10	10

5G NR

Bandwidth	Auto RBW, kHz
5 MHz	68
10 MHz	150
15 MHz	220
20 MHz	270
25 MHz	360
30 MHz	430
40 MHz	560
50 MHz	680
60 MHz	820
70 MHz	1000
80 MHz	1100

Bandwidth	Auto RBW, kHz
90 MHz	1300
100 MHz	1500
200 MHz	2700
400 MHz	3000

Video BW

Lets you change the instrument post-detection filter (VBW or “video bandwidth”) from 1 Hz to 8 MHz in approximately 10% steps. In addition, a wide-open video filter bandwidth may be chosen by selecting 50 MHz. The VBW is annotated at the bottom of the display, in the center.

Normally, **Video BW (Auto)** selects automatic coupling of the Video BW to RBW using the ratio set by the VBW:3 dB RBW control. To decouple the resolution bandwidth, press the **Auto/Man** toggle on the **Video BW** control, or simply enter a different value for **Video BW**.

When the **Video BW** is manually selected, it may be returned to the coupled state by pressing the **Auto/Man** toggle on the **Video BW** control. This may also be done by pressing Auto Couple or by performing a **Preset**.

Remote Command	`[:SENSe]:CHPower:BANDwidth:VIDeo <bandwidth>`
	`[:SENSe]:CHPower:BANDwidth:VIDeo?`
	`[:SENSe]:CHPower:BANDwidth:VIDeo:AUTO ON | OFF | 1 | 0`
	`[:SENSe]:CHPower:BANDwidth:VIDeo:AUTO?`

Example	`:CHP:BAND:VID 2.4 MHz`
	`:CHP:BAND:VID?`
	`:CHP:BAND:VID:AUTO OFF`
	`:CHP:BAND:VID:AUTO?`

Notes	For numeric entries, the instrument chooses the nearest (arithmetically, on a linear scale, rounding up) available VBW to the value entered. The 50 MHz VBW is defined to mean “wide open” The values shown in this table reflect the conditions after a Mode Preset
Dependencies	Sometimes the displayed Video BW is not actually used to process the trace data: When the Average Detector is selected and **Sweep Type** is set to **Swept,** the video bandwidth filter cannot be used, because it uses the same hardware as the Average Detector When the Quasi-Peak, EMI Average or RMS Average detector is selected the VBW is implemented by the digital IF as part of the detector When this is the case, the VBW still acts to change the Sweep Time, if Sweep Time is in Auto, and still affects the data on other traces for which this is not the case
Couplings	Video bandwidth (VBW) is normally coupled to RBW. If **VBW** is set to Auto, then the VBW is changed as the RBW changes, to maintain the ratio set by the VBW:3 dB RBW control (usually 10:1 for measurements that do not have a VBW:3 dB RBW control)

Preset	Auto (unless noted in table below) ON
State Saved	Saved in instrument state
Min	1 Hz
Max	50 MHz
Annunciation	A "#" mark appears before "VBW" in the annotation when it is not coupled
Annotation	In the bottom center of the screen, "VBW <value> <units>" indicates the current video bandwidth value. Note that for some detectors this is not the value actually used for VBW (see above)
Backwards Compatibility Notes	For backwards compatibility this command obeys both the `BANDwidth` and `BWIDth` forms

VBW Presets

Unless noted in the table below, the Preset value of VBW is **Auto**.

Mode	Preset Value
WCDMA	2.40 MHz

RBW Filter Type

Selects the type for the resolution bandwidth filters. Historically, the Res BW filters in HP/Agilent/Keysight spectrum instruments were Gaussian filters, specified using the –3 dB bandwidth of the filter. That is, a 10 MHz Res BW filter was a Gaussian shape with its –3 dB points 10 MHz apart. In the X-Series, the **RBW Filter BW** menu lets you choose between a Gaussian and Flat Top filter shape, for varying measurement conditions.

Filter Type	SCPI Example
Gaussian	`:BAND:SHAP GAUS`
Flattop	`:BAND:SHAP FLAT`

For more information, see the RBW Filter Type control description for the Swept SA measurement.

Remote Command	`[:SENSe]:CHPower:BANDwidth:SHAPe GAUSsian | FLATtop` `[:SENSe]:CHPower:BANDwidth:SHAPe?`
Example	`:CHP:BAND:SHAP GAUS` `:CHP:BAND:SHAP?`
Notes	`GAUSsian`= Gaussian `FLATtop` = Flattop We use `SHAPe` instead of `TYPE` (even though the control name uses Type) because `TYPE` is used for backwards compatibility

Preset	Auto Couple chooses the preset value
State Saved	Saved in instrument state
Annotation	The annotation under RBW in the bottom left of the screen shows the type of filter or bandwidth that is being used. The following examples illustrate this:

–3 dB (Normal) filter BW:	Res BW 300 Hz
–6 dB filter BW:	Res BW (–6 dB) 422 Hz
Noise filter BW:	Res BW (Noise) 317 Hz
Impulse filter BW:	Res BW (Impulse) 444 Hz
CISPR filter BW:	Res BW (CISPR) 200 Hz
MIL filter BW:	Res BW (MIL) 1 kHz
Flattop filter type:	Res BW (Flattop) 300 Hz

Backwards Compatibility SCPI	`[:SENSe]:CHPower:BWIDth:SHAPe`

3.7.5 Display

The Display key opens the Display Menu, which lets you configure display items for the current Mode, Measurement View or Window.

3.7.5.1 Meas Display

The Meas Display tab contains controls for setting up the display for the current Measurement, View or Window.

Bar Graph On/Off

Turns the Bar Graph On and Off.

Remote Command	`:DISPlay:CHPower:WINDow[1]:BGRaph ON | OFF | 1 | 0` `:DISPlay:CHPower:WINDow[1]:BGRaph?`
Example	`:DISP:CHP:WIND:BGR ON` `:DISP:CHP:WIND:BGR?`
Preset	`OFF`
State Saved	Saved in instrument state
Range	`ON|OFF`
Backwards Compatibility SCPI	`:DISPlay:CHPower:VIEW[1]:WINDow[1]:BGRaph`

3.7.5.2 View

Contains controls for selecting the current **View**, and for editing User Views.

User View

Lets you choose a View from the saved User Views for the current measurement. This panel only appears if a User View exists for the current measurement.

Remote Command	`:DISPlay:VIEW:ADVanced:SELect <alphanumeric>` `:DISPlay:VIEW:ADVanced:SELect?`
Example	Select Baseband as the current View `:DISP:VIEW:ADV:SEL “Baseband”`

Notes	You must be in the measurement whose View you are trying to set to send the command. You can only set Views for the current measurement using this command
	For predefined views, the parameter is derived from the view name that is shown in the View list in the user interface. For example, if you are trying to select the Trace Zoom view in the Swept SA measurement, you send:
	`:DISP:VIEW:ADV:SEL "Trace Zoom"`
	because “Trace Zoom” is the name of the View as seen in the Mode/Meas dialog or in the Display, View menu
	You *cannot* use the legacy View parameter (which in this case would be `TZOom`) with `:DISP:VIEW:ADV:SEL`
	`<alphanumeric>` is case insensitive; you can specify mixed case, however the name will be evaluated on a single case. Thus, both of the following forms work:
	`:DISP:VIEW:ADV:SEL "Trace Zoom"`
	`:DISP:VIEW:ADV:SEL "TRACE ZOOM"`
	If the specified view is not a valid View, the query returns the error message “-224, Illegal parameter value; View with the name <alphanumeric> does not exist”
	If the display is disabled (via `:DISP:ENAB OFF`) then the error message “-221, Settings conflict; View SCPI cannot be used while Display is disabled” is generated

Backwards Compatibility SCPI	The legacy node `:DISPlay:VIEW[:SELect]` is retained for backwards compatibility, but it only supports predefined views

Restore Layout to Default

Restores the Layout to the default for Basic.

Modified Views are very temporary; if you exit the current measurement they are discarded, and they are not saved in State. To retain this View for later use, and to be able to return easily to your original Basic View, you can save your edited View as a "User View".

Save Layout as New View

Saves your new View as a User View. An alpha keyboard appears, which lets you name your new View; the default is the old View name plus a number.

Remote Command	`:DISPlay:VIEW:ADVanced:NAME <alphanumeric>`
Example	`:DISP:VIEW:ADV:NAME "Baseband"` Creates a new View named `Baseband` from the current View, and selects it as the current View
Notes	`<alphanumeric>` is case insensitive; you can specify mixed case, however the name will be evaluated on a single case If `<alphanumeric>` name already exists as a View, the error message "-224, Illegal parameter value; View <alphanumeric> already exists" is generated If the display is disabled (via `:DISP:ENAB OFF`) then the error message "-221, Settings conflict; User View SCPI cannot be used while Display is disabled" is generated

Re-Save User View

You can re-edit a User View; if you make changes, then an asterisk will appear next to the User View's name. You can then tap **Re-Save User View** to save it back to its existing name, or **Save Layout as New View** to add another, new User View.

This is a front panel function only, there is no remote command available to perform this function. To do this remotely, you must first perform **Save Layout as New View**, then delete the old User View and rename the new one with the name of the View you just deleted.

Rename User View

You can rename the current View by giving it a new unique name. Only User Views can be renamed, if the current View is a Predefined View, an error occurs.

Remote Command	`:DISPlay:VIEW:ADVanced:REName <alphanumeric>`
Example	`:DISP:VIEW:ADV:REN "Baseband"`
Notes	`<alphanumeric>` is case insensitive; you can specify mixed case, however the name will be evaluated on a single case If the `<alphanumeric>` specifying the new name is already present in the list of View names, the error message "-224, Illegal parameter value; View <alphanumeric> already exists" is generated If the current View is a Predefined View, the error message "-224, Illegal parameter value; Cannot rename a Predefined View" is generated If the display is disabled (via `:DISP:ENAB OFF`) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated

Delete User View

You can delete the current View if it is a User View. The default view becomes the current view for the Measurement.

Remote Command	`:DISPlay:VIEW:ADVanced:DELete`
Example	`:DISP:VIEW:ADV:DEL`
Notes	`<alphanumeric>` is case insensitive; you can specify mixed case, however the name will be evaluated on a single case If the `<alphanumeric>` is not present in the list of View names, the error message "-224, Illegal parameter value; View <alphanumeric> does not exist" is generated If the current View is a Predefined View, the error message "-224, Illegal parameter value; Cannot delete a Predefined View" is generated If the display is disabled (via `:DISP:ENAB OFF`) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated

Delete All User Views

Deletes all previously saved User Views. The default view becomes the current view for the Measurement if a User View was the current view when this command was executed.

Remote Command	`:DISPlay:VIEW:ADVanced:DELete:ALL`
Example	`:DISP:VIEW:ADV:DEL:ALL`
Notes	Disabled if there are no User Views

View Editor Remote Commands

The following remote commands help you manage Views and User Views. Note that the SCPI node for User Views handles both Predefined and User Views. The legacy nodes, `:DISPlay:VIEW[:SELect]` and `:DISPlay:VIEW:NSEL`, are retained for backwards compatibility, but they only support predefined views.

View Listing Query

Returns a string containing a comma-separated list of names for *all* the Views, including User Views, available for the current Measurement.

Remote Command	`:DISPlay:VIEW:ADVanced:CATalog?`
Example	`:DISP:VIEW:ADV:CAT?`

Notes	Returns a quoted string of the available Views for the current measurement, separated by commas. The list includes names for *all* the Views, including User Views, available for the current Measurement Example: `"Normal,Trace Zoom,Spectrogram,Baseband,myView1,yourView1"` No distinction is made between Predefined and User Views If you switch measurements with the display disabled (via `:DISP:ENAB OFF`), then query the list of available Views, the result is undefined

User View Listing Query

Returns a string containing a comma-separated list of names for *only* the User Views available for the current Measurement.

Remote Command	`:DISPlay:VIEW:ADVanced:USER:CATalog?`
Example	`:DISP:VIEW:ADV:USER:CAT?`
Notes	Returns a quoted string of the available User Views for the current measurement, separated by commas. Example: `"Baseband,myView1,yourView1"` If you switch measurements with the display disabled (see "Display Enable (Remote Command Only)" on page 1894), then query the list of available Views, the result is undefined

3.7.5.3 Annotation

Contains controls for setting up the annotation for the current Mode or Measurement.

Graticule

Turns the display graticule On or Off for all windows with graticules in all measurements in the current Mode. Also turns the graticule Y-Axis annotation on and off.

Remote Command	`:DISPlay:GRATicule[:STATe] OFF | ON | 0 | 1` `:DISPlay:GRATicule[:STATe]?`
Example	`:DISP:GRAT OFF`
Notes	The graticule is the set of horizontal and vertical lines that make up the grid/divisions for the X-Axis and Y-Axis
Preset	`ON`
State Saved	Saved in instrument state
Backwards Compatibility	`:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe] OFF | ON | 0 | 1` `:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe]?`

SCPI	This command is accepted for backwards compatibility with older instruments, but the WINDow, TRACe and GRID parameters are ignored

Screen Annotation

Controls the display of the annunciation and annotation around the graticule, including any annotation on lines (such as the display line, the threshold line, etc.) and the Y-Axis annotation, for all windows with screen annotation in all measurements in the current Mode.

This does *not* include marker annotation (or the N dB result). When OFF, the graticule expands to fill the entire graticule area, leaving only the 1.5% gap above the graticule, as described in the **Trace** section.

Remote Command	:DISPlay:ANNotation:SCReen[:STATe] OFF | ON | 0 | 1 :DISPlay:ANNotation:SCReen[:STATe]?
Example	:DISP:ANN:SCR OFF
Dependencies	Grayed-out and forced to OFF when **System Display Settings**, **Annotation** is OFF
Preset	ON This remains OFF through a Preset when **System Display Settings**, **Annotation** is set to OFF
State Saved	Saved in instrument state

Trace Annotation

Turns on and off the labels on the traces, showing their detector (or their Math Mode) as described in the **Trace** section, for all windows in all measurements in the current Mode for which Trace Annotation on/off is supported.

If Trace Math is being performed on a trace, then the Trace Math annotation replaces the detector annotation.

For measurements that support limit lines, this key also turns on and off the labels on the Limit Lines. The label is the Limit number annotation and Limit Comment displayed on the graph. If the length of the comment is greater than 20 characters, the first 8 characters and the last 8 characters are displayed, joined with ….

Remote Command	:DISPlay:ANNotation:TRACe[:STATe] ON | OFF | 1 | 0 :DISPlay:ANNotation:TRACe[:STATe]?
Example	:DISP:ANN:TRAC OFF
Preset	OFF
State Saved	Saved in instrument state

Control Annotation

Turns on and off the display of values on the Active Function controls for all measurements in the current Mode. This is a security feature.

Remote Command	`:DISPlay:ACTivefunc[:STATe] ON | OFF | 1 | 0` `:DISPlay:ACTivefunc[:STATe]?`
Example	`:DISP:ACT OFF`
Dependencies	Grayed out and forced to `OFF` when **System Display Settings**, **Annotation** is `OFF`
Preset	`ON` This remains `OFF` through a Preset when **System Display Settings**, **Annotation** is set to `OFF`
State Saved	Saved in instrument state

Meas Bar

Turns the Measurement Bar at the top of the screen on and off for all measurements in the current Mode. When `OFF`, the graticule area expands to fill the area formerly occupied by the Measurement Bar.

Remote Command	`:DISPlay:ANNotation:MBAR[:STATe] OFF | ON | 0 | 1` `:DISPlay:ANNotation:MBAR[:STATe]?`
Example	`:DISP:ANN:MBAR OFF`
Dependencies	Grayed out and forced to `OFF` when **System Display Settings**, **Annotation** is `OFF`
Preset	`ON` This remains `OFF` through a Preset when **System Display Settings**, **Annotation** is set to `OFF`
State Saved	Saved in instrument state

Display Enable (Remote Command Only)

Turns the display on/off, including the display drive circuitry. The backlight stays lit to confirm that the instrument is on. The display enable setting is mode global. Theare three reasons for turning the display off:

1. To increase speed as much as possible by freeing the instrument from having to update the display
2. To reduce emissions from the display, drive circuitry
3. For security purposes

If you have turned off the display:

- and you are in local operation, the display can be turned back on by pressing any key or by sending :SYSTem:DEFaults MISC or :DISPlay:ENABle ON (neither *RST nor :SYSTem:PRESet enable the display)
- and you are in remote operation, the display can be turned back on by pressing the **Local** or **Esc** keys, or by sending :SYSTem:DEFaults MISC or :DISPlay:ENABle ON (neither *RST nor :SYSTem:PRESet enable the display)
- and you are using either the :SYSTem:KLOCk command or GPIB local lockout, then *no* front-panel key press will turn the display back on. You must turn it back on remotely.

If the display is OFF, many SCPI commands related to User Views and Multiscreen functionality do not work, and return the error messages "-221, Settings conflict; Screen SCPI cannot be used when Display is disabled" or "221, Settings conflict; View SCPI cannot be used while Display is disabled". These commands include:

Name	Command
Select User View	:DISPlay:VIEW:ADVanced:SELect
Rename User View	:DISPlay:VIEW:ADVanced:REName
Delete User View	:DISPlay:VIEW:ADVanced:DELete
Create User View	:DISPlay:VIEW:ADVanced:NAME
Select Screen	:INSTrument:SCReen:SELect
Delete Screen	:INSTrument:SCReen:DELete
Delete All But This Screen	:INSTrument:SCReen:DELete:ALL
Add Screen	:INSTrument:SCReen:CREate
Rename Screen	:INSTrument:SCReen:REName
Sequencer On/Off	:SYSTem:SEQuencer

Remote Command	:DISPlay:ENABle OFF | ON | 0 | 1 :DISPlay:ENABle?
Example	:DISP:ENAB OFF
Couplings	:DISP:ENAB OFF turns Backlight OFF and :DISP:ENAB ON turns Backlight ON, but changing Backlight settings does *not* change the state of :DISP:ENAB
Preset	ON Set by :SYST:DEF MISC, but not affected by *RST or :SYSTem:PRESet
State Saved	Not saved in instrument state
Backwards Compatibility Notes	:SYST:PRES no longer turns on :DISPlay:ENABle as it did in legacy analyzers

3.7.6 Freq

The **Freq** key opens the Frequency menu, which contains controls that allow you to control the Frequency and Channel parameters of the instrument.

Some features in the Frequency menu are the same for all measurements in the current Mode – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by Meas Preset. For example, the Center Freq setting is the same for all measurements - it does not change as you change measurements.

3.7.6.1 Settings

The Settings Tab contains controls that pertain to the X axis parameters of the measurement. These parameters control how data on the vertical (X) axis is displayed and control instrument settings that affect the horizontal axis.

Center Frequency

Sets the frequency that corresponds to the horizontal center of the graticule. While adjusting the Center Frequency the Span is held constant.

The center frequency setting is the same for all measurements within a mode, that is, it is Meas Global. Some modes are also able to share a Mode Global center frequency value. If this is the case, the Mode will have a **Global** tab in its **Meas Setup** menu.

The **Center Freq** function sets (and queries) the Center Frequency for the currently selected input. If your instrument has multiple inputs, and you select another input, the Center Freq changes to the value for that input. SCPI commands are available to directly set the Center Freq for a specific input.

Center Freq is remembered as you go from input to input. Thus you can set a Center Freq of 10 GHz with the RF Input selected, change to BBIQ and set a Center Freq of 20 MHz, then switch to External Mixing and set a Center Freq of 60 GHz, and when you go back to the RF Input the Center Freq will go back to 10 GHz; back to BBIQ and it is 20 MHz; back to External Mixing and it is 60 GHz.

See:

"RF Center Freq" on page 878

"Ext Mix Center Freq" on page 879

"I/Q Center Freq" on page 880

"Center Frequency Presets" on page 876

"VXT Models with Radio Heads/CIU Frequency Range" on page 878

Remote Command	`[:SENSe]:FREQuency:CENTer <freq>`

	`[:SENSe]:FREQuency:CENTer?`

Example	`:FREQ:CENT 50 MHz`
	sets Center Frequency to 50 MHz
	`:FREQ:CENT UP`
	increments the Center Frequency by the value of CF Step
	`:FREQ:CENT?`
	returns the current value of Center Frequency

Notes	This command sets the RF, External Mixing or I/Q Center Frequency depending on the selected input For RF input it is equivalent to `:FREQ:RF:CENT` For I/Q input it is equivalent to `:FREQ:IQ:CENT` For External Mixer it is equivalent to `:FREQ:EMIX:CENT` Preset and Max values are dependent on Hardware Options (5xx) If no terminator (e.g. MHz) is sent the terminator Hz is used. If a terminator with unit other than Frequency is used, an invalid suffix error message is generated
Dependencies	Not available in the MSR, LTE-Advanced FDD/TDD and 5G NR modes.
Preset	Depends on instrument maximum frequency, mode, measurement, and selected input See "Center Frequency Presets" on page 876 and "RF Center Freq" on page 878 and "Ext Mix Center Freq" on page 879 and "I/Q Center Freq" on page 880 and "VXT Models with Radio Heads/CIU Frequency Range" on page 878
State Saved	Saved in instrument state
Min/Max	Depends on instrument maximum frequency, mode, measurement, and selected input See "Center Frequency Presets" on page 876 and "RF Center Freq" on page 878 and "I/Q Center Freq" on page 880 and "VXT Models with Radio Heads/CIU Frequency Range" on page 878
Annotation	Center <value> appears in the lower left corner of the display
Status Bits/OPC dependencies	Non-overlapped

Center Frequency Presets

The following table provides the Center Frequency Presets for the Spectrum Analyzer mode, and the Max Freq, for the various frequency options:

Freq Option	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
503 (all but CXA)	1.805 GHz	3.6 GHz	3.7 GHz
503 (CXA)	1.505 GHz	3.0 GHz	3.08 GHz
507 (all but CXA)	3.505 GHz	7.0 GHz	7.1 GHz
507 (CXA)	3.755 GHz	7.5 GHz	7.58 GHz
508 (all but MXE)	1.805 GHz	3.6 GHz	8.5 GHz

Freq Option	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
508 (MXE)	4.205 GHz	8.4 GHz	8.5 GHz
513	6.805 GHz	13.6 GHz	13.8 GHz
526 (except CXA and MXE)	13.255 GHz	26.5 GHz	27.0 GHz*
526 (CXA)	13.255 GHz	26.5 GHz	26.55 GHz
526 (MXE)	1.805 GHz	3.6 GHz	27.0 GHz
532	16.005 GHz	32.0 GHz	32.5 GHz
540	20.005 GHz	40.0 GHz	40.5 GHz
543	21.505 GHz	43.0 GHz	43.0 GHz
544	22.005 GHz	44.0 GHz	45.0 GHz
550	25.005 GHz	50.0 GHz	52 GHz
F03 (CXA-m)	1.505 GHz	3.0 GHz	3.08 GHz
F07 (CXA-m)	3.755 GHz	7.5 GHz	7.575 GHz
F13 (CXA-m)	6.805 GHz	13.6 GHz	13.8 GHz
F26 (CXA-m)	13.255 GHz	26.5 GHz	26.55 GHz
504 (M9420A/21A, M8920A)	2.145 GHz	3.88GHz	3.88 GHz
506 (M9420A/21A, M8920A)	3.245 GHz	6.08GHz	6.08 GHz
F06 (M9410A/11A)	1.0 GHz	6.08 GHz	6.08 GHz
F06 (M9415A)	1 GHz	1.08 GHz	6.6 GHz
F08 (M9415A)	1 GHz	1.08 GHz	8.6 GHz
F12 (M9415A)	1 GHz	1.08 GHz	12.9 GHz

*For option 526, the Max CF in RTSA is 26.999999995 GHz.

N9041B Center Freq Presets

Input	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
Input 1, all models	25.005 GHz	50.0 GHz	52 GHz
Input 2, opt 585	42.505 GHz	85.0 GHz	86 GHz
Input 2, opt 590	45.005 GHz	90.0 GHz	92 GHz
Input 2, opt 5CX	55.005 GHz	110.0 GHz	110 GHz

Input 2, CXA and MXE

Model	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
CXA opt C75	0.7505 GHz	1.5 GHz	1.58 GHz
MXE	505 MHz	1 GHz	1.000025 GHz

Tracking Generator Frequency Limits (CXA only)

Tracking Generator Option	Min Freq (clips to this freq when turn TG on and can't tune below while TG on)	If above this Freq, Stop Freq clipped to this Freq when TG turned on	Max Freq (can't tune above) while TG on
T03	9 kHz	3.0 GHz	3.08 GHz
T06	9 kHz	6.0 GHz	6.05 GHz

Tracking Generator Frequency Limits(CXA-m only)

Tracking Generator Option	Min Freq (clips to this freq when turn TG on and can't tune below while TG on)	If above this Freq, Stop Freq clipped to this Freq when TG turned on	Max Freq (can't tune above) while TG on
T03	2 MHz	3.08 GHz	3.08 GHz
T07	2 MHz	7.575 GHz	7.575 GHz
T13	2 MHz	13.8 GHz	13.8 GHz
T26	2 MHz	26.55 GHz	26.55 GHz

VXT Models with Radio Heads/CIU Frequency Range

The following table shows the Center Frequency Presets and Range for VXT modes with Radio Heads/CIU.

Products with Radio Heads/CIU	Preset	Start frequency	Stop frequency
M9421A + CIU	6 GHz	5.9 GHz	12 GHz
M9410A + CIU	6 GHz	5.9 GHz	12 GHz
M9410A + CIU + RRH	25 GHz	24.25 GHz	43.5 GHz

RF Center Freq

SCPI command for specifying the RF Center Frequency. This command sets the Center Frequency to be used when the RF input is selected, even if the RF input is not the input that is selected at the time the command is sent. Note that the **Center Freq** function in the **Frequency** menu on the front panel *always* applies to the currently selected input.

Remote Command	`[:SENSe]:FREQuency:RF:CENTer <freq>` `[:SENSe]:FREQuency:RF:CENTer?`
Example	`:FREQ:RF:CENT 30 MHz` `:FREQ:RF:CENT?`
Notes	This command is the same in all modes, but the parameter is Measurement Global. So the value is independent in each mode and common across all the measurements in the mode
Dependencies	If the electronic/soft attenuator is enabled, any attempt to set Center Frequency such that the Stop Frequency would be >3.6 GHz fails and results in an advisory message. If the equivalent SCPI command is sent, this same message is generated as part of a "-221, Settings conflict" warning

Preset	See table above
State Saved	Saved in instrument state
Min	-79.999995 MHz
Max	26.999999995 GHz See table above. Basically instrument maximum frequency - 5 Hz If the knob or step keys are being used, also depends on the value of Span

Ext Mix Center Freq

SCPI command for specifying the External Mixer Center Frequency. This command sets the Center Frequency to be used when the External Mixer is selected, even if the External Mixer input is not the input which is selected at the time the command is sent. Note that the **Center Freq** function in the **Frequency** menu on the front panel *always* applies to the currently selected input.

Remote Command	`[:SENSe]:FREQuency:EMIXer:CENTer <freq>` `[:SENSe]:FREQuency:EMIXer:CENTer?`
Example	`:FREQ:EMIX:CENT 60 GHz` `:FREQ:EMIX:CENT?`
Notes	This command is the same in all modes, but the parameter is Measurement Global. So the value is independent in each mode and common across all the measurements in the mode
Couplings	When returning to External Mixing after having been switched to one of the other inputs (e.g., RF), you will return to the settings that you had when you left External Mixing. So you will return to the band you were in, with the Center Frequency that you had. However, Span is not an input-dependent parameter, so you will retain the span from the other input. Therefore, the instrument comes back with the span from the previous input, limited as necessary by the current mixer setup
Preset	When a Mode Preset is performed while in External Mixing, the Start frequency of the current Mode is set to the nominal Min Freq of the lowest harmonic range in the Harmonic Table for the current mixer setup. Similarly, the Stop frequency of the current Mode is set to the nominal Max Freq of the highest harmonic range in the Harmonic Table. The Center Freq thus presets to the point arithmetically equidistant from these two frequencies Note that, if the current measurement has a limited Span available to it, and cannot achieve the Span shown in the table (Span=Stop Freq – Start Freq), the instrument uses the maximum Span the measurement allows, and still sets the Center Freq to the midpoint of the Start and Stop Freq values in the Harmonic Table When Restore Input/Output Defaults is performed, the mixer presets to the 11970A, whose Start and Stop frequencies are 26.5 and 40 GHz respectively. The center of these two frequencies is 33.25 GHz Therefore, after a Restore Input/Output Defaults, if you go into External Mixing and do a Mode Preset while in the Spectrum Analyzer Mode, the resulting Center Freq is 33.25 GHz
State Saved	Yes
Min	The minimum frequency in the currently selected mixer band + 5 Hz If the knob or step keys are being used, also depends on Span
Max	The maximum frequency in the currently selected mixer band - 5 Hz If the knob or step keys are being used, also depends on Span

I/Q Center Freq

SCPI command for specifying the I/Q Center Frequency. This command will set the Center Frequency to be used when the I/Q input is selected, even if the I/Q input is not the input which is selected at the time the command is sent. Note that the **Center Freq** function in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command	`[:SENSe]:FREQuency:IQ:CENTer <freq>` `[:SENSe]:FREQuency:IQ:CENTer?`
Example	`:FREQ:IQ:CENT 30 MHz`
Notes	This command is the same in all modes, but the parameter is Measurement Global. So the value is independent in each mode and common across all the measurements in the mode
Preset	0 Hz
State Saved	Saved in instrument state
Min	-40.049995 MHz
Max	40.049995 MHz

Span

Changes the displayed frequency range symmetrically about the center frequency. While adjusting the Span, the Center Frequency is held constant, which means that both Start Frequency and Stop Frequency will change.

If the Span is set to a value greater than the maximum allowable span of the instrument, an error message is generated indicating the data is out of range and was clipped to upper limit.

The default (and minimum) Span is calculated using the number of carriers and the carrier width where;

Span = (Upper Carrier Freq + (max offset IBW * (1 + alpha)) / 2) - (Lower Carrier Freq - (max offset IBW * (1 + alpha)) / 2)

If the RRC Filter in on, then the span is increased by a factor of 1 + Filter Alpha.

See "Span Presets" on page 882

Remote Command	`[:SENSe]:CHPower:FREQuency:SPAN <freq>` `[:SENSe]:CHPower:FREQuency:SPAN?`
Example	`:CHP:FREQ:SPAN 10 MHz` `:CHP:FREQ:SPAN?`
Dependencies	If the electrical attenuator is enabled, any attempt to set Span such that the Stop Frequency would be >3.6 GHz results in an error In instruments with an RF Preselector, such as MXE, you cannot sweep across the band break at 3.6 GHz while the RF Preselector is on in Continuous sweep, as there is a mechanical switch which

	bypasses the RF Preselector above 3.6 GHz. See the Stop Frequency control description for details of this limitation For the MSR mode, this control is not shown For WLAN 802.11ac (80 MHz + 80 MHz), the control is not enabled and its value is coupled with the spacing between the center frequencies of the two carriers Span = | Center Frequency 1 – Center Frequency 2| + Integ BW + 40 MHz Margin When the calculated span is over 1 GHz, it's still coupled to its maximum value, which is 1 GHz
Couplings	Span affects RBW, sweeptime, FFT & Sweep choice (including FFT Width, Phase Noise Optimization and ADC Dither auto couplings) Any value of the Center Frequency or Span that is within the frequency range of the instrument is allowed when the value is being set through the front panel numeric key pad or the SCPI command. The other parameter is forced to a different value if needed, to keep the Start and the Stop Frequencies within the instrument's frequency range When using the knob or the step up/down keys or the UP |DOWN keywords in SCPI, the value that is being changed i.e. the Center Frequency or Span, is limited so that the other parameter is not forced to a new value When Res BW is set to Auto, the resolution bandwidth is auto-coupled to span. The ratio of span /RBW is approximately 106:1. When the Res BW is set to Man, bandwidths are entered by the user, and these bandwidths are used regardless of other instrument settings Since Span is coupled to Integ BW in the factory default condition, if you change the Integ BW setting, the span setting changes by a proportional amount until a limit value is reached. However, the span can be individually set. The minimum value of the span is coupled with the integration bandwidth Span cannot be set less than the Integ BW value. When Span is changed, the ratio of Span/Integ BW is set, and retained when Integ BW is changed
Preset	Depends on instrument maximum frequency, mode, measurement, and selected input See "Span Presets" on page 882
State Saved	Saved in instrument state
Min	100 Hz
Max	Depends on instrument maximum frequency, mode, measurement, and selected input. See "Span Presets" on page 882 If the knob or step keys are being used, depends on the value of the other three interdependent parameters Center Frequency, Start Frequency, Stop Frequency
Annunciation	Data out of range, value clipped to upper limit
Annotation	Span <value> appears on the first line of the annotation in the lower right corner of display

LTE, 5G NR only:

Remote Command	`[:SENSe]:CHPower:FREQuency:SPAN:AUTO ON | OFF | 1 | 0` `[:SENSe]:CHPower:FREQuency:SPAN:AUTO?`
Example	`:CHP:FREQ:SPAN:AUTO OFF` `:CHP:FREQ:SPAN:AUTO?`
Notes	The span value is adjusted when the relevant carrier parameters such as bandwidth, integration bandwidth, number of component carriers etc., are changed, whatever the span state (Auto or Man) When in Man state, if the input value is less than the required sum of total integration bandwidths and

	gaps of the multi-carriers, the required span value is set
Dependencies	This is only available in LTE/LTE-Advanced FDD/TDD and 5G NR CHP measurement
Preset	ON
State Saved	Saved in instrument state
Range	Auto|Man

Span Presets

The following table provides the Max Span, for the various frequency options:

Freq Option	Max Span (can't set higher than this)
503 (all but CXA)	3.7 GHz
503, F03 (CXA, CXA-m)	3.08 GHz
507 (all but CXA)	7.1 GHz
507 (CXA, CXA-m)	7.575 GHz
508 (all but MXE)	8.5 GHz
508 (MXE)	8.5 GHz
513, F13	13.8 GHz
526 (all but CXA and MXE)	27.0 GHz
526 (MXE)	27.0 GHz
526, F26 (CXA, CXA-m)	26.55 GHz
544	44.5 GHz
550	52 GHz
F06 (VXT models M9410A/11A)	5.75 GHz
F06 & EP6 (VXT models M9410A/11A)	6.27 GHz
F06 & LFE & EP6 (VXT models M9411A)	6.5999935 GHz
M9415A-F06	6.27 GHz

Freq Option	Max Span (can't set higher than this)
M9415A-F08	8.27 GHz
M9415A-F12	12.57 GHz

Input 2:

Model	Max Span (can't set higher than this)
CXA opt C75	1.58 GHz
MXE	1.000025 GHz

Note that if you are in External Mixing, the maximum Span will be equal to the Maximum Stop Frequency – Minimum Start Frequency for the currently selected mixer.

Span Presets by Mode

Mode	Radio Std	Preset Value
SA		3 MHz
WCDMA		7.5 MHz
LTE		7.5 MHz
LTETDD		7.5 MHz
5G NR		150 MHz
WLAN	802.11a/g(OFDM/DSSS-OFDM)	30 MHz
	802.11b	37.5 MHz
	802.11n/ac/ax/be 20MHz	30 MHz
	802.11n/ac/ax/be 40MHz	60 MHz
	802.11n/ac/ax/be 80 MHz	120 MHz
	802.11n/ac/ax/be 160 MHz	240 MHz
	802.11n/ac/ax/be 80 MHz + 80 MHz	360 MHz
	802.11be 320 MHz	480MHz
	802.11be 160MHz + 160MHz	440MHz

CF Step

Changes the step size for the center frequency and start and stop frequency functions. Once a step size has been selected and the center frequency function is active, the step keys (and the UP|DOWN parameters for Center Frequency from remote commands) change the center frequency by the step-size value. The step size function is useful for finding harmonics and sidebands beyond the current frequency span of the instrument.

Note that the start and stop frequencies also step by the CF Step value.

Remote Command	`[:SENSe]:FREQuency:CENTer:STEP[:INCRement] <freq>`
	`[:SENSe]:FREQuency:CENTer:STEP[:INCRement]?`
	`[:SENSe]:FREQuency:CENTer:STEP:AUTO OFF | ON | 0 | 1`
	`[:SENSe]:FREQuency:CENTer:STEP:AUTO?`

Example	`:FREQ:CENT:STEP 500 MHz`
	`:FREQ:CENT UP`
	increases the current center frequency value by 500 MHz
	`:FREQ:CENT:STEP?`
	`:FREQ:CENT:STEP:AUTO ON`
	`:FREQ:CENT:STEP:AUTO?`

Notes	Preset and Max values are depending on Hardware Options
Dependencies	If the electronic/soft attenuator is enabled, any attempt to change the value of the center frequency >3.6 GHz by pressing the Up-arrow key, fails and results in an advisory message. If the equivalent SCPI command is sent, this same message is generated as part of a "-221, Settings conflict" warning Not available in the MSR, LTE-A FDD/TDD and 5G NR modes
Couplings	When auto-coupled, the center frequency step size is set to 10% of the span
Preset	Auto
State Saved	Saved in instrument state
Min	– (the maximum frequency of the instrument). That is, 27 GHz max freq instrument has a CF step range of ±27 GHz. Note that this is the maximum frequency given the current settings of the instrument, so in External Mixing, for example, it is the maximum frequency of the current mixer band
Max	The maximum frequency of the instrument. That is, 27 GHz max freq instrument has a CF step range of ±27 GHz. Note that this is the maximum frequency given the current settings of the instrument, so in External Mixing, for example, it is the maximum frequency of the current mixer band
Status Bits/OPC dependencies	non-overlapped

Full Span (Remote Command Only)

Changes the span to show the full frequency range of the spectrum analyzer. It maximizes the span within a range not changing the center frequency.

Remote Command	`[:SENSe]:CHPower:FREQuency:SPAN:FULL`
Example	`:CHP:FREQ:SPAN:FULL`
Couplings	Selecting full span changes the measurement span value

3.7.7 Marker

Accesses a menu that enables you to select, set up and control the markers for the current measurement. If there are no active markers, **Marker** selects marker 1, sets it to Normal and places it at the center of the display. If the selected marker is Off, it is set to Normal and placed it at the center of the screen on the trace determined by the **Marker Trace** rules.

For more detailed information on the types of Markers and the interaction between Markers, see the Marker section of the Swept SA measurement.

3.7.7.1 Select Marker

Specifies the *selected marker*. The term “selected marker” is used throughout this document to specify which marker will be affected when you change marker settings, perform a Peak Search, etc.

The Select Marker control appears above the menu panel, indicating that it applies to all controls in the Marker menu panels. Select Marker is blanked if you select a tab whose controls do *not* depend on the selected marker (e.g., Counter).

On any menu tab for which Select Marker displays, the first control is always **Marker Frequency|Time**.

Notes	The selected marker is remembered even when not in the Marker menu and is used if a Search is done or a Band Function is turned on or for Signal Track or Continuous Peak
Preset	Marker 1
State Saved	The number of the selected marker is saved in instrument state
Annunciation	Appears in the marker results block label for **Normal, Delta** and **Fixed** markers

3.7.7.2 Settings

The controls on the Settings tab include the Marker active function and a radio button selection of the marker control mode (Normal, Delta, or Off) for the selected marker, as well as additional functions that help you use markers.

Marker Frequency

Sets the marker X Axis value in the current marker X Axis Scale unit. It has no effect if the control mode is **Off,** but is the SCPI equivalent of entering an X value if the control mode is **Normal** or **Delta**.

Remote Command	`:CALCulate:CHPower:MARKer[1]|2|...|12:X <freq>` `:CALCulate:CHPower:MARKer[1]|2|...|12:X?`
Example	`:CALC:CHP:MARK3:X 0`

	:CALC:CHP:MARK3:X?
Notes	If no suffix is sent, uses the fundamental units for the current marker X Axis Scale. If a suffix is sent that does not match the current marker X Axis Scale unit, an error "Invalid suffix" is generated The query returns the marker's absolute X Axis value if the control mode is **Normal**, or the offset from the marker's reference marker if the control mode is **Delta**. The query is returned in the fundamental units for the current marker X Axis scale: Hz for **Frequency** and Inverse Time, seconds for Period and Time
Preset	After a preset, all markers are turned OFF, so Marker X-Axis Value query returns a not a number (NAN)
State Saved	Saved in instrument state
Min	-9.9E+37
Max	9.9E+37
Annotation	Mkr # <X value> and <Marker value> upper right on graph

Marker X Axis Position (Remote Command Only)

Sets the marker X-Axis Scale position in trace points. This setting has no effect if the control mode is **Off,** but is the SCPI equivalent of entering a value if the control mode is **Normal** or **Delta**, except in trace points rather than X-Axis Scale units. The entered value is immediately translated into the current X-Axis Scale units for setting the value of the marker.

Remote Command	:CALCulate:CHPower:MARKer[1]|2|...|12:X:POSition <real> :CALCulate:CHPower:MARKer[1]|2|...|12:X:POSition?
Example	:CALC:CHP:MARK10:X:POS 0 :CALC:CHP:MARK10:X:POS?
Notes	The query returns the marker's absolute X-Axis value in trace points if the control mode is **Normal**, or the offset from the marker's reference marker in trace points if the control mode is **Delta**. The value is returned as a real number, not an integer, corresponding to the translation from X-Axis Scale units to trace points . When a Marker is turned on, it is placed center of the screen on the trace. Therefore the default value depends on instrument condition. If the marker is Off the response is Not A Number
Preset	After a preset, all markers are turned OFF, so Marker X-Axis Value query returns a not a number (NAN)
State Saved	Saved in instrument state
Min	-9.9E+37
Max	9.9E+37

Marker Y Axis Value (Remote Command only)

Returns the marker Y Axis value in the current marker Y-Axis unit.

Remote Command	:CALCulate:CHPower:MARKer[1]|2|...|12:Y?
Example	:CALC:CHP:MARK11:Y?
Notes	The query returns the marker Y-Axis result if the control mode is **Normal** or **Delta** If the marker is **Off**, then the response is Not A Number

Preset	Result dependent on Markers setup and signal source
State Saved	No
Backwards Compatibility SCPI	:CALCulate:CHPower:MARKer[1]|2|...|12:FUNCtion:RESult?

Marker Mode

Sets the marker control mode to POSition (Normal), DELTa, or OFF. All interactions and dependencies detailed under the control description are enforced when the remote command is sent. If the selected marker is OFF, pressing Marker sets it to POSition and places it at the center of the screen on the trace determined by the Marker Trace rules. At the same time, Marker X Axis Value appears on the Active Function area.

The default active function is the active function for the currently selected marker control mode. If the current control mode is OFF, there is no active function and the active function is turned off.

Remote Command	:CALCulate:CHPower:MARKer[1]|2|...|12:MODE POSition | DELTa | OFF :CALCulate:CHPower:MARKer[1]|2|...|12:MODE?
Example	:CALC:CHP:MARK3:MODE POS :CALC:CHP:MARK3:MODE?
Preset	OFF
State Saved	Saved in instrument state
Range	POSition|DELTa|OFF
Annotation	Mkr # <X value> and <Marker value> upper right on graph When Marker Trace is Polar in WCDMA mode: Mkr # <Chip Value (RHO & QPSKEVM)/Symbol Value (CDP)>, <X value> and <Y value> upper right on graph

Backward Compatibility SCPI Commands

Sets or queries the state of a marker. Setting a marker that is OFF to ON (1) puts it in POSition (Normal) mode and places it at the center of the screen.

Remote Command	:CALCulate:CHPower:MARKer[1]|2|...|12:STATe OFF | ON | 0 | 1 :CALCulate:CHPower:MARKer[1]|2|...|12:STATe?
Example	:CALC:CHP:MARK3:STAT ON :CALC:CHP:MARK3:STAT?
Preset	OFF

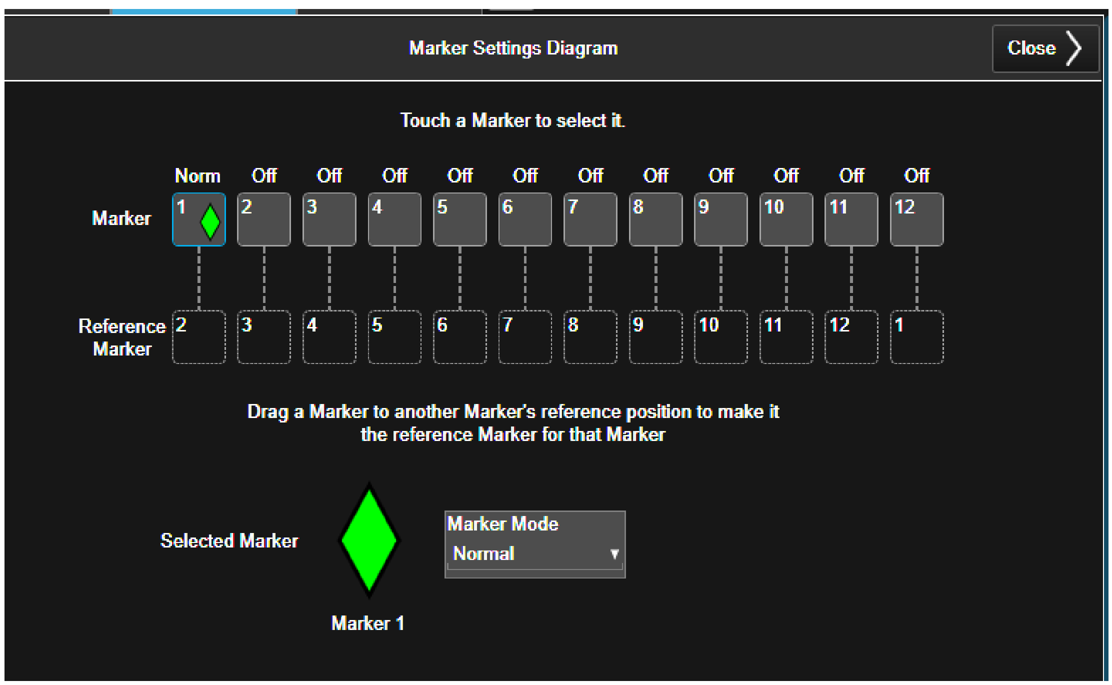
State Saved	Saved in instrument state
Range	OFF|ON

Delta Marker (Reset Delta)

The effect of pressing this button is exactly the same as pressing the **Delta** selection on the **Marker Mode** radio button. The selected marker becomes a Delta Marker. If the selected marker is already a Delta marker, the reference marker is moved to the current position of the selected marker, thus resetting the Delta to zero.

Marker Settings Diagram

The Marker Settings Diagram lets you configure the Marker system using a visual utility.



All Markers Off

Turns off all markers.

Remote Command	:CALCulate:CHPower:MARKer:AOFF
Example	:CALC:CHP:MARK:AOFF

3.7.7.3 Peak Search

The controls on the **Peak Search** tab allow you to move the marker to selected peaks of the signal, giving you enormous analysis capabilities, particularly when combined with the Delta Marker function.

NOTE
Pressing the **Peak Search** hardkey automatically moves you to the **Peak Search** page of the **Marker** menu *and* performs a Peak Search.

Pressing the **Peak Search** tab once you are already *in* the **Marker** menu does *not* perform a Peak Search.

Marker Frequency

The **Marker Frequency** control is the fundamental control that you use to move a marker around on the trace. This is the same as the **Marker Frequency** control on the **Settings** tab.

Peak Search

Pressing the **Peak Search** control moves the selected marker to the trace point which has the maximum Y-Axis value for that marker's trace.

NOTE
Pressing the **Peak Search** hardkey automatically moves you to the **Peak Search** page of the **Marker** menu *and* performs a Peak Search.

Remote Command	`:CALCulate:CHPower:MARKer[1]|2|...|12:MAXimum`

Example	`:CALC:CHP:MARK2:MAX`
	`:SYST:ERR?`
	can be used to query the errors to determine if a peak is found. The message "No peak found" will be returned after an unsuccessful search

Notes	Sending this command selects the subopcoded marker In the W-CDMA mode, this command does not work when the selected marker is located on the polar trace. In this case, the command is ignored

Marker Delta

Pressing this button has exactly the same effect as pressing the **Delta** selection on the **Marker Mode** radio button on the **Settings** tab. The selected marker becomes a Delta Marker. If the selected marker is already a Delta marker, the reference marker is moved to the current position of the selected marker, thus resetting the Delta to zero.

The control is duplicated here in the **Peak Search** Menu to allow you to conveniently perform a peak search and change the marker's control mode to Delta without having to access two separate menus.

3.7.7.4 Properties

The controls on the Properties tab are used to set certain properties of the selected marker.

Marker Frequency

The **Marker Frequency** control is the fundamental control that you use to move a marker around on the trace. This is the same as the **Marker Frequency** control on the **Settings** tab.

Relative To

Selects the marker to which the selected marker is relative (its reference marker).

Every marker has another marker to which it is relative. This marker is referred to as the "reference marker" for that marker. This attribute is set by the **Marker, Properties, Relative To** key. The marker must be a **Delta** marker to make this attribute relevant. If it is a **Delta** marker, the reference marker determines how the marker is controlled and how its value is displayed. A marker cannot be relative to itself.

Remote Command	`:CALCulate:CHPower:MARKer[1]|2|...|12:REFerence <integer>` `:CALCulate:CHPower:MARKer[1]|2|...|12:REFerence?`
Example	`:CALC:CHP:MARK:REF 5` `:CALC:CHP:MARK:REF?`
Notes	This command causes the marker specified with the subopcode to become selected Range (for SCPI command): 1 to 12. If the range is exceeded the value is clipped A marker cannot be relative to itself so that choice is not available, and if sent from SCPI generates error -221: "Settings conflict; marker cannot be relative to itself" When queried a single value is returned (the specified marker numbers relative marker)
Couplings	The act of specifying the selected marker's reference marker makes the selected marker a Delta marker If the reference marker is off, it is turned on in **Normal** mode at the delta marker location
Preset	The preset default "Relative To" marker (reference marker) is the next higher numbered marker (current marker +1). For example, if marker 2 is selected, then it's default reference marker is marker 3. The exception is marker 12, which has a default reference of marker 1 Set to the defaults by using **Restore Mode Defaults.** This is not reset by **Marker Off**, **All Markers Off**, or **Preset**
State Saved	Saved in instrument state. Not affected by Marker Off and hence not affected by Preset or power cycle
Min	1

Max	12
Annunciation	Appears in the marker label of a **Delta** marker

Marker Trace

Selects the trace on which you want your marker placed. A marker is associated with one and only one trace. This trace is used to determine the placement, result, and X-Axis Scale of the marker. All markers have an associated trace; it is from that trace that they determine their attributes and behaviors, and it is to that trace that they go when they become Normal or Delta markers.

Specifying a Marker Trace manually or with this command associates the marker with the specified trace. If the marker is not OFF, it moves the marker from the trace it was on to the new trace. If the marker is OFF it stays off but is now associated with the specified trace.

The query returns the number of the trace on which the marker is currently placed.

Remote Command	`:CALCulate:CHPower:MARKer[1]|2|...|12:TRACe 1	2	3` `:CALCulate:CHPower:MARKer[1]|2|...|12:TRACe?`
Example	`:CALC:CHP:MARK2:TRAC 2` `:CALC:CHP:MARK2:TRAC?`
Notes	A marker may be placed on a blanked and/or inactive trace, even though the trace is not visible and/or updating. An application may register a trace name to be displayed on the control instead of a trace number.
Couplings	The state of **Marker Trace** is not affected by the "Auto Couple" on page 1718 key Sending the remote command causes the addressed marker to become selected.
Preset	1
State Saved	Saved in instrument state
Min	1
Max	3

Marker Settings Diagram

The Marker Settings Diagram lets you configure the Marker system using a visual utility. This is the same as the "Marker Settings Diagram" on page 888 control on the **Settings** tab.

3.7.8 Meas Setup

The **Meas Setup** menu panel contains functions for setting up the measurement parameters and also contains functions for setting up parameters global to all measurements in the Mode.

3.7.8.1 Settings

The **Settings** tab contains frequently used Meas Setup functions to which you will want the fastest access.

Avg/Hold Number

Specifies the number of measurement averages used to calculate the measurement result. The average is displayed at the end of each sweep. After the specified number of average counts, the averaging mode (terminal control) setting determines the averaging action.

Remote Command	`[:SENSe]:CHPower:AVERage:COUNt <integer>` `[:SENSe]:CHPower:AVERage:COUNt?`
Example	`:CHP:AVER:COUN 15` `:CHP:AVER:COUN?`
Preset	SA, WLAN: 10 WCDMA, LTE, LTETDD, LTEAFDD, LTEATDD, 5G NR, MSR: 200
State Saved	Saved in instrument state
Min/Max	1/10000
Annotation	The average count is displayed in the measurement bar on the front panel display. The annotation appears in the format n/N where n is the current average and N is the average count

Averaging On/Off

Turns averaging on or off for the Channel Power measurement.

NOTE: In this measurement, the **Average Type** is preset to the `Log-Pwr Avg (Video)` method. Other averaging methods are not available.

Remote Command	`[:SENSe]:CHPower:AVERage[:STATe] ON | OFF | 1 | 0` `[:SENSe]:CHPower:AVERage[:STATe]?`
Example	`:CHP:AVER ON` `:CHP:AVER?`
Preset	`ON`
State Saved	Yes
Range	`ON|OFF`

Avg Mode

Allows you to select the type of termination control used for the averaging function. This determines the averaging action after the specified number of data acquisitions (average count) is reached. Options are:

– EXPonential: The measurement averaging continues using the specified number of averages to compute each exponentially-weighted averaged value. The average is displayed at the end of each sweep

– REPeat: The measurement resets the average counter each time the specified number of averages is reached

Remote Command	[:SENSe]:CHPower:AVERage:TCONtrol EXPonential | REPeat [:SENSe]:CHPower:AVERage:TCONtrol?
Example	:CHP:AVER:TCON EXP :CHP:AVER:TCON?
Preset	EXP
State Saved	Yes
Range	EXPonential|REPeat

Integ BW

Specifies the range of integration used in calculating the power in the channel. The integration bandwidth (IBW) is displayed on the trace as two markers connected by an arrow.

Remote Command	[:SENSe]:CHPower:BANDwidth:INTegration <bandwidth> [:SENSe]:CHPower:BANDwidth:INTegration?
Example	:CHP:BAND:INT 10MHz :CHP:BAND:INT?
Dependencies	For the LTE-Advanced FDD/TDD, 5G NR and MSR modes, this control is not shown In order to keep backwards compatible with the legacy LTE FDD/TDD, the SCPI command is supported in LTE & LTE-A converged application
Couplings	The minimum value of the span is coupled with Integ BW When you change Integ BW, the span changes accordingly by keeping the same ratio of Span/Integ BW
Preset	

Mode	Radio Std	Integ BW
SA		2 MHz
WCDMA		5 MHz
LTE, LTETDD, LTEAFDD, LTEATDD		5 MHz

	Mode	Radio Std	Integ BW
	WLAN	802.11a/g(OFDM/DSSS-OFDM)	20 MHz
		802.11b	25 MHz
		802.11n/ac/ax/be (20MHz)	20 MHz
		802.11n/ac/ax/be (40MHz)	40 MHz
		802.11n/ac/ax/be (80MHz)	80 MHz
		802.11ax/be (80 MHz + 80 MHz)	80 MHz
		802.11ac/ax/be (160 MHz)	160 MHz
		802.11be (160 MHz + 160MHz)	160 MHz
		802.11be (320MHz)	320 MHz
State Saved	Saved in instrument state		
Min/Max	100 Hz/Hardware Maximum Span		
Backwards Compatibility SCPI	`[:SENSe]:CHPower:BWIDth:INTegration`		

PSD Unit

Sets the unit bandwidth for Power Spectral Density. The available units are dBm/Hz and dBm/MHz.

Remote Command	`:UNIT:CHPower:POWer:PSD DBMHZ | DBMMHZ` `:UNIT:CHPower:POWer:PSD?`
Example	`:UNIT:CHP:POW:PSD DBMMHZ` `:UNIT:CHP:POW:PSD?`
Couplings	When the PSD unit is changed, the PSD result of the "`:MEAS|READ|FETCH:CHP1?`" is also changed by the PSD unit basis (in either dBm/Hz or dBm/MHz)
Preset	WLAN mode or SA mode with WLAN radio standard: `DBMMHZ` Otherwise: `DBMHZ`
State Saved	Saved in instrument state
Range	dBm/Hz|dBm/MHz

IF Gain

Sets the IF Gain function to Auto, Low Gain or High Gain. These settings affect sensitivity and IF overloads.

Remote Command	`[:SENSe]:CHPower:IF:GAIN[:STATe] ON | OFF | 1 | 0`

	[:SENSe]:CHPower:IF:GAIN[:STATe]? [:SENSe]:CHPower:IF:GAIN:AUTO[:STATe] ON | OFF | 1 | 0 [:SENSe]:CHPower:IF:GAIN:AUTO[:STATe]?
Example	:CHP:IF:GAIN ON :CHP:IF:GAIN? :CHP:IF:GAIN:AUTO ON :CHP:IF:GAIN:AUTO?
Notes	ON = high gain OFF = low gain
Dependencies	The IF Gain controls (FFT IF Gain and Swept IF Gain) have no effect when the U7227A USB Preamplifier is connected. This is not annotated or reflected on any control; there are no controls grayed out nor any SCPI locked out. The instrument simply behaves as though both FFT IF Gain and Swept IF Gain are set to Low regardless of the setting on the controls This control is not available in VXT models M9420A/21A, EXM, or UXM This control is not available in the E7760, M9393A or M9391A
Couplings	Auto sets IF Gain to High Gain under any of the following conditions: – The input attenuator is set to 0 dB, or the preamp is turned on and the frequency range is under 3.6 GHz For other conditions, Auto sets IF Gain to Low Gain
Preset	OFF OFF
State Saved	Saved in instrument state
Range	Low Gain|High Gain

Spur Avoidance

Because the VXT models M9410A/11A/15A are direct-conversion (zero-IF) receivers, feedthrough leakage from the local oscillator appears as a spurious signal (spur) at the center frequency. The **Spur Avoidance** function is provided to eliminate this spur, at the expense of some measurement speed.

When **Spur Avoidance** is enabled (the default), the instrument uses a software algorithm to remove this spur from the displayed measurement data, but the algorithm only operates under certain conditions. Specifically, it only operates in the multiple capture case.

You can disable this function to speed up your measurement by setting Spur Avoidance to “Disabled.”

Note that when Spur Avoidance is not in effect, either because you have disabled it or because you are not in multiple capture, the following warning message will appear in the status bar:

`Settings Alert;Spur Avoidance Off`

This is to alert you that measurement accuracy might be impacted by the fact that Spur Avoidance is not in effect.

Remote Command	[:SENSe]:CHPower:SAVoid[:STATe] ON | OFF | 0 | 1 [:SENSe]:CHPower:SAVoid[:STATe]?
Example	:CHP:SAV ON :CHP:SAV?
Dependencies	This control only appears in VXT models M9410A/11A/15A
Preset	OFF
State Saved	Saved in instrument state
Range	ON|OFF

Meas Setup Summary Table

The Meas Setup Summary Table lets you view and access many of the parameters in the **Meas Setup** menus on one screen.

Auto Couple

Immediately puts all Auto/Man functions into Auto. The **Auto Couple** action is confined to the current measurement only. It does not affect other measurements in the mode.

In the Auto state, Auto/Man functions are said to be “coupled”, meaning their values change as you make changes to other values in the measurement. This helps ensure accurate measurements and optimum dynamic range. Auto Couple is an immediate action function, and when it is executed, all the Auto/Man controls for the current measurement are set to Auto, and all measurement settings coupled to the Auto/Man parameters are automatically set to their optimal value.

For further details of measurement-specific settings (if any), see "Measurement-Specific Details" on page 897 below.

Remote Command	:COUPle ALL
Example	:COUP ALL
Backwards Compatibility SCPI	:COUPLE ALL | NONE
Backwards Compatibility Notes	:COUP:NONE puts all Auto/Man parameters in manual mode, decoupling all the coupled instrument parameters. It is retained for backwards compatibility and is *not* recommended for making measurements or new designs

All Auto/Man parameter couplings in the measurement are set to Auto. This includes couplings that may be unavailable or grayed-out due to the current state. For example, in the Swept SA measurement, there is no Auto/Man coupling for RBW while in Zero Span. Nonetheless, if **Auto Couple** were executed while in Zero Span it would set RBW to Auto "behind the scenes" so that, on exit from Zero Span, it would be in Auto.

Any Auto/Man selection specific (local) to the other measurements in the current Mode will not be affected by **Auto Couple**. Any functions that are *not* coupled with other instrument parameters, such as ranging or leveling variables, such as "AutoRange" or "AutoScale", will not be affected.

Executing the **Auto Couple** command generates the informational message, "All Auto/Man functions have been set to Auto".

Each parameter, upon being set to Auto, selects and sets the appropriate auto-coupled value based on that parameter's coupling rules. The Dependency Resolver orchestrates the couplings for parameters that are dependent on one or more other parameters. The coupling and dependency rules for each parameter are defined in the chapter describing that parameter.

Executing the **Auto Couple** command *does not* affect markers, marker functions, trace or display attributes, or any other instrument setting other than those specifically mentioned above.

Measurement-Specific Details

TOI

Parameters affected by Auto Couple are:

- Center Frequency Step
- Resolution Bandwidth
- Span/RBW Ratio
- Sweep Time
- Video BandwidthVBW/RBW ratio
- Upper and Lower Tone (set to Sense
-)Zero span measurement Resolution Bandwidth
- Zero span measurement Dwell Time

Harmonics

For Harmonics, these parameters are:

- Resolution Bandwidth
- Fundamental Frequency

- Dwell Time
- Range Table Resolution Bandwidths
- Range Table Dwell Times

Meas Preset

Restores all the measurement parameters to their default values.

Remote Command	:CONFigure:CHPower
Example	:CONF:CHP

3.7.8.2 Radio

The Radio tab contains controls to select the Radio Device, and enable or disable HSPA/HSPA+ options.

Radio Device

Allows you to specify the device to be used.

Remote Command	[:SENSe]:RADio:STANdard:DEVice BTS | MS [:SENSe]:RADio:STANdard:DEVice?
Example	:RAD:STAN:DEV MS :RAD:STAN:DEV?
Preset	BTS
State Saved	Saved in instrument state.
Range	BTS | MS
Backwards Compatibility SCPI	[:SENSe]:RADio:DEVice

HSPA Enable

Allows you to turn on or off the HSDPA/HSUPA option enable. This selection is necessary because some of the auto detection functions that expect an HSPA signal are less tolerant when the signal is noisy or distorted. When the HSPA signal is not expected, turn HSPA Enable off.

Remote Command	[:SENSe]:RADio:CONFigure:HSDPa[:STATe] 0 | 1 | OFF | ON

	[:SENSe]:RADio:CONFigure:HSDPa[:STATe]?
Example	:RAD:CONF:HSDP 0 :RAD:CONF:HSDP?
Preset	ON
State Saved	Saved in instrument state.
Range	On|Off

HSPA+ Enable

Allows you to turn on or off the HSPA+ option enable. This selection is necessary because some of the auto detection functions that expect an HSPA+ signal are less tolerant when the signal is noisy or distorted. When the HSPA+ signal is not expected, turn HSPA+ Enable off.

Remote Command	[:SENSe]:RADio:CONFigure:EHSPa[:STATe] OFF | ON | 0 | 1 [:SENSe]:RADio:CONFigure:EHSPa[:STATe]?
Example	:RAD:CONF:EHSP 0 :RAD:CONF:EHSP?
Notes	When HSPA enable is OFF, HSPA+ function is disabled too.
Preset	ON
State Saved	Saved in instrument state.
Range	On|Off

3.7.8.3 Meas Method

This tab allows you to choose between Integration Bandwidth and RRC Weighted methods of making the measurement, and to set certain other relevant parameters. In MSR, LTE-A FDD/TDD and 5G NR modes, this feature is not supported.

Meas Method

Select between the Integration BW and RRC Weighted methods. Selecting the RRC Weighted method turns the Root Raised Cosine (RRC) filter On. The a value (roll off) for the filter is set to the value of the RRC Filter Alpha parameter, and the RRC filter bandwidth is set to the RRC Filter BW parameter.

Remote Command	[:SENSe]:CHPower:FILTer[:RRC][:STATe] OFF | ON | 0 | 1 [:SENSe]:CHPower:FILTer[:RRC][:STATe]?

Example	`:CHP:FILT OFF` `:CHP:FILT?`
Notes	This parameter is normally used when TETRA is selected as the Radio Std
Dependencies	For WLAN 802.11 ac (80 + 80 MHz), RRC Weighted is not supported In order to maintain backwards compatibility with the legacy LTE FDD/TDD modes, the SCPI command is supported in the LTE & LTE-A converged applications
Preset	`OFF`
State Saved	Saved in instrument state
Range	Integration BW|RRC Weighted

RRC Filter Alpha

Inputs the alpha value for the Root Raised Cosine (RRC) filter.

Remote Command	`[:SENSe]:CHPower:FILTer[:RRC]:ALPHa <real>` `[:SENSe]:CHPower:FILTer[:RRC]:ALPHa?`
Example	`:CHP:FILT:ALPH 0.5` `:CHP:FILT:ALPH?`
Notes	This parameter is normally used when TETRA is selected as the Radio Std
Dependencies	In order to maintain backwards compatibility with the legacy LTE FDD/TDD modes, the SCPI command is supported in the LTE & LTE-A converged applications
Preset	0.22
State Saved	Saved in instrument state
Min/Max	0.01/1.00

RRC Filter BW

Inputs the Root Raised Cosine (RRC) filter bandwidth. Normally, the filter bandwidth is the same as the symbol rate of the signal.

Remote Command	`[:SENSe]:CHPower:FILTer[:RRC]:BANDwidth <real>` `[:SENSe]:CHPower:FILTer[:RRC]:BANDwidth?`
Example	`:CHP:FILT:BAND 10MHz` `:CHP:FILT:BAND?`
Notes	This parameter is normally used when TETRA is selected as the Radio Std
Dependencies	

	In order to maintain backwards compatibility with the legacy LTE FDD/TDD modes, the SCPI command is supported in the LTE & LTE-A converged applications
Preset	SA, WCDMA, LTE, LTETDD: 3.84MHz WLAN:

Radio Std	Value
802.11a/g (OFDM/DSSS-OFDM)	16.6 MHz
802.11b	22 MHz
802.11n (20MHz)	17.8 MHz
802.11n (40MHz	36.6 MHz

State Saved	Saved in instrument state
Min/Max	100 Hz/100 MHz
Backwards Compatibility SCPI	`[:SENSe]:CHPower:FILTer[:RRC]:BWIDth`

3.7.8.4 Limits

Accesses the Limits menu that allows you to set up the test limit for channel power or power spectral density.

When DVB-T radio standard is selected in SA mode, this functionality is disabled, and the input signal is instead compared against a pre-defined spectrum mask.

In LTE-A FDD/TDD and 5G NR modes, this feature is not supported.

In MSR mode, this feature is not supported because the power of each carrier may be different.

Power Limit

If Power Limit is on, it is used as threshold to determine whether the real measured channel power can be passed or not. If real measured channel power exceeds Power Limit, channel power test fails, otherwise, it passes.

If Power Limit is off, channel power test is always passed.

Remote Command	`:CALCulate:CHPower:LIMit:POWer <ampl>`
	`:CALCulate:CHPower:LIMit:POWer?`
	`:CALCulate:CHPower:LIMit:POWer:STATe OFF | ON | 0 | 1`
	`:CALCulate:CHPower:LIMit:POWer:STATe?`

Example	`:CALC:CHP:LIM:POW 16.00` `:CALC:CHP:LIM:POW?`

	:CALC:CHP:LIM:POW:STAT ON :CALC:CHP:LIM:POW:STAT?

Notes	This parameter and PSD Limit can determine Pass/Fail criteria
	If ((power limit = On) and (PSD limit= Off))
	– Pass if (power test passes)
	– Fail if (power test fails)
	If ((power limit = On) and (PSD limit= On))
	– Pass if (both power test and PSD test pass)
	– Fail if (either of power test or PSD test fails)
	If ((power limit = Off) and (PSD limit= On))
	– Pass if (PSD test passes)
	– Fail if (PSD test fails)
	If ((power limit = Off) and (PSD limit= Off))
	– Always Pass
	For WLAN 802.11ac (80 MHz + 80 MHz), the power test and the PSD test are performed to both carriers. Which means the power (or PSD) readouts of both carriers should be compared with the power (or PSD) limit individually, and the test passes only when both values are lower than the limit

Dependencies	In order to maintain backwards compatibility with the legacy LTE FDD/TDD modes, the SCPI command is supported in the LTE & LTE-A converged applications
Preset	16.00 All modes other than WLAN: OFF WLAN: ON
State Saved	Saved in instrument state Yes
Range	OFF|ON
Min/Max	-200.0/200.0

PSD Limit

If PSD (power spectral density) Limit is ON, PSD Limit is used as threshold to determine whether the real measured PSD can be passed or not. If real measured PSD exceeds PSD Limit, PSD test fails, otherwise, it passes.

If PSD is off, PSD test is always passed.

Remote Command	:CALCulate:CHPower:LIMit:PSDensity <real> :CALCulate:CHPower:LIMit:PSDensity?

	`:CALCulate:CHPower:LIMit:PSDensity:STATe OFF | ON | 0 | 1` `:CALCulate:CHPower:LIMit:PSDensity:STATe?`

Example	`:CALC:CHP:LIM:PSD 4.00`
	`:CALC:CHP:LIM:PSD?`
	`:CALC:CHP:LIM:POW:STAT ON`
	`:CALC:CHP:LIM:POW:STAT?`

Notes	This parameter and Power Limit can determine Pass/Fail criteria
	If ((power limit = On) and (PSD limit= Off))
	– Pass if (power test passes)
	– Fail if (power test fails)
	If ((power limit = On) and (PSD limit= On))
	– Pass if (both power test and PSD test pass)
	– Fail if (either of power test or PSD test fails)
	If ((power limit = Off) and (PSD limit= On))
	– Pass if (PSD test passes)
	– Fail if (PSD test fails)
	If ((power limit = Off) and (PSD limit= Off))
	– Always Pass
	For WLAN 802.11ac (80 MHz + 80 MHz), the power test and the PSD test are performed to both carriers. Which means the PSD (or power) readouts of both carriers should be compared with the PSD (or power) limit individually, and the test passes only when both values are lower than the limit

Dependencies	In order to maintain backwards compatibility with the legacy LTE FDD/TDD modes, the SCPI command is supported in the LTE & LTE-A converged applications
Couplings	The value is automatically converted when PSD Unit is changed
Preset	WLAN mode or SA mode with WLAN radio standard: 4.00 dBm/MHz Otherwise: 4.00 dBm/Hz All modes other than WLAN: `OFF` WLAN: `ON`
State Saved	Saved in instrument state Yes
Range	`OFF | ON`
Min/Max	-200.0/200.0

Power Limit Fail (remote command only)

The command is query-only, and is used to query whether a power test passes or fails. When DVB-T radio standard is selected in SA mode, the result of this query has no meaning.

Remote Command	`:CALCulate:CHPower:LIMit:POWer:FAIL?`
Example	`:CALC:CHP:LIM:POW:FAIL?`
Notes	Query only When Power Limit is off, the returned value is always 0 (pass) When Power Limit is on, the returned value is 0(pass) while power test passes and 1(fail) while power test fails
Dependencies	In order to maintain backwards compatibility with the legacy LTE FDD/TDD modes, the SCPI command is supported in the LTE & LTE-A converged applications

PSD Limit Fail (Remote Command only)

The command is query only, and used to query whether PSD test passes or fails. When DVB-T radio standard is selected in SA mode, the result of this query has no meaning.

Remote Command	`:CALCulate:CHPower:LIMit:PSD:FAIL?`
Example	`:CALC:CHP:LIM:PSD:FAIL?`
Notes	Query only When PSD Limit is off, the returned value is always 0 (pass) When PSD Limit is on, the returned value is 0 (pass) while PSD test passes and 1(fail) while PSD test fails
Dependencies	In order to maintain backwards compatibility with the legacy LTE FDD/TDD modes, the SCPI command is supported in the LTE & LTE-A converged applications

3.7.8.5 Advanced

The Advanced tab contains controls for setting advanced functions of the instrument.

– This tab does not appear in EXM or VXT

– This tab does not appear in the M9393A or M9391A

Phase Noise Optimization

Allows you to select the LO (local oscillator) phase noise behavior for various operating conditions. When in Auto, selects the LO (local oscillator) phase noise behavior to optimize dynamic range and speed for various instrument operating conditions.

For full details, see "Parameter Options, Installed Options & Ranges" on page 905 below.

Remote Command	`[:SENSe]:CHPower:FREQuency:SYNThesis[:STATe] 1 | ... | 5`
	For the meaning of each numeric option value, see "Parameter Options, Installed Options & Ranges" on page 905 below
	`[:SENSe]:CHPower:FREQuency:SYNThesis[:STATe]?`
	`[:SENSe]:CHPower:FREQuency:SYNThesis:AUTO[:STATe] OFF | ON | 0 | 1`
	`[:SENSe]:CHPower:FREQuency:SYNThesis:AUTO[:STATe]?`

Example	`:CHP:FREQ:SYNT 1`
	`:CHP:FREQ:SYNT?`
	`:CHP:FREQ:SYNT:AUTO 1`
	`:CHP:FREQ:SYNT:AUTO?`

Dependencies	Does not appear in all models. For models in which the control is not displayed, the SCPI command is accepted for compatibility (although no action is taken)
Preset	3 `OFF`
State Saved	Saved in instrument state
Range	See "Ranges" on page 910 below
Annotation	**EP0:** Balanced | Best Wide | Fast | Best Close | Best Spurs **Other than EP0:** Best Close | Best Wide | Fast Found in the Meas Bar under **PNO** When not in Auto, label changes to **#PNO**

Parameter Options, Installed Options & Ranges

The Phase Noise Optimization control lets you optimize the setup and behavior of the Local Oscillator (LO) depending on your specific measurement conditions. You may wish to trade off noise and speed, for example, to make a measurement faster without regard to noise or with optimum noise characteristics without regard to speed.

Parameter Values Summary

Option	#	Description
"Balanced" on page 907	1	– In instruments with EP0, balances close-in phase noise with spur avoidance – In instruments without EP0 optimizes phase noise for small

Option	#	Description
		frequency offsets from the carrier
"Best Wide-offset" on page 907	2	Optimizes phase noise for wide frequency offsets from the carrier
"Fast Tuning" on page 907	3	Optimizes LO for tuning speed
"Best Close-in" on page 906	4 or 1*	– In instruments with EP0, emphasizes close-in phase noise performance without regard to spur avoidance – In instruments without EP0, this setting is accepted but no action is taken
"Best Spurs" on page 907	5	– In instruments with EP0, emphasizes spur avoidance over close-in phase noise performance – In instruments without EP0, this setting is accepted but no action taken
Auto	-	Automatically selects LO (local oscillator) phase noise behavior to optimize dynamic range and speed for various instrument operating conditions

*Dependent on Option EP0 installation. See "Best Close-in" on page 906 below.

The actual behavior varies somewhat depending on model number and option; for example, you always get Fast Tuning by choosing Option #3, but in some models, "Fast Tuning" on page 907 is identical in effect to "Best Close-in" on page 906.

Best Close-in

Without option EP0

`:FREQ:SYNT 1`

The LO phase noise is optimized for smaller offsets from the carrier, at the expense of phase noise farther out.

The actual frequency offset within which noise is optimized is shown with in square brackets, as this can vary depending on the hardware set in use. For example, in some instruments this annotation appears as [offset <20 kHz]

With option EP0

`:FREQ:SYNT 4`

In instruments with Option EP0, the LO is configured for the best possible close-in phase noise (offsets up to 600 kHz from the carrier), regardless of spurious products that occur with some center frequencies. Because this is generally less desirable for close-in measurements than the "Balanced" on page 907 setting, parameter 1 selects "Balanced" on page 907 in EP0 instruments, in the interests of optimizing code compatibility across the family. Parameter 4 selects "Best Close-in" on page 906, which is usually not as good a choice as "Balanced" on page 907.

Balanced

`:FREQ:SYNT 1`

In instruments with EP0, the LO is configured for the best possible phase noise at offsets up to 600 kHz from the carrier whenever there are no significant spurs within the span observed with an on-screen carrier. When there will be such a spur, the LO is reconfigured in a way that allows the phase noise to increase by 7 dB mostly within ±1 octave around 400 kHz offset. The spurs will always be below –70 dBc.

Best Spurs

`:FREQ:SYNT 5`

In instruments with EP0, the LO is configured for better phase noise than the "Best Wide-offset" on page 907 case close to the carrier, but the configuration has 11 dB worse phase noise than the "Best Close-in" on page 906 case mostly within ±1 octave around 300 kHz offset. Spurs are even lower than in the "Balanced" on page 907 case at better than –90 dBc, whether or not the carrier is on-screen.

This setting is never selected when Phase Noise Optimization is in Auto, you must select it manually.

Best Wide-offset

`:FREQ:SYNT 2`

The LO phase noise is optimized for wider offsets from the carrier. Optimization is especially improved for offsets from 70 kHz to 300 kHz. Closer offsets are compromised and the throughput of measurements (especially remote measurements where the center frequency is changing rapidly), is reduced.

The actual frequency offset beyond which noise is optimized is shown with in square brackets, as this can vary depending on the hardware set in use. For example, in some instruments this annotation appears as [offset >30 kHz]

In instruments with Option EP0, the LO is configured for the best possible phase noise at offsets up to 600 kHz from the carrier whenever there are no significant spurs within the span observed with an on-screen carrier. When there will be such a spur, the LO is reconfigured in a way that allows the phase noise to increase by 7 dB mostly within ±1 octave around 400 kHz offset. The spurs will always be below –70 dBc.

Fast Tuning

`:FREQ:SYNT 3`

In this mode, the LO behavior compromises phase noise at many offsets from the carrier in order to allow rapid measurement throughput when changing the center frequency or span. The term "Fast Tuning" on page 907 refers to the time it takes to move the local oscillator to the start frequency and begin a sweep; this setting does not impact the actual sweep time in any way.

In instruments with EP1, the LO behavior compromises phase noise at offsets below 4 MHz in order to improve measurement throughput. The throughput is especially affected when moving the LO more than 2.5 MHz and up to 10 MHz from the stop frequency to the next start frequency.

In instruments with Option EP0, this is the same configuration as "Best Spurs" on page 907. It is available with the "Fast Tuning" on page 907 label for convenience, and to make the user interface more consistent with other X-Series instrument family members.

(In models whose hardware does not provide for a "Fast Tuning" on page 907 option, the settings for "Best Close-in" on page 906 are used if "Fast Tuning" on page 907 is selected. This gives the fastest possible tuning for that hardware set.)

Auto

```
:FREQ:SYNT:AUTO ON
```

Selects the LO (local oscillator) phase noise behavior to optimize dynamic range and speed for various instrument operating conditions. The selection rules are as follows.

Auto Optimization Rules

X-Series instruments have several grades of LO, offering different configurations when in the Auto Mode. The rules for Auto selection are as follows:

Models with Option	Conditions	Selection
EP0 Models with option EP0 have a two stage local oscillator, which switches to a single loop for fast tuning (available in UXA)	Center frequency is < 699.9 kHz	"Balanced" on page 907
	Span > 114.1 MHz, *or* RBW > 800 kHz	"Fast Tuning" on page 907
	RBW > 290 kHz, *or* Span > 4.2 MHz	"Best Wide-offset" on page 907
	Other conditions	"Balanced" on page 907
EP1 Models with option EP1 have a two-loop local oscillator, which switches to a single loop for fast tuning (available in PXA)	Span > 44.44 MHz, *or* RBW > 1.9 MHz, *or* Source Mode is set to "Tracking"	"Fast Tuning" on page 907
	Center frequency is < 195 kHz, *or* CF >= 1 MHz *and* Span <= 1.3 MHz *and* RBW <= 75 kHz	"Best Close-in" on page 906
	All other conditions	"Best Wide-offset" on page 907
EP2	CF < 130 kHz , *or*	"Best Close-in"

Models with Option	Conditions	Selection
Models with option EP2 use a different loop bandwidth for the fast-tuning choice, which is a compromise between tuning speed and phase noise, giving good tuning speed at all offsets. Although not as good as for "Best Close-in" on page 906; this is useful when you have to look across a wide range of spans (available, for example, in MXA for excellent phase noise)	CF > 12 MHz *and* Span < 495 kHz *and* RBW < 40 kHz	on page 906
	Span > 22 MHz, *or* RBW > 400 kHz, *or* CF ≤ 12 MHz *and* Span < 495 kHz *and* RBW < 23 kHz	"Fast Tuning" on page 907
	All other conditions	"Best Wide-offset" on page 907
EP4 (available in CXA for improved phase noise)	Span > 101 MHz *or* RBW > 1.15 MHz *or* Source Mode is set to "Tracking"	"Fast Tuning" on page 907
	CF is < 109 kHz *or* CF >= 4.95 MHz *and* Span <= 666 kHz *and* RBW < 28 kHz	"Best Close-in" on page 906
	All other conditions	"Best Wide-offset" on page 907
All Other Models Note that in these models, the hardware does not actually provide for an extra-fast tuning option, so the settings for "Fast Tuning" on page 907 are actually the same as "Best Close-in" on page 906, but the rules are implemented this way so that the user who doesn't care about phase noise but does care about tuning speed doesn't have to remember which of the other two settings gives faster tuning	Span > 12.34 MHz, *or* RBW > 250 kHz, *or* Source Mode is set to "Tracking"	"Fast Tuning" on page 907
	Center frequency is < 25 kHz, *or* CF >= 1 MHz *and* Span <= 141.4 kHz *and* RBW <= 5 kHz	"Best Close-in" on page 906
	All other conditions	"Best Wide-offset" on page 907

In all the above cases:

– The RBW to be used in the calculations is the equivalent –3 dB bandwidth of the current RBW filter

– The rules apply whether in swept spans, zero span, or FFT spans

Ranges

Option	Option #	Phase Noise Option	Range
No EPx Option	1	Best Close-in	[offset < 20 kHz]
	2	Best Wide-offset	[offset > 30 kHz]
	3	Fast Tuning	[same as Best Close-In]
EP0	4	Best Close-in	[offset < 600 kHz]
	1	Balanced	[offset < 600 kHz]
	5	Best Spurs	[offset < 600 kHz]
	2	Best Wide-offset	[offset > 800 kHz]
	3	Fast Tuning	[same as Best Close-In]
EP1	1	Best Close-in	[offset < 140 kHz]
	2	Best Wide-offset	[offset > 160 kHz]
	3	Fast Tuning	[single loop]
EP2, EP3, EP5	1	Best Close-in	[offset < 70 kHz]
	2	Best Wide-offset	[offset > 100 kHz]
	3	Fast Tuning	[medium loop bw]
EP4	1	Best Close-in	[offset < 90 kHz]
	2	Best Wide-offset	[offset > 130 kHz]
	3	Fast Tuning	[same as Best Close-In]

Noise Floor Extension

Allows you to turn on/configure the **Noise Floor Extension** (NFE) function. Some Modes (such as Spectrum Analyzer Mode), support two states of NFE, Full and Adaptive. The `ON` state (in Modes which do not support Adaptive NFE) matches the `FULL` state (in Modes that *do* support Adaptive NFE).

In `ON` or `FULL` NFE, the expected noise power of the instrument (derived from a factory calibration) is subtracted from the trace data. This will usually reduce the apparent noise level by about 10 dB in low band, and 8 dB in high band (>~3.6 GHz).

In Adaptive NFE, there is not the same dramatic visual impact on the noise floor as there is in Full NFE. Adaptive NFE controls the amount of correction that is applied based on other instrument settings like RBW, averaging and sweep time. Adaptive NFE controls the degree of potential improvement in the noise floor to give more improvement for those instrument settings that can make good use of the potential improvement, such as settings that provide more averaging. The result is that when not much averaging is being performed, the signal displays more like the NFE-off case; and when lots of averaging is being performed, the signal displays more like the full-NFE case.

Adaptive NFE (in Modes which support it) is recommended for general-purpose use. For fully ATE (automatic test equipment) applications, where the distraction of a person using the instrument is not a risk, Full NFE is recommended.

NFE works with any RBW, VBW, detector, any setting of Average Type, any amount of trace averaging, and any signal type. It is ineffective when the trace is not smoothed (smoothing processes include narrow VBWs, trace averaging, and long sweep times with the detector set to Average or Peak). It works best with extreme amounts of smoothing, and with the average detector, with the Average Type set to Power.

In those cases where the cancellation is ineffective, it nonetheless has no undesirable side-effects. There is no significant speed impact to having Noise Floor Extension on.

The best accuracy is achieved when substantial smoothing occurs in each point before trace averaging. Thus, when using the average detector, results are better with long sweep times and fewer trace averages. When using the sample detector, the VBW filter should be set narrow with less trace averaging, instead of a wide VBW filter with more trace averaging.

NOTE

Noise Floor Extension has no effect unless the RF Input is selected, so it does nothing when External Mixing is selected.

In Modes that support Adaptive NFE, the default state of NFE is Adaptive. In Modes that do not support Adaptive NFE, the default state of NFE is OFF. Prior to the introduction of Adaptive NFE (firmware version A.18.00), the default state of NFE was OFF for all Modes.

With the introduction of Adaptive NFE, the menu control is changed from On|Off to Full|Adaptive|Off. For SCPI Backwards Compatibility, the existing SCPI command to turn NFE on and off was retained, and a new command was added to set the state to turn Adaptive On and Off

`[:SENSe]:CORRection:NOISe:FLOor ON|OFF|1|0` is retained, default changed to On for modes that support Adaptive NFE

`[:SENSe]:CORRection:NOISe:FLOor:ADAPtive ON|OFF|1|0` is added (for certain Modes), default=On

FULL = `:CORRection:NOISe:FLOor ON` plus `:CORRection:NOISe:FLOor:ADAPtive ON`

See "More Information" on page 912

Remote Command	`[:SENSe]:CORRection:NOISe:FLOor ON | OFF | 1 | 0` `[:SENSe]:CORRection:NOISe:FLOor?`
Example	`:CORR:NOIS:FLO ON`
Dependencies	This control only appears in instruments with the NFE or NF2 license installed. In all others, the control does not appear, however the SCPI command will be accepted without error (but will have no effect)
Couplings	When NFE is enabled in any mode manually, a prompt will be displayed reminding you to perform the Characterize Noise Floor operation if it is needed. If NFE is enabled through SCPI and a Characterize

	Noise Floor operation is needed, an error will be entered in the system error queue
Preset	Unaffected by Mode Preset. Turned ON at startup and by Restore Mode Defaults in Modes that support Adaptive. Turned OFF at startup and by Restore Mode Defaults in Modes that do not support Adaptive
State Saved	No

Remote Command	`[:SENSe]:CORRection:NOISe:FLOor:ADAptive ON | OFF | 1 | 0` `[:SENSe]:CORRection:NOISe:FLOor:ADAptive?`

Example	`:CORR:NOIS:FLO ON`
	First turn NFE on, this is Full mode
	`:CORR:NOIS:FLO:ADAP ON`
	Then set it to Adaptive

Dependencies	Only available in Modes that support Adaptive NFE Only appears in instruments with the NFE or NF2 license installed. In all others, the control does not appear, but the SCPI command is accepted without error (but has no effect)
Couplings	For backwards compatibility, sending `:CORR:NOIS:FLO ON` turns NFE Adaptive OFF. To turn Adaptive ON, you must issue the commands in the proper order, as shown in the example above
Preset	Not affected by Mode Preset, but set to ON at startup and by Restore Mode Defaults
State Saved	No

More Information

The instrument is characterized in the factory (or during a field calibration) with a model of the noise, referred to the input mixer, versus frequency in each band and path combination. Bands are 0 (low band) and 1 through 4 (high band) in a 26.5 GHz instrument, for example. Paths include normal paths, preamp paths, the electronic attenuator, etc.

In most band/path combinations, the noise can be well characterized based on just two parameters and the instrument frequency response before compensation for frequency-dependent losses.

After the noise density at the input mixer is estimated, the effects of the input attenuator, RBW, detector, etc. are computed to get the estimated input-port-referred noise level.

In the simplest case, the measured power (signal plus instrument noise) in each display point (bucket) is compensated by subtracting the estimated noise power, leaving just the signal power. This is the operation when the detector is Average and the Average Type is set to Power.

In other cases, operation is often not quite as good but still highly effective. With peak detection, the noise floor is estimated based on the RBW and the duration of the bucket using the same equations used in the noise marker function. The voltage of the noise is subtracted from the voltage of the observed signal-plus-noise measurement to compute the estimated signal voltage. The peak detector is one example of processing that varies with detector to give good estimates of the signal level without the instrument noise.

For best operation, the average detector and the power scale are recommended, as already stated. Peak detection for pulsed-RF can still give excellent effectiveness. FFT analysis does not work well, and does not do NFE well, with pulsed-RF signals, so this combination is not recommended. Negative peak detection is not very useful, either. Sample detection works well, but is never better than the average detector because it doesn’t smooth as well. The Normal detector is a combination of peak and negative peak behaviors, and works about as well as these.

For best operation, extreme smoothing is desirable, as already stated. Using narrow VBWs works well, but using very long bucket durations and the average detector works best. Reducing the number of trace points will make the buckets longer.

For best operation, the power scale (Average Type = Power) is optimum. When making CW measurements in the presence of noise without NFE, averaging on the decibel scale has the advantage of reducing the effect of noise. When using NFE, the NFE does an even better job than using the log scale ever could. Using NFE with the log scale is not synergistic, though; NFE with the power scale works a little better than NFE with log averaging type.

The results from NFE with internal preamp can often be lower than the theoretical noise in a signal source at room temperature, a noise density of -174 dBm/Hz. This is expected and useful behavior, because NFE is designed to report the amount of input signal that is in excess of the thermal noise, not the amount that includes the thermal noise. This can be a useful behavior because thermal noise often interferes with what you want to measure, instead of being part of what you want to measure. Note that NFE is not adequately accurate to always be able to read below kTB.

Adaptive NFE provides an alternative to fully-on and -off NFE. Fully-on NFE can, notably in cases with little or no averaging of the spectrum, result in a display that is distractingly unfamiliar in the variability in response to low level signals. Fully-off NFE fails to achieve the potential improvement in dynamic range and associated accuracy of measurement of low level signals. Adaptive NFE controls the degree of potential improvement in the noise floor to give more improvement for those instrument settings that can make good use of the potential improvement—those settings with high degrees of variance reduction through some variant of averaging. When the potential improvement is small, the display acts like the NFE-off case, and when it is high, it acts like the fully-on case, and in-between, application is a compromise between attractiveness and effectiveness.

On instruments with the NF2 license installed, the calibrated Noise Floor used by Noise Floor Extensions should be refreshed periodically. Keysight recommends that the **Characterize Noise Floor** operation be performed after the first 500 hours of operation, and once every calendar year. The control to perform this is located in the **System, Alignments, Advanced** menu. If you have not done this yourself at the recommended interval, then when you turn on Noise Floor Extensions, the instrument will prompt you to do so with a dialog that says:

"This action will take several minutes to perform. Please disconnect all cables from the RF input and press Enter to proceed. Press ESC to cancel, or Postpone to postpone for a week"

If you **Cancel**, you will be prompted again the next time you turn NFE `ON`. If you **Postpone**, you will be prompted again after a week passes and you then turn NFE `ON`.

3.7.8.6 Global

The controls in this menu apply to all Modes in the instrument.

Some controls (for example, **Global Center Freq**) allow you to switch certain Meas Global parameters to a Mode Global state. These switches apply to all Modes that support global settings. For example, no matter what Mode you are in when you set **Global Center Freq** to `ON`, it applies to all Modes that support Global Settings.

Other controls (for example, **Extend Low Band**) are actually set in this menu, but apply to all Modes.

Global Center Freq

The software maintains a Mode Global value called **Global Center Freq**.

When **Global Center Freq** is switched `ON`, the current Mode's center frequency is copied into the **Global Center Frequency**, and from then on all Modes that support global settings use the **Global Center Frequency**, so you can switch between any of these Modes and the Center Freq will remain unchanged.

Adjusting the Center Freq of any Mode that supports Global Settings, while **Global Center Freq** is `ON`, modifies the Global Center Frequency.

When **Global Center Freq** is switched `OFF`, the Center Freq of the current Mode is unchanged, but now the Center Freq of each Mode is once again independent.

When **Mode Preset** is pressed while **Global Center Freq** is `ON`, the Global Center Freq is preset to the preset Center Freq of the current Mode.

This function is reset to `OFF` when "Restore Defaults" on page 1737 (in this tab) is pressed, or when **System**, **Restore Defaults**, **All Modes** is pressed.

Remote Command	`:INSTrument:COUPle:FREQuency:CENTer ALL | NONE` `:INSTrument:COUPle:FREQuency:CENTer?`
Example	`:INST:COUP:FREQ:CENT ALL` `:INST:COUP:FREQ:CENT?`
Preset	Set to `OFF` on **Global** Settings, **Restore Defaults** and **System, Restore Defaults, All Modes**
Range	`ALL|NONE`

Preset	OFF
Backwards Compatibility SCPI	:GLOBal:FREQuency:CENTer[:STATe] 1 | 0 | ON | OFF :GLOBal:FREQuency:CENTer[:STATe]?

Global EMC Std

When this control is switched ON, the current Mode's EMC Std is copied into the **Global EMC Std**, and from then on all Modes that support global settings use the Global EMC Std, so you can switch between any of these Modes and the EMC Std will remain unchanged.

Adjusting the EMC Std of any Mode that supports Global Settings, while Global EMC Std is ON, will modify the **Global EMC Std**.

When **Global EMC Std** is switched OFF, the EMC Std of the current Mode is unchanged, but now the EMC Std of each Mode is once again independent. When **Mode Preset** is pressed while **Global EMC Std** is ON, the Global EMC Std is preset to the preset EMC Std of the current Mode.

This function is reset to OFF when "Restore Defaults" on page 1737 (in this tab) is pressed, or when **System, Restore Defaults, All Modes** is pressed.

Remote Command	:INSTrument:COUPle:EMC:STANdard ALL | NONE :INSTrument:COUPle:EMC:STANdard?
Example	:INST:COUP:EMC:STAN ALL :INST:COUP:EMC:STAN?
Dependencies	Only available if option EMC is installed
Preset	Set to OFF on **Global** Settings, **Restore Defaults** and **System, Restore Defaults, All Modes**
Range	ALL|NONE

Extend Low Band

The software maintains a Mode Global value called **Extend Low Band**.

Under the current sweep configuration crossing over two bands, when **Extend Low Band** is turned ON, the instrument checks whether one band can cover the whole sweep frequency range or not. If it can, then the instrument locks the band; otherwise, it does nothing (the band crossover occurs).

This function does *not* work when **Band Lock** under **System > Service > Lock Functions** is not -1 (no Band Lock). In that case, **Band Lock** takes priority over **Extend Low Band**.

This function is reset to OFF when "Restore Defaults" on page 1737 (in this tab) is pressed, or when **System**, **Restore Defaults**, **All Modes** is pressed.

This parameter is available for SA, RTSA, WCDMA, WIMAX OFDMA, LTEAFDD, LTEATDD Modes.

Remote Command	`:INSTrument:COUPle:FREQuency:BAND:EXTend 0 | 1 | ON | OFF` `:INSTrument:COUPle:FREQuency:BAND:EXTend?`
Example	`:INST:COUP:FREQ:BAND:EXT 1` `:INST:COUP:FREQ:BAND:EXT?`
Dependencies	Only applies to UXA, PXA, MXA and EXA
Preset	Set to `OFF` by **Global** Settings > **Restore Defaults** and **System** > **Restore Defaults** > **All Modes**
Range	`ON|OFF`

Restore Defaults

Resets all of the functions in the **Global** Settings menu to `OFF`. This also occurs when **System**, **Restore Defaults**, **All Modes** is pressed.

Remote Command	`:INSTrument:COUPle:DEFault`
Example	`:INST:COUP:DEF`
Backwards Compatibility SCPI	`:GLOBal:DEFault`

3.7.9 Sweep

The **Sweep** key accesses controls that enable you configure and control the acquisition of data and the X-axis parameters of the instrument. These controls might include Sweep Time, Continuous/Single, Pause/Resume, X Scale and number of Points.

3.7.9.1 Sweep/Control

Contains controls for the Sweep and Control functions of the instrument, such as Sweep Time and Continuous/Single.

Sweep Time

Controls the time the instrument takes to sweep the current frequency span in swept measurements, displays the sweep time in swept measurements, and displays the equivalent Sweep Time in FFT measurements.

NOTE In instruments without sweeping hardware, this control may be labeled "Acquisition Time"

When Sweep Time is in Auto, the instrument computes a time that will give accurate measurements based on other settings, such as RBW and VBW.

You can choose a shorter sweep time to improve the measurement throughput (with some potential unspecified accuracy reduction), but the Meas Uncal indicator will come on if the sweep time you set is less than the calculated Auto Sweep time.

You can also select a longer sweep time, which can be useful (for example) for obtaining accurate insertion loss measurements on very narrowband filters.

In the ACP measurements, use [:SENSe]:ACP:OFFSet:LIST:SWEep:TIME to set the number of points used for measuring the offset channels for Basic and cdmaOne. For cdma2000, 1xEVDO and W-CDMA, this command sets the sweep time when using the sweep mode.

NOTE: Significantly faster sweep times are available with Option FS1.

NOTE: The Meas Uncal (measurement uncalibrated) warning is given in the Status Bar at the bottom of the screen when the manual Sweep time entered is faster than the time computed by the instrument's Sweep time equations, that is, the Auto Sweep Time. The instrument's computed Sweep time will give accurate measurements; if you sweep faster than this your measurements may be inaccurate. A Meas Uncal condition may be corrected by returning the Sweep Time to Auto; by entering a longer Sweep Time; or by choosing a wider RBW and/or VBW.

Remote Command	[:SENSe]:CHPower:SWEep:TIME <time> [:SENSe]:CHPower:SWEep:TIME? [:SENSe]:CHPower:SWEep:TIME:AUTO OFF | ON | 0 | 1 [:SENSe]:CHPower:SWEep:TIME:AUTO?
Example	:CHP:SWE:TIME 25ms :CHP:SWE:TIME? :CHP:SWE:TIME:AUTO OFF :CHP:SWE:TIME:AUTO?
Dependencies	In certain instruments without sweeping hardware, such as VXT models M9420A/21A, the Sweep Time control is grayed out, and the Auto/Man toggle disappears
Couplings	Sweep Time is coupled to RBW when Sweep Time is set to Auto; in this case the sweep time is changed as the RBW changes, to maintain amplitude calibration Sweep Time is also coupled to the Video Bandwidth (VBW). As the VBW is changed, the sweep time (when set to Auto) is changed to maintain amplitude calibration. This occurs because of common hardware between the two circuits
Preset	Automatically Calculated unless noted below WCDMA: 1.0 ms, CDMA2K: 9.4ms, 1xEVDO: 2.66ms ON unless noted below

	WCDMA: OFF
State Saved	Saved in instrument state
Min	Typically: 1 ms
Max	In swept spans: 4000 s
Annotation	The sweep time is displayed in the lower-right corner of the screen. The number of points is displayed parenthetically, as: Sweep 13.3 ms (1001 points) A "#" mark appears before "Sweep" in the annotation when it is switched from Auto to Manual coupling
Status Bits/OPC dependencies	Meas Uncal is Bit 0 in the STATus:QUEStionable:INTegrity:UNCalibrated register

Sweep/Measure

Allows you to toggle between Continuous and Single sweep or measurement operation. The Single/Continuous state is Meas Global, so the setting affects *all* measurements.

The front-panel key **Single/Cont** performs exactly the same function

NOTE **In the WAVeform measurement, this control only appears in the Meas Bar, and not in the Sweep/Control tab.**

See "More Information" on page 919

Remote Command	:INITiate:CONTinuous OFF | ON | 0 | 1 :INITiate:CONTinuous?
Example	:INIT:CONT 0 :INIT:CONT OFF puts instrument into Single measurement operation :INIT:CONT 1 :INIT:CONT ON puts instrument into Continuous measurement operation
Preset	ON Note that :SYST:PRES sets :INIT:CONT to ON but *RST sets :INIT:CONT to OFF
State Saved	Saved in instrument state
Annunciation	The **Single/Continuous** icon in the Meas Bar changes depending on the setting: – A line with an arrow is Single – A loop with an arrow is Continuous

More Information

With **Avg/Hold Num** (in the **Meas Setup** menu) set to **Off** or set to **On** with a value of 1, a sweep is taken after the trigger condition is met; and the instrument continues to take new sweeps after the current sweep has completed and the trigger condition is again met. However, with **Avg/Hold Num** set to On with a value >1, multiple sweeps (data acquisitions) are taken for the measurement. The trigger condition must be met prior to each sweep. The sweep is not stopped when the average count k equals the number N set for Avg/Hold Num is reached, but the number k stops incrementing. A measurement average usually applies to all traces, marker results, and numeric results, but sometimes only applies to the numeric results.

If the instrument is in Single measurement, pressing the **Cont/Single** toggle control does not change k and does not cause the sweep to be reset; the only action is to put the instrument into Continuous measurement operation.

If it is already in Continuous sweep:

– the `:INIT:CONT 1` command has no effect

– the `:INIT:CONT 0` command will place the instrument in Single Sweep but will have no effect on the current sequence until k = N, at which point the current sequence will stop and the instrument will go to the idle state.

See "Restart" on page 1738 control description for details on the `:INIT:IMM` (Restart) function.

If you are already in Single sweep, the `:INIT:CONT OFF` command has no effect.

If you are already in Single Sweep, then pressing the **Cont/Single** toggle control in the middle of a sweep does not restart the sweep or sequence. Similarly, pressing the **Cont/Single** toggle control does not restart the sweep or sequence if the sweep is not in the idle state (for example, if you are taking a very slow sweep, or the instrument is waiting for a trigger). Even though pressing the **Cont/Single** toggle control in the middle of a sweep does *not* restart the sweep, sending `:INIT:IMM` *does* reset it.

Restart

The **Restart** function restarts the current sweep, or measurement, or set of averaged/held sweeps or measurements. In measurements that support pausing, if you are Paused, pressing **Restart** performs a **Resume**.

The Restart function is accessed in several ways:

– Pressing the **Restart** key

– Sending the remote command `:INIT:IMM`

– Sending the remote command `:INIT:REST`

See "More Information" on page 920

Remote Command	`:INITiate[:IMMediate]` `:INITiate:RESTart`
Example	`:INIT:IMM` `:INIT:REST`
Notes	`:INIT:REST` and `:INIT:IMM` and the front-panel **Restart** key perform exactly the same function
Couplings	Resets average/hold count k For the first sweep, overwrites all active (update=on) traces with new current data For application modes, resets other parameters as required by the measurement
Status Bits/OPC dependencies	This is an Overlapped command The `:STATus:OPERation` register bits 0 through 8 are cleared The `:STATus:QUEStionable` register bit 9 (INTegrity sum) is cleared The `SWEEPING` bit is set The `MEASURING` bit is set
Backwards Compatibility Notes	For Spectrum Analysis mode in ESA and PSA, the **Restart** hardkey and the `:INIT:REST` command restart trace averages (displayed average count reset to 1) for a trace in **Clear Write**, but did not restart **Max Hold** and **Min Hold** In the X-Series, the **Restart** hardkey and the `:INIT:REST` command restart not only **Trace Average**, but **Max Hold** and **Min Hold** traces as well For wireless comms modes in ESA and PSA, the **Restart** hardkey and the `:INIT:REST` command restarted every measurement, including all traces and numeric results. There is no change to this operation

More Information

The **Restart** function first aborts the current sweep or measurement as quickly as possible. It then resets the sweep and trigger systems, sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is in the process of aligning when a Restart is executed, the alignment finishes before the restart function is performed.

Even when set for Single operation, multiple sweeps may be taken when **Restart** is pressed (for example, when averaging/holding is on). Thus when we say that Restart "restarts a measurement," depending on the current settings, we may mean:

- It restarts the current sweep
- It restarts the current measurement
- It restarts the current set of sweeps if any trace is in Trace Average, Max Hold or Min Hold

– It restarts the current set of measurements if Averaging, or Max Hold, or Min Hold is on for the measurement

With Average/Hold Number (in Meas Setup menu) set to 1, or Averaging off, or no trace in Trace Average or Hold, a single sweep is equivalent to a single measurement. A single sweep is taken after the trigger condition is met; and the instrument stops sweeping once that sweep has completed. However, with Average/Hold Number >1 and at least one trace set to Trace Average, Max Hold, or Min Hold (SA Measurement) or Averaging on (most other measurements), multiple sweeps/data acquisitions are taken for a single measurement. The trigger condition must be met prior to each sweep. The sweep is stopped when the average count k equals the number N set for Average/Hold Number. A measurement average usually applies to all traces, marker results, and numeric results, but sometimes only applies to the numeric results.

Once the full set of sweeps has been taken, the instrument will go to the idle state. To take one more sweep without resetting the average count, increment the average count by 1, by pressing the step up key while Average/Hold Number is the active function, or by sending the remote command `:CALC:AVER:TCON UP`.

Pause/Resume

Pauses a measurement after the current data acquisition is complete.

When a measurement is paused:

– The label on this control changes to **Resume**. Pressing **Resume** un-pauses the measurement.

– Pressing **Restart** also performs a **Resume**.

Remote Command	`:INITiate:PAUSe` `:INITiate:RESume`
Example	`:INIT:PAUS` `:INIT:RES`
Dependencies	Not displayed in Modes that do not support pausing
Couplings	When Averaging is On, if the measurement is paused no more updates will occur until either a Resume or Restart occurs If the measurement is resumed, the averaging continues to use the traces from before the Pause occurred and continues to use the traces from the point where the Resume occurred. This still provides real-time traces, but they will no longer be gap free In a view with a Waterfall window, when the measurement is paused, the Waterfall stops updating. When Resume is selected, the Waterfall will retain the existing traces and continue updating using traces from the point at which Resume was selected. The time stamp of the individual Waterfall traces will show the time from the beginning of the measurement the trace relates to, showing there was a gap in the Waterfall capture In Density view, when the measurement is paused, the Density Display stops updating. When the

	measurement is resumed, if Persistence is ON, the persistence fading will continue from the point when the measurement was paused If a Restart occurs, the average counter is reset and all results are discarded. The measurement begins again, using traces after the Restart occurred

Abort (Remote Command Only)

This command stops the current measurement. It aborts the current measurement as quickly as possible, resets the sweep and trigger systems, and puts the measurement into an "idle" state. If the instrument is in the process of aligning when `:ABORt` is sent, the alignment finishes before the abort function is performed, so `:ABORt` does *not* abort an alignment.

If the instrument is set for Continuous measurement, it sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is set for Single measurement, it remains in the "idle" state until an `:INIT:IMM` command is received.

Remote Command	`:ABORt`
Example	`:ABOR`
Notes	If `:INIT:CONT` is `ON`, then a new continuous measurement will start immediately, with sweep (data acquisition) occurring once the trigger condition has been met If `:INIT:CONT` is `OFF`, then `:INIT:IMM` is used to start a single measurement, with sweep (data acquisition) occurring once the trigger condition has been met
Dependencies	For continuous measurement, `:ABORt` is equivalent to the **Restart** key Not all measurements support the abort command
Status Bits/OPC dependencies	The `:STATus:OPERation` register bits 0 through 8 are cleared The `:STATus:QUEStionable` register bit 9 (INTegrity sum) is cleared Since all the bits that feed into OPC are cleared by `:ABORt`, the `:ABORt` will cause the *OPC query to return true

3.7.9.2 Sweep Config

This tab accesses controls that enable you to configure the Sweep and Control functions of the instrument, such as Sweep Rules.

Sweep Time Rules

Switches the instrument between `NORMal` and `ACCuracy` sweep states.

Setting **Auto Sweep Time** to `ACCuracy` results in slower sweep times, usually about three times as long, but yields better amplitude accuracy for CW signals. The instrument amplitude accuracy specifications only apply when **Auto Sweep Time** is set to `ACCuracy`.

Additional amplitude errors that occur when **Auto Sweep Time** is set to `NORMal` are usually well under 0.1 dB, though this is not guaranteed. Because of the faster sweep times and still low errors, `NORMal` is the preferred setting of **Auto Sweep Time**. **Auto Sweep Time** is set to `NORMal` on a **Preset** or **Auto Couple**. This means that in the Preset or Auto Coupled state, instrument amplitude accuracy specifications do not apply.

Remote Command	`[:SENSe]:CHPower:SWEep:TIME:AUTO:RULes NORMal | ACCuracy` `[:SENSe]:CHPower:SWEep:TIME:AUTO:RULes?`
Example	`:CHP:SWE:TIME:AUTO:RUL NORM` `:CHP:SWE:TIME:AUTO:RUL?`
Dependencies	This control does not appear in Spectrum Analyzer Mode in VXT models M9420A/21A This control is not available in E7760
Couplings	Set to `NORMal` when **Auto Couple** is pressed or sent remotely
Preset	`NORMal`
State Saved	Saved in instrument state
Range	`NORMal|ACCuracy`

Points

Sets the number of points taken per sweep, and displayed in the traces. The current value of points is displayed parenthetically, next to the sweep time in the lower-right corner of the display. Using more points provides greater resolution. Using fewer points compacts the data and decreases the time required to access a trace over the remote interface.

Increasing the number of points does not increase the sweep time. However, it can slightly impact the trace processing time and therefore the overall measurement speed. Decreasing the number of points does not decrease the sweep time, but it may speed up the measurement, depending on the other sweep settings (for example, in FFT sweeps). Fewer points will always speed up the I/O.

Due to minimum sweep rate limitations of the hardware, the minimum sweep time available to the user will increase above its normal value of 1 ms as the number of sweep points increases above 15001.

Changing the number of sweep points has several effects on the instrument.Since markers are read at the point location, the marker reading may change.The sweep time resolution will change. Trace data for all the traces will be cleared and, if **Sweep** is in **Cont**, a new trace taken. If any trace is in average or hold, the averaging starts over.

Due to sweep time quantization issues, the knob and up/down keys cannot be used to adjust the number of points.

When in a split screen display each window may have its own value for points.

When sweep points is changed, an informational message is displayed, "Sweep points changed, all traces cleared."

Remote Command	`[:SENSe]:CHPower:SWEep:POINts <integer>` `[:SENSe]:CHPower:SWEep:POINts?`
Example	`:CHP:SWE:POIN 501` `:CHP:SWE:POIN?`
Dependencies	This function is not available when Signal ID is set to On in External Mixing Neither the knob nor the step keys can be used to change this value. If it is tried, a warning is given Not displayed in modes that do not support Swept
Couplings	Whenever the number of sweep points change: All trace data is erased Any traces with Update Off will also go to Display Off (like going from View to Blank in the older instruments) Sweep time is re-quantized Any limit lines that are on will be updated If averaging/hold is on, averaging/hold starts over The resolution of setting the sweep time depends on the number of points selected
Preset	1001
State Saved	Saved in instrument state
Min	101
Max	100,001
Annotation	On second line of annotations, in lower right corner in parenthesis behind the sweep annotation

IF Dithering

This control lets you turn **IF Dithering** on and off. IF Dithering is a technique used in unpreselected instruments (such as Keysight's modular instruments) to enhance the rejection of images and internally-generated spurious signals.

Remote Command	`[:SENSe]:SWEep:IF:DITHer OFF | ON | 0 | 1` `[:SENSe]:SWEep:IF:DITHer?`
Dependencies	This control only appears in Spectrum Analyzer Mode in VXT
Preset	`OFF`
State Saved	Saved in instrument state

Image Protection

This control lets you turn IF Protection on and off. IF Protection is a technique used in unpreselected instruments (such as Keysight's modular instruments) to detect and suppress images and spurs that may be present in non-preselected hardware.

IF Protection takes two sweeps and by correlating the data between them, provides a single, correct power-versus-frequency trace.

Remote Command	`[:SENSe]:SWEep:IMAGeprot OFF | ON | 0 | 1` `[:SENSe]:SWEep:IMAGeprot?`
Dependencies	This control only appears in Spectrum Analyzer Mode in VXT
Preset	ON
State Saved	Saved in instrument state

3.7.10 Trace

The **Trace** menu lets you control the acquisition, display, storage, detection and manipulation of trace data for the available traces. The Trace Control tab of this menu contains radio-button selections for the trace type (**Clear/Write, Trace Average, Max Hold, Min Hold**) and **View/Blank** setting for the selected trace.

3.7.10.1 Select Trace

Specifies the *selected trace*, which is the trace that will be affected when you change trace settings.

The **Select Trace** control appears above the menu panel, indicating that it applies to *all* controls in the menu panel. **Select Trace** is blanked if you select a tab whose controls do *not* depend on the selected trace (for example, **Trace Function**).

Notes	The selected trace is remembered even when not in the **Trace** menu
Preset	Trace 1
State Saved	Yes

3.7.10.2 Trace Control

The controls on the Trace Control tab allow you to set the type of the Trace and its update mode.

There are four trace Types: **Clear/Write, Trace Average, Max Hold** and **Min Hold.** Each type handles data in a different way.

Each trace also has two values that determine whether it is being written or not and whether it is being displayed or not. These values, **Update** and **Display,** are described more fully in the **View/Blank** control description, but suffice it to say that when **Update** is On a trace is updating and when **Update** is Off it is not; and when **Display** is On it is visible and when **Display** is Off it is not. These terms are used throughout the descriptions below.

When Trace Annotation (see Display menu) is On, each non-blanked trace is labeled on the trace with the detector used to take it.

For slower sweeps a visual indicator exists on the trace where the new data is being written, a green “caret” or ^ symbol, which moves across the bottom of the graticule showing the current trace point.

Trace Type

Allows you to select the type of trace you want to you use for the current measurement. There are four trace Types: Clear/Write, Trace Average, Max Hold and Min Hold.

Besides the **Trace Type**, the **View/Blank** state must be set to **Active** (**Update** On, **Display** On) for a trace to be updating and visible. Selecting any **Trace Type** automatically makes the trace **Active**. See also the **View/Blank** menu description.

Remote Command	`:TRACe[1]|2|3:CHPower:TYPE WRITe	AVERage	MAXHold	MINHold` `:TRACe[1]|2|3:CHPower:TYPE?`
Example	`:TRAC:CHP:TYPE WRIT` `:TRAC:CHP:TYPE?`
Notes	Available options are: Clear Write — `WRITe` — Each trace update replaces the old data in the trace with new data Average — `AVERage` — The instrument maintains and displays an average trace, which represents the cumulative average on a point-by-point basis of the new trace data and previous averaged trace data Maximum Hold — `MAXHold` — The instrument maintains and displays a max hold trace, which represents the maximum data value on a point-by-point basis of the new trace data and previous trace data Minimum Hold — `MINHold` — The instrument maintains and displays a min hold trace, which represents the minimum data value on a point-point basis of the new trace data and previous trace data
Couplings	When Detector setting is “Auto” (`[:SENSe]:CHPower:DETector:AUTO?`), Detector (`[:SENSe]:CHPower:DETector[:FUNCtion]?`) switches aligning with the switch of this parameter: “`NORMal`” with `WRITe` (Clear Write), “`AVERage`” with `AVERage`, “`POSitive` (peak)” with `MAXHold`, and “`NEGative` (peak)” with `MINHold`
Preset	`AVERage`
State Saved	Saved in instrument state
Range	ClearWrite|Average|MaxHold|MinHold

Clear and Write | Restart Averaging | Restart Max/Min Hold

Starts the trace writing as though the trace type had just been selected. Pressing this control has exactly the same effect as selecting the current trace type again – the control is provided because it may not be obvious that re-selecting the current selection from a radio button menu will take an action.

This button displays different labels depending on the **Trace Type**:

– Clear/Write: Clear and Write

– Trace Average: Restart Averaging

– Max Hold: Restart Max Hold

– Min Hold: Restart Min Hold

View/Blank

Lets you set the state of the two trace values, **Update** and **Display**. The four choices available are:

Active	Update and Display both ON
View	Update OFF, Display ON
Blank	Update OFF, Display OFF
Background	Update ON, Display OFF This allows a trace to be blanked and continue to update “in the background”, which was not possible in the past

See the tables below for details onthe SCPI remote commands to control these two variables.

Preset	Trace On
State Saved	Saved in instrument state
Range	Trace On|Blank

Trace Update State On/Off

Toggles a trace Update state between On and Off. The OFF selection makes the trace inactive. This does not affect whether the trace is visible or not. To change the trace visibility, see "Trace Display State On/Off" on page 928

Remote Command	`:TRACe[1]|2|3:CHPower:UPDate[:STATe] ON | OFF | 0 | 1` `:TRACe[1]|2|3:CHPower:UPDate[:STATe]?`
Example	`:TRAC:CHP:UPD ON` `:TRAC:CHP:UPD?`
Couplings	Whenever you set **Update** to ON for any trace, the **Display** is set to ON for that trace
Preset	1|0|0 (ON for Trace 1; OFF for 2 &3)
State Saved	Saved in instrument state

Trace Display State On/Off

Toggles a trace Display state between On and Off. The OFF selection makes the trace not visible. This does not affect whether the trace is updating or not.

Even when not visible, traces may be queried, and markers may be placed on them.

Remote Command	:TRACe[1]|2|3:CHPower:DISPlay[:STATe] ON | OFF | 0 | 1 :TRACe[1]|2|3:CHPower:DISPlay[:STATe]?
Example	:TRAC:CHP:DISP ON :TRAC:CHP:DISP?
Couplings	Whenever you set **Update** to ON for any trace, the **Display** is set to ON for that trace
Preset	1|0|0 (ON for Trace 1; OFF for 2 &3)
State Saved	Saved in instrument state

3.7.10.3 Detector

The Detector tab lets you choose and configure detectors for the selected trace.

Detector

Selects a detector to be used by the instrument for the current measurement. The following choices are available:

- Auto- the detector selected depends on marker functions, trace functions, average type, and the trace averaging function
- Normal-the detector determines the peak of the CW-like signals, and it yields alternating maximums and minimums of noise-like signals. This is also referred to as Rosenfell detection
- Average-the detector determines the average of the signal within the sweep points, using RMS averaging
- Peak (Positive)-the detector determines the maximum of the signal within the sweep points
- Sample-the detector indicates the instantaneous level of the signal at the center of the sweep points represented by each display point
- Negative Peak-the detector determines the minimum of the signal within the sweep points

Because they may not find a spectral component's true peak, neither average nor sample detectors measure amplitudes of CW signals as accurately as peak or normal, but they do measure noise without the biases of peak detection.

Remote	[:SENSe]:CHPower:DETector[:FUNCtion] NORMal | AVERage | POSitive |

Command	SAMPle | NEGative | RMS [:SENSe]:CHPower:DETector[:FUNCtion]?
Example	:CHP:DET NORM :CHP:DET? :CHP:DET RMS Sets the detector to Average. Average uses RMS averaging, so this is equivalent to selecting an RMS detector
Notes	The query returns a name that corresponds to the detector type as shown below The RMS selection sets the detector type to AVERage with RMS averaging. Therefore if RMS has been selected, the query will return AVER

String Returned	Definition
NORM	Normal
AVER	Average (RMS)
POS	Peak
SAMP	Sample
NEG	Negative Peak

Couplings	When Detector setting is “Auto” ([:SENSe]:CHPower:DETector:AUTO?), Detector ([:SENSe]:CHPower:DETector[:FUNCtion]?) switches aligning with the switch of this parameter: “NORMal” with Clear Write, “AVERage” with AVERage, “POSitive (peak)” with MAXHold, and “NEGative (peak)” with MINHold
Preset	AVERage
State Saved	Saved in instrument state
Range	NORMal|AVERage|POSitive|SAMPle|NEGative|RMS

Detector Select Auto/Man

Sets the Detector mode to Auto or Manual. In Auto, the proper detector is chosen based on rules that take into account the measurement settings and other instrument settings.

When any detector is selected by the user, this toggles automatically set to Man (manual).

Remote Command	[:SENSe]:CHPower:DETector:AUTO ON | OFF | 1 | 0 [:SENSe]:CHPower:DETector:AUTO?
Example	:CHP:DET:AUTO ON :CHP:DET:AUTO?
Couplings	When Detector setting is “Auto” ([:SENSe]:CHPower:DETector:AUTO?), Detector ([:SENSe]:CHPower:DETector[:FUNCtion]?) switches aligning with the switch of this

	parameter: "NORMal" with Clear Write, "AVERage" with AVERage, "POSitive (peak)" with MAXHold, and "NEGative (peak)" with MINHold
Preset	ON
State Saved	Yes

3.7.10.4 Math

The Math tab lets you turn on and configure trace math functions.

Math Function

Trace math functions perform mathematical operations between traces and, in some cases, user-specified offsets. When in a trace math function, the indicated function is performed during the sweep with the math function used in place of a detector.

The trace operands for the math function are set using the **Trace Operands** control.

See also "More Information" on page 931 and "How trace math is processed" on page 934.

Remote Command	`:CALCulate:CHPower:MATH TRACe1 | TRACe2 | TRACe3, PDIFference | PSUM | LOFFset | LDIFference | OFF, TRACe1 | TRACe2 | TRACe3,TRACe1 | TRACe2 | TRACe3, <real>,<real>` `:CALCulate:CHPower:MATH? TRACe1 | TRACe2 | TRACe3`

Example	`:CALC:CHP:MATH TRAC1,PDIF,TRAC2,TRAC3,0,0`
	Sets Trace 1 to Power Diff trace math function, and sets the First Trace operand (for Trace 1) to Trace 2 and the Second Trace operand (for Trace 1) to Trace 3
	`:CALC:CHP:MATH TRAC1,PSUM,TRAC2,TRAC3,0,0`
	Sets Trace 1 to Power Sum trace math function and sets the First Trace operand (for Trace 1) to Trace 2 and the Second Trace operand (for Trace 1) to Trace 3
	`:CALC:CHP:MATH TRAC1,LOFF,TRAC3,TRAC2,-6.00,0`
	Sets Trace 1 to Log Offset trace math function, sets the First Trace operand (for Trace 1) to Trace 3, leaves the Second Trace operand (for Trace 1) unchanged (it is irrelevant for this function) and sets the Log Offset (for Trace 1) to -6 dB
	`:CALC:CHP:MATH TRAC1,LDIF,TRAC2,TRAC3,0,-6.00`
	Sets Trace 1 to Log Diff trace math function, sets the First Trace operand (for Trace 1) to Trace 2, sets the Second Trace operand (for Trace 1) to Trace 3, and sets the Log Difference reference for Trace 1 to -6 dBm
	`:CALC:CHP:MATH TRAC1,OFF,TRAC2,TRAC3,0,0`
	Turns off trace math for trace 1

Notes	**Math Function** has 6 main sets of parameters:

	Set	Defines the "result trace"	TRACe1|TRACe2|TRACe3
	Set 2	Defines the "function"	PDIFference|PSUM|LOFFset|LDIFference|OFF
	Set 3	A "trace operand" (1)	TRACe1|TRACe2|TRACe3
	Set 4	A "trace operand" (2)	TRACe1|TRACe2|TRACe3
	Set 5	Defines the "Log Offset" (in dB)	
	Set 6	Defines the "Log Difference Reference" (in dBm)	

Note that the Trace Math mode is an enumeration; that is, when a math function is set for a trace, it turns off any math function that is on for that trace and sets the new math function.

The parameters sent in the command are reflected in the values in the control menu. There is no default for any parameter; all 6 parameters must be sent to satisfy the parser. Failure to specify a parameter results in a missing parameter message

Remote command examples are included in each section below

Dependencies	None of the trace operands can be the destination trace. If any of the three trace math commands is sent with a destination trace number matching one of the operands, a warning is generated and the function does not turn on
Couplings	Whenever a math function other than OFF is selected for a trace, that trace is set to Display=ON and Update=ON
Preset	OFF,TRACe2,TRACe3,0,0 | OFF,TRACe3,TRACe1,0,0 | OFF,TRACe1,TRACe2,0,0
State Saved	The trace math function for each trace is saved in instrument state
Range	Power Difference|Power Sum|Log Offset|Log Difference|Off
Annunciation	The function is annotated on the trace if Trace Annotation is ON
Status Bits/OPC dependencies	*OPC can be used to detect the completion of a sweep, which will also correspond to the completion of the math operation, since all math takes place during the sweep

More Information

IMPORTANT

To generate a trace math result, *you must take a sweep*. The trace math engine, described below, operates in concert with the sweep engine in the instrument. Until a sweep has been taken, even if the constituent traces are not in Update mode, no result is generated.

Note that certain events can affect the trace in ways that affects all points at once. This can happen in any number of ways, including:

- A trace clear taking place
- A trace being loaded from the file system
- Trace data being sent in from the remote interface
- A copy or exchange of trace data

You should try to avoid these occurrences during a sweep, as they will tend to invalidate the math result being accumulated.

The Trace Math functions are:

Power Diff (Op1 - Op2)

Calculates a power difference between the `First Trace` operand and the `Second Trace` operand and puts the result in the destination trace.

During the sweep, the following formula is executed for each point in the trace operands, and the corresponding point is generated for the destination trace:

```
DestinationTrace = 10 log(10(1/10)(FirstTrace) – 10(1/10)(SecondTrace))
```

The values of the trace points are assumed to be in a decibel scale, as they are internally stored.

If a point in `FirstTrace` is equal to `maxtracevalue`, the resultant point is also `maxtracevalue`.

Otherwise, if the result of the subtraction is less than or equal to 0, the resultant point is `mintracevalue`.

Power Sum (Op1 + Op2)

Calculates a power sum between the `First Trace` operand and the `Second Trace` operand and puts the result in the destination trace.

During the sweep, the following formula is executed for each point in the trace operands, and the corresponding point is generated for the destination trace.

```
DestinationTrace = 10 log(10(1/10)(FirstTrace) + 10(1/10)(SecondTrace))
```

The values of the trace points are assumed to be in a decibel scale, as they are internally stored.

If a point in either trace operand is equal to `maxtracevalue`, the resultant point is also `maxtracevalue`.

Log Offset (Op1 + Offset)

Calculates a log offset from the `First Trace` operand and puts the result in the destination trace. This is like the B-DL function in some older instruments. The offset is entered on the `Offset` control, which only appears when this math function is in force for the selected trace. Each destination trace has its own offset.

During the sweep, the following formula is executed for each point in the trace operand, and the corresponding point is generated for the destination trace.

```
DestinationTrace = FirstTrace + Offset
```

The values of the trace points are assumed to be in dBm (as they are internally stored) and the offset is in dB.

If a point in the trace operand is equal to `maxtracevalue`, the resultant point is also `maxtracevalue`.

If a point in the trace operand is equal to `mintracevalue`, the resultant point is also `mintracevalue`.

Example: If offset is 25 dB, then our destination trace will be higher than the operand trace by 25 dB.

Note that the `Second Trace` operand is not used for this function.

Log Diff (Op1 - Op2 + Ref)

Offsets the difference between the `First Trace` operand and the `Second Trace` operand by a reference and puts the result in the destination trace. This is like the A-B+DL function in some older instruments. The Reference is entered on the **Reference** control, which only appears when this math function is in force for the selected trace. Each destination trace has its own reference.

Offsets the difference between the `First Trace` operand and the `Second Trace` operand by a reference and puts the result in the destination trace. This is like the A-B+DL function in some older instruments. The Reference is entered on the **Reference** control, which only appears when this math function is in force for the selected trace. Each destination trace has its own reference.

During the sweep, the following formula is executed for each point in the trace operands, and the corresponding point is generated for the destination trace.

```
DestinationTrace = (FirstTrace - SecondTrace) + Reference
```

The values of the operand trace points are assumed to be in decibel units (as they are internally stored) and the reference is in dBm so the result is in dBm.

Example: If the first operand trace 1 is at 5 dBm, the second operand trace 2 is at –5 dBm, and the reference is –25 dBm, then the destination trace will be –15 dBm.

Example: If the first operand trace1 is at 60 dBuV, the second operand trace 2 is at 50 dBuV, and the reference is 35 dBuV, then the destination trace will be 45 dBuV.

If a point in `FirstTrace` is equal to `maxtracevalue`, the resultant point is also `maxtracevalue`.

If a point in `FirstTrace` is equal to `mintracevalue`, the resultant point is also `mintracevalue`.

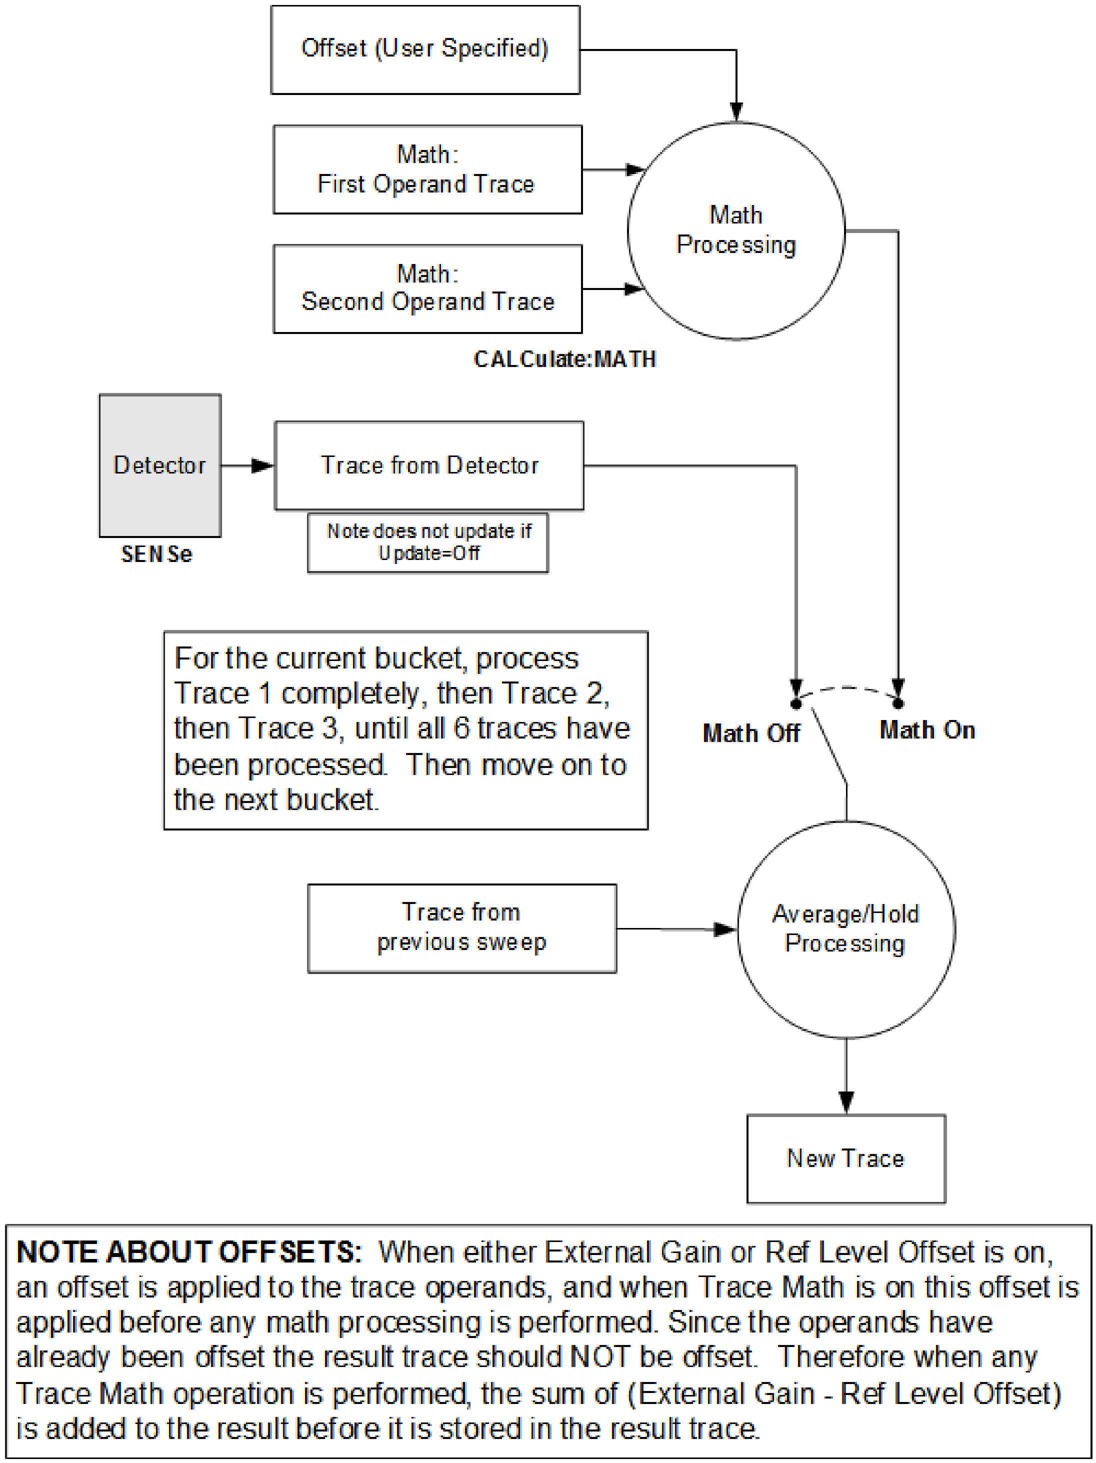
If neither of the above is true for a given point, then:

- If that point in `SecondTrace` is equal to `maxtracevalue`, the resultant point is `mintracevalue`.
- If that point in `SecondTrace` is equal to `mintracevalue`, the resultant point is `maxtracevalue`.

How trace math is processed

Whenever a trace math function is turned on, or the parameters and/or operands of an existing trace math function are changed, the destination trace is cleared. After the trace is cleared, all x-axis values in the trace, and the domain of the trace, are set to match the X-Axis settings of the first trace operand. When this is complete, a new sweep is initiated.

The process of acquiring data, processing it using the math and Average/Hold functions, and presenting it as trace data, consists of several functional blocks, as shown below:



For each active trace, the current trace point is processed for `Trace 1`, then `Trace 2`, then `Trace 3`, etc. Trace data is taken from either the detector for that trace, or from the mathematical result of up to two other traces and an offset, depending on whether trace math is on or not. The resultant data is then fed to the Average/Hold processing block, where (if the trace type is **Average**, **Max Hold**, or **Min Hold**) it is processed with previous trace data. The new trace data resulting from this process is then available for display, storage or remote output.

When the processing is complete for `Trace 1`, `Trace 2` is processed, and so on until all six traces have been processed. This allows a downstream trace to use as one of its math components a fully processed upstream trace. In other words, if math is `ON` for `Trace 4`, and its operand traces are `Trace 2` and `Trace 3`, then all detector, math, average and hold processing for Traces 2 and 3 is completed before the math is performed for `Trace 4`. When the current trace point is completed for all traces, the instrument moves on to the next trace point.

This allows very flexible and powerful math functions to be configured. For example, `Trace 1` can be an average trace, which can be fed with an offset to `Trace 2`, which can also be in **Max Hold**, allowing you to obtain the **Max Hold** of an Average trace.

Note that none of this processing is performed on inactive traces.

Note also that for any active trace with math `ON`, the Operand traces should have *lower* numbers than the trace (for example, using `Trace 4` as an operand for `Trace 1` will cause the data coming from `Trace 4` to be delayed by one sweep).

Operand 1/2

Selects the first and second trace operands, respectively, to be used for the trace math functions for the destination trace.

The operands are common to all math functions for a given trace. The most recently sent `:CALCulate:MATH` command for a given trace sets the operands for that trace, and will be reflected on the trace operand controls for that trace.

Example	The following examples are for the Swept SA measurement.
	1) Set Trace 3 to Power Diff trace math function. Set the First Trace operand (for Trace 3) to Trace 1 and the Second Trace operand (for Trace 3) to Trace 2
	`:CALC:MATH TRACE3,PDIF,TRACE1,TRACE2,0,0`
	
	2) Set Trace 3 to Log Offset trace math function. Set the First Trace operand (for Trace 3) to Trace 1, leave the Second Trace operand (for Trace 3) unchanged (it is irrelevant for this function) and set the Log Offset (for Trace 3) to -6 dB
	`:CALC:MATH TRACE3,LOFF,TRACE1,TRACE2,-6.00,0`

Notes	See the Math Function section for how to specify Operand 1 and Operand 2 using the `:CALCulate:MATH` SCPI command
Dependencies	The destination trace cannot be an operand. The destination trace number is gray on the dropdown
Preset	**Operand 1**: Trace number minus 2 (wraps at 1) For example, for Trace 1, Operand 1 presets to Trace 5; for Trace 6, it presets to Trace 4 **Operand 2**: Trace number minus 1 (wraps at 1) For example, for Trace 1, Operand 2 presets to Trace 6; for Trace 6, it presets to Trace 5
State Saved	Operand 1 and Operand 2 for each trace are stored in instrument state

Offset

The Offset value is used by the Log Offset math function.

Example	The following example is for the Swept SA measurement. `:CALC:MATH TRACE3,LOFF,TRACE1,TRACE2,-6.00,0` Sets Trace 3 to Log Offset trace math function, sets the First Trace operand (for Trace 3) to Trace 1, leaves the Second Trace operand (for Trace 3) unchanged (it is irrelevant for this function) and sets the Log Offset (for Trace 3) to -6 dB
State Saved	The Log Offset value for each trace is saved in Instrument State
Min	–100 dB
Max	100 dB

Reference

The Reference value is used by the Log Diff math function.

Example	The following example is for the Swept SA measurement. `:CALC:MATH TRACE3,LDIF,TRACE1,TRACE2,0,-6.00` Sets Trace 3 to Log Diff trace math function, sets the First Trace operand (for Trace 3) to Trace 1, sets the Second Trace operand (for Trace 3) to Trace 2, and sets the Log Difference reference (for Trace 3) to -6 dBm
State Saved	The Log Difference reference value for each trace is saved in instrument state
Min/Max	Same as reference level

3.7.10.5 Trace Function

The Trace Function includes controls to:

– Copy and Exchange traces

– Preset or Clear all traces

From Trace

Selects the trace to be copied to or exchanged with the **To Trace** when a "Copy" on page 1553 or "Exchange" on page 1553 is performed

Preset	1

To Trace

Selects the trace to be copied from or exchanged with the **From Trace** when a "Copy" on page 1553 or "Exchange" on page 1553 is performed

Preset	2

Copy

This button executes a Trace Copy based on the From Trace and To Trace parameters. The Copy is done from the From Trace to the To Trace. The action is performed once.

The X-Axis settings and domain of a trace go with it when it is copied.

Remote Command	For Swept SA Measurement (in SA Mode):
	`:TRACe:COPY TRACE1 | TRACE2 | TRACE3 | TRACE4 | TRACE5 | TRACE6, TRACE1 | TRACE2 | TRACE3 | TRACE4 | TRACE5 | TRACE6`
	
	For all other measurements:
	`:TRACe:<meas>:COPY TRACe1 | TRACe2 | TRACe3, TRACe1 | TRACe2 | TRACe3`
	where:
	<meas> is the identifier for the current measurement.
	Note that the format of the TRACe<n> parameter differs from that for the Swept SA Measurement.

Example	`:TRAC:COPY TRACE1,TRACE3` Copies Trace 1 to Trace 3 and puts Trace 3 in Update=Off, Display=On
Notes	The `:TRACe:COPY` command is of the form: `:TRACe:COPY <source_trace>,<dest_trace>`
Dependencies	When Signal ID is on, this key is grayed out
Couplings	The destination trace is put in View (Update=Off, Display=On) after the copy

Preset	For Swept SA Measurement (in SA Mode):
	`TRACE1, TRACE2`
	For all other measurements:
	`TRACe1, TRACe2`

Exchange

This button executes a Trace Exchange based on the From Trace and To Trace parameters. The From Trace and To Trace are exchanged with each other. The action is performed once.

The X-Axis settings and domain of a trace go with it when it is exchanged with another trace.

Remote Command	For Swept SA Measurement (in SA Mode):
	`:TRACe:EXCHange TRACE1 | TRACE2 | TRACE3 | TRACE4 | TRACE5 | TRACE6, TRACE1 | TRACE2 | TRACE3 | TRACE4 | TRACE5 | TRACE6`
	
	For all other measurements:
	`:TRACe:<meas>:EXCHange TRACe1 | TRACe2 | TRACe3, TRACe1 | TRACe2 | TRACe3`
	where:
	<meas> is the identifier for the current measurement.
	Note that the format of the TRACe<n> parameter differs from that for the Swept SA Measurement.

Example	`:TRAC:EXCH TRACE1,TRACE2` Exchanges Trace 1 and Trace 2 and puts both traces in Update=Off, Display=On
Notes	The `TRACe[:<meas>]:EXCHange` command is of the form: `:TRACe[:<meas>]:EXCHange <trace_1>,<trace_2>`
Couplings	Both traces are put in View (Update=Off, Display=On) after the exchange
Backwards Compatibility Notes	The copy and exchange operations menu in ESA and PSA is replaced with the more general purpose Trace Function menu. The remote commands are unaffected, as they were already general

Preset All Traces

Turns on Trace 1 and blanks all other traces. Useful when you have many traces on and you want to go back to having only Trace 1 on the display. Does not affect the trace type, detector or any other aspect of the trace system.

Remote Command	`:TRACe[:<meas>]:PRESet:ALL`
Example	`:TRAC:PRES:ALL`
Dependencies	When Signal ID is on, this key is grayed out

Clear All Traces

Clears all traces. Does not affect the state of any function or variable in the instrument. Loads `mintracevalue` into all of the points all traces, except traces in **Min Hold** in which case it loads `maxtracevalue`. Does so even if Update=Off.

Remote Command	`:TRACe[:<meas>]:CLEar:ALL`
Example	`:TRAC:CLE:ALL` Clears all traces
Dependencies	When Signal ID is on, this key is grayed out

3.7.10.6 Advanced

The **Advanced** tab contains controls for setting advanced functions of the instrument.

Measure Trace

Specifies which trace's scalar results are displayed in the Metrics window, and retrieved by sending a `:READ` or `:FETCh` command:

- Trace 1
- Trace 2
- Trace 3

Remote Command	`:CALCulate:CHPower:MTRace TRACe1 | TRACe2 | TRACe3` `:CALCulate:CHPower:MTRace?`
Example	`:CALC:CHP:MTR TRAC1` `:CALC:CHP:MTR?`
Dependencies	Trace 2 and Trace 3 are grayed out when no trace data is available
Preset	`TRACe1`
State Saved	No
Range	Trace 1 | Trace 2 | Trace 3

3.8 Occupied BW Measurement

The Occupied BW measurement computes and displays the bandwidth occupied by a given percentage of the total mean power of a signal.

Occupied BW Measurement Commands

The following commands and queries can be used to retrieve the measurement results:

:CONFigure:OBWidth

:CONFigure:OBWidth:NDEFault

:INITiate:OBWidth

:FETCh:OBWidth[n]?

:MEASure:OBWidth[n]?

:READ:OBWidth[n]?

Backwards Compatibility Commands

Command	Return Value
:FETCh:OBWidth:OBWidth? :MEASure:OBWidth:OBWidth? :READ:OBWidth:OBWidth?	Returns the Occupied Bandwidth (Hz)
:FETCh:OBWidth:FERRor? :MEASure:OBWidth:FERRor? :READ:OBWidth:FERRor?	Returns the Transmit Frequency Error (Hz)
:FETCh:OBWidth:XDB? :MEASure:OBWidth:XDB? :READ:OBWidth:XDB?	Returns the xdB Bandwidth (Hz)

Remote Command Results for Occupied Bandwidth Measurement

The following table describes the results returned by the :FETCh:OBWidth[n]?, :MEASure:OBWidth[n]?, and :READ:OBWidth[n]? queries listed above, according to the index value n.

n	Results Returned
1, *or* not specified	Returns 7 scalar results, in the following order: 1. Occupied Bandwidth – Hz 2. Total Power or OBW Power – dBm (Power reference type can be changed with the Power Ref control in Meas Setup

n	Results Returned
	3. Span - Hz 4. Spectrum Trace Points - points 5. Res BW – Hz 6. Transmit Frequency Error Hz 7. 7. x dB Bandwidth - Hz
2	Returns the frequency-domain spectrum trace (data array) for the entire frequency range being measured for Trace 1
3	1. Number of active carriers
Mode = LTEAFDD, LTEATDD, 5GNR	Returns number of active carriers within Span in Auto detected mode, otherwise the command is out of scope
4	Returns OBW Boundaries table results in the following order: 1. Occupied bandwidth – Hz 2. Total Power or OBW Power – dBm (Power reference type is changed with the Power Ref control in Meas Setup) 3. x dB Reference Power – dBm 4. x dB Reference Power Frequency - offset frequency [Hz] 5. x dB Reference Power Frequency – absolute frequency [Hz] 6. NaN (9.91E+37) 7. NaN (9.91E+37) 8. NaN (9.91E+37) 9. Lower OBW boundary - offset frequency [Hz] 10. Lower OBW boundary - absolute frequency [Hz] 11. Lower OBW boundary - absolute power [dBm] 12. Lower OBW boundary - relative power [dBc] 13. Upper OBW boundary - offset frequency [Hz] 14. Upper OBW boundary - absolute frequency [Hz] 15. Upper OBW boundary - absolute power [dBm] 16. Upper OBW boundary - relative power [dBc] 17. Lower x dB BW boundary - offset frequency [Hz] 18. Lower x dB BW boundary - absolute frequency [Hz] 19. Lower x dB BW boundary - absolute power [dBm] 20. NaN (9.91E+37) 21. Upper x dB BW boundary - offset frequency [Hz] 22. Upper x dB BW boundary - absolute frequency [Hz] 23. Upper x dB BW boundary - absolute power [dBm] 24. NaN (9.91E+37) Results 6, 7, 8, 20 and 24 always return NaN (9.91E+37)
5	Returns the frequency-domain spectrum trace (data array) for the entire

n	Results Returned
	frequency range being measured for Trace 2
6	Returns the frequency-domain spectrum trace (data array) for the entire frequency range being measured for Trace 3

3.8.1 Views

The Occupied BW measurement has two Predefined views: the OBW Result View and the OBW Boundaries View.

These Views are multiple-window Views. When in a multiple window View, you select a window by touching it. The menu controls may sometimes change depending on which window is selected.

Whenever the View changes, the default menu is **Frequency**, unless otherwise specified in the View description.

If you have modified the current View, using the "View Editor" on page 128, an asterisk appears next to that View in the radio button panel. You can save the modified View as a User View (see "Save Layout as New View" on page 1890).

View Selection by Name

Remote Command	`:DISPlay:OBWidth:VIEW[:SELect] OBWResults | BOUNdaries` `:DISPlay:OBWidth:VIEW[:SELect]?`
Example	`:DISP:OBW:VIEW OBWR` `:DISP:OBW:VIEW?`
Preset	`OBWResults`
State Saved	Saved in instrument state
Range	`OBWResults|BOUNdaries`

View Selection by Number

Remote Command	`:DISPlay:OBWidth:VIEW:NSELect <integer>` `:DISPlay:OBWidth:VIEW:NSELect?`
Example	`:DISP:OBW:VIEW:NSEL 2` `:DISP:OBW:VIEW:NSEL?`
Preset	1
State Saved	Saved in instrument state
Min/Max	1/2

3.8.1.1 OBW Results

Windows: "Graph" on page 944, "Metrics - OBW Results" on page 945

The spectrum trace is displayed in the upper window. Measurement results such as Occupied Bandwidth or Power are displayed in the lower window.

Example	`:DISP:OBW:VIEW OBWR`

3.8.1.2 OBW Boundaries

Windows: "Graph" on page 944, "Metrics - OBW Boundaries" on page 947

The spectrum trace is displayed in the upper window. The lower window of OBW Results view is replaced by the OBW boundaries table in this view. Occupied bandwidth and X dB bandwidth for both lower and upper boundaries are displayed.

Example	`:DISP:OBW:VIEW BOUN`

3.8.2 Windows

There are three windows available in the OBW measurement. The Gate window is available only when Gate View is turned on in the Gate Settings menu under Trigger.

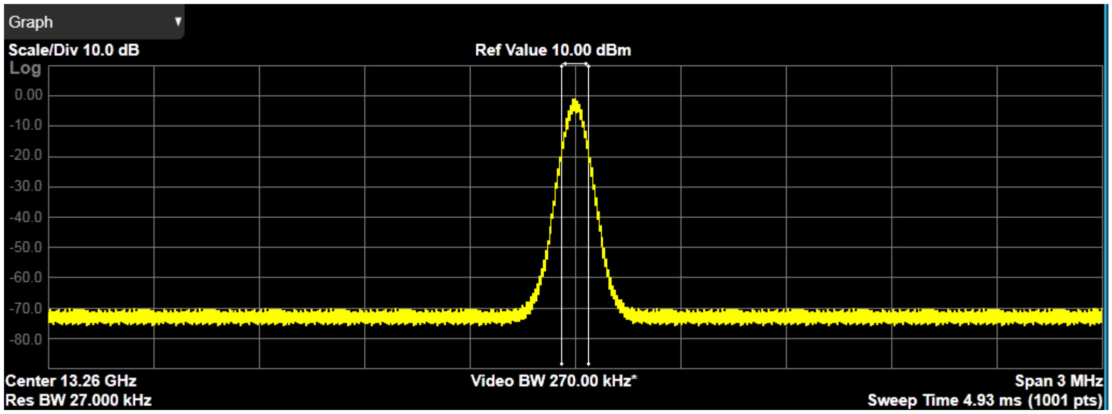
3.8.2.1 Graph

The Graph window appears in two Views, as follows:

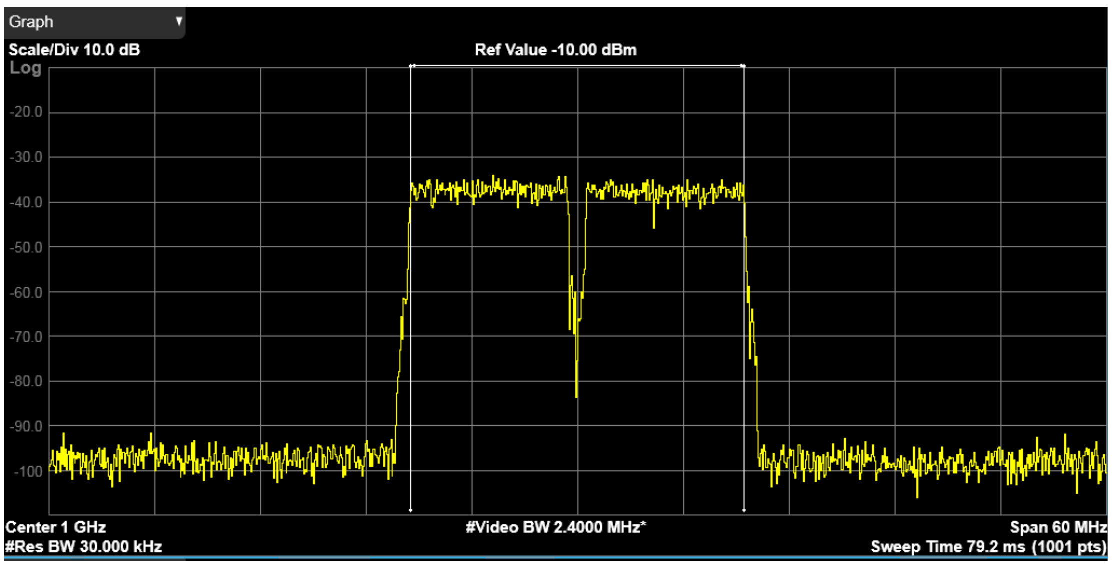
View	Size	Position
OBW Results	Three fifth, full width	Top
OBW Boundaries	Half, full width	Top
Gate View	One third, full width	Middle

Spectrum View

For SA, WCDMA, WLAN mode:



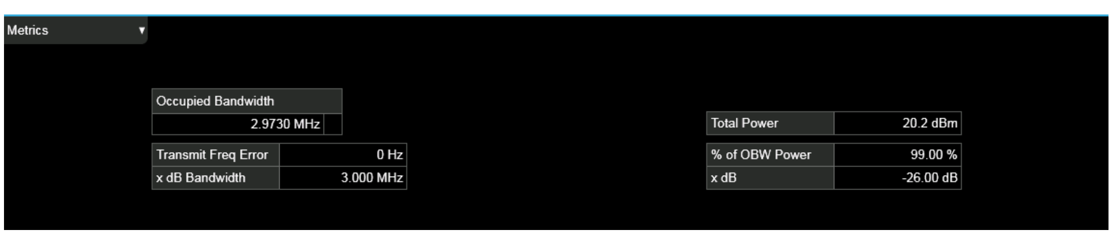
For LTE-Advanced FDD/TDD mode only:



3.8.2.2 Metrics - OBW Results

The OBW Results window displays the textual results of the Occupied BW measurement.

View	Size	Position
OBW Results	Two fifth, full width	Bottom
Gate View	One third, full width	Bottom



For the LTE-Advanced FDD/TDD and 5G NR modes, the metric result is shown as below:

Occupied Bandwidth

The occupied bandwidth result is $f_2 - f_1$, where f_1 and f_2 are the lower and upper carrier boundary point. f_1 and f_2 are calculated with a Occupied Bandwidth algorithms.

Total Power or OBW Power

The total power is the power integrated in the specified span setting. The OBW power is calculated from multiplying the total power by OBW percent power. The user can select the total power or the OBW power with the Power Ref control in Meas Setup.

Transmit Freq Error

The transmit freq error (transmit frequency error) result is calculated as the difference between $(f_2+f_1)/2$ and the tuned center frequency of the signal, where f_1 and f_2 are the lower and upper carrier boundary point.

x dB Bandwidth

The x dB result is a bandwidth measured between two points on the signal which are a certain number of dBs down from the highest signal point within the OBW Span. For example, If the 'x dB' parameter is set to –26 dB, and the 'Occupied BW Span' is set to 10 MHz, then the maximum signal power level is first determined from the 10 MHz wide trace sweep. Next, the two furthest frequencies below (xdb_f_1) and above (xdb_f_2) the frequency of the maximum level occurrence are found where the signal level is 26 dB below the peak level. This calculation also uses linear interpolation to find the lower and upper carrier boundary point within the width of a sweep point (the span divided by the number of sweep points).

The x dB bandwidth is calculated to be xdb_f2 – xdb_f_1.

% of OBW Power

This is the setting parameter. See "% of OBW Power" on page 1016

x dB

This is the setting parameter. See "x dB" on page 1017.

Active Carriers

In the LTE-Advanced FDD/TDD and 5G NR modes, the number of active carriers is displayed to show how many carriers are identified as active in auto detected mode of span, otherwise “-” is displayed to indicate that it is out of scope. When there is one active carrier, Transmit Freq Error is displayed. Otherwise, “---“ is displayed.

Measure Trace

See "Measure Trace" on page 1054

3.8.2.3 Metrics - OBW Boundaries

The OBW Boundaries window displays occupied bandwidth and X dB bandwidth for both lower and upper boundaries.

View	Size	Position
OBW Boundaries	Half, full width	Bottom
Gate View	One third, full width	Bottom

Occupied Bandwidth

The occupied bandwidth result is $f_2 – f_1$, where f_1 and f_2 are the lower and upper carrier boundary point. f_1 and f_2 are calculated with a Occupied Bandwidth algorithms.

Total Power or OBW Power

The total power is the power integrated in the specified span setting. The OBW power is calculated from multiplying the total power by OBW percent power. The user can select the total power or the OBW power with the Power Ref control in Meas Setup.

x dB

This is the setting parameter. See "x dB" on page 1017.

x dB Ref Pwr

The x dB reference power result shows the power of the highest signal point within the OBW Span.

x dB At Freq

The x dB reference power frequency result shows the frequency of the highest signal point within the OBW Span. The frequency display type, either Offset or Absolute, can be selected with the Boundary Frequency control under Display.

OBW Boundary Results

Name	Corresponding Results
Lower OBW boundary - offset frequency [Hz]	Offset frequency of the lower OBW boundary from center frequency
Lower OBW boundary - absolute power [dB]	Absolute power on the point of lower OBW boundary
Lower OBW boundary - relative power [dBc]	Relative power on the point of lower OBW boundary
Upper OBW boundary - offset frequency [Hz]	Offset frequency of the upper OBW boundary from center frequency
Upper OBW boundary - absolute power [dB]	Absolute power on the point of upper OBW boundary
Upper OBW boundary - relative power [dBc]	Relative power on the point of upper OBW boundary
Lower x dB BW boundary - offset frequency [Hz]	Offset frequency of the lower x dB BW boundary from center frequency
Lower x dB BW boundary - absolute power [dB]	Absolute power on the point of lower x dB BW boundary
Upper x dB BW boundary - offset frequency [Hz]	Offset frequency of the lower x dB BW boundary from center frequency
Upper x dB BW boundary - absolute power [dB]	Absolute power on the point of lower x dB BW boundary

3.8.2.4 Gate

Turning on Gate View shows the Gate Window, which allows you to see your Gating signal at the same time as the measured data. See the description under Gate View in the Trigger, Gate Settings section.

Views in which the Gate window appears:

View	Size	Position
Gate View	One third, full width	Top

3.8.3 Amplitude

Activates the **Amplitude** menu and selects **Reference Level** or **Reference Value** as the active function, depending on the measurement.

Some features in this menu apply to multiple measurements. Some other features apply only to specific measurements and their controls are blanked or grayed-out in measurements that do not support the feature.

3.8.3.1 Y Scale

The Y Scale Tab contains controls that pertain to the Y axis parameters of the measurement. These parameters control how data on the vertical (Y) axis is displayed and control instrument settings that affect the vertical axis.

Ref Value

Sets the value for the absolute power reference. The reference line is at the top, center, or bottom of the graticule, depending on the value of the Ref Position function.

Remote Command	`:DISPlay:OBWidth:WINDow[1]:TRACe:Y[:SCALe]:RLEVel <real>` `:DISPlay:OBWidth:WINDow[1]:TRACe:Y[:SCALe]:RLEVel?`
Example	`:DISP:OBW:WIND:TRAC:Y:RLEV 125` `:DISP:OBW:WIND:TRAC:Y:RLEV?`
Couplings	When Auto Scaling is On (default), this value is automatically determined by the measurement result. When you set a value manually, Auto Scaling changes to Off Attenuation is not coupled to Ref Value
Preset	10.00 dBm
State Saved	Saved in instrument state
Min/Max	-250.00 dBm / 250.00 dBm
Annotation	Ref <value> top left of graph
Backwards Compatibility SCPI	`:DISPlay:OBWidth:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:RLEVel`

Scale/Div

For measurements that support a logarithmic Y-Axis, Scale/Div sets the height of one division of the graticule in the current Y-Axis unit.

Scale/Div also determines the displayed amplitude range in the log plot graph. Since there are usually 10 vertical graticule division on the display, the total amplitude range of the graph is typically 10x this amount. For example, if Scale/Div is 10 dB, then the total range of the graph is 100 dB.

Remote Command	`:DISPlay:OBWidth:WINDow[1]:TRACe:Y[:SCALe]:PDIVision <rel_ampl>` `:DISPlay:OBWidth:WINDow[1]:TRACe:Y[:SCALe]:PDIVision?`
Example	`:DISP:OBW:WIND:TRAC:Y:PDIV 5` `:DISP:OBW:WIND:TRAC:Y:PDIV?`
Couplings	When the Auto Scaling is On, this value is automatically determined by the measurement result. When

	you set a value manually, Auto Scaling automatically changes to Off
Preset	10.00 dB / Div
State Saved	Saved in instrument state
Min	0.10 dB
Max	20 dB
Annotation	<value> dB/ left upper of graph
Backwards Compatibility SCPI	:DISPlay:OBWidth:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:PDIVision

Ref Position

Positions the reference level at the top, center, or bottom of the Y Scale display. Changing the reference position does not change the reference level value.

Remote Command	:DISPlay:OBWidth:WINDow[1]:TRACe:Y[:SCALe]:RPOSition TOP | CENTer | BOTTom :DISPlay:OBWidth:WINDow[1]:TRACe:Y[:SCALe]:RPOSition?
Example	:DISP:OBW:WIND:TRAC:Y:RPOS CENT :DISP:OBW:WIND:TRAC:Y:RPOS?
Preset	TOP
State Saved	Saved in instrument state
Range	TOP|CENTer|BOTTom
Annotation	The greater than (>) and less than (<) symbols are displayed on both sides of the graph to indicate the Reference Position
Backwards Compatibility SCPI	:DISPlay:OBWidth:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:RPOSition

Auto Scaling

Toggles the Auto Scaling function between On and Off.

Remote Command	:DISPlay:OBWidth:WINDow[1]:TRACe:Y[:SCALe]:COUPle 0 | 1 | OFF | ON :DISPlay:OBWidth:WINDow[1]:TRACe:Y[:SCALe]:COUPle?
Example	:DISP:OBW:WIND:TRAC:Y:COUP OFF :DISP:OBW:WIND:TRAC:Y:COUP?
Couplings	When Auto Scaling is On, and the Restart front-panel key is pressed, this function automatically sets the scale per division to 10 dB and determines the reference values based on the measurement results When you set a value to either Scale/Div or Ref Value manually, Auto Scaling automatically changes to Off

Preset	1
State Saved	Saved in instrument state
Range	OFF|ON
Backwards Compatibility SCPI	:DISPlay:OBWidth:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:COUPle

3.8.3.2 Attenuation

Controls the attenuator functions and interactions between the attenuation system components.

There are two attenuator configurations in the X-Series. One is a Dual-Attenuator configuration consisting of a mechanical attenuator and an optional electronic attenuator. The other configuration uses a single attenuator with combined mechanical and electronic sections thatcontrols all the attenuation functions. Different models in the X-Series come with different configurations.

- See "Dual-Attenuator Configurations" on page 951
- See "Single-Attenuator Configuration" on page 952

Most attenuation settings are the same for all measurements – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by Meas Preset.

This tab is only available when the hardware set includes an input attenuator, which is typically only the case when using Keysight’s box instruments. For example, this tab does not appear in:

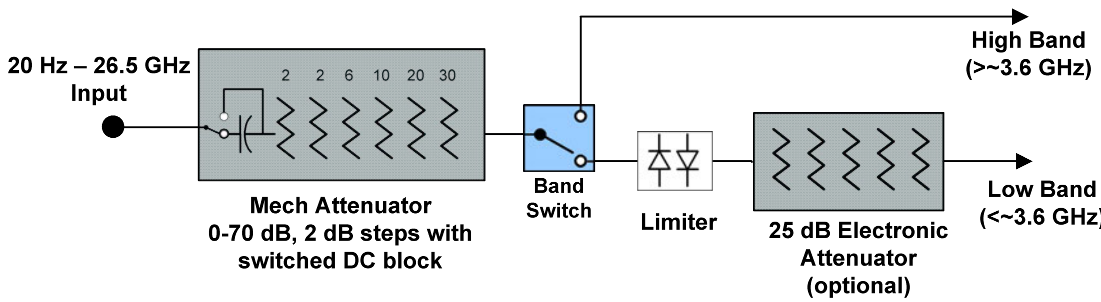
- VXT models M9420A/21A/10A/11A
- E7760
- M9391A
- M9393A

This tab also does not appear in UXM. In UXM all Attenuation and Range settings are disabled, as the expected input power level is handled by the Call Processing App that drives the DUT power control.

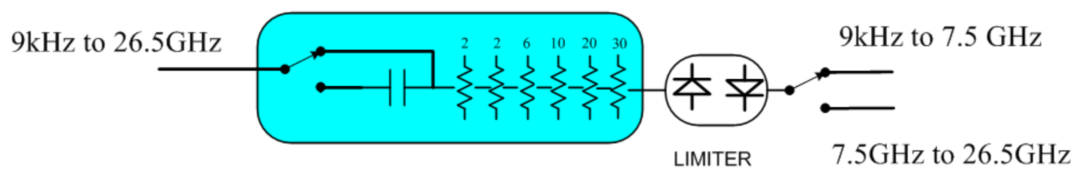
Dependencies	In measurements that support the I/Q inputs, this tab is unavailable when I/Q is the selected input, and is replaced by the Range tab in that case

Dual-Attenuator Configurations

Configuration 1: Mechanical attenuator + optional electronic attenuator

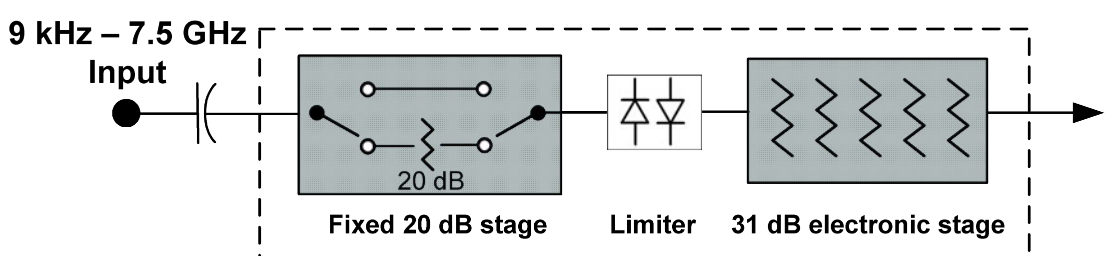


Configuration 2: Mechanical attenuator, no optional electronic attenuator

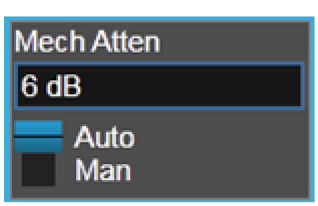


(note that Configuration 2 is not strictly speaking a dual-section attenuator, since there is no electronic section available. However, it behaves exactly like Configuration 1 without the Electronic Attenuator option EA3, therefore for the sake of this document it is grouped into the "Dual-Attenuator" configuration)

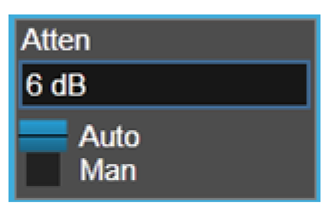
Single-Attenuator Configuration



You can tell which attenuator configuration you have by pressing the Attenuation tab, which (in most Modes) opensthe Attenuation menu. If the first control in the Attenuation menu says Mech Atten you have the Dual-Attenuator configuration. If the first control says Atten you have the Single-Attenuator configuration.



Dual Attenuator



Single Attenuator

(Note that depending on the measurement, there may be no Auto/Man functionality on the Mech Atten control).

In the Single-Attenuator configuration, youcontrol the attenuation with a single control, as the fixed stage has only two states. In the Dual-Attenuator configuration, both stages have significant range so you are given separate control of the mechanical and electronic attenuator stages.

When you have the Dual-Attenuator configuration, you may still have only a Single-Attenuator, because unless option EA3 (the Electronic Attenuator option) is available, and you purchase it, you will have only the mechanical attenuator.

Full Range Atten

The **Full Range Atten** control and **Attenuator Summary** only appear in N9041B, when the RF input is selected and the RF Input Port is set to RF Input 2, and the Full Range Attenuator is installed. The Full Range Attenuator adds a second input attenuator at the beginning of the RF Input 2, which enhances the protection and optimizes the performance of the extra internal mixers used by RF Input 2.

Remote Command	`[:SENSe]:POWer[:RF]:FRATten <rel_ampl>` `[:SENSe]:POWer[:RF]:FRATten?`
Example	`:POW:FRAT 14` `:POW:FRAT?`
Notes	When you enter an amplitude value that falls between valid values, the value will be incremented to the next smallest valid value
Dependencies	Only appears if input RF is selected, and RF Input Port 2 is selected, and the Full Range Attenuator exists
Couplings	This value is never changed by any coupling, however other couplings use this value. See the **Reference Level** and "Mech Atten" on page 1750 command descriptions
Preset	20 dB
State Saved	Saved in instrument state
Min	0 dB
Max	Only valid values are 0, 6, 14, 20 dB
Annotation	When the Input is RF, and the Input Port is RF Input 2, and the Full Range Attenuator is installed: On the Meas Bar, the field “Atten” displays as follows: – If the sweep is entirely < 50 GHz, the value shown after “Atten:” is equal to Mech Atten + Elec Atten + Full Range Atten – If the sweep is entirely > 50 GHz, the value shown after “Atten:” is equal to Full Range Atten – If the sweep straddles 50 GHz, the value shown after “Atten:” is preceded by the symbol “>=” and is equal to Full Range Atten In the **Amplitude**, "Attenuation" on page 1747 menu, and the Atten Meas Bar dropdown menu panel, a summary is displayed as follows:

	"Total Atten below 50 GHz" followed by the value of Full Range Atten + Mech Atten + Elec Atten "Total Atten above 50 GHz" followed by the value of Full Range Atten For example, if Mech Atten = 6 dB, Elec Atten = 4 dB, and Full Range Atten = 20 dB, the summary below is shown: – Attenuator summary: – Total Atten below 50 GHz: 30 dB – Total Atten above 50 GHz: 20 dB

Mech Atten

This control is labeled **Mech Atten** in Dual-Attenuator models and **Atten** in Single-Attenuator models. In the Dual-Attenuator configuration, this control only affects the mechanical attenuator.

This control lets you modify the attenuation applied to the RF input signal path. This value is normally auto coupled to the Ref Level, the Internal Preamp Gain, any External Gain that is entered, and the Max Mixer Level, as described in the table below.

See "Attenuator Configurations and Auto/Man" on page 956

Remote Command	`[:SENSe]:POWer[:RF]:ATTenuation <rel_ampl>`
	`[:SENSe]:POWer[:RF]:ATTenuation?`
	`[:SENSe]:POWer[:RF]:ATTenuation:AUTO OFF | ON | 0 | 1`
	`[:SENSe]:POWer[:RF]:ATTenuation:AUTO?`

Example	`:POW:ATT 20`
	Dual-Attenuator configuration: sets the mechanical attenuator to 20 dB
	Single-Attenuator mode: sets the main attenuation to 20 dB (see below for definition of "main" attenuation)
	In either case, if the attenuator was in Auto, it is set to Manual
	`:POW:ATT:AUTO ON`
	Turn Auto Mech Atten ON

Dependencies	Some measurements do not support the Auto setting of "Mech Atten" on page 954. In these measurements, the Auto/Man selection is not available, and the Auto/Man toggle function is not available In Dual-Attenuator configurations, when the electronic attenuator is enabled, the mechanical attenuator has no auto setting and the Auto/Man toggle function is not available. The state of Auto/Man is remembered and restored when the electronic attenuator is once again disabled. This is described in more detail in "Elec Atten" on page 1753 See "Attenuator Configurations and Auto/Man" on page 956 for more information on the Auto/Man functionality `:POW:ATT:AUTO` is only available in measurements that support Mech Atten Auto, such as Swept SA

Couplings	If the RF Input Port is the RF Input: – If the USB Preamp is connected to USB, use 0 dB for Mech Atten – Otherwise compute the auto-selected value of Mech Atten based on **Reference Level**, Int Preamp, External Gain, Ref Level Offset, Max Mixer Level, µW Path Control and IF Gain settings. Limit this value to be no less than 6 dB (total attenuation below 6 dB can never be chosen by Auto) – In the N9041B, if the RF Input Port is RF Input 2, use the formula above and subtract the Full Range Atten value from the result to determine the Mech Atten. Limit the value so that it is never lower than 0 dB and so that total attenuation, including Full Range Atten, is never less than 6 dB (total attenuation, including Full Range Atten below 6 dB, can never be chosen by Auto) In External Mixingand BBIQ, where the Attenuator is not in the signal path, the Attenuator setting changes as described above when "Mech Atten" on page 954 is in Auto, but no changes are made to the actual attenuator hardware setting until the input is changed back to the RF Input For CXA-m with option FSA (Fine-Step Attenuator or 2 dB steps), the FSA-like behavior is only available when the frequency setting is <= 7.5GHz. So, when the frequency is changed from below 7.5GHz to above 7.5GHz, the attenuation setting will be changed to a multiple of 10dB which will be no smaller than the previous setting. For example, 4dB attenuation will be changed to 10dB
Preset	The preset for Mech Attenuation is “Auto” The Auto value of attenuation is 10 dB ON
State Saved	Saved in instrument state
Min	0 dB The attenuation set by this control cannot be decreased below 6 dB with the knob or step keys. Values below 6 dB must be directly entered from the keypad or via SCPI. This protects against setting a dangerously small attenuation value, which can put the instrument at risk of damage to input circuitry. If the current mechanical attenuation is below 6 dB, it can be increased with the knob and step keys, but not decreased
Max	CXA Option 503 or 507: 50 dB EXA: 60 dB All other models: 70 dB Note that in the Single-Attenuator configuration, the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB.
Annotation	The current value for Total Atten is displayed in the Measurement Bar at the top of the display. A value appears for Electronic Attenuation only if the Electronic Attenuator is enabled. The annotation appears as Atten: <total> dB (e<elec>) The e letter is in amber in Single-Attenuator configurations For example: Dual-Attenuator configuration: Atten: 24 dB (e14) Indicating the total attenuation is at 24 dB and the electronic attenuation is at 14 dB Single-Attenuator configuration: A: 24 dB (e14)

Indicating the total attenuation is at 24 dB and the “soft” attenuation is at 14 dB (see below for definition of “soft” attenuation)

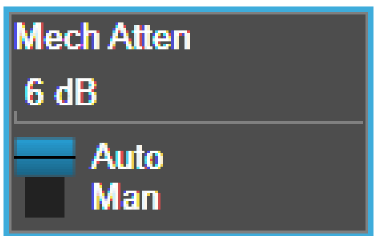
When in Manual, a # sign appears in front of Atten in the annotation

Attenuator Configurations and Auto/Man

As described in "Attenuation" on page 1747 , there are two distinct attenuator configurations available in the X-Series, the single attenuator and Dual-Attenuator configurations. In Dual-Attenuator configurations, we have the mechanical attenuation and the electronic attenuation, and the current total attenuation is the sum of the electronic + mechanical attenuation. In Single-Attenuator configurations, we refer to the attenuation set using "Mech Atten" on page 954 (or `:POW:ATT`) as the “main” attenuation; and the attenuation that is set by `:POW:EATT` as the “soft” attenuation (`:POW:EATT` is honored even in the Single-Attenuator configuration, for compatibility purposes). Then the current total attenuation is the sum of the main + soft attenuation. See "Elec Atten" on page 1753 for more on “soft” attenuation.

NOTE

In some measurements, the **Mech Atten** control has an Auto/Man function. In these measurements, an Auto/Man switch is shown on the **Mech Atten** control:



Note that in configurations that include an Electronic Attenuator, this switch is only shown when the Electronic Attenuator is disabled.

In other measurements, **Mech Atten** has no Auto/Man function. In these measurements, no switch is shown on the **Mech Atten** control:

Mech Atten also appears with no switch, as above, in configurations that include an Electronic Attenuator but when the Electronic Attenuator is enabled.

Elec Atten

Controls the Electronic Attenuator in Dual-Attenuator configurations. This control does not appear in Single-Attenuator configurations, as the control of both the mechanical and electronic stages of the Single-Attenuator is integrated into the single **Atten** control.

This control includes an Enable/Disable toggle switch; it is only possible to enter a value for the Electronic Attenuator when this switch is in the “Enable” position.

See "More Information" on page 958

Remote Command	`[:SENSe]:POWer[:RF]:EATTenuation <rel_ampl>`
	`[:SENSe]:POWer[:RF]:EATTenuation?`
	`[:SENSe]:POWer[:RF]:EATTenuation:STATe OFF | ON | 0 | 1`
	`[:SENSe]:POWer[:RF]:EATTenuation:STATe?`

Example	`:POW:EATT 10`
	`:POW:EATT?`
	`:POW:EATT:STAT ON`
	`:POW:EATT:STAT?`

Notes	Electronic Attenuation’s specification is defined only when Mechanical Attenuation is 6 dB
Dependencies	This control only appears in Dual-Attenuator models with an Electronic Attenuator installed and licensed. It does not appear in models with the Single-Attenuator configuration, as in the Single-Attenuator configuration there is no “electronic attenuator” there is only a single integrated attenuator (which has both a mechanical and electronic stage). However, in the Single-Attenuator configuration, EATT SCPI commands are accepted for compatibility with other X-series instruments and set a “soft” attenuation as described in . The “soft” attenuation is treated as an addition to the “main” attenuation value set by the Atten control or the POW:ATT SCPI command and affects the total attenuation displayed on the Atten control and the Meas Bar The electronic attenuator (and the “soft” attenuation function provided in Single-Attenuator configurations) is unavailable above the low band (0-3.6 GHz, 0-3.4 GHz 0-3GHz, depending on the model). If the low band ranges from 0-3.6GHz, and Stop Frequency of the instrument is > 3.6 GHz, then the **Enabled/Disabled** section of the **Elec Atten** control will be OFF and grayed out If the Internal Preamp is on, meaning it is set to Low Band or Full, the electronic attenuator (and the “soft” attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the **Enabled/Disabled** section of the **Elec Atten** control will be OFF and grayed out If either of the above is true, if the SCPI command is sent, an error indicating that the electronic attenuator is unavailable will be sent If both of the above are true, pressing the control will generate error message -221, in other words, the frequency range lockout takes precedence If the electronic/soft Attenuator is enabled, then the Stop Freq of the instrument is limited to 3.6 GHz and the Internal Preamp is unavailable The SCPI-only “soft” electronic attenuation for the single-attenuator configuration is not available in all measurements; in particular, it is not available in the Swept SA measurement
Couplings	Enabling and disabling the Electronic Attenuator affects the setting of the Mechanical Attenuator (in Dual-Attenuator configurations). This is described in more detail below and in the section "Attenuator Configurations and Auto/Man" on page 1752
Preset	`OFF` (Disabled) for Swept SA measurement `ON` (Enabled) for all other measurements that support the electronic attenuator
State Saved	Saved in instrument state

Min	0 dB
Max	Dual-Attenuator configuration: 24 dB Single-Attenuator configuration: the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB
Annotation	See Annotation under the **Mech Atten** control description

More Information

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear. These advantages primarily aid in remote operation and are negligible for front panel use. See "Using the Electronic Attenuator: Pros and Cons" on page 959 for a detailed discussion of the pros and cons of using the electronic attenuator.

For the Single-Attenuator configuration, for SCPI backwards compatibility, the “soft” attenuation feature replaces the Dual-Attenuator configuration’s electronic attenuator. All the same couplings and limitations apply. See "Attenuator Configurations and Auto/Man" on page 1752

Mechanical Attenuator Transition Rules

When the Electronic Attenuator is enabled, the Mechanical Attenuator transitions to a state that has no Auto function. Below are the rules for transitioning the Mechanical Attenuator. Note that the information below ONLY applies to the Dual-Attenuator configurations, and ONLY when the Electronic Attenuator is installed:

When the Electronic Attenuation is enabled from a disabled state:

The Mechanical Attenuator is initialized to 10 dB (this is its optimal performance setting). You can then set it as desired with SCPI, numeric keypad, step keys, or knob, and it behaves as it normally would in manual mode

The Auto/Man state of (Mech) Atten is saved

The Auto/Man toggle on the (Mech) Atten control disappears and the auto rules are disabled

The Electronic Attenuator is set to 10 dB less than the previous value of the Mechanical Attenuator, within the limitation that it must stay within the range of 0 to 24 dB of attenuation

Examples in the Dual-Attenuator configuration:

Mech Atten at 20 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 10 dB. New total attenuation equals the value before Elec Atten enabled

Mech Atten at 0 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 0 dB. New total attenuation does not equal the value before Elec Atten enabled

Mech Atten at 40 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 24 dB. New total attenuation does not equal the value before Elec Atten enabled

When the Electronic Attenuation is disabled from an enabled state:

The Elec Atten control is grayed out

- The Auto/Man state of (Mech) Atten is restored

If now in Auto, (Mech) Atten recouples

If now in Man, (Mech) Atten is set to the value of total attenuation that existed before the Elec Atten was disabled. The resulting value is rounded up to the smallest value possible given the (Mech) Atten Step setting - (That is, 57 dB changes to 58 dB when (Mech) Atten Step is 2 dB)

Using the Electronic Attenuator: Pros and Cons

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear.

The “finer steps” advantage of the electronic attenuator is beneficial in optimizing the alignment of the instrument dynamic range to the signal power in the front panel as well as remote use. Thus, you can achieve improved relative signal measurement accuracy. Compared to a mechanical attenuator with 2 dB steps, the 1 dB resolution of the electronic attenuator only gives better resolution when the odd-decibel steps are used. Those odd-decibel steps are less accurately calibrated than the even-decibel steps, so one tradeoff for this superior relative accuracy is reduced absolute amplitude accuracy.

Another disadvantage of the electronic attenuator is that the spectrum analyzer loses its “Auto” setting, making operation less convenient.

Also, the relationship between the dynamic range specifications (TOI, SHI, compression, and noise) and instrument performance are less well-known with the electrical attenuator. With the mechanical attenuator, TOI, SHI, and compression threshold levels increase dB-for-dB with increasing attenuation, and the noise floor does as well. With the electronic attenuator, there is an excess attenuation of about 1 to 3 dB between 0 and 3.6 GHz, making the effective TOI, SHI, and so forth, less well known. Excess attenuation is the actual attenuation relative to stated attenuation. Excess attenuation is accounted for in the instrument calibration

Adjust Atten for Min Clipping

Sets the combination of mechanical and electronic attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an "immediate action" function, that is, it executes once, when the control is pressed.

The algorithms that are used for the adjustment are documented under "Pre-Adjust for Min Clipping" on page 1757.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMediate`
Example	`:POW:RANG:OPT IMM`
Notes	Executing Adjust Atten for Min Clipping initiates the measurement.
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements For the Waveform measurement, this control is available only in 5G NR Mode

Adjust Atten

Allows you to select;

- Electric attenuator only
- Combination of Electric attenuator and Mechanical attenuator

when the command `[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMediate` is executed.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE EONLy | COMBined` `[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE?`
Example	`:POW:RANG:OPT:TYPE EONL` `:POW:RANG:OPT:TYPE?`
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements For the Waveform measurement, this control is available only in 5G NR Mode
Preset	`COMBined`
State Saved	Saved in instrument state

Pre-Adjust for Min Clipping

If this function is ON, it applies the adjustment described under "Adjust Atten for Min Clipping" on page 1756 each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

In Dual-Attenuator models, you can set **Elec+Mech Atten**, in which case both attenuators participate in the autoranging, or **Elec Atten Only**, in which case the mechanical attenuator does not participate in the autoranging. This latter case results in less wear on the mechanical attenuator and is usually faster.

See "Adjustment Algorithm" on page 961

Selection	Example	Note
Off	`:POW:RANGe:OPT:ATT OFF`	This is the default setting
Elec Atten Only	`:POW:RANGe:OPT:ATT ELEC`	Selects only the electric attenuator to participate in auto ranging. This offers less wear on the mechanical attenuator and is usually faster

Selection	Example	Note
Mech + Elec Atten	:POW:RANGe:OPT:ATT COMB	In Dual-Attenuator models, this selects both attenuators to participate in the autoranging

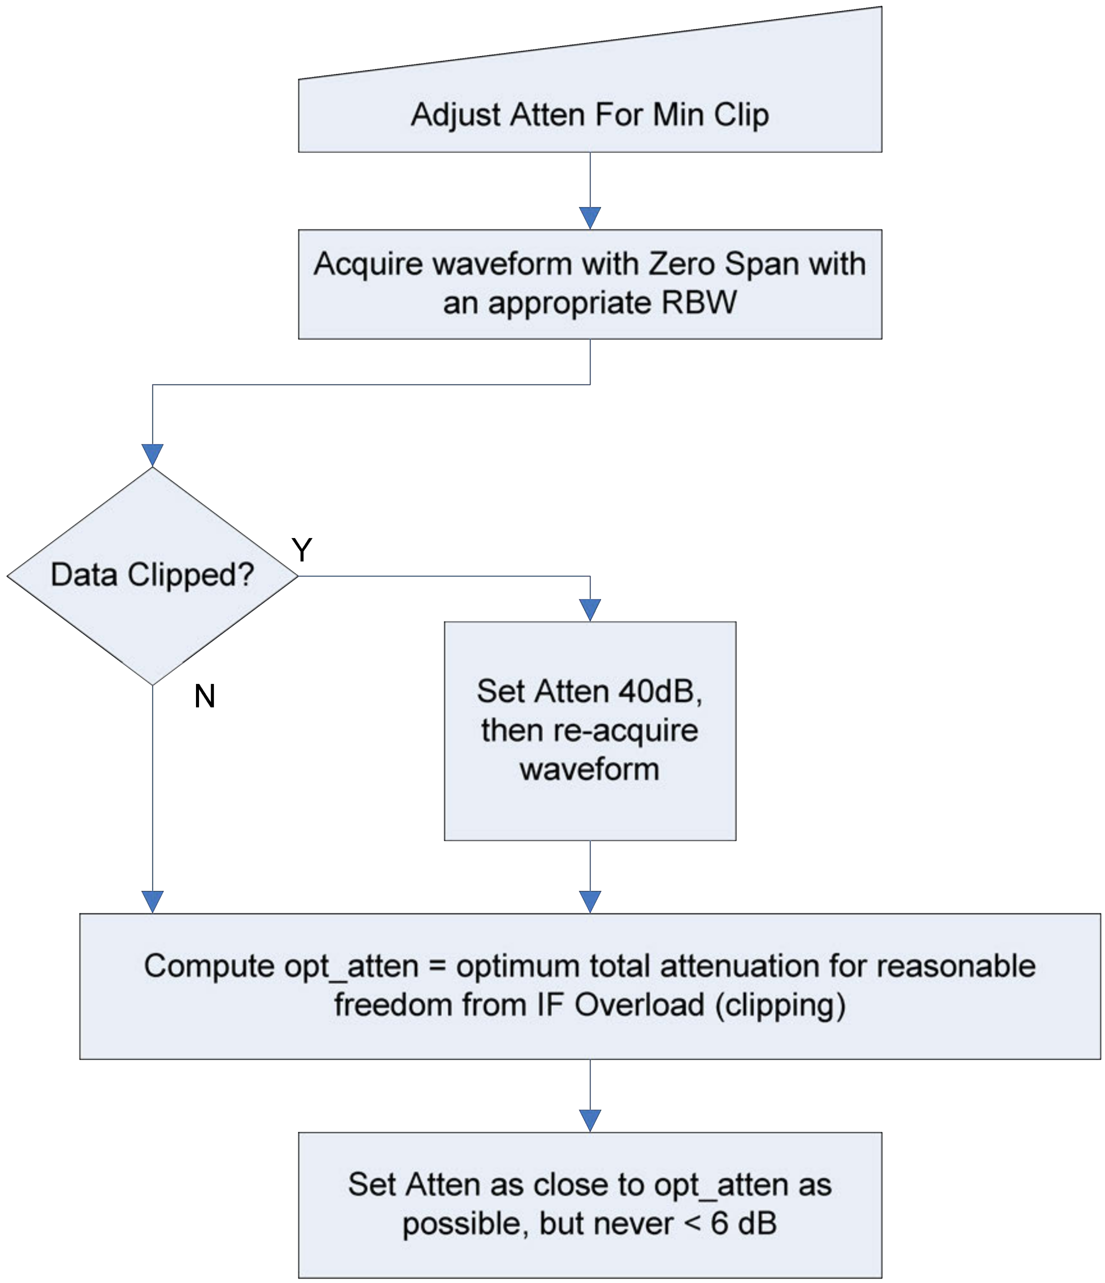
Remote Command	[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF | ON | ELECtrical | COMBined [:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?
Example	:POW:RANG:OPT:ATT OFF :POW:RANG:OPT:ATT?
Notes	The parameter option ELECtrical sets this function to ON in Single-Attenuator models The parameter option COMBined is mapped to ELECtrical in Single-Attenuator models. If you send COMBined, it sets the function to ON and returns ELEC to a query For SCPI compatibility with models that do not have an input attenuator, the ON parameter is honored and mapped to COMBined
Dependencies	This control only appears in Dual-Attenuator models with an Electronic Attenuator installed In instruments with Dual-Attenuator model, when **Enable** "Elec Atten" on page 1753 is OFF or grayed-out, "Pre-Adjust for Min Clipping" on page 960 is grayed-out This control does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements For the Waveform measurement, this control is available only in 5G NR Mode
Preset	OFF when Elec Atten is Disabled at preset, otherwise ELEC
State Saved	Saved in instrument state
Range	Dual-Attenuator models: Off | Elec Atten Only | Mech + Elec Atten Single-Attenuator models: Off | On

Notes	ON aliases to "Elec Atten Only" (:POW:RANG:OPT:ATT ELEC) OFF aliases to "Off" (:POW:RANG:OPT:ATT OFF) :POW:RANG:AUTO? returns true if :POW:RANG:OPT:ATT is not OFF
Backwards Compatibility SCPI	[:SENSe]:POWer[:RF]:RANGe:AUTO ON | OFF | 1 | 0 [:SENSe]:POWer[:RF]:RANGe:AUTO?

Adjustment Algorithm

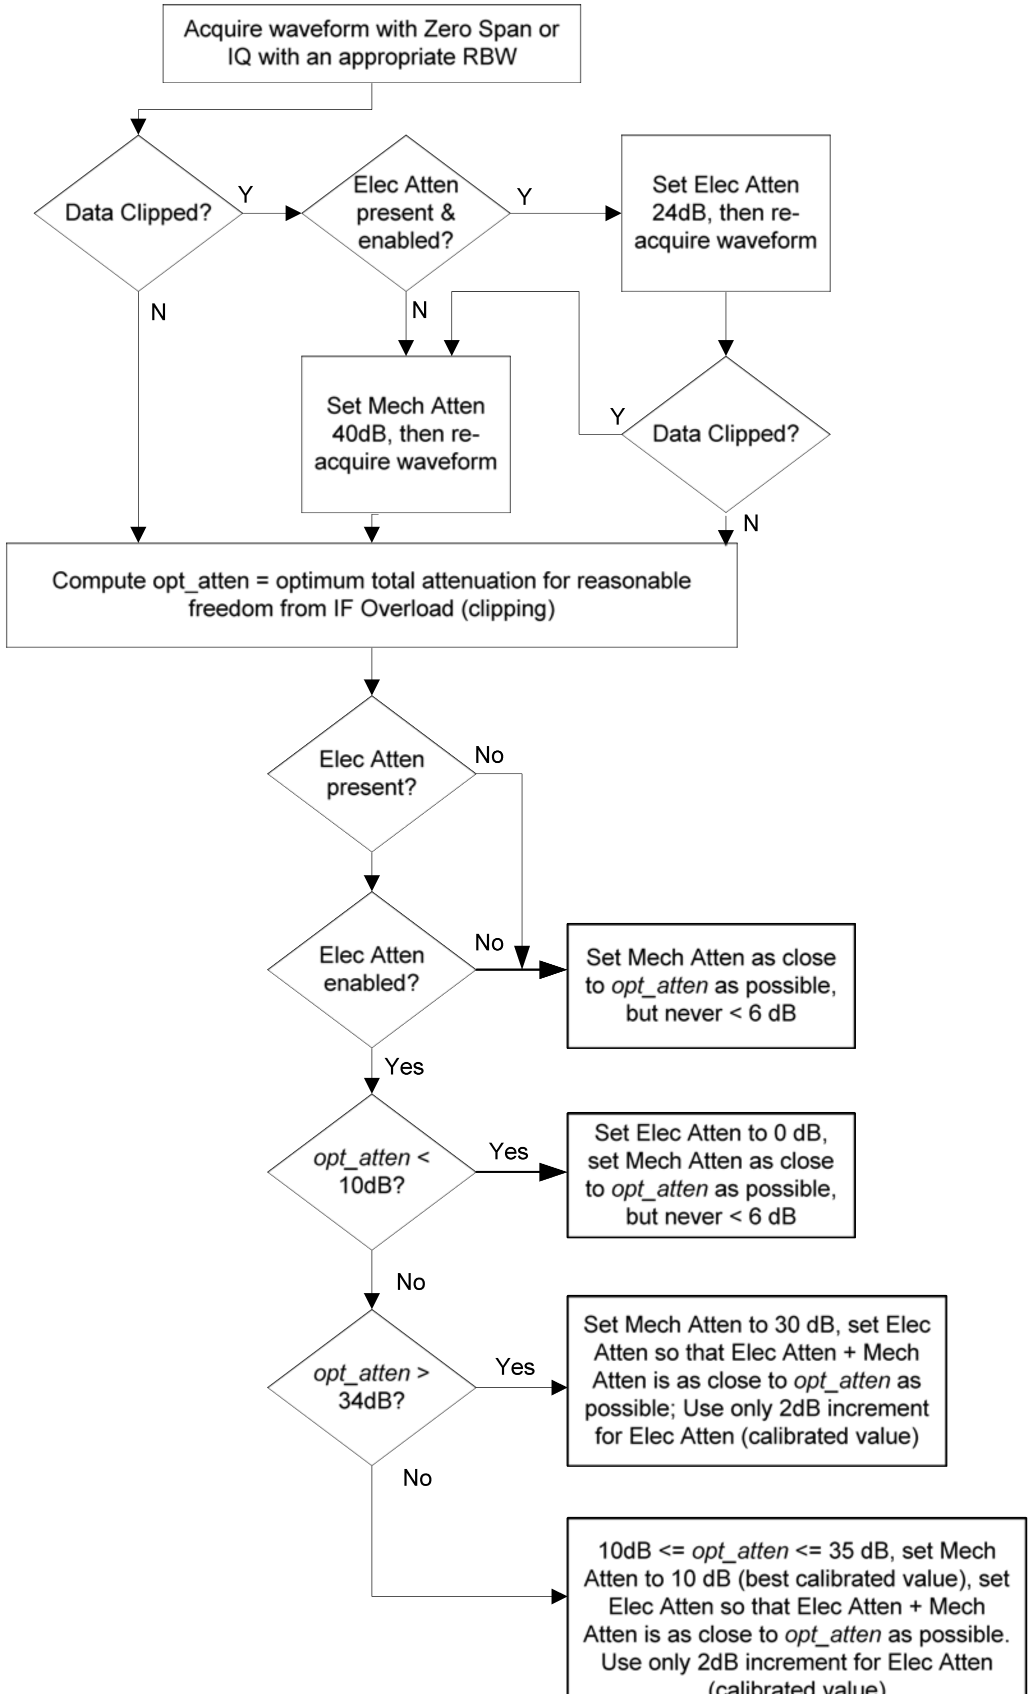
The algorithms for the adjustment are documented below:

Single-Attenuator Models



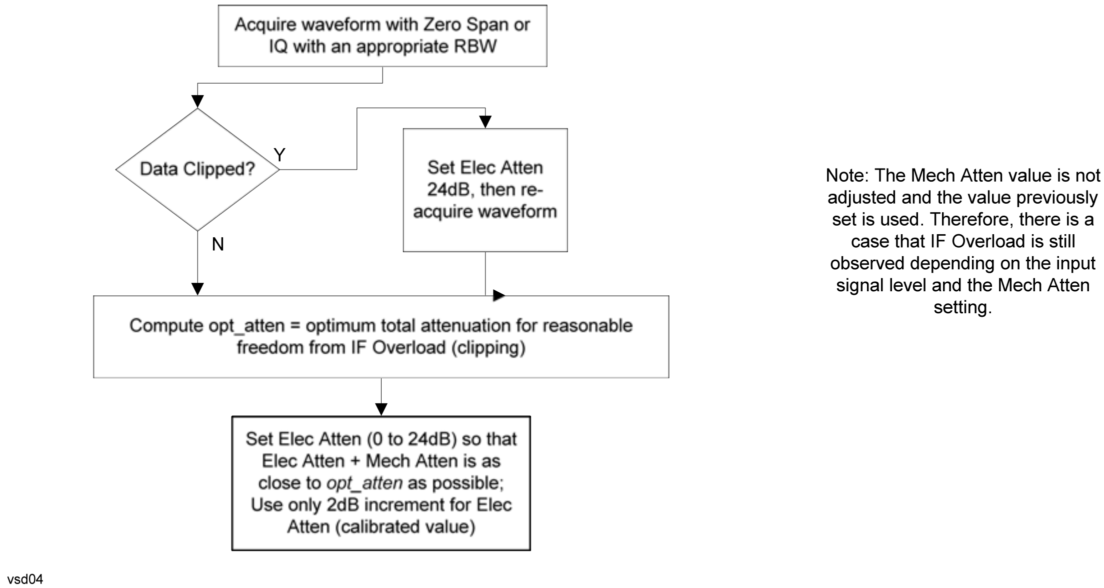
Dual-Attenuator models

"Adjust Atten for Min Clipping" on page 1756 or "Pre-Adjust for Min Clipping" on page 960 selection is Mech + Elec Atten:



Acquire waveform with Zero Span or IQ with an appropriate RBW
Data Clipped?
Y
N
Elec Atten present & enabled?
Y
N
Set Elec Atten 24dB, then re-acquire waveform
Set Mech Atten 40dB, then re-acquire waveform
Y
Data Clipped?
N
Compute opt_atten = optimum total attenuation for reasonable freedom from IF Overload (clipping)
Elec Atten present?
No
Elec Atten enabled?
No
Set Mech Atten as close to opt_atten as possible, but never < 6 dB
Yes
opt_atten < 10dB?
Yes
Set Elec Atten to 0 dB, set Mech Atten as close to opt_atten as possible, but never < 6 dB
No
opt_atten > 34dB?
Yes
Set Mech Atten to 30 dB, set Elec Atten so that Elec Atten + Mech Atten is as close to opt_atten as possible; Use only 2dB increment for Elec Atten (calibrated value)
No
10dB <= opt_atten <= 35 dB, set Mech Atten to 10 dB (best calibrated value), set Elec Atten so that Elec Atten + Mech Atten is as close to opt_atten as possible. Use only 2dB increment for Elec Atten (calibrated value)

"Pre-Adjust for Min Clipping" on page 960 selection is Elec Only:



Mech Atten Step

Controls thestep size used when making adjustments to the input attenuation.

This control is labeled **Mech Atten Step** in Dual-Attenuator models and **Atten Step** in Single-Attenuator models. In the Dual-Attenuator configuration, this control only affects the step size of the mechanical attenuator.

Remote Command	`[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement] 10 dB | 2 dB` `[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement]?`
Example	`:POW:ATT:STEP 2` `:POW:ATT:STEP?`
Notes	This feature has a toggle choice from the front panel, but it takes a specific value (in dB) when used remotely. The only valid values are 2 and 10
Dependencies	Blanked in EXA, CXA and CXA-m if option FSA (2 dB steps) is not present. If blanked, attempts to set it via SCPI yield an error
Couplings	When the attenuation step size changes, the current mechanical attenuation value is adjusted (if necessary) to be quantized to the new step size. That is, if step is set to 10 dB, mech atten is increased if necessary so it is a multiple of 10 dB
Preset	EXA, CXA and CXA-m: 10 dB (2 dB with option FSA) All other models: 2 dB
State Saved	Saved in instrument state

3.8.3.3 Range (Non-attenuator models)

This tab is only available for Keysight's modular signal analyzers and certain other Keysight products. Examples include:

- VXT
- E7760
- M9391A
- M9393A

This tab also does not appear in UXM. In UXM, all Attenuation and Range settings are disabled, as the expected input power level is handled by the Call Processing App that drives the DUT power control.

State Saved	No

Range

Represents the amplitude of the largest sinusoidal signal that could be present within the IF without being clipped by the ADC. For signals with high peak-to-average ratios, the range may need to exceed the rms signal power by a significant amount to avoid clipping.

This is a measurement global setting.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe <real>` `[:SENSe]:POWer[:RF]:RANGe?`
Example	`:POW:RANG 10 dBm` `:POW:RANG?`
Notes	The MIN and MAX values are affected by the External Gain parameters, and by the **Center Frequency** The hardware compensates for frequency response and alters the Range setting
Preset	0 dBm
State Saved	Yes
Min	-100
Max	100
Annotation	Meas Bar

Adjust Range for Min Clipping

Sets the combination of attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an "immediate action" function, that is, it executes once, when the key is pressed.

This key does not appear in measurements that do not support this functionality.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMediate`
Notes	Executing Adjust Range for Min Clipping initiates the measurement
Dependencies	This control does not appear in the Swept SA and Monitor Spectrum measurements This control appears in all measurements in E7760

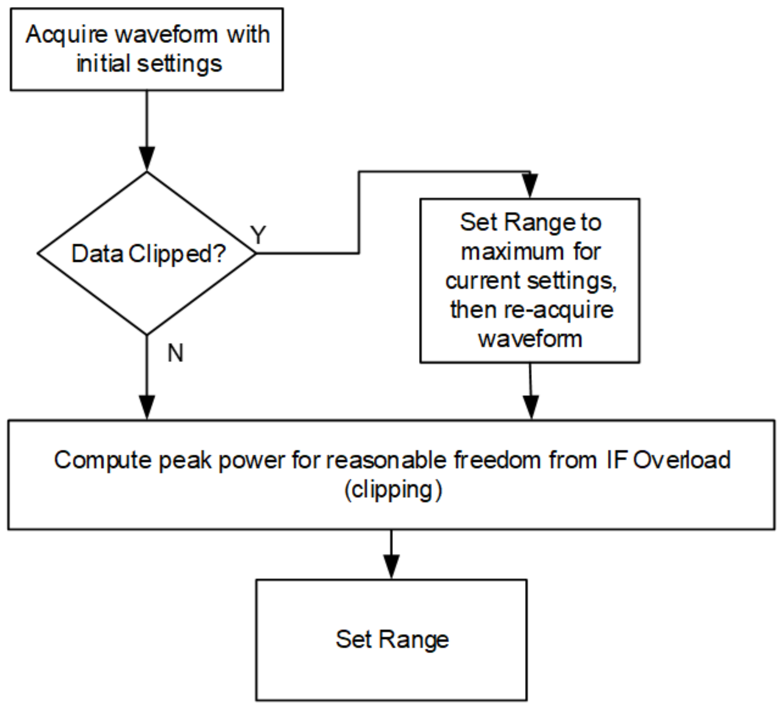
Pre-Adjust for Min Clipping

If this function is `ON`, it applies the adjustment described under Adjust Range For Min Clipping each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF | ON | ELECtrical | COMBined` `[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?`
Notes	Because there is no attenuator control available in these models, the control displays only `ON` and `OFF` choices. However, for SCPI compatibility with other platforms, all three parameters (`ELECtrical`, `COMBined`, and `ON`) are honored and all are mapped to `ELECtrical`, so if any of these three parameters is sent, a subsequent query will return `ELEC`
Dependencies	This control does not appear in the Swept SA and Monitor Spectrum measurements This control appears in all measurements in E7760
Preset	`OFF` for Swept SA measurement; `ON` for all other measurements that support **Pre-Adjust for Min Clipping**
State Saved	Saved in instrument state

Adjustment Algorithm

The algorithm for the adjustment is documented below:



Peak-to-Average Ratio

Used with "Range (Non-attenuator models)" on page 1864 to optimize the level control in the instrument. The value is the ratio, in dB, of the peak power to the average power of the signal to be measured. A ratio of 0 should be used for sinusoidal signals; for 802.11g OFDM signals use 9 dB.

All Applications (Modes) show the current value of Peak-to-Average ratio on the control. However, some applications do not permit changing the value. In these situations, the control is grayed-out.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:PARatio <real>` `[:SENSe]:POWer[:RF]:RANGe:PARatio?`
Example	`:POW:RANG:PAR 12 dB`
Notes	In some Applications (Modes) this parameter is read-only; meaning the value will appear on the control and query via SCPI, but is not changeable. In such applications the control is grayed-out. Attempting to change the value via SCPI will be ignored but no error message will be generated
Dependencies	This control does not appear in Spectrum Analyzer Mode
Preset	10 dB VXT Models M9410A/11A: 0 dB
State Saved	Saved in instrument state
Min	0 dB
Max	20 dB VXT Models M9410A/11A: 50 dB

Mixer Lvl Offset

This is an advanced setting to adjust target Range at the input mixer, which in turn affects the signal level in the instrument's IF. This setting can be used when additional optimization is needed after setting "Peak-to-Average Ratio" on page 1866. Positive values of offset optimize noise performance over distortion, negative values optimize distortion performance over noise.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet <real>` `[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet?`
Example	`:POW:RANG:MIX:OFFS -5 dB`
Preset	0 dB
State Saved	Saved in instrument state
Min	-35 dB VXT Models M9410A/11A: -34 dB
Max	30 dB

3.8.3.4 Signal Path

Contains controls that pertain to the routing of the signal through the frontend of the instrument.

In general, this tab only appears in instruments whose hardware supports this signal routing. For example, this tab does not appear in many of the modular instrument products, including VXT Models M9420/21A. It also does not appear in UXM.

This tab *does* appear in VXT Models M9410A/11A because the Software Preselection control is in this tab, and VXT Models M9410A/11A implement a version of Software Preselection.

Presel Center

Pressing this control adjusts the centering of the preselector filter to optimize the amplitude accuracy at the frequency of the selected marker. If the selected marker is not on when **Presel Center** is pressed, the instrument turns on the selected marker, performs a peak search, and then performs centering on the marker's center frequency. If the selected marker is already on and between the start and stop frequencies of the instrument, the instrument performs the preselector calibration on that marker's frequency. If the selected marker is already on, but outside the frequency range between Start Freq and Stop Freq, the instrument first performs a peak search, and then performs centering on the marker's center frequency.

The value displayed on "Preselector Adjust" on page 1869 will change to reflect the new preselector tuning.

A number of considerations should be observed to ensure proper operation. See "Proper Preselector Operation" on page 969.

Remote Command	`[:SENSe]:POWer[:RF]:PCENter`
Example	`:POW:PCEN`
Notes	Note that the rules outlined above under the control description apply for the remote command as well as the key. The result of the command is dependent on marker position, etc. Any message shown by the control press is also shown in response to the remote command
Dependencies	Does not appear in CXA-m Does not appear in VXT Models M9410A/11A Grayed-out if the microwave preselector is off – If the selected marker's frequency is below Band 1, an advisory message is generated "Preselector not used in this frequency range" and no action is taken – Grayed-out if entirely in Band 0, that is, if Stop Freq is below about 3.6 GHz – Grayed-out if entirely above 50 GHz, that is, if Start Freq is above 50 GHz – Blank in models that do not include a preselector, such as option 503. If the remote command is sent in these instruments, it is accepted without error, and the query always returns 0 – Grayed-out in the Spectrogram View
Couplings	The active marker position determines where the centering will be attempted If the instrument is in a measurement such as averaging when centering is initiated, the act of centering the preselector restarts averaging, but the first average trace will not be taken until the centering is completed The offset applied to do the centering reads out on the "Preselector Adjust" on page 1869 control
Status Bits/OPC dependencies	When centering the preselector, `*OPC` will not return true until the process is complete and a subsequent measurement has completed, nor will results be returned to `:READ` or `:MEASure` queries The Measuring bit should remain set while this command is operating and should not go false until the subsequent sweep/measurement has completed

Proper Preselector Operation

A number of considerations should be observed to ensure proper operation:

1 If the selected marker is off, the instrument turns on a marker, performs a peak search, and adjusts the preselector using the selected marker's frequency. It uses the "highest peak" peak search method unqualified by threshold or excursion, so that there is no chance of a 'no peak found' error. It continues with that peak, even if it is the peak of just noise. Therefore, for this operation to work properly, there should be a signal on screen in a preselected range for the peak search to find

2 If the selected marker is already on, the instrument attempts the centering at that marker's frequency. There is no preselector for signals below about 3.6 GHz, so if the marker is on a signal below 3.6 GHz, no centering will be attempted and an advisory message generated

3 In some models, the preselector can be bypassed. If it is bypassed, no centering will be attempted in that range and a message will be generated

Preselector Adjust

Allows you to manually adjust the preselector filter frequency to optimize its response to the signal of interest. This function is only available when "Presel Center" on page 1868is available.

For general purpose signal analysis, using **Presel Center** is recommended. Centering the filter minimizes the impact of long-term preselector drift. **Preselector Adjust** can be used instead to manually optimize the preselector. One application of manual optimization would be to peak the preselector response, which both optimizes the signal-to-noise ratio and minimizes amplitude variations due to small (short-term) preselector drifting.

When **Presel Center** is performed, the offset applied to do the centering becomes the new value of **Preselector Adjust**.

Remote Command	`[:SENSe]:POWer[:RF]:PADJust <freq>` `[:SENSe]:POWer[:RF]:PADJust?`
Example	`:POW:PADJ 100KHz` `:POW:PADJ?`
Notes	The value on the control reads out to 0.1 MHz resolution
Dependencies	– Does not appear in CXA-m – Does not appear in VXT Models M9410A/11A – Grayed-out if microwave preselector is off – Grayed-out if entirely in Band 0, that is, if Stop Freq is below about 3.6 GHz – Grayed-out if entirely above 50 GHz, that is, if Start Freq is above 50 GHz – Blank in models that do not include a preselector, such as option 503. If the SCPI is sent in these instruments, it is accepted without error, and the query always returns 0 – Grayed-out in the Spectrogram View
Preset	0 MHz
State Saved	The **Preselector Adjust** value set by "Presel Center" on page 1868, or by manually adjusting **Preselector Adjust** It is not saved in instrument state, and does not survive a Preset or power cycle
Min	-500 MHz
Max	500 MHz
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:MW:PADJust` `[:SENSe]:POWer[:RF]:MMW:PADJust`

Notes	PSA had multiple preselectors, and you could select which preselector to adjust. Since the X-Series has only one mm/uW preselector, the preselector selection control is no longer available. However, to provide backward compatibility, we accept the legacy remote commands The command form has no effect, the query always returns `MWAVe`
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:PADJust:PRESelector MWAVe | MMWave | EXTernal` `[:SENSe]:POWer[:RF]:PADJust:PRESelector?`

Internal Preamp

Accesses a menu of controls for the internal preamps. Turning on the preamp gives a better noise figure, but a poorer inter-modulation distortion (TOI) to noise floor dynamic range. You can optimize this setting for your particular measurement.

The instrument takes the preamp gain into account as it sweeps. If you sweep outside of the range of the preamp, the instrument will also account for that. The displayed result always reflects the correct gain.

For some measurements, when the preamp is on and any part of the displayed frequency range is below the lowest frequency for which the preamp has specifications, a warning condition message appears in the status line. For example, for a preamp with a 9 kHz lowest specified frequency: "Preamp: Accy unspec'd below 9 kHz".

Selection	Example	Note
Off	`:POW:GAIN OFF`	
Low Band	`:POW:GAIN ON` `:POW:GAIN:BAND LOW`	Sets the internal preamp to use only the low band. The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Low Band selection in the dropdown
Full Range	`:POW:GAIN ON` `:POW:GAIN:BAND FULL`	Sets the internal preamp to use its full range. The low band (0-3.6 GHz, 0-3.4 GHz, 0-3GHz, depending on the model) is supplied by the low band preamp and the frequencies above low band are supplied by the high band preamp The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Full Range selection in the dropdown. If the high band option is not installed the Full Range selection does not appear

Remote Command	`[:SENSe]:POWer[:RF]:GAIN:BAND LOW | FULL` `[:SENSe]:POWer[:RF]:GAIN:BAND?`

	`[:SENSe]:POWer[:RF]:GAIN[:STATe] OFF | ON | 0 | 1` `[:SENSe]:POWer[:RF]:GAIN[:STATe]?`

Example	`:POW:GAIN:BAND LOW`
	`:POW:GAIN:BAND?`
	`:POW:GAIN OFF`
	`:POW:GAIN?`

Dependencies	Preamp is not available on all hardware platforms. If the preamp is not present or is unlicensed, the control is not shown Does not appear in VXT Models M9410A/11A/15A If `:POW:GAIN:BAND FULL` is sent when a low band preamp is available, the preamp band parameter is set to `LOW` instead of `FULL`, and an "Option not installed" message is generated The preamp is not available when the electronic/soft attenuator is enabled
Preset	`LOW` `OFF`
State Saved	Saved in instrument state
Annotation	When the USB Preamp is not connected to USB, the Preamp annotation in the Meas Bar says "Off" if the preamp is off and displays the frequency range of the low band or full range preamp depending on the setting. For example, if the Preamp is set to Low Band and the Low Band is 3.6 GHz the annotation says "3.6 GHz". If it is a 13.6 GHz preamp and it is set to Full Range the annotation says "13.6 GHz" When the USB Preamp is connected to USB, the Preamp annotation says "Preamp: USB" if the internal preamp is off or "Preamp: USB, Int" if the internal preamp is on (only for measurements that support the USB preamp)

LNA

Lets you turn the Low Noise Amplifier (**LNA**) on or off.

The LNA is an additional preamplifier that provides superior DANL and frequency range compared to the Internal Preamp. The LNA provides lower system noise figure, especially at frequencies above 100 MHz, and can be operated up to the full range of 50 GHz instruments.

For best possible sensitivity, the LNA can be turned on together with the "Internal Preamp" on page 1870, although if you operate both preamps together, note that the TOI (distortion) specifications are impacted. The sensitivity improvement of this combination is substantial when operating in high band (frequencies above 3.6 GHz).

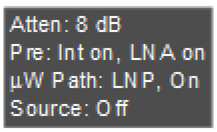
See "More Information" on page 973

Remote Command	`[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe] OFF | ON | 0 | 1` `[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe]?`
Example	`:POW:GAIN:LNA ON`

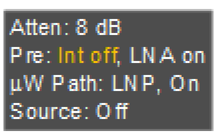
Dependencies	Requires option LNA Option LNA is not required by VXT model M9415A Does not appear in VXT models M9420A/21A/10A/11A May not appear in some measurements
Preset	OFF
State Saved	Saved in State

More Information

When the LNA is installed, the preamp annotation changes to show the state of both the LNA and the Internal Preamp. Below is an example:



Note that when operating entirely in the low band (below about 3.6 GHz), if the LNA is on, the Internal Preamp is switched off (even if you have its switch set to ON). This is because the noise performance is actually degraded in low band if both preamps are on. In this case, the annotation reflects the actual state of the two preamps, but the Internal Preamp annotation displays in amber, to warn you that the actual state of the Internal Preamp does not match the **Internal Preamp** switch control display:



µW Path Control

Options for this control include **µW Preselector Bypass** (Option MPB), **Low Noise Path** (Option LNP) and **Full Bypass Enable** in the High Band path circuits.

When the µW Preselector is bypassed, flatness is improved, but will be subject to spurs from out of band interfering signals. When **Low Noise Path Enable** is selected, the instrument automatically bypasses certain circuitry in the high frequency bands that can contribute to noise, when it is appropriate based on other instrument settings.

For most applications, the preset state is **Standard Path**, which provides the best remote-control throughput, minimizes acoustic noise from switching and minimizes the risk of wear in the hardware switches, particularly in remote test scenarios where both low band and high band setups will follow in rapid succession. In this path, the bypass of the low band/high band switch and microwave preamp is never activated, which can cause some noise degradation but preserves the life of the bypass switch.

For applications that utilize the wideband IF paths, the preset state is **µW Preselector Bypass**, if option MPB is present. This is because, when using a wideband IF such as the 140 MHz IF, the µW Preselector's bandwidth can be narrower than the available IF bandwidth, causing degraded amplitude flatness and phase linearity, so it is desirable to bypass the preselector in the default case.

You may choose **Low Noise Path Enable** for a lower noise floor, especially in the 21-26.5 GHz region, though without improving many measures of dynamic range, and without giving the best possible noise floor. The preamp, if purchased and used, gives better noise floor than does **Low Noise Path Enable**, but the preamp's compression threshold and third-order intercept are much poorer than that of **Low Noise Path Enable**.

A fourth choice is **Full Bypass Enable**, which combines **µW Preselector Bypass** and **Low Noise Path Enable**. Because this can bypass most of the circuitry between the input and the first mixer, care should be taken when using this setting to avoid damaging the mixer. **Full Bypass Enable** is only available if both options LNP and MPB are present, as well as option FBP.

Path	Example	Note
Standard Path	`:POW:MW:PATH STD`	Normal setting for most measurements. µW Preselector in circuit, Low Noise Path disabled
Low Noise Path Enable	`:POW:MW:PATH LNP`	See "Low Noise Path Enable" on page 978
µW Preselector Bypass	`:POW:MW:PATH MPB`	See "µW Preselector Bypass" on page 980
Full Bypass Enable	`:POW:MW:PATH FULL`	See "Full Bypass Enable" on page 980

Remote Command	`[:SENSe]:POWer[:RF]:MW:PATH STD | LNPath | MPBypass | FULL` `[:SENSe]:POWer[:RF]:MW:PATH?`

Example	`:POW:MW:PATH LNP`
	Enables the Low Noise path
	`:POW:MW:PATH?`

Notes	If "Presel Center" on page 1868 is performed, the instrument will momentarily switch to the Standard Path, regardless of the setting of **µW Path Control** The DC Block will always be switched in when the low noise path is switched in, to protect succeeding circuitry from DC. Note that this does not mean "when the low noise path is enabled" but when, based on the Low Noise Path rules, the path is actually switched in. This can happen when the selection is **Low Noise Path Enable** or **Full Bypass Enable**. In the case where the DC Block is switched in the instrument is now AC coupled. However, if you selected DC coupling, the UI would still behave as though it were DC coupled, including all annunciation, warnings, status bits, and responses to SCPI queries. This is because, based on other settings, the instrument could switch out the low noise path at any time and hence go back to being DC coupled Alignment switching ignores the settings in this menu, and restores them when finished
Dependencies	Does not appear in CXA-m

	Does not appear in VXT Models M9410A/11A Does not appear in BBIQ and External Mixing The **Low Noise Path Enable** selection does not appear unless Option LNP is present and licensed The **µW Preselector Bypass** selection does not appear unless Option MPB is present and licensed The **Full Bypass Enable** selection does not appear unless options LNP and MPB are both present as well as option FBP In any of these cases, if the required options are not present and the SCPI command is sent, error -241, "Hardware missing; Option not installed" is generated **Low Noise Path Enable** and **Full Bypass Enable** are grayed-out if the current measurement does not support them **Low Noise Path Enable** and **Full Bypass Enable** are not supported in Avionics and MMR Modes. In any of these cases (that is, the feature is not supported in either measurement or mode), if the SCPI command is sent, the following error is generated: -221, “Setting Conflict; Feature not supported for this measurement”
Preset	All except modes specified below: `STD` IQ Analyzer, VXA, Pulse and Avionics mode: – MPB option present and licensed: `MPB` – MPB option not present and licensed: `STD`
State Saved	Save in instrument state
Range	Standard Path|Low Noise Path Enable|µW Presel Bypass|Full Bypass Enable
Annotation	In the Meas Bar, if the Standard path is chosen, it says: µW Path: Standard If Low Noise Path is enabled but the LNP switch is not thrown, it shows: µW Path: LNP,Off If the Low Noise Path is enabled and the LNP switch IS thrown, it shows: µW Path: LNP,On If the preselctor is bypassed, it says: µW Path: Bypass If Full Bypass Enable is selected but the LNP switch is not thrown, it shows: µW Path: FByp,Off If Full Bypass Enable is selected and the LNP switch IS thrown, it shows: µW Path: FByp,On

µW Path Control Auto [Mode: VMA, WLAN, NR5G, CQM]

In VMA, WLAN, 5G NR, CQM modes, an Auto/Man switch is added to **µW Path Control**:

This allows the function to automatically switch based on certain Auto Rules as shown below:

VMA Mode

Measurement	When µW Path Control is in Auto:
Digital Demod	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Monitor Spectrum	Always Presel Bypass
IQ Waveform	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Custom OFDM	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Channel Power	Always Presel Bypass
Occupied BW	Always Presel Bypass
CCDF	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
ACP	Always Presel Bypass
SEM	Always Presel Bypass
Spurious Emissions	Always Standard Path

WLAN Mode

Measurement	When µW Path Control is in Auto:
Modulation Analysis	Always Presel Bypass
Spectral Flatness	Always Presel Bypasss
Power vs Time	Always Presel Bypass
Monitor Spectrum	Always Presel Bypass
IQ Waveform	Always Presel Bypass
Channel Power	Always Presel Bypass
Occupied BW	Always Presel Bypass
CCDF	Always Presel Bypass
SEM	1. For 11be 320M, when 'Enabled Wideband IF for FFT' is OFF or 'Sweep Type Rule' is Best Dynamic Range, auto µW path is standard. 2. For other cases, auto µW path is presel bypass if presel bypass is enabled,

Measurement	When µW Path Control is in Auto:
	auto µW path is standard if presel bypass is not enabled.
Spurious Emissions	Always Standard Path

5G NR Mode

Measurement	When µW Path Control is in Auto:
Modulation Analysis	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Full Bypass if conditions warrant(FBP Option is available and “Allow Full Bypass in Auto” is On), otherwise choose Preselector Bypass
Monitor Spectrum	Always Standard Path
IQ Waveform	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Full Bypass if conditions warrant(FBP Option is available and “Allow Full Bypass in Auto” is On), otherwise choose Preselector Bypass
Channel Power	Always Standard Path
Occupied BW	Always Standard Path
CCDF	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
ACP	Always Standard Path
SEM	Always Standard Path
Spurious Emissions	Always Standard Path
Transmit On|Off Power	Use Standard Path unless tuned frequency > 3.6 GHz and Info BW > 15 MHz, in which case choose Preselector Bypass

Channel Quality Mode

Measurement	When µW Path Control is in Auto:
Group Delay	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Full Bypass if conditions warrant(FBP Option is available and “Allow Full Bypass in Auto” is On), otherwise choose Preselector Bypass
Monitor Spectrum	Always Standard Path
IQ Waveform	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
CCDF	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass

Remote Command	`[:SENSe]:POWer[:RF]:MW:PATH:AUTO ON | OFF | 1 | 0` `[:SENSe]:POWer[:RF]:MW:PATH:AUTO?`
Example	`:POW:MW:PATH:AUTO ON` `:POW:MW:PATH:AUTO?`

Dependencies	Only appears in VMA, WLAN, 5G NR and CQM modes
Couplings	See the tables above
Preset	ON
Range	ON|OFF

Low Noise Path Enable

You may select **Low Noise Path Enable**, which gives a lower noise floor under some circumstances, particularly when operating in the 21-26.5 GHz region. With the Low Noise Path enabled, the low band/high band switch and microwave preamp are bypassed whenever all of the following are true:

– The instrument is not in the Low Band, meaning:

– the start frequency is above 3.5 GHz and

– the stop frequency is above 3.6 GHz

– the internal preamp is not installed or (if installed) is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Low Noise Path Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the **Low Noise Path Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Low Noise Path Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

For measurements that use IQ acquisition, the low noise path is used when **Center Frequency** is in High Band (> 3.6 GHz) and no preamp is in use. In other words, the rules above are modified to use only the center frequency to qualify which path to switch in. This is not the case for FFTs in the Swept SA measurement; they use the same rules as swept measurements.

Note that the Low Noise Path, while giving improved DANL, has the disadvantage of decreased TOI performance and decreased gain compression performance relative to the standard path.

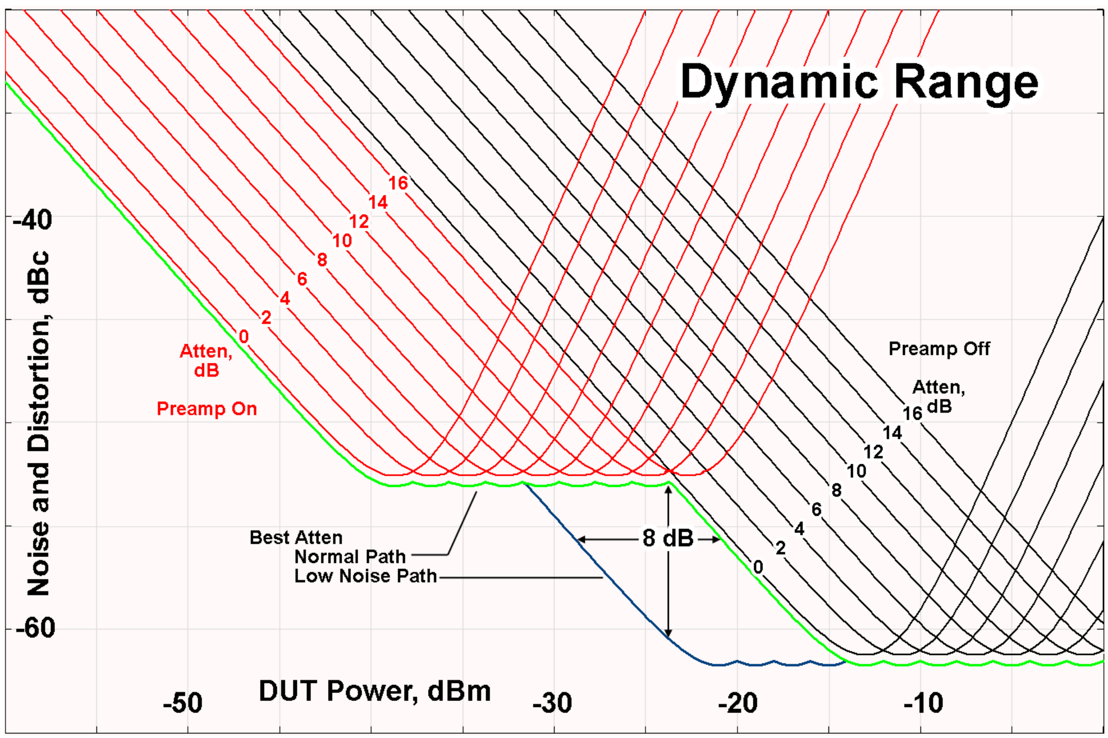
Note also that the bypass switch is a mechanical switch and has finite life, so if the **Low Noise Path Enable** is selected, it is possible to cause frequent cycling of this switch by frequently changing instrument settings such that the above conditions hold true only some of the time. A user making tests of this nature should consider opting for the **Standard Path**, which will never throw the bypass switch, at the expense of some degraded noise performance.

The low noise path is useful for situations where the signal level is so low that the instrument performance is dominated by noise even with 0 dB attenuation, but still high enough that the preamp option would have excessive third-order intermodulation or compression. The preamp, if purchased and used, gives better

noise floor than does the “Low Noise Path.” However, its compression threshold and third-order intercept are much poorer than that of the non-preamp path.

There are some applications, typically for signals around –30 dBm, for which the third-order dynamic range of the standard path is good enough, but the noise floor is not low enough even with 0 dB input attenuation. When the third-order dynamic range of the preamp path is too little and the noise floor of the standard path is too high, the Low Noise Path can provide the best dynamic range

The graph below illustrates the concept. It shows, in red, the performance of an instrument at different attenuation settings, both with the preamp on and off, in a measurement that is affected by both instrument noise and instrument TOI. The green shows the best available dynamic range, offset by 0.5 dB for clarity. The blue shows how the best available dynamic range improves for moderate signal levels with the low noise path switched in. In this illustration, the preamp improves the noise floor by 15 dB while degrading the third-order intercept by 30 dB, and the low noise path reduces loss by 8 dB. The attenuator step size is 2 dB.



There are other times where selecting the low noise path improves performance, too. Compression-limited measurements such as finding the nulls in a pulsed-RF spectrum can profit from the low noise path in a way similar to the TOI-limited measurement illustrated. Accuracy can be improved when the low noise path allows the optimum attenuation to increase from a small amount like 0, 2 or 4 dB to a larger amount, giving better return loss at the instrument input. Harmonic measurements, such as second and third harmonic levels, are much improved using the low noise path because of the superiority of that path for harmonic (though not intermodulation) distortion performance.

µW Preselector Bypass

Toggles the preselector bypass switch for band 1 and higher. When the microwave presel is on, the signal path is preselected. When the microwave preselector is off, the signal path is not preselected. The preselected path is the normal path for the instrument.

The preselector is a tunable bandpass filter which prevents signals away from the frequency of interest from combining in the mixer to generate in-band spurious signals (images). The consequences of using a preselector filter are its limited bandwidth, the amplitude and phase ripple in its passband, and any amplitude and phase instability due to center frequency drift.

Option MPB or pre-selector bypass provides an unpreselected input mixer path for certain X-Series signal analyzers with frequency ranges above 3.6 GHz. This signal path allows a wider bandwidth and less amplitude variability, which is an advantage when doing modulation analysis and broadband signal analysis. The disadvantage is that, without the preselector, image signals will be displayed. Another disadvantage of bypassing the preselector is increased LO emission levels at the front panel input port.

Image responses are separated from the real signal by twice the 1st IF. For IF Paths of 10 MHz and 25 MHz, the 1st IF is 322.5 MHz, so the image response and the real signal will be separated by 645 MHz. The 1st IF will be different for other IF Path settings. When viewing a real signal and its corresponding image response in internal mixing, the image response will be to the left of the real signal.

Also, the image response and the real signal typically have the same amplitude and exhibit the same shape factor.

However, if Option FS1, Fast Sweep Capability, is enabled, the image response in the Swept SA measurement appears lower in amplitude and has a much wider shape factor compared to the real signal.

Full Bypass Enable

With **Full Bypass Enable** selected, the microwave preselector is bypassed. In addition, the low band/high band switch and microwave preamp are bypassed whenever all of the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz.
- the internal preamp is not installed or (if installed) is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. The only time the Low

Noise Path is used is when **Full Bypass Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

CAUTION: When **Full Bypass Enable** is selected, and "Attenuation" on page 1747 is set to 0 dB, there will be a direct AC connection between the input and the first converter when the Low Noise Path switches in (when Start Freq >3.6 GHz and the Preamp is either not licensed, set to Low Band, or Off). This puts the first converter at high risk to be damaged by high AC power. Consequently, whenever **Full Bypass Enable** is selected, a warning message appears in the status bar:

Full Bypass Enabled, maximum safe input power reduced

Microwave Preselector Bypass Backwards Compatibility

Example	`:POW:MW:PRES OFF` Bypasses the microwave preselector
Notes	Included for Microwave Preselector Bypass backwards compatibility The `ON` parameter sets the `STD` path (`:POW:MW:PATH STD`) The `OFF` parameter sets path `MPB` (`:POW:MW:PATH MPB`)
Preset	`ON`
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe] ON | OFF | 0 | 1` `[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe]?`

Frequency Extender Preselection Bypass

Frequency Extender Preselection Bypass only applies to the high frequency path of the Frequency Extender and only if the Frequency Extender allows it. For example, the V3050A high frequency path is 50 – 110 GHz and does allow control of the preselector bypass.

When the Frequency Extender's preselection is bypassed, flatness is improved, but will be subject to spurs from out of band interfering signals. For bandwidths greater than 2.5 [GHz], it is recommended that the signal bypass the Frequency Extender Preselector since the max bandwidth of the Preselector can be as narrow as 2.5 [GHz].

For most applications, the preset state is `OFF`, which gives the best remote-control throughput, minimizes acoustic noise from switching, minimizes out of band spurs, and minimizes the risk of wear in the hardware switches.

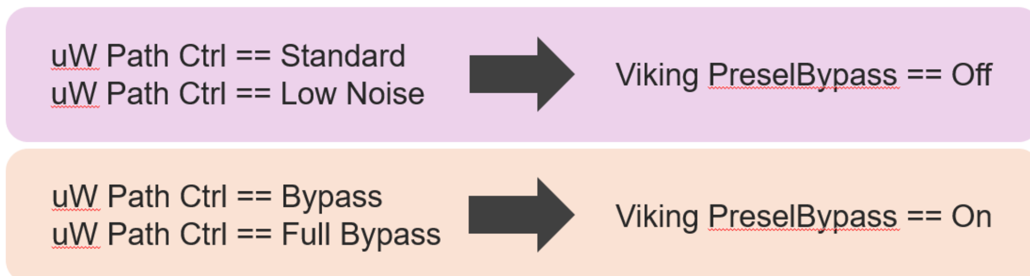
Coupling with Microwave Preselector Control

The control of whether to apply or bypass the Frequency Extender's preselection is dependent on the Microwave Path Control setting.

The coupling between the Microwave Path Control and Frequency Extender Preselector Bypass is described below.

UW PATH CTRL	UW PRESELECTOR	VIKING PRESELECTOR
Standard Path	On	**On**
Low Noise Path Enable	On	**On**
uW Presel Bypass	Off	**Off**
Full Bypass Enable	Off	**Off**

In other words…



For the Frequency Extender Preselector Bypass to take effect, it requires a Frequency Extender device (such as V3050A) be connected and External RF (ERFIN) selected as the input.

The Frequency Extender Preselector is applied or bypassed depending on the Microwave Path Control setting only when the acquisition is above 50 [GHz]. Hence, it will be bypassed only when the acquisition is above 50 [GHz].

Preselector and Bandwidth Conflict

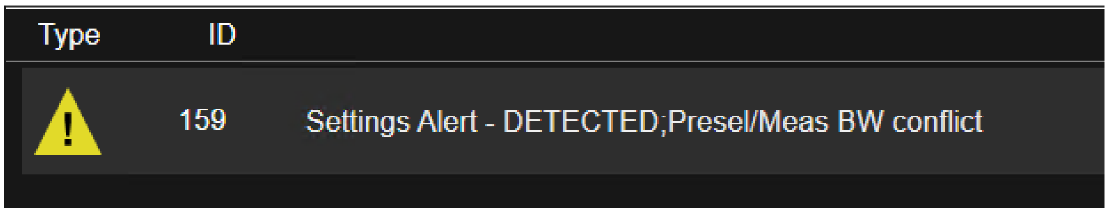
When the Frequency Extender Preselector is applied and the signal bandwidth is greater than 2.5 [GHz], then a settings alert message will show to warn the user that the signal may be distorted due to the limitation of the Frequency Extender Preselector bandwidth.

An example of the settings alert message is shown below.

Settings Alert message in the Status Bar at the bottom of the display.

Settings Alert message in the error queue

.



Software Preselection

Software Preselection is provided in some instruments, either to compensate for issues with provided hardware preselection or to provide the preselection function when there is no hardware preselector.

N9041B

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

In the N9041B, Software Preselection only applies for frequencies above 50 GHz, therefore it is only used for RF Input 2. Even if it is turned on, it will not be used for other inputs and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that in the N9041B, in Swept SA, Software Preselection will work even if the measurement is using an FFT sweep type. In measurements other than Swept SA, Software Preselection will not be used if the measurement is using an FFT sweep type.

N9042B+V3050A

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 88 GHz, software preselection must be used to suppress and separate images above 88 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

For N9042B+V3050A, Software Preselection only applies for frequencies above 88 GHz, therefore it is only used for External RF. Even if it is turned on, it will not be used for other inputs and never for frequencies below 88 GHz. This is why the label of this control contains the parenthetical note “(>~88 GHz)”.

Note that for N9042B+V3050A, in Swept SA, Software Preselection will work even if the measurement is using an FFT sweep type. In measurements other than Swept SA, Software Preselection will not be used if the measurement is using an FFT sweep type.

VXT models M9410A/11A

Software Preselection is used to provide the preselection function, as there is no hardware preselector in these models. Two background traces are taken and compared point by point, and the point with the lowest amplitude from the two traces is used. This provides a method to reduce spurs that are internally generated within the VXT, but the user should note the following when using Software Preselection:

- There is some speed cost due to the need to take multiple captures
- Taking the point with the lowest amplitude in each trace will make the average noise level lower at all points that do not have a spur. This can reduce the accuracy of the measurement of noise and noise-like signals.

Because of the difficulty in identifying spurs manually, you are encouraged to leave Software Preselection ON at all times in VXT models M9410A/11A. If you turn it off in order to speed up your measurement or improve noise accuracy, be aware of unwanted onscreen spurs.

Remote Command	`[:SENSe]:POWer[:RF]:SWPResel:STATe 0 | 1 | ON | OFF` `[:SENSe]:POWer[:RF]:SWPresel:STAT?`
Example	`:POW:SWPR:STAT 1` `:POW:SWPR:STAT?`
Dependencies	Only appears in N9041B, N9042B+V2050A, and VXT models M9410A/11A. Does not appear in all measurements
Couplings	Sweep Time is affected by SW Preselection. Also Auto Tune supports SW Preselection, so set SW Preselection state and then do Auto Tune
Preset	N9041B: OFF N9042B+V3050A: ON M9410A/11A: ON
State Saved	Saved in instrument state

SW Preselection Type

Specifies the algorithm used for software preselection.

Two hidden sweeps are taken in succession. The second sweep is offset in LO frequency by 2*IF/N. For each point in each trace, the smaller amplitude from the two traces is taken and placed in that point in the selected trace. The Peak detector is auto-selected to improve the image suppression effectiveness. Responses of each trace that lie on top of one another will remain and are valid signals. Other signals are images and are suppressed. The action of taking the smaller of the two traces will make the average noise level lower in all points that do not have an image, thus reducing the accuracy of the measurement of noise and noise-like signals.

- NORMal - mathematically removes all image and multiple responses of signals present at the input
- ADVanced - any trace processing (such as "max hold" or trace averaging) is performed on the points of both candidate traces before the "select minimum" operation occurs. This form of processing works better for non-stationary signals, such as pulsed-RF signals

Remote Command	[:SENSe]:POWer[:RF]:SWPResel NORMal | ADVanced [:SENSe]:POWer[:RF]:SWPResel?
Example	:POW:SWPR NORM :POW:SWPR?
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method When "Software Preselection" on page 1883 is Disabled, this control is grayed-out. Its grayout message is "Unavailable unless SW Presel enabled"
Preset	N9041B: ADVanced N9042B+V3050A: NORMal
State Saved	Saved in instrument state

SW Preselection BW

Specifies the effective bandwidth to be used for Software Preselection.

The choices are:

- NORMal – when making Swept measurements, a software preselection algorithm is used which takes up to 4 background acquisitions, then post-processes the result. This algorithm can remove images from signals with an occupied bandwidth up to around 3 GHz. (Default/Preset setting). When making FFT measurements, this algorithm is not used, instead the same algorithm is used as for NARRow (below)
- NARRow– a software preselection algorithm is used which takes two background acquisitions, then post-processes the result to detect and remove images from wideband signals with occupied bandwidths up to 2 GHz. This increases the risk of images failing to be rejected, but improves the measurement speed

Remote Command	[:SENSe]:POWer[:RF]:SWPResel:BW NORMal | NARRow [:SENSe]:POWer[:RF]:SWPResel:BW?
Example	:POW:SWPR:BW NARR
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method When "Software Preselection" on page 1883 is Disabled, this control is grayed out. Its grayout message is "Unavailable unless SW Presel enabled" For N9042B+V3050A the parameter is SCPI only and always set to NARRow when Software

	Preselection is enabled
Preset	N9041B: NORMal N9042B+V3050A: NARRow
State Saved	Saved in instrument state

High Freq Prefilter

Lets you set the state of Prefilter for Center Frequencies above 1310 MHz.

In VXT Models M9410A/11A, the Receiver RF path has a bank of filters that come after the RF Attenuator in the signal path. Since this bank of filters precedes the mixer they are known as the "Prefilter" bank. Their purpose is to eliminate unwanted in-band mixing products by filtering out all but the desired frequencies before the signals get to the mixer. There are 13 prefilter bands to cover the frequencies between 9 kHz and 6000 MHz. The Prefilter provides the necessary rejection of the unwanted signal.

Remote Command	`[:SENSe]:<measurement>:PFILter[:STATe] ON | OFF | 1 | 0` `[:SENSe]:<measurement>:PFILter[:STATe]?`

Example	For example, to enable High Freq Prefilter in IQ Analyzer Mode:
	For the Complex Spectrum Measurement:
	`:SPEC:PFIL ON`
	For the IQ Waveform Measurement:
	`:WAV:PFIL ON`
	`:`

Dependencies	This control only appears in VXT models M9410A/11A with center frequency above 1310 MHz
Preset	See "Prefilter Presets" below
State Saved	Saved in instrument state

Prefilter Presets

Meas	Mode	Preset
SPEC	BASIC	OFF
WAV	BASIC, WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA	OFF
MON	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA	OFF
RHO	WCDMA	OFF
CDP	WCDMA	OFF
PCON	WCDMA	OFF
EVMQ	WCDMA	OFF
CHP	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF

Meas	Mode	Preset
OBW	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
ACP	WCDMA, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
SEM	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
PST	WCDMA, WLAN, LTEAFDD, LTEATDD, 5GNR, VMA, SA	OFF
PVT	WLAN, LTEAFDD, LTEATDD, 5GNR	OFF
EVM	WLAN, LTEAFDD, LTEATDD, 5GNR	OFF
FLAT	WLAN	OFF
EVMM	WLAN	OFF
CEVM	LTEAFDD, LTEATDD	OFF
PAVT	5GNR, VMA	OFF
DDEM	VMA	OFF
OFDM	VMA	OFF
SAN	SA	ON
HARM	SA	ON

3.8.4 BW

The BW key opens the bandwidth menu, which contains controls for the Resolution Bandwidth and Video Bandwidth functions of the instrument.

The Resolution BW functions control filter bandwidth and filter type. There are two filter types, Gaussian and Flattop. The Gaussian filters have a response curve that is parabolic on a log scale. The Flattop filter shape is a close approximation of a rectangular filter.

3.8.4.1 Settings

The Settings tab contains the basic Bandwidth functions. In most measurements it is the only tab under Bandwidth.

Res BW

Activates the resolution bandwidth active function, which allows you to manually set the resolution bandwidth (RBW) of the instrument.

Normally, Res BW (Auto) selects automatic coupling of the Res BW to Span using the ratio set by the Span:3 dB RBW control (some measurements do not have a Span:3 dB RBW control, in which case the measurement chooses the optimal ratio). To decouple the resolution bandwidth, press the Auto/Man toggle on the Res BW control, or simply enter a different value for Res BW.

When the Res BW is manually selected, it may be returned to the coupled state by pressing the Auto/Man toggle on the Res BW control. This may also be done by pressing Auto Couple or by performing a Preset.

See:

"RBW Presets" on page 989

"More Information" on page 989

Remote Command	`[:SENSe]:OBWidth:BANDwidth[:RESolution] <bandwidth>`
	`[:SENSe]:OBWidth:BANDwidth[:RESolution]?`
	`[:SENSe]:OBWidth:BANDwidth[:RESolution]:AUTO ON | OFF | 1 | 0`
	`[:SENSe]:OBWidth:BANDwidth[:RESolution]:AUTO?`

Example	`:OBW:BAND 5 MHz`
	`:OBW:BAND?`
	`:OBW:BAND:AUTO ON`
	`:OBW:BAND:AUTO?`

Notes	For numeric entries, all RBW Types choose the nearest (arithmetically, on a linear scale, rounding up) available RBW to the value entered The setting and querying of values depend on the current bandwidth type This parameter is preset by the Meas Method selection. Preset values are as follows: – IBW: 100 kHz – IBWR: 27 kHz – FAST (WCDMA): 390 kHz When Meas Method is "Fast Power" and Fast Power RBW mode is "Speed," RBW is calculated as follows: – RBW = Span × 2.442 × 10^{-3}
Couplings	Sweep time is coupled to the RBW. As the RBW changes, the sweep time (if set to Auto) is changed to maintain amplitude calibration Video bandwidth (VBW) is coupled to the RBW. As the resolution bandwidth changes, the video bandwidth (if set to Auto) changes to maintain the ratio of VBW/RBW (10:1) When the Res BW is set to Auto, the resolution bandwidth is auto-coupled to the span. The ratio of Span/RBW is approximately 106:1 when auto coupled. When Res BW is set to Man, and the bandwidths are entered manually, these bandwidths are used regardless of other instrument settings
Preset	Auto (unless noted in the table below) See table below
State Saved	Saved in instrument state
Min	1 Hz
Max	8 MHz is the max equivalent –3 dB RBW, which means that the named RBW (the one shown on the control etc.) can actually exceed 8 MHz if using a filter other than –3 dB Gaussian
Annotation	A "#" mark appears before "RBW" in the annotation when it is switched from Auto to Manual coupling
Backwards Compatibility Notes	For backwards compatibility this command obeys both the `BANDwidth` and `BWIDth` forms For ESA, the maximum Res BW was 5 MHz; on X-Series it is 8 MHz

RBW Presets

Unless noted in the table below, the Preset value of RBW is **Auto**.

Mode	Preset Value
WCDMA	30 kHz
BT	10 kHz
WLAN	100 kHz
MSR	30 kHz
LTE, LTETDD, LTEAFDD, LTEATDD, 5G NR	30 kHz

More Information

When **Res BW** is set to **Auto**, the bandwidth selected depends on the Filter Type (see "Filter Type" below).

Only certain discrete resolution bandwidths are available. The available bandwidths are dependent on the **Filter Type** or the **EMC Standard**. If an unavailable bandwidth is entered with the numeric keypad, the closest available bandwidth is selected.

Video BW

Lets you change the instrument post-detection filter (VBW or "video bandwidth") from 1 Hz to 8 MHz in approximately 10% steps. In addition, a wide-open video filter bandwidth may be chosen by selecting 50 MHz. The VBW is annotated at the bottom of the display, in the center.

Normally, **Video BW (Auto)** selects automatic coupling of the Video BW to RBW using the ratio set by the VBW:3 dB RBW control. To decouple the resolution bandwidth, press the **Auto/Man** toggle on the **Video BW** control, or simply enter a different value for **Video BW**.

When the **Video BW** is manually selected, it may be returned to the coupled state by pressing the **Auto/Man** toggle on the **Video BW** control. This may also be done by pressing Auto Couple or by performing a **Preset**.

Remote Command	`[:SENSe]:OBWidth:BANDwidth:VIDeo <bandwidth>`
	`[:SENSe]:OBWidth:BANDwidth:VIDeo?`
	`[:SENSe]:OBWidth:BANDwidth:VIDeo:AUTO ON | OFF | 1 | 0`
	`[:SENSe]:OBWidth:BANDwidth:VIDeo:AUTO?`

Example	`:OBW:BAND:VID 2.4 MHz`
	`:OBW:BAND:VID?`
	`:OBW:BAND:VID:AUTO ON`
	`:OBW:BAND:VID:AUTO?`

Notes	For numeric entries, the instrument chooses the nearest (arithmetically, on a linear scale, rounding up)

	available VBW to the value entered. The 50 MHz VBW is defined to mean "wide open" The values shown in this table reflect the conditions after a Mode Preset
Dependencies	Sometimes the displayed Video BW is not actually used to process the trace data: When the Average Detector is selected and Sweep Type is set to **Swept**, the video bandwidth filter cannot be used, because it uses the same hardware as the Average Detector When the Quasi-Peak, EMI Average or RMS Average detector is selected the VBW is implemented by the digital IF as part of the detector When this is the case, the VBW still acts to change the Sweep Time, if Sweep Time is in Auto, and still affects the data on other traces for which this is not the case
Couplings	Video bandwidth (VBW) is normally coupled to RBW. If **VBW** is set to Auto, then the VBW is changed as the RBW changes, to maintain the ratio set by the VBW:3 dB RBW control (usually 10:1 for measurements that do not have a VBW:3 dB RBW control)
Preset	Auto (unless noted in table below) ON
State Saved	Saved in instrument state
Min	1 Hz
Max	50 MHz
Annunciation	A "#" mark appears before "VBW" in the annotation when it is not coupled
Annotation	In the bottom center of the screen, "VBW <value> <units>" indicates the current video bandwidth value. Note that for some detectors this is not the value actually used for VBW (see above)
Backwards Compatibility Notes	For backwards compatibility this command obeys both the `BANDwidth` and `BWIDth` forms

VBW Presets

Unless noted in the table below, the Preset value of VBW is **Auto**.

Mode ID	Preset Value
WCDMA	300 kHz
BT	30 kHz

RBW Filter Type

Selects the type for the resolution bandwidth filters. Historically, the Res BW filters in HP/Agilent/Keysight spectrum analyzers were Gaussian filters, specified using the –3 dB bandwidth of the filter. That is, a 10 MHz Res BW filter was a Gaussian shape with its –3 dB points 10 MHz apart. In the X-Series, the **RBW Filter BW** menu lets you choose between a Gaussian and Flat Top filter shape, for varying measurement conditions.

Filter Type	SCPI Example
Gaussian	`:BAND:SHAP GAUS`
Flattop	`:BAND:SHAP FLAT`

For more information see the RBW Filter Type control description for the Swept SA measurement.

Remote Command	`[:SENSe]:OBWidth:BANDwidth:SHAPe GAUSsian | FLATtop` `[:SENSe]:OBWidth:BANDwidth:SHAPe?`
Example	`:OBW:BAND:SHAP GAUS` `:OBW:BAND:SHAP?`
Notes	`GAUSsian` = Gaussian `FLATtop` = Flattop
Dependencies	In the Swept SA measurement, the **RBW Filter Type** control is grayed out if the **EMC Standard** is set to **CISPR** or **MIL**. In this case the **Filter Type** is always Gaussian; the **Filter BW** is chosen as appropriate for the filter and the standard. Any attempt to set it to Flattop will give an error
Preset	Auto Couple chooses the preset value
State Saved	Saved in instrument state
Annotation	The annotation under RBW in the bottom left of the screen shows the type of filter or bandwidth that is being used. The following examples illustrate this:

–3 dB (Normal) filter BW:	Res BW 300 Hz
–6 dB filter BW:	Res BW (–6 dB) 422 Hz
Noise filter BW:	Res BW (Noise) 317 Hz
Impulse filter BW:	Res BW (Impulse) 444 Hz
CISPR filter BW :	Res BW (CISPR) 200 Hz
MIL filter BW:	Res BW (MIL) 1 kHz
Flattop filter type:	Res BW (Flattop) 300 Hz

Backwards Compatibility SCPI	`[:SENSe]:OBWidth:BWIDth:SHAPe`

3.8.5 Display

The Display key opens the Display Menu, which lets you configure display items for the current Mode, Measurement View or Window.

3.8.5.1 Meas Display

The Meas Display tab contains controls for setting the display for the current Measurement, View or Window.

x dB BW Boundaries On/Off

Turns the x dB BW Boundaries On and Off.

Remote Command	:DISPlay:OBWidth:WINDow[1]:XDB 0 | 1 | OFF | ON :DISPlay:OBWidth:WINDow[1]:XDB?
Example	:DISP:OBW:WIND:XDB 1 :DISP:OBW:WIND:XDB?
Preset	0
State Saved	Saved in instrument state
Range	OFF|ON
Backwards Compatibility SCPI	:DISPlay:OBWidth:VIEW:WINDow[1]:XDB

Boundary Frequency

Selects frequency display type from either Offset or Absolute:

– OFFSet: offsets from Center Freq to OBW boundary frequency are displayed

– ABSolute: absolute frequencies are displayed

Remote Command	:DISPlay:OBWidth:WINDow2:BOUNdaries:FREQuency OFFSet | ABSolute :DISPlay:OBWidth:WINDow2:BOUNdaries:FREQuency?
Example	:DISP:OBW:WIND2:BOUN:FREQ ABS :DISP:OBW:WIND2:BOUN:FREQ?
Preset	OFFSet
State Saved	Saved in instrument state
Range	OFFSet|ABSolute
Backwards Compatibility SCPI	:DISPlay:OBWidth:VIEW2:WINDow2:BOUNdaries:FREQuency

3.8.5.2 View

Contains controls for selecting the current **View**, and for editing User Views.

Views

The Occupied BW measurement has two Predefined views: the OBW Result View and the OBW Boundaries View.

These Views are multiple-window Views. When in a multiple window View, you select a window by touching it. The menu controls may sometimes change depending on which window is selected.

Whenever the View changes, the default menu is **Frequency**, unless otherwise specified in the View description.

If you have modified the current View, using the "View Editor" on page 128, an asterisk appears next to that View in the radio button panel. You can save the modified View as a User View (see "Save Layout as New View" on page 1890).

View Selection by Name

Remote Command	`:DISPlay:OBWidth:VIEW[:SELect] OBWResults | BOUNdaries` `:DISPlay:OBWidth:VIEW[:SELect]?`
Example	`:DISP:OBW:VIEW OBWR` `:DISP:OBW:VIEW?`
Preset	`OBWResults`
State Saved	Saved in instrument state
Range	`OBWResults|BOUNdaries`

View Selection by Number

Remote Command	`:DISPlay:OBWidth:VIEW:NSELect <integer>` `:DISPlay:OBWidth:VIEW:NSELect?`
Example	`:DISP:OBW:VIEW:NSEL 2` `:DISP:OBW:VIEW:NSEL?`
Preset	1
State Saved	Saved in instrument state
Min/Max	1/2

OBW Results

Windows: "Graph" on page 944, "Metrics - OBW Results" on page 945

The spectrum trace is displayed in the upper window. Measurement results such as Occupied Bandwidth or Power are displayed in the lower window.

Example	`:DISP:OBW:VIEW OBWR`

OBW Boundaries

Windows: "Graph" on page 944, "Metrics - OBW Boundaries" on page 947

The spectrum trace is displayed in the upper window. The lower window of OBW Results view is replaced by the OBW boundaries table in this view. Occupied bandwidth and X dB bandwidth for both lower and upper boundaries are displayed.

Example	`:DISP:OBW:VIEW BOUN`

User View

Lets you choose a View from the saved User Views for the current measurement. This panel only appears if a User View exists for the current measurement.

Remote Command	`:DISPlay:VIEW:ADVanced:SELect <alphanumeric>` `:DISPlay:VIEW:ADVanced:SELect?`
Example	Select Baseband as the current View `:DISP:VIEW:ADV:SEL “Baseband”`

Notes	You must be in the measurement whose View you are trying to set to send the command. You can only set Views for the current measurement using this command
	For predefined views, the parameter is derived from the view name that is shown in the View list in the user interface. For example, if you are trying to select the Trace Zoom view in the Swept SA measurement, you send:
	`:DISP:VIEW:ADV:SEL "Trace Zoom"`
	because “Trace Zoom” is the name of the View as seen in the Mode/Meas dialog or in the Display, View menu
	You *cannot* use the legacy View parameter (which in this case would be `TZOom`) with `:DISP:VIEW:ADV:SEL`
	`<alphanumeric>` is case insensitive; you can specify mixed case, however the name will be evaluated on a single case. Thus, both of the following forms work:
	`:DISP:VIEW:ADV:SEL "Trace Zoom"`
	`:DISP:VIEW:ADV:SEL "TRACE ZOOM"`
	If the specified view is not a valid View, the query returns the error message “-224, Illegal parameter value; View with the name <alphanumeric> does not exist”
	If the display is disabled (via `:DISP:ENAB OFF`) then the error message “-221, Settings conflict; View SCPI cannot be used while Display is disabled” is generated

Backwards Compatibility SCPI	The legacy node `:DISPlay:VIEW[:SELect]` is retained for backwards compatibility, but it only supports predefined views

Restore Layout to Default

Restores the Layout to the default for Basic.

Modified Views are very temporary; if you exit the current measurement they are discarded, and they are not saved in State. To retain this View for later use, and to be able to return easily to your original Basic View, you can save your edited View as a "User View".

Save Layout as New View

Saves your new View as a User View. An alpha keyboard appears, which lets you name your new View; the default is the old View name plus a number.

Remote Command	`:DISPlay:VIEW:ADVanced:NAME <alphanumeric>`
Example	`:DISP:VIEW:ADV:NAME "Baseband"` Creates a new View named `Baseband` from the current View, and selects it as the current View
Notes	`<alphanumeric>` is case insensitive; you can specify mixed case, however the name will be evaluated on a single case If `<alphanumeric>` name already exists as a View, the error message "-224, Illegal parameter value; View <alphanumeric> already exists" is generated If the display is disabled (via `:DISP:ENAB OFF`) then the error message "-221, Settings conflict; User View SCPI cannot be used while Display is disabled" is generated

Re-Save User View

You can re-edit a User View; if you make changes, then an asterisk will appear next to the User View's name. You can then tap **Re-Save User View** to save it back to its existing name, or **Save Layout as New View** to add another, new User View.

This is a front panel function only, there is no remote command available to perform this function. To do this remotely, you must first perform **Save Layout as New View**, then delete the old User View and rename the new one with the name of the View you just deleted.

Rename User View

You can rename the current View by giving it a new unique name. Only User Views can be renamed, if the current View is a Predefined View, an error occurs.

Remote Command	`:DISPlay:VIEW:ADVanced:REName <alphanumeric>`
Example	`:DISP:VIEW:ADV:REN "Baseband"`
Notes	`<alphanumeric>` is case insensitive; you can specify mixed case, however the name will be evaluated

	on a single case If the <alphanumeric> specifying the new name is already present in the list of View names, the error message "-224, Illegal parameter value; View <alphanumeric> already exists" is generated If the current View is a Predefined View, the error message "-224, Illegal parameter value; Cannot rename a Predefined View" is generated If the display is disabled (via :DISP:ENAB OFF) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated

Delete User View

You can delete the current View if it is a User View. The default view becomes the current view for the Measurement.

Remote Command	:DISPlay:VIEW:ADVanced:DELete
Example	:DISP:VIEW:ADV:DEL
Notes	<alphanumeric> is case insensitive; you can specify mixed case, however the name will be evaluated on a single case If the <alphanumeric> is not present in the list of View names, the error message "-224, Illegal parameter value; View <alphanumeric> does not exist" is generated If the current View is a Predefined View, the error message "-224, Illegal parameter value; Cannot delete a Predefined View" is generated If the display is disabled (via :DISP:ENAB OFF) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated

Delete All User Views

Deletes all previously saved User Views. The default view becomes the current view for the Measurement if a User View was the current view when this command was executed.

Remote Command	:DISPlay:VIEW:ADVanced:DELete:ALL
Example	:DISP:VIEW:ADV:DEL:ALL
Notes	Disabled if there are no User Views

View Editor Remote Commands

The following remote commands help you manage Views and User Views. Note that the SCPI node for User Views handles both Predefined and User Views. The legacy nodes, :DISPlay:VIEW[:SELect] and :DISPlay:VIEW:NSEL, are retained for backwards compatibility, but they only support predefined views.

View Listing Query

Returns a string containing a comma-separated list of names for *all* the Views, including User Views, available for the current Measurement.

Remote Command	`:DISPlay:VIEW:ADVanced:CATalog?`
Example	`:DISP:VIEW:ADV:CAT?`
Notes	Returns a quoted string of the available Views for the current measurement, separated by commas. The list includes names for *all* the Views, including User Views, available for the current Measurement Example: `"Normal,Trace Zoom,Spectrogram,Baseband,myView1,yourView1"` No distinction is made between Predefined and User Views If you switch measurements with the display disabled (via `:DISP:ENAB OFF`), then query the list of available Views, the result is undefined

User View Listing Query

Returns a string containing a comma-separated list of names for *only* the User Views available for the current Measurement.

Remote Command	`:DISPlay:VIEW:ADVanced:USER:CATalog?`
Example	`:DISP:VIEW:ADV:USER:CAT?`
Notes	Returns a quoted string of the available User Views for the current measurement, separated by commas. Example: `"Baseband,myView1,yourView1"` If you switch measurements with the display disabled (see "Display Enable (Remote Command Only)" on page 1894), then query the list of available Views, the result is undefined

3.8.5.3 Annotation

Contains controls for setting up the annotation for the current Mode or Measurement.

Graticule

Turns the display graticule On or Off for all windows with graticules in all measurements in the current Mode. Also turns the graticule Y-Axis annotation on and off.

Remote Command	`:DISPlay:GRATicule[:STATe] OFF | ON | 0 | 1`

	:DISPlay:GRATicule[:STATe]?
Example	:DISP:GRAT OFF
Notes	The graticule is the set of horizontal and vertical lines that make up the grid/divisions for the X-Axis and Y-Axis
Preset	ON
State Saved	Saved in instrument state
Backwards Compatibility SCPI	:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe] OFF | ON | 0 | 1 :DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe]? This command is accepted for backwards compatibility with older instruments, but the WINDow, TRACe and GRID parameters are ignored

Screen Annotation

Controls the display of the annunciation and annotation around the graticule, including any annotation on lines (such as the display line, the threshold line, etc.) and the Y-Axis annotation, for all windows with screen annotation in all measurements in the current Mode.

This does *not* include marker annotation (or the N dB result). When OFF, the graticule expands to fill the entire graticule area, leaving only the 1.5% gap above the graticule, as described in the **Trace** section.

Remote Command	:DISPlay:ANNotation:SCReen[:STATe] OFF | ON | 0 | 1 :DISPlay:ANNotation:SCReen[:STATe]?
Example	:DISP:ANN:SCR OFF
Dependencies	Grayed-out and forced to OFF when **System Display Settings**, **Annotation** is OFF
Preset	ON This remains OFF through a Preset when **System Display Settings**, **Annotation** is set to OFF
State Saved	Saved in instrument state

Trace Annotation

Turns on and off the labels on the traces, showing their detector (or their Math Mode) as described in the **Trace** section, for all windows in all measurements in the current Mode for which Trace Annotation on/off is supported.

If Trace Math is being performed on a trace, then the Trace Math annotation replaces the detector annotation.

For measurements that support limit lines, this key also turns on and off the labels on the Limit Lines. The label is the Limit number annotation and Limit Comment displayed on the graph. If the length of the comment is greater than 20 characters, the first 8 characters and the last 8 characters are displayed, joined with ....

Remote Command	`:DISPlay:ANNotation:TRACe[:STATe] ON | OFF | 1 | 0` `:DISPlay:ANNotation:TRACe[:STATe]?`
Example	`:DISP:ANN:TRAC OFF`
Preset	`OFF`
State Saved	Saved in instrument state

Control Annotation

Turns on and off the display of values on the Active Function controls for all measurements in the current Mode. This is a security feature.

Remote Command	`:DISPlay:ACTivefunc[:STATe] ON | OFF | 1 | 0` `:DISPlay:ACTivefunc[:STATe]?`
Example	`:DISP:ACT OFF`
Dependencies	Grayed out and forced to `OFF` when **System Display Settings**, **Annotation** is `OFF`
Preset	`ON` This remains `OFF` through a Preset when **System Display Settings**, **Annotation** is set to `OFF`
State Saved	Saved in instrument state

Meas Bar

Turns the Measurement Bar at the top of the screen on and off for all measurements in the current Mode. When `OFF`, the graticule area expands to fill the area formerly occupied by the Measurement Bar.

Remote Command	`:DISPlay:ANNotation:MBAR[:STATe] OFF | ON | 0 | 1` `:DISPlay:ANNotation:MBAR[:STATe]?`
Example	`:DISP:ANN:MBAR OFF`
Dependencies	Grayed out and forced to `OFF` when **System Display Settings**, **Annotation** is `OFF`
Preset	`ON` This remains `OFF` through a Preset when **System Display Settings**, **Annotation** is set to `OFF`
State Saved	Saved in instrument state

Display Enable (Remote Command Only)

Turns the display on/off, including the display drive circuitry. The backlight stays lit to confirm that the instrument is on. The display enable setting is mode global. Theare three reasons for turning the display off:

1. To increase speed as much as possible by freeing the instrument from having to update the display

2. To reduce emissions from the display, drive circuitry

3. For security purposes

If you have turned off the display:

– and you are in local operation, the display can be turned back on by pressing any key or by sending `:SYSTem:DEFaults MISC` or `:DISPlay:ENABle ON` (neither `*RST` nor :SYSTem:PRESet enable the display)

– and you are in remote operation, the display can be turned back on by pressing the **Local** or **Esc** keys, or by sending `:SYSTem:DEFaults MISC` or `:DISPlay:ENABle ON` (neither `*RST` nor `:SYSTem:PRESet` enable the display)

– and you are using either the `:SYSTem:KLOCk` command or GPIB local lockout, then *no* front-panel key press will turn the display back on. You must turn it back on remotely.

If the display is `OFF`, many SCPI commands related to User Views and Multiscreen functionality do not work, and return the error messages "-221, Settings conflict; Screen SCPI cannot be used when Display is disabled" or "221, Settings conflict; View SCPI cannot be used while Display is disabled". These commands include:

Name	Command
Select User View	`:DISPlay:VIEW:ADVanced:SELect`
Rename User View	`:DISPlay:VIEW:ADVanced:REName`
Delete User View	`:DISPlay:VIEW:ADVanced:DELete`
Create User View	`:DISPlay:VIEW:ADVanced:NAME`
Select Screen	`:INSTrument:SCReen:SELect`
Delete Screen	`:INSTrument:SCReen:DELete`
Delete All But This Screen	`:INSTrument:SCReen:DELete:ALL`
Add Screen	`:INSTrument:SCReen:CREate`
Rename Screen	`:INSTrument:SCReen:REName`
Sequencer On/Off	`:SYSTem:SEQuencer`

Remote Command	`:DISPlay:ENABle OFF | ON | 0 | 1` `:DISPlay:ENABle?`
Example	`:DISP:ENAB OFF`
Couplings	`:DISP:ENAB OFF` turns Backlight `OFF` and `:DISP:ENAB ON` turns Backlight `ON`, but changing Backlight settings does *not* change the state of `:DISP:ENAB`
Preset	`ON` Set by `:SYST:DEF MISC`, but not affected by `*RST` or `:SYSTem:PRESet`

State Saved	Not saved in instrument state
Backwards Compatibility Notes	`:SYST:PRES` no longer turns on `:DISPlay:ENABle` as it did in legacy analyzers

3.8.6 Freq

The Freq key opens the Frequency menu, which contains controls that allow you to control the Frequency and Channel parameters of the instrument.

Some features in the Frequency menu are the same for all measurements in the current Mode – they do not change as you change measurements. Settings like these are called "Meas Global" and are unaffected by Meas Preset. For example, the Center Freq setting is the same for all measurements - it does not change as you change measurements.

3.8.6.1 Settings

The Settings Tab contains controls that pertain to the X axis parameters of the measurement. These parameters control how data on the vertical (X) axis is displayed and control instrument settings that affect the horizontal axis.

Span

Set the frequency of the occupied bandwidth span for the current measurement.

Remote Command	`[:SENSe]:OBWidth:FREQuency:SPAN <freq>`
	`[:SENSe]:OBWidth:FREQuency:SPAN?`
	`[:SENSe]:OBWidth:FREQuency:SPAN:AUTO ON | OFF | 0 | 1`
	`[:SENSe]:OBWidth:FREQuency:SPAN:AUTO?`

Example	`:OBW:FREQ:SPAN 2.4 MHz`
	`:OBW:FREQ:SPAN?`
	`:OBW:FREQ:SPAN:AUTO 0`
	`:OBW:FREQ:SPAN:AUTO?`

Notes	Span Auto Detector (`[:SENSe]:OBWidth:FREQuency:SPAN:AUTO`) is only available in the MSR, LTEAFDD/LTEATDD and 5GNR modes
Dependencies	The Auto Detect functionality is only available in the MSR, LTEAFDD/LTEATDD and 5GNR modes
Preset	SA: 3 MHz WCDMA: 10 MHz LTE, LTETDD, LTEAFDD, LTEATDD: 10 MHz BT: 2 MHz 5GNR: 200 MHz

	RTS: 27 kHz MSR: 10 MHz WLAN: – If Radio Std is 802.11b: 30MHz – If Radio Std is 802.11a/g/n/ac/ax/be (20MHz): 25 MHz – If Radio Std is 802.11n/ac/ax/be (40MHz): 50 MHz – If Radio Std is 802.11n/ac/ax/be (80MHz): 100 MHz – If Radio Std is 802.11ac/ax/be (160MHz): 200 MHz – If Radio Std is 802.11be (320MHz): 400 MHz
State Saved	Yes
Min	100 Hz
Max	Hardware Maximum Span For the max value of each hardware, see Center Frequency Presets table in 6.2.1.1 Center Frequency
Backwards Compatibility SCPI	`[:SENSe]:EBWidth:FREQuency:SPAN`

Center Frequency

Sets the frequency that corresponds to the horizontal center of the graticule. While adjusting the Center Frequency the Span is held constant.

The center frequency setting is the same for all measurements within a mode, that is, it is Meas Global. Some modes are also able to share a Mode Global center frequency value. If this is the case, the Mode will have a **Global** tab in its **Meas Setup** menu.

The **Center Freq** function sets (and queries) the Center Frequency for the currently selected input. If your instrument has multiple inputs, and you select another input, the Center Freq changes to the value for that input. SCPI commands are available to directly set the Center Freq for a specific input.

Center Freq is remembered as you go from input to input. Thus you can set a Center Freq of 10 GHz with the RF Input selected, change to BBIQ and set a Center Freq of 20 MHz, then switch to External Mixing and set a Center Freq of 60 GHz, and when you go back to the RF Input the Center Freq will go back to 10 GHz; back to BBIQ and it is 20 MHz; back to External Mixing and it is 60 GHz.

See:

"RF Center Freq" on page 1005

"Ext Mix Center Freq" on page 1006

"I/Q Center Freq" on page 1007

"Center Frequency Presets" on page 1003

"VXT Models with Radio Heads/CIU Frequency Range" on page 1005

Remote Command	`[:SENSe]:FREQuency:CENTer <freq>` `[:SENSe]:FREQuency:CENTer?`

Example	`:FREQ:CENT 50 MHz`
	sets Center Frequency to 50 MHz
	`:FREQ:CENT UP`
	increments the Center Frequency by the value of CF Step
	`:FREQ:CENT?`
	returns the current value of Center Frequency

Notes	This command sets the RF, External Mixing or I/Q Center Frequency depending on the selected input For RF input it is equivalent to `:FREQ:RF:CENT` For I/Q input it is equivalent to `:FREQ:IQ:CENT` For External Mixer it is equivalent to `:FREQ:EMIX:CENT` Preset and Max values are dependent on Hardware Options If no terminator (e.g.., MHz) is sent the terminator Hz is used. If a terminator with unit other than Frequency is used, an invalid suffix error message is generated
Dependencies	Not available in the MSR, LTEAFDD/LTEATDD and 5GNR modes.
Preset	Depends on instrument maximum frequency, mode, measurement, and selected input See "Center Frequency Presets" on page 1003, "RF Center Freq" on page 1005, "Ext Mix Center Freq" on page 1006, "I/Q Center Freq" on page 1007 and "VXT Models with Radio Heads/CIU Frequency Range" on page 1005
State Saved	Saved in instrument state
Min/Max	Depends on instrument maximum frequency, mode, measurement, and selected input See "Center Frequency Presets" on page 1003, "RF Center Freq" on page 1005, "I/Q Center Freq" on page 1007 and "VXT Models with Radio Heads/CIU Frequency Range" on page 1005
Annotation	Center <value> appears in the lower left corner of the display
Status Bits/OPC dependencies	Non-overlapped

Center Frequency Presets

The following table provides the Center Frequency Presets for the Spectrum Analyzer mode, and the Max Freq, for the various frequency options:

Freq Option	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
503 (all but CXA)	1.805 GHz	3.6 GHz	3.7 GHz
503 (CXA)	1.505 GHz	3.0 GHz	3.08 GHz
507 (all but CXA)	3.505 GHz	7.0 GHz	7.1 GHz
507 (CXA)	3.755 GHz	7.5 GHz	7.58 GHz

Freq Option	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
508 (all but MXE)	1.805 GHz	3.6 GHz	8.5 GHz
508 (MXE)	4.205 GHz	8.4 GHz	8.5 GHz
513	6.805 GHz	13.6 GHz	13.8 GHz
526 (except CXA and MXE)	13.255 GHz	26.5 GHz	27.0 GHz*
526 (CXA)	13.255 GHz	26.5 GHz	26.55 GHz
526 (MXE)	1.805 GHz	3.6 GHz	27.0 GHz
532	16.005 GHz	32.0 GHz	32.5 GHz
540	20.005 GHz	40.0 GHz	40.5 GHz
543	21.505 GHz	43.0 GHz	43.0 GHz
544	22.005 GHz	44.0 GHz	45.0 GHz
550	25.005 GHz	50.0 GHz	52 GHz
F03 (CXA-m)	1.505 GHz	3.0 GHz	3.08 GHz
F07 (CXA-m)	3.755 GHz	7.5 GHz	7.575 GHz
F13 (CXA-m)	6.805 GHz	13.6 GHz	13.8 GHz
F26 (CXA-m)	13.255 GHz	26.5 GHz	26.55 GHz
504 (M9420A/21A, M8920A)	2.145 GHz	3.88GHz	3.88 GHz
506 (M9420A/21A, M8920A)	3.245 GHz	6.08GHz	6.08 GHz
F06 (M9410A/11A)	1.0 GHz	6.08 GHz	6.08 GHz
F06 (M9415A)	1 GHz	1.08 GHz	6.6 GHz
F08 (M9415A)	1 GHz	1.08 GHz	8.6 GHz
F12 (M9415A)	1 GHz	1.08 GHz	12.9 GHz

*For option 526, the Max CF in RTSA is 26.999999995 GHz.

N9041B Center Freq Presets

Input	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
Input 1, all models	25.005 GHz	50.0 GHz	52 GHz
Input 2, opt 585	42.505 GHz	85.0 GHz	86 GHz
Input 2, opt 590	45.005 GHz	90.0 GHz	92 GHz
Input 2, opt 5CX	55.005 GHz	110.0 GHz	110 GHz

Input 2, CXA and MXE

Model	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
CXA opt C75	0.7505 GHz	1.5 GHz	1.58 GHz
MXE	505 MHz	1 GHz	1.000025 GHz

Tracking Generator Frequency Limits (CXA only)

Tracking Generator Option	Min Freq (clips to this freq when turn TG on and can't tune below while TG on)	If above this Freq, Stop Freq clipped to this Freq when TG turned on	Max Freq (can't tune above) while TG on
T03	9 kHz	3.0 GHz	3.08 GHz
T06	9 kHz	6.0 GHz	6.05 GHz

Tracking Generator Frequency Limits(CXA-m only)

Tracking Generator Option	Min Freq (clips to this freq when turn TG on and can't tune below while TG on)	If above this Freq, Stop Freq clipped to this Freq when TG turned on	Max Freq (can't tune above) while TG on
T03	2 MHz	3.08 GHz	3.08 GHz
T07	2 MHz	7.575 GHz	7.575 GHz
T13	2 MHz	13.8 GHz	13.8 GHz
T26	2 MHz	26.55 GHz	26.55 GHz

VXT Models with Radio Heads/CIU Frequency Range

The following table shows the Center Frequency Presets and Range for VXT modes with Radio Heads/CIU.

Products with Radio Heads/CIU	Preset	Start frequency	Stop frequency
M9421A + CIU	6 GHz	5.9 GHz	12 GHz
M9410A + CIU	6 GHz	5.9 GHz	12 GHz
M9410A + CIU + RRH	25 GHz	24.25 GHz	43.5 GHz

RF Center Freq

SCPI command for specifying the RF Center Frequency. This command will set the Center Frequency to be used when the RF input is selected, even if the RF input is not the input that is selected at the time the command is sent. Note that the **Center Freq** function in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command	`[:SENSe]:FREQuency:RF:CENTer <freq>` `[:SENSe]:FREQuency:RF:CENTer?`
Example	`:FREQ:RF:CENT 30 MHz`

	`:FREQ:RF:CENT?`
Notes	This command is the same in all modes, but the parameter is Measurement Global. So the value is independent in each mode and common across all the measurements in the mode
Dependencies	If the electronic/soft attenuator is enabled, any attempt to set Center Frequency such that the Stop Frequency would be >3.6 GHz fails and results in an advisory message. If the equivalent SCPI command is sent, this same message is generated as part of a "-221, Settings conflict" warning
Preset	See table above
State Saved	Saved in instrument state
Min	-79.999995 MHz
Max	See table above. Basically instrument maximum frequency - 5 Hz If the knob or step keys are being used, also depends on the value of Span

Ext Mix Center Freq

SCPI command for specifying the External Mixer Center Frequency. This command will set the Center Frequency to be used when the External Mixer is selected, even if the External Mixer input is not the input which is selected at the time the command is sent. Note that the **Center Freq** function in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command	`[:SENSe]:FREQuency:EMIXer:CENTer <freq>` `[:SENSe]:FREQuency:EMIXer:CENTer?`
Example	`:FREQ:EMIX:CENT 60 GHz` `:FREQ:EMIX:CENT?`
Notes	This command is the same in all modes, but the parameter is Measurement Global. So the value is independent in each mode and common across all the measurements in the mode
Couplings	When returning to External Mixing after having been switched to one of the other inputs (e.g., RF), you will come back into the settings that you had when you left External Mixing. So you will come back to the band you were in with the Center Frequency that you had. However, Span is not an input-dependent parameter, therefore you will bring the span over from the other input. Therefore, the instrument comes back with the span from the previous input, limited as necessary by the current mixer setup
Preset	When a Mode Preset is performed while in External Mixing, the Start frequency of the current Mode is set to the nominal Min Freq of the lowest harmonic range in the Harmonic Table for the current mixer setup. Similarly, the Stop frequency of the current Mode is set to the nominal Max Freq of the highest harmonic range in the Harmonic Table. The Center Freq thus presets to the point arithmetically equidistant from these two frequencies Note that, if the current measurement has a limited Span available to it, and cannot achieve the Span shown in the table (Span=Stop Freq – Start Freq), the instrument uses the maximum Span the measurement allows, and still sets the Center Freq to the midpoint of the Start and Stop Freq values in the Harmonic Table When Restore Input/Output Defaults is performed, the mixer presets to the 11970A, whose Start and Stop frequencies are 26.5 and 40 GHz respectively. The center of these two frequencies is 33.25 GHz Therefore, after a Restore Input/Output Defaults, if you go into External Mixing and do a Mode Preset while in the Spectrum Analyzer Mode, the resulting Center Freq is 33.25 GHz

State Saved	Yes
Min	The minimum frequency in the currently selected mixer band + 5 Hz If the knob or step keys are being used, also depends on Span
Max	The maximum frequency in the currently selected mixer band - 5 Hz If the knob or step keys are being used, also depends on Span

I/Q Center Freq

SCPI command for specifying the I/Q Center Frequency. This command will set the Center Frequency to be used when the I/Q input is selected, even if the I/Q input is not the input which is selected at the time the command is sent. Note that the **Center Freq** function in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command	`[:SENSe]:FREQuency:IQ:CENTer <freq>` `[:SENSe]:FREQuency:IQ:CENTer?`
Example	`:FREQ:IQ:CENT 30 MHz`
Notes	This command is the same in all modes, but the parameter is Measurement Global. So the value is independent in each mode and common across all the measurements in the mode
Preset	0 Hz
State Saved	Saved in instrument state
Min	-40.049995 MHz
Max	40.049995 MHz

Full Span (Remote Command Only)

Changes the Occupied Bandwidth Span to show the full frequency range of the instrument. It maximizes the span within a range not changing the center frequency. When using external mixing, it changes the displayed frequency span to the frequency range specified for the selected external mixing band.

Remote Command	`[:SENSe]:OBWidth:FREQuency:SPAN:FULL`
Example	`:OBW:FREQ:SPAN:FULL`
Couplings	Selecting full span changes the measurement span value

3.8.7 Marker

Accesses a menu that enables you to select, set up and control the markers for the current measurement. If there are no active markers, **Marker** selects marker 1, sets it to Normal and places it at the center of the display. If the selected marker is Off, it is set to Normal and placed it at the center of the screen on the trace determined by the Marker Trace rules.

For more detailed information on the types of Markers and the interaction between Markers, see the Marker section of the Swept SA measurement.

3.8.7.1 Select Marker

Specifies the selected marker. The term “selected marker” is used throughout this document to specify which marker will be affected when you change marker settings, perform a Peak Search, etc.

The Select Marker control appears above the menu panel, indicating that it applies to all controls in the Marker menu panels. Select Marker is blanked if you select a tab whose controls do NOT depend on the selected marker (e.g., Counter).

On any menu tab for which Select Marker displays, the first control is always **Marker Frequency|Time**.

Notes	The selected marker is remembered even when not in the Marker menu and is used if a Search is done or a Band Function is turned on or for Signal Track or Continuous Peak
Preset	Marker 1
State Saved	The number of the selected marker is saved in instrument state
Annunciation	Appears in the marker results block label for **Normal** and **Delta** markers

3.8.7.2 Settings

The controls on the Settings tab include the Marker active function and a radio button selection of the marker control mode (Normal, Delta or Off) for the selected marker, as well as additional functions that help you use markers.

Marker Frequency

Sets the marker X Axis value in the current marker X Axis Scale unit. It has no effect if the control mode is **Off,** but is the SCPI equivalent of entering an X value if the control mode is **Normal** or **Delta**.

Remote Command	`:CALCulate:OBWidth:MARKer[1]|2|...|12:X <freq>` `:CALCulate:OBWidth:MARKer[1]|2|...|12:X?`
Example	`:CALC:OBW:MARK3:X 0` `:CALC:OBW:MARK3:X?`
Notes	If no suffix is sent, uses the fundamental units for the current marker X Axis Scale. If a suffix is sent that does not match the current marker X Axis Scale unit, an error “Invalid suffix” is generated The query returns the marker’s absolute X Axis value if the control mode is **Normal**, or the offset from the marker’s reference marker if the control mode is **Delta.** The query is returned in the fundamental units for the current marker X Axis scale: Hz for **Frequency** and **Inverse Time**, seconds for **Period** and **Time**
Preset	After a preset, all markers are turned OFF, so Marker X Axis Value query returns a not a number (NAN)

State Saved	Saved in instrument state
Min	-9.9E+37
Max	9.9E+37
Annotation	Mkr # <X value> and <Marker value> upper right on graph

Marker X Axis Position (Remote Command Only)

Sets the marker X Axis Scale position in trace points. This setting has no effect if the control mode is **Off,** but is the SCPI equivalent of entering a value if the control mode is **Normal** or **Delta** - except in trace points rather than X Axis Scale units. The entered value is immediately translated into the current X Axis Scale units for setting the value of the marker.

Remote Command	:CALCulate:OBWidth:MARKer[1]|2|...|12:X:POSition <real> :CALCulate:OBWidth:MARKer[1]|2|...|12:X:POSition?
Example	:CALC:OBW:MARK10:X:POS 0 :CALC:OBW:MARK10:X:POS?
Notes	The query returns the marker's absolute X Axis value in trace points if the control mode is **Normal**, or the offset from the marker's reference marker in trace points if the control mode is **Delta**. The value is returned as a real number, not an integer, corresponding to the translation from X Axis Scale units to trace points . When a Marker is turned on, it is placed center of the screen on the trace. Therefore the default value depends on instrument condition. If the marker is Off the response is Not A Number
Preset	After a preset, all markers are turned OFF, so Marker X Axis Value query returns a Not A Number (NAN)
State Saved	Saved in instrument state
Min	-9.9E+37
Max	9.9E+37

Marker Y Axis Value (Remote Command only)

Returns the marker Y Axis value in the current marker Y Axis unit.

Remote Command	:CALCulate:OBWidth:MARKer[1]|2|...|12:Y?
Example	:CALC:OBW:MARK11:Y?
Notes	The query returns the marker Y-axis result, if the control mode is **Normal** or **Delta.** If the marker is **Off** the response is Not A Number
Preset	Result dependent on Markers setup and signal source
State Saved	No
Backwards Compatibility SCPI	:CALCulate:OBWidth:MARKer[1]|2|...|12:FUNCtion:RESult?

Marker Mode

Sets the marker control mode to **Normal**, **Delta**, or **Off**. All interactions and dependencies detailed under the control description are enforced when the remote command is sent. If the selected marker is Off, pressing Marker sets it to Normal and places it at the center of the screen on the trace determined by the **Marker Trace** rules. At the same time, **Marker X Axis Value** appears on the Active Function area.

The default active function is the active function for the currently selected marker control mode. If the current control mode is Off, there is no active function and the active function is turned off.

Remote Command	`:CALCulate:OBWidth:MARKer[1]|2|...|12:MODE POSition | DELTa | OFF` `:CALCulate:OBWidth:MARKer[1]|2|...|12:MODE?`
Example	`:CALC:OBW:MARK:MODE POS` `:CALC:OBW:MARK:MODE?`
Preset	`OFF`
State Saved	Saved in instrument state
Range	`POSition|DELTa|OFF`
Annotation	Mkr # <X value> and <Marker value> upper right on graph When Marker Trace is Polar in WCDMA mode: Mkr # <Chip Value (RHO & QPSKEVM)/Symbol Value (CDP)>, <X value> and <Y value> upper right on graph

Backward Compatibility SCPI Command

Sets or queries the state of a marker. Setting a marker which is OFF to state ON or 1 puts it in **Normal** mode and places it at the center of the screen.

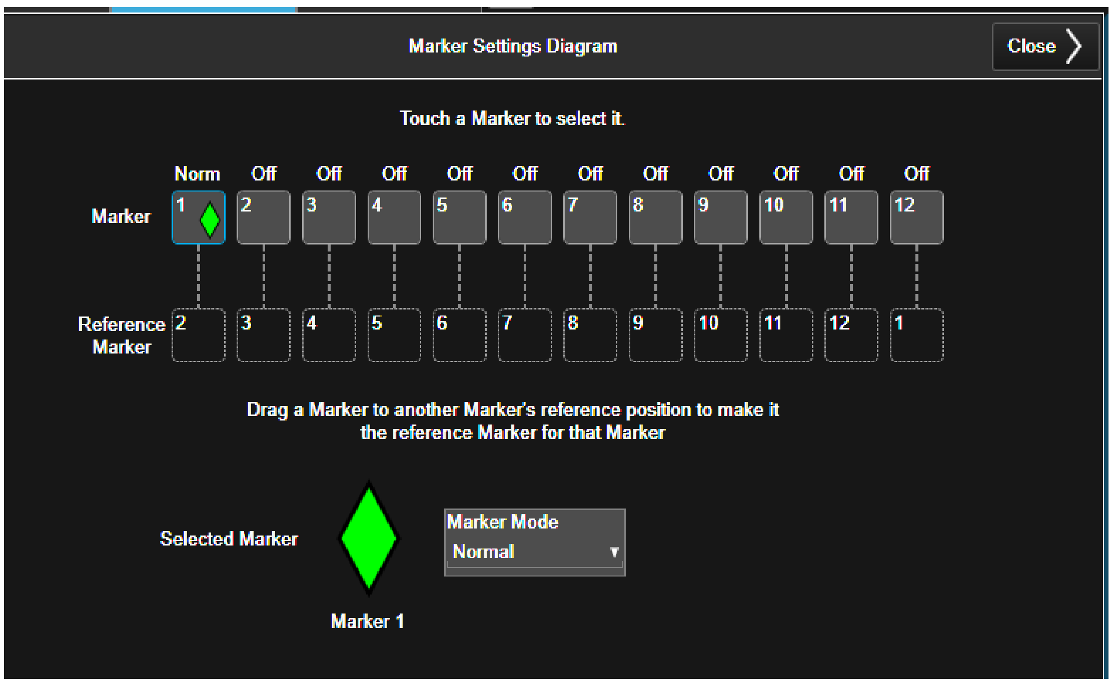
Remote Command	`:CALCulate:OBWidth:MARKer[1]|2|...|12:STATe OFF | ON | 0 | 1` `:CALCulate:OBWidth:MARKer[1]|2|...|12:STATe?`
Example	`:CALC:OBW:MARK3:STAT ON` `:CALC:OBW:MARK3:STAT?`
Preset	`OFF`
State Saved	Saved in instrument state
Range	`OFF|ON`

Delta Marker (Reset Delta)

Pressing this button is exactly the same as pressing the “Delta” selection on the Marker Mode radio button. The selected marker becomes a Delta Marker. If the selected marker is already a Delta marker, the reference marker is moved to the current position of the selected marker, thus resetting the Delta to zero.

Marker Settings Diagram

The Marker Settings Diagram lets you configure the Marker system using a visual utility.



All Markers Off

Turns off all markers.

Remote Command	`:CALCulate:OBWidth:MARKer:AOFF`
Example	`:CALC:OBW:MARK:AOFF`

3.8.7.3 Peak Search

The controls on the Peak Search tab allow you to move the marker to selected peaks of the signal, giving you enormous analysis capabilities, particularly when combined with the Delta Marker function.

NOTE

Pressing the **Peak Search** hardkey automatically moves you to the **Peak Search** page of the **Marker** menu *and* performs a Peak Search.

Pressing the **Peak Search** tab once you are already *in* the **Marker** menu does *not* perform a Peak Search.

Marker Frequency

The Marker Frequency control is the fundamental control that you use to move a marker around on the trace. This is the same as the Marker Frequency control on the Settings tab.

Peak Search

Pressing the **Peak Search** control moves the selected marker to the trace point which has the maximum y-axis value for that marker's trace.

NOTE	Pressing the **Peak Search** hardkey automatically moves you to the **Peak Search** page of the **Marker** menu *and* performs a Peak Search.

Remote Command	`:CALCulate:OBWidth:MARKer[1]|2|...|12:MAXimum`

Example	`:CALC:OBW:MARK2:MAX`
	`:SYST:ERR?`
	can be used to query the errors to determine if a peak is found. The message "No peak found" (-200) will be returned after an unsuccessful search

Notes	Sending this command selects the subopcoded marker In the WCDMA mode, this command does not work when the selected marker is located on the polar trace. In this case, the command is ignored

Marker Delta

Pressing this button is exactly the same as pressing the "Delta" selection on the Marker Mode radio button on the Settings tab. The selected marker becomes a Delta Marker. If the selected marker is already a Delta marker, the reference marker is moved to the current position of the selected marker, thus resetting the Delta to zero.

The control is duplicated here in the Peak Search Menu to allow you to conveniently perform a peak search and change the marker's control mode to Delta without having to access two separate menus.

3.8.7.4 Properties

The controls on the Properties tab are used to set certain properties of the selected marker.

Marker Frequency

The Marker Frequency control is the fundamental control that you use to move a marker around on the trace. This is the same as the Marker Frequency control on the Settings tab.

Relative To

Selects the marker to which the selected marker is relative (its reference marker).

Every marker has another marker to which it is relative. This marker is referred to as the “reference marker” for that marker. This attribute is set by the **Marker, Properties, Relative To** key. The marker must be a **Delta** marker to make this attribute relevant. If it is a **Delta** marker, the reference marker determines how the marker is controlled and how its value is displayed. A marker cannot be relative to itself.

Remote Command	`:CALCulate:OBWidth:MARKer[1]|2|...|12:REFerence <integer>` `:CALCulate:OBWidth:MARKer[1]|2|...|12:REFerence?`
Example	`:CALC:OBW:MARK:REF 2` `:CALC:OBW:MARK:REF?`
Notes	This command causes the marker specified with the subopcode to become selected Range (for SCPI command): 1 to 12. If the range is exceeded the value is clipped A marker cannot be relative to itself so that choice is not available, and if sent from SCPI generates error -221: “Settings conflict; marker cannot be relative to itself” When queried a single value is returned (the specified marker numbers relative marker)
Couplings	The act of specifying the selected marker’s reference marker makes the selected marker a Delta marker If the reference marker is off it is turned on in **Normal** mode at the delta marker location
Preset	The preset default “Relative To” marker (reference marker) is the next higher numbered marker (current marker +1). For example, if marker 2 is selected, then it’s default reference marker is marker 3. The exception is marker 12, which has a default reference of marker 1 Set to the defaults by using **Restore Mode Defaults.** This is not reset by **Marker Off**, **All Markers Off**, or **Preset**
State Saved	Saved in instrument state. Not affected by Marker Off and hence not affected by Preset or power cycle
Min	1
Max	12
Annunciation	Appears in the marker label of a **Delta** marker

Marker Trace

Selects the trace on which you want your marker placed. A marker is associated with one and only one trace. This trace is used to determine the placement, result, and X-Axis Scale of the marker. All markers have an associated trace; it is from that trace that they determine their attributes and behaviors, and it is to that trace that they go when they become Normal or Delta markers.

Specifying a Marker Trace manually or with this command associates the marker with the specified trace. If the marker is not OFF, it moves the marker from the trace it was on to the new trace. If the marker is OFF it stays off but is now associated with the specified trace.

The query returns the number of the trace on which the marker is currently placed.

Remote Command	`:CALCulate:OBWidth:MARKer[1]|2|...|12:TRACe 1 | 2 | 3` `:CALCulate:OBWidth:MARKer[1]|2|...|12:TRACe?`
Example	`:CALC:OBW:MARK2:TRAC 2` `:CALC:OBW:MARK2:TRAC?`
Notes	A marker may be placed on a blanked and/or inactive trace, even though the trace is not visible and/or updating An application may register a trace name to be displayed on the control instead of a trace number
Couplings	The state of **Marker Trace** is not affected by the "Auto Couple" on page 1718 key Sending the remote command causes the addressed marker to become selected.
Preset	1
State Saved	Saved in instrument state
Min	1
Max	3

Marker Settings Diagram

The **Marker Settings Diagram** lets you configure the Marker system using a visual utility. This is the same as the"Marker Settings Diagram" on page 1011 control on the **Settings** tab.

3.8.8 Meas Setup

The Meas Setup menu panel contains functions for setting up the measurement parameters and also contains functions for setting up parameters global to all measurements in the mode.

3.8.8.1 Settings

The Settings tab contains frequently used Meas Setup functions to which you will want the fastest access.

Avg/Hold Num

Specifies the number of measurement averages used when calculating the measurement result. The average is displayed at the end of each sweep.

Initiates an averaging routine that averages the sweep points in a number of successive sweeps, resulting in trace smoothing.

After the specified number of average counts, the average mode (termination control) setting determines the average action.

Remote Command	`[:SENSe]:OBWidth:AVERage:COUNt <integer>` `[:SENSe]:OBWidth:AVERage:COUNt?`
Example	`:OBW:AVER:COUN 1500` `:OBW:AVER:COUN?`
Preset	10
State Saved	Yes
Min/Max	1/10000
Annotation	The average count is displayed in the measurement bar on the front panel display. The annotation appears in the format n/N where n is the current average and N is the average count
Backwards Compatibility SCPI	`[:SENSe]:EBWidth:AVERage:COUNt`

Averaging On/Off

Turns averaging on or off.

NOTE In this measurement, the **Average Type** is preset to the `Log-Pwr Avg (Video)` method. Other averaging methods are not available.

Remote Command	`[:SENSe]:OBWidth:AVERage[:STATe] ON | OFF | 1 | 0` `[:SENSe]:OBWidth:AVERage[:STATe]?`
Example	`:OBW:AVER ON` `:OBW:AVER?`
Couplings	Averaging state is coupled to "Max Hold (Remote Command Only)" on page 1021. If **Max Hold** is changed from `OFF` to `ON`, Averaging state is automatically set to `ON`
Preset	`ON`
State Saved	Yes
Range	`ON|OFF`
Backwards Compatibility SCPI	`[:SENSe]:EBWidth:AVERage[:STATe]`

Average Mode

Enables you to set the averaging mode.

- When set to EXPonential the measurement averaging continues using the specified number of averages to compute each averaged value. The average is displayed at the end of each sweep
- When set to REPeat, the measurement resets the average counter each time the specified number of averages is reached

Remote Command	[:SENSe]:OBWidth:AVERage:TCONtrol EXPonential | REPeat [:SENSe]:OBWidth:AVERage:TCONtrol?
Example	:OBW:AVER:TCON REP :OBW:AVER:TCON?
Preset	EXP
State Saved	Yes
Range	EXPonential|REPeat

% of OBW Power

Assigns the percentage of the total power that is measured within the Occupied Bandwidth for the current measurement. The resulting Occupied Bandwidth limits are displayed by markers placed on the frequencies of the specified percentage.

Remote Command	[:SENSe]:OBWidth:PERCent <real> [:SENSe]:OBWidth:PERCent?
Example	:OBW:PERC 75 :OBW:PERC?
Preset	99.00
State Saved	Yes
Min/Max	10/99.99

Power Ref

This control enables you to select Power Ref Type:

- Total Power – Total power in the current span is displayed
- OBW Power – With the OBW percent power, occupied power is displayed

When Power Ref type is changed, the annotation in the lower window and Remote Command SCPI Results also change.

Remote Command	`[:SENSe]:OBWidth:PREFerence TPOWer | OBWPower` `[:SENSe]:OBWidth:PREFerence?`
Example	`:OBW:PREF TPOW` `:OBW:PREF?`
Preset	`TPOWer`
State Saved	Saved in instrument state
Range	`TPOWer|OBWPower`

x dB

Sets the x dB value used for the "x dB bandwidth" result that measures the bandwidth between two points on the signal which is x dB down from the highest signal point within the OBW Span.

Remote Command	`[:SENSe]:OBWidth:XDB <rel_ampl>` `[:SENSe]:OBWidth:XDB?`
Example	`:OBW:XDB -20` `:OBW:XDB?`
Preset	-26.0 dB Unless noted below BT: -20.0 dB
State Saved	Yes
Min/Max	-100.0 dB/-0.1 dB
Backwards Compatibility SCPI	`[:SENSe]:EBWidth:XDB`

Power Integration Method

Selects the power integration method:

– Normal - By integrating the linear power bucket values from the lower edge of the trace, and interpolating to find the point where the integrated power equals (1 – [Occ BW % Pwr]) / 2 (0.5% if, for example, the 99% occupied bandwidth is to be found) of the total power, frequency f1 is obtained. This procedure is repeated from the upper trace edge to find frequency f2. This calculation uses linear interpolation to find the lower and upper carrier boundary point within the width of a sweep point (the span divided by the number of sweep points), f1 and f2

– From Center - Measures the power spectrum distribution within two times or more frequency range over the requirement for Occupied Bandwidth specification centering on the current carrier frequency

Remote Command	`[:SENSe]:OBWidth:INTegration[:METHod] NORMal | ICENter` `[:SENSe]:OBWidth:INTegration[:METHod]?`

Example	:OBW:INT NORM :OBW:INT?
Preset	NORMal unless noted below For 5GNR, Uplink: ICENter
State Saved	Yes
Range	NORMal|ICENter

Spur Avoidance

Because the VXT models M9410A/11A/15A are direct-conversion (zero-IF) receivers, feedthrough leakage from the local oscillator appears as a spurious signal (spur) at the center frequency. The **Spur Avoidance** function is provided to eliminate this spur, at the expense of some measurement speed.

When **Spur Avoidance** is enabled (the default), the instrument uses a software algorithm to remove this spur from the displayed measurement data, but the algorithm only operates under certain conditions. Specifically, it only operates in the multiple capture case.

You can disable this function to speed up your measurement by setting Spur Avoidance to “Disabled.”

Note that when Spur Avoidance is not in effect, either because you have disabled it or because you are not in multiple capture, the following warning message will appear in the status bar:

`Settings Alert;Spur Avoidance Off`

This is to alert you that measurement accuracy might be impacted by the fact that Spur Avoidance is not in effect.

Remote Command	[:SENSe]:OBWidth:SAVoid[:STATe] OFF | ON | 0 | 1 [:SENSe]:OBWidth:SAVoid[:STATe]?
Example	:OBW:SAV ON :OBW:SAV?
Dependencies	This control only appears in VXT models M9410A/11A/15A
Preset	OFF
State Saved	Saved in instrument state
Range	OFF|ON

Meas Setup Summary Table

The Meas Setup Summary Table lets you view and access many of the parameters in the Meas Setup menus on one screen.

Auto Couple

Immediately puts all Auto/Man functions into Auto. The **Auto Couple** action is confined to the current measurement only. It does not affect other measurements in the mode.

In the Auto state, Auto/Man functions are said to be “coupled”, meaning their values change as you make changes to other values in the measurement. This helps ensure accurate measurements and optimum dynamic range. Auto Couple is an immediate action function, and when it is executed, all the Auto/Man controls for the current measurement are set to Auto, and all measurement settings coupled to the Auto/Man parameters are automatically set to their optimal value.

For further details of measurement-specific settings (if any), see "Measurement-Specific Details" on page 1020 below.

Remote Command	`:COUPle ALL`
Example	`:COUP ALL`
Backwards Compatibility SCPI	`:COUPLE ALL | NONE`
Backwards Compatibility Notes	`:COUP:NONE` puts all Auto/Man parameters in manual mode, decoupling all the coupled instrument parameters. It is retained for backwards compatibility and is *not* recommended for making measurements or new designs

All Auto/Man parameter couplings in the measurement are set to Auto. This includes couplings that may be unavailable or grayed-out due to the current state. For example, in the Swept SA measurement, there is no Auto/Man coupling for RBW while in Zero Span. Nonetheless, if **Auto Couple** were executed while in Zero Span it would set RBW to Auto "behind the scenes" so that, on exit from Zero Span, it would be in Auto.

Any Auto/Man selection specific (local) to the other measurements in the current Mode will not be affected by **Auto Couple**. Any functions that are *not* coupled with other instrument parameters, such as ranging or leveling variables, such as "AutoRange" or "AutoScale", will not be affected.

Executing the **Auto Couple** command generates the informational message, "All Auto/Man functions have been set to Auto".

Each parameter, upon being set to Auto, selects and sets the appropriate auto-coupled value based on that parameter’s coupling rules. The Dependency Resolver orchestrates the couplings for parameters that are dependent on one or more other parameters. The coupling and dependency rules for each parameter are defined in the chapter describing that parameter.

Executing the **Auto Couple** command *does not* affect markers, marker functions, trace or display attributes, or any other instrument setting other than those specifically mentioned above.

Measurement-Specific Details

TOI

Parameters affected by Auto Couple are:

- Center Frequency Step
- Resolution Bandwidth
- Span/RBW Ratio
- Sweep Time
- Video BandwidthVBW/RBW ratio
- Upper and Lower Tone (set to Sense
-)Zero span measurement Resolution Bandwidth
- Zero span measurement Dwell Time

Harmonics

For Harmonics, these parameters are:

- Resolution Bandwidth
- Fundamental Frequency
- Dwell Time
- Range Table Resolution Bandwidths
- Range Table Dwell Times

Meas Preset

Restores all measurement parameters to their default values.

Remote Command	`:CONFigure:OBWidth`
Example	`:CONF:OBW`

Max Hold (Remote Command Only)

When ON, Max Hold displays and holds the maximum responses of the current measurement. Turn Max Hold OFF to disable the maximum hold feature.

Remote Command	[:SENSe]:OBWidth:MAXHold ON | OFF | 1 | 0 [:SENSe]:OBWidth:MAXHold?
Example	:OBW:MAXH ON :OBW:MAXH?
Couplings	Max Hold is coupled to Average/Hold state. The Max Hold function is activated only if Average state is On. If Max Hold is changed to On when Average state is Off, Average state is automatically set to On
Preset	OFF
State Saved	Yes
Range	OFF|ON
Backwards Compatibility SCPI	[:SENSe]:EBWidth:MAXHold

3.8.8.2 Radio

The Radio tab contains controls to select the Radio Device, and enable or disable HSPA/HSPA+ options.

Radio Device

Allows you to specify the device to be used.

Remote Command	[:SENSe]:RADio:STANdard:DEVice BTS | MS [:SENSe]:RADio:STANdard:DEVice?
Example	:RAD:STAN:DEV MS :RAD:STAN:DEV?
Preset	BTS
State Saved	Saved in instrument state.
Range	BTS | MS
Backwards Compatibility SCPI	[:SENSe]:RADio:DEVice

HSPA Enable

Allows you to turn on or off the HSDPA/HSUPA option enable. This selection is necessary because some of the auto detection functions that expect an HSPA signal are less tolerant when the signal is noisy or distorted. When the HSPA signal is not expected, turn HSPA Enable off.

Remote Command	`[:SENSe]:RADio:CONFigure:HSDPa[:STATe] 0 | 1 | OFF | ON` `[:SENSe]:RADio:CONFigure:HSDPa[:STATe]?`
Example	`:RAD:CONF:HSDP 0` `:RAD:CONF:HSDP?`
Preset	ON
State Saved	Saved in instrument state.
Range	On|Off

HSPA+ Enable

Allows you to turn on or off the HSPA+ option enable. This selection is necessary because some of the auto detection functions that expect an HSPA+ signal are less tolerant when the signal is noisy or distorted. When the HSPA+ signal is not expected, turn HSPA+ Enable off.

Remote Command	`[:SENSe]:RADio:CONFigure:EHSPa[:STATe] OFF | ON | 0 | 1` `[:SENSe]:RADio:CONFigure:EHSPa[:STATe]?`
Example	`:RAD:CONF:EHSP 0` `:RAD:CONF:EHSP?`
Notes	When HSPA enable is OFF, HSPA+ function is disabled too.
Preset	ON
State Saved	Saved in instrument state.
Range	On|Off

3.8.8.3 Limits

The Limits tab lets you set measurement Limits and be alerted when they have been exceeded.

3.8.8.4 Advanced

The Advanced tab contains controls for setting advanced functions of the instrument.

– This tab does not appear in EXM or VXT

– This tab does not appear in the M9393A or M9391A

Noise Floor Extension

Allows you to turn on/configure the Noise Floor Extension (NFE) function. Some Modes (such as Spectrum Analyzer Mode), support two states of NFE, Full and Adaptive. The ON state (in Modes which do not support Adaptive NFE) matches the FULL state (in Modes which DO support Adaptive NFE).

In ON or FULL NFE, the expected noise power of the instrument (derived from a factory calibration) is subtracted from the trace data. This will usually reduce the apparent noise level by about 10 dB in low band, and 8 dB in high band (>~3.6 GHz).

In Adaptive NFE, there is not the same dramatic visual impact on the noise floor as there is in Full NFE. Adaptive NFE controls the amount of correction that is applied based on other instrument settings like RBW, averaging and sweep time. Adaptive NFE controls the degree of potential improvement in the noise floor to give more improvement for those instrument settings that can make good use of the potential improvement, such as settings that provide more averaging. The result is that when not much averaging is being performed, the signal displays more like the NFE-off case; and when lots of averaging is being performed, the signal displays more like the full-NFE case.

Adaptive NFE (in Modes which support it) is recommended for general-purpose use. For fully ATE (automatic test equipment) applications, where the distraction of a person using the instrument is not a risk, Full NFE is recommended.

NFE works with any RBW, VBW, detector, any setting of Average Type, any amount of trace averaging, and any signal type. It is ineffective when the trace is not smoothed (smoothing processes include narrow VBWs, trace averaging, and long sweep times with the detector set to Average or Peak). It works best with extreme amounts of smoothing, and with the average detector, with the Average Type set to Power.

In those cases where the cancellation is ineffective, it nonetheless has no undesirable side-effects. There is no significant speed impact to having Noise Floor Extension on.

The best accuracy is achieved when substantial smoothing occurs in each point before trace averaging. Thus, when using the average detector, results are better with long sweep times and fewer trace averages. When using the sample detector, the VBW filter should be set narrow with less trace averaging, instead of a wide VBW filter with more trace averaging.

NOTE	Noise Floor Extensions has no effect unless the RF Input is selected, therefore it does nothing when External Mixing is selected. In Modes that support Adaptive NFE, the default state of NFE is Adaptive. In Modes that do not support Adaptive NFE, the default state of NFE is OFF. Prior to the introduction of Adaptive NFE (firmware version A.18.00), the default state of NFE was OFF for all Modes.

With the introduction of Adaptive NFE, the menu control is changed from On|Off to Full|Adaptive|Off. For SCPI Backwards Compatibility, the existing SCPI command to turn NFE on and off was retained, and a new command was added to set the state to turn Adaptive On and Off

`[:SENSe]:CORRection:NOISe:FLOor ON|OFF|1|0` is retained, default changed to On for modes which support Adaptive NFE

`[:SENSe]:CORRection:NOISe:FLOor:ADAPtive ON|OFF|1|0` is added (for certain Modes), default=On

FULL = `:CORRection:NOISe:FLOor ON` plus `:CORRection:NOISe:FLOor:ADAPtive ON`

Remote Command	`[:SENSe]:CORRection:NOISe:FLOor ON | OFF | 1 | 0` `[:SENSe]:CORRection:NOISe:FLOor?`
Example	`:CORR:NOIS:FLO ON`
Dependencies	This control only appears in instruments with the NFE or NF2 license installed. In all others, the control does not appear, however the SCPI command will be accepted without error (but will have no effect)
Couplings	When NFE is enabled in any mode manually, a prompt will be displayed reminding you to perform the Characterize Noise Floor operation if it is needed. If NFE is enabled through SCPI and a Characterize Noise Floor operation is needed, an error will be entered in the system error queue
Preset	Unaffected by Mode Preset. Turned ON at startup and by Restore Mode Defaults in Modes which support Adaptive. Turned OFF at startup and by Restore Mode Defaults in Modes which do not support Adaptive
State Saved	No

Remote Command	`[:SENSe]:CORRection:NOISe:FLOor:ADAptive ON | OFF | 1 | 0` `[:SENSe]:CORRection:NOISe:FLOor:ADAptive?`

Example	First turn NFE on, this is Full mode
	`:CORR:NOIS:FLO ON`
	Then set it to Adaptive
	`:CORR:NOIS:FLO:ADAP ON`

Dependencies	Only available in Modes that support Adaptive NFE Only appears in instruments with the NFE or NF2 license installed. In all others, the control does not appear, however the SCPI command will be accepted without error (but will have no effect)

Couplings	Sending :CORR:NOIS:FLO ON turns NFE Adaptive OFF for backwards compatibility. So to turn Adaptive on, you must issue the commands in the proper order, as shown in the example above
Preset	Not affected by Mode Preset, but set to ON at startup and by Restore Mode Defaults
State Saved	No

More Information

The instrument is characterized in the factory (or during a field calibration) with a model of the noise, referred to the input mixer, versus frequency in each band and path combination. Bands are 0 (low band) and 1 through 4 (high band) in a 26.5 GHz instrument, for example. Paths include normal paths, preamp paths, the electronic attenuator, etc.

In most band/path combinations, the noise can be well characterized based on just two parameters and the instrument frequency response before compensation for frequency-dependent losses.

After the noise density at the input mixer is estimated, the effects of the input attenuator, RBW, detector, etc. are computed to get the estimated input-port-referred noise level.

In the simplest case, the measured power (signal plus analyzer noise) in each display point (bucket) is compensated by subtracting the estimated noise power, leaving just the signal power. This is the operation when the detector is Average and the Average Type is set to Power.

In other cases, operation is often not quite as good but still highly effective. With peak detection, the noise floor is estimated based on the RBW and the duration of the bucket using the same equations used in the noise marker function. The voltage of the noise is subtracted from the voltage of the observed signal-plus-noise measurement to compute the estimated signal voltage. The peak detector is one example of processing that varies with detector to give good estimates of the signal level without the analyzer noise.

For best operation, the average detector and the power scale are recommended, as already stated. Peak detection for pulsed-RF can still give excellent effectiveness. FFT analysis does not work well, and does not do NFE well, with pulsed-RF signals, so this combination is not recommended. Negative peak detection is not very useful, either. Sample detection works well, but is never better than the average detector because it doesn’t smooth as well. The Normal detector is a combination of peak and negative peak behaviors, and works about as well as these.

For best operation, extreme smoothing is desirable, as already stated. Using narrow VBWs works well, but using very long bucket durations and the average detector works best. Reducing the number of trace points will make the buckets longer.

For best operation, the power scale (Average Type = Power) is optimum. When making CW measurements in the presence of noise without NFE, averaging on the decibel scale has the advantage of reducing the effect of noise. When using NFE, the NFE does an even better job than using the log scale ever could. Using NFE with the log scale is not synergistic, though; NFE with the power scale works a little better than NFE with log averaging type.

The results from NFE with internal preamp can often be lower than the theoretical noise in a signal source at room temperature, a noise density of -174 dBm/Hz. This is expected and useful behavior, because NFE is designed to report the amount of input signal that is in excess of the thermal noise, not the amount that includes the thermal noise. This can be a useful behavior because thermal noise often interferes with what you want to measure, instead of being part of what you want to measure. Note that NFE is not adequately accurate to always be able to read below kTB.

Adaptive NFE provides an alternative to fully-on and -off NFE. Fully-on NFE can, notably in cases with little or no averaging of the spectrum, result in a display that is distractingly unfamiliar in the variability in response to low level signals. Fully-off NFE fails to achieve the potential improvement in dynamic range and associated accuracy of measurement of low level signals. Adaptive NFE controls the degree of potential improvement in the noise floor to give more improvement for those instrument settings that can make good use of the potential improvement—those settings with high degrees of variance reduction through some variant of averaging. When the potential improvement is small, the display acts like the NFE-off case, and when it is high, it acts like the fully-on case, and in-between, application is a compromise between attractiveness and effectiveness.

On instruments with the NF2 license installed, the calibrated Noise Floor used by Noise Floor Extensions should be refreshed periodically. Keysight recommends that the **Characterize Noise Floor** operation be performed after the first 500 hours of operation, and once every calendar year. The control to perform this is located in the **System, Alignments, Advanced** menu. If you have not done this yourself at the recommended interval, then when you turn on Noise Floor Extensions, the instrument will prompt you to do so with a dialog that says:

“This action will take several minutes to perform. Please disconnect all cables from the RF input and press Enter to proceed. Press ESC to cancel, or Postpone to postpone for a week”

If you Cancel, you will be prompted again the next time you turn NFE on. If you postpone, you will be prompted again after a week passes and you then turn NFE on.

IF Gain

The IF Gain control can be used to set the IF Gain function to Auto, Low Gain or High Gain. These settings affect sensitivity and IF overloads.

This only applies to the RF input. It does not apply to baseband I/Q input.

Remote Command	`[:SENSe]:OBWidth:IF:GAIN[:STATe] ON | OFF | 1 | 0`
	`[:SENSe]:OBWidth:IF:GAIN[:STATe]?`
	`[:SENSe]:OBWidth:IF:GAIN:AUTO[:STATe] ON | OFF | 1 | 0`

	[:SENSe]:OBWidth:IF:GAIN:AUTO[:STATe]?
Example	:OBW:IF:GAIN ON :OBW:IF:GAIN? :OBW:IF:GAIN:AUTO OFF :OBW:IF:GAIN:AUTO?
Notes	ON = high gain OFF = low gain
Dependencies	The IF Gain control has no effect when the U7227A USB Preamplifier is connected. This is not annotated or reflected on any control; there are no controls grayed out nor any SCPI locked out. The instrument simply behaves as though both IF Gain is set to Low regardless of the setting on the control This control is not available in VXT, EXM, or UXM This control is not available in the E7760, M9393A or M9391A
Couplings	Auto sets IF Gain to High Gain under any of the following conditions: – the input attenuator is set to 0 dB – or the preamp is turned on and the frequency range is under 3.6 GHz For other conditions, Auto sets IF Gain to Low Gain
Preset	OFF OFF
State Saved	Saved in instrument state
Range	Low Gain|High Gain

3.8.8.5 Global

The controls in this menu apply to all Modes in the instrument.

Some controls (for example, **Global Center Freq**) allow you to switch certain Meas Global parameters to a Mode Global state. These switches apply to all Modes that support global settings. For example, no matter what Mode you are in when you set **Global Center Freq** to ON, it applies to all Modes that support Global Settings.

Other controls (for example, **Extend Low Band**) are actually set in this menu, but apply to all Modes.

Global Center Freq

The software maintains a Mode Global value called **Global Center Freq**.

When **Global Center Freq** is switched ON, the current Mode's center frequency is copied into the **Global Center Frequency**, and from then on all Modes that support global settings use the **Global Center Frequency**, so you can switch between any of these Modes and the Center Freq will remain unchanged.

Adjusting the Center Freq of any Mode that supports Global Settings, while **Global Center Freq** is ON, modifies the Global Center Frequency.

When **Global Center Freq** is switched OFF, the Center Freq of the current Mode is unchanged, but now the Center Freq of each Mode is once again independent.

When **Mode Preset** is pressed while **Global Center Freq** is ON, the Global Center Freq is preset to the preset Center Freq of the current Mode.

This function is reset to OFF when "Restore Defaults" on page 1737 (in this tab) is pressed, or when **System**, **Restore Defaults**, **All Modes** is pressed.

Remote Command	:INSTrument:COUPle:FREQuency:CENTer ALL | NONE :INSTrument:COUPle:FREQuency:CENTer?
Example	:INST:COUP:FREQ:CENT ALL :INST:COUP:FREQ:CENT?
Preset	Set to OFF on **Global** Settings, **Restore Defaults** and **System, Restore Defaults, All Modes**
Range	ALL|NONE

Preset	OFF
Backwards Compatibility SCPI	:GLOBal:FREQuency:CENTer[:STATe] 1 | 0 | ON | OFF :GLOBal:FREQuency:CENTer[:STATe]?

Global EMC Std

When this control is switched ON, the current Mode's EMC Std is copied into the **Global EMC Std**, and from then on all Modes that support global settings use the Global EMC Std, so you can switch between any of these Modes and the EMC Std will remain unchanged.

Adjusting the EMC Std of any Mode that supports Global Settings, while Global EMC Std is ON, will modify the **Global EMC Std**.

When **Global EMC Std** is switched OFF, the EMC Std of the current Mode is unchanged, but now the EMC Std of each Mode is once again independent. When **Mode Preset** is pressed while **Global EMC Std** is ON, the Global EMC Std is preset to the preset EMC Std of the current Mode.

This function is reset to OFF when "Restore Defaults" on page 1737 (in this tab) is pressed, or when **System, Restore Defaults, All Modes** is pressed.

Remote Command	:INSTrument:COUPle:EMC:STANdard ALL | NONE :INSTrument:COUPle:EMC:STANdard?
Example	:INST:COUP:EMC:STAN ALL :INST:COUP:EMC:STAN?

Dependencies	Only available if option EMC is installed
Preset	Set to OFF on **Global** Settings, **Restore Defaults** and **System, Restore Defaults, All Modes**
Range	ALL|NONE

Extend Low Band

The software maintains a Mode Global value called **Extend Low Band**.

Under the current sweep configuration crossing over two bands, when **Extend Low Band** is turned ON, the instrument checks whether one band can cover the whole sweep frequency range or not. If it can, then the instrument locks the band; otherwise, it does nothing (the band crossover occurs).

This function does *not* work when **Band Lock** under **System** > **Service** > **Lock Functions** is not -1 (no Band Lock). In that case, **Band Lock** takes priority over **Extend Low Band**.

This function is reset to OFF when "Restore Defaults" on page 1737 (in this tab) is pressed, or when **System**, **Restore Defaults**, **All Modes** is pressed.

This parameter is available for SA, RTSA, WCDMA, WIMAX OFDMA, LTEAFDD, LTEATDD Modes.

Remote Command	:INSTrument:COUPle:FREQuency:BAND:EXTend 0 | 1 | ON | OFF :INSTrument:COUPle:FREQuency:BAND:EXTend?
Example	:INST:COUP:FREQ:BAND:EXT 1 :INST:COUP:FREQ:BAND:EXT?
Dependencies	Only applies to UXA, PXA, MXA and EXA
Preset	Set to OFF by **Global** Settings > **Restore Defaults** and **System** > **Restore Defaults** > **All Modes**
Range	ON|OFF

Restore Defaults

Resets all of the functions in the **Global** Settings menu to OFF. This also occurs when **System**, **Restore Defaults**, **All Modes** is pressed.

Remote Command	:INSTrument:COUPle:DEFault
Example	:INST:COUP:DEF
Backwards Compatibility SCPI	:GLOBal:DEFault

3.8.9 Sweep

The Sweep key accesses controls that enable you configure and control the acquisition of data and the X-axis parameters of the instrument. These controls might include Sweep Time, Continuous/Single, Pause/Resume, X Scale and number of Points.

3.8.9.1 Sweep/Control

Contains controls for the Sweep and Control functions of the instrument, such as Sweep Time and Continuous/Single.

Sweep Time

Controls the time the instrument takes to sweep the current frequency span in swept measurements, displays the sweep time in swept measurements, and displays the equivalent Sweep Time in FFT measurements.

NOTE **In instruments without sweeping hardware this control may be labelled "Acquisition Time"**

When **Sweep Time** is in Auto, the instrument computes a time that will give accurate measurements based on other settings of the instrument, such as RBW and VBW.

You can choose a shorter sweep time to improve the measurement throughput (with some potential unspecified accuracy reduction), but the Meas Uncal indicator will come on if the sweep time you set is less than the calculated Auto Sweep time.

You can also select a longer sweep time, which can be useful (for example) for obtaining accurate insertion loss measurements on very narrowband filters.

NOTE **Significantly faster sweep times are available with Option FS1.**

NOTE **The Meas Uncal (measurement uncalibrated) warning is given in the Status Bar at the bottom of the screen when the manual Sweep time entered is faster than the time computed by the instrument's Sweep time equations, that is, the Auto Sweep Time. The instrument's computed Sweep time will give accurate measurements; if you sweep faster than this your measurements may be inaccurate. A Meas Uncal condition may be corrected by returning the Sweep Time to Auto; by entering a longer Sweep Time; or by choosing a wider RBW and/or VBW.**

Remote Command	`[:SENSe]:OBWidth:SWEep:TIME <time>`
	`[:SENSe]:OBWidth:SWEep:TIME?`
	`[:SENSe]:OBWidth:SWEep:TIME:AUTO OFF | ON | 0 | 1`
	`[:SENSe]:OBWidth:SWEep:TIME:AUTO?`

Example	`:OBW:SWE:TIME 50 ms` `:OBW:SWE:TIME?`

	`:OBW:SWE:TIME:AUTO OFF` `:OBW:SWE:TIME:AUTO?`
Dependencies	In certain instruments without sweeping hardware, such as VXT models M9420A/21A, the Sweep Time control is grayed out, and the Auto/Man toggle disappears
Couplings	Sweep time is coupled to RBW when **Sweep Time** is set to Auto; in this case the sweep time is changed as the RBW changes, to maintain amplitude calibration Sweep Time is also coupled to the Video Bandwidth (VBW). As the VBW is changed, the sweep time (when set to Auto) is changed to maintain amplitude calibration. This occurs because of common hardware between the two circuits
Preset	Automatically Calculated unless noted below WCDMA: 32.6 ms `ON` unless noted below WCDMA Mode: `OFF`
State Saved	Saved in instrument state
Min	Typically: 1 ms
Max	In swept spans: 4000 s
Annotation	The sweep time is displayed in the lower-right corner of the screen. The number of points is displayed parenthetically, as Sweep 13.3 ms (1001 points) A "#" mark appears before "Sweep" in the annotation when it is switched from Auto to Manual coupling
Status Bits/OPC dependencies	Meas Uncal is Bit 0 in the STATus:QUEStionable:INTegrity:UNCalibrated register

Sweep/Measure

Allows you to toggle between Continuous and Single sweep or measurement operation. The Single/Continuous state is Meas Global, so the setting affects *all* measurements.

The front-panel key **Single/Cont** performs exactly the same function

NOTE	In the `WAVeform` measurement, this control only appears in the Meas Bar, and not in the **Sweep/Control** tab.

See "More Information" on page 1032

Remote Command	`:INITiate:CONTinuous OFF | ON | 0 | 1` `:INITiate:CONTinuous?`

Example	`:INIT:CONT 0`
	`:INIT:CONT OFF`
	puts instrument into Single measurement operation

	`:INIT:CONT 1`
	`:INIT:CONT ON`
	puts instrument into Continuous measurement operation

Preset	ON Note that `:SYST:PRES` sets `:INIT:CONT` to `ON` but `*RST` sets `:INIT:CONT` to `OFF`
State Saved	Saved in instrument state
Annunciation	The **Single/Continuous** icon in the Meas Bar changes depending on the setting: – A line with an arrow is Single – A loop with an arrow is Continuous

More Information

With **Avg/Hold Num** (in the **Meas Setup** menu) set to **Off** or set to **On** with a value of 1, a sweep is taken after the trigger condition is met; and the instrument continues to take new sweeps after the current sweep has completed and the trigger condition is again met. However, with **Avg/Hold Num** set to On with a value >1, multiple sweeps (data acquisitions) are taken for the measurement. The trigger condition must be met prior to each sweep. The sweep is not stopped when the average count k equals the number N set for Avg/Hold Num is reached, but the number k stops incrementing. A measurement average usually applies to all traces, marker results, and numeric results, but sometimes only applies to the numeric results.

If the instrument is in Single measurement, pressing the **Cont/Single** toggle control does not change k and does not cause the sweep to be reset; the only action is to put the instrument into Continuous measurement operation.

If it is already in Continuous sweep:

- the `:INIT:CONT 1` command has no effect
- the `:INIT:CONT 0` command will place the instrument in Single Sweep but will have no effect on the current sequence until k = N, at which point the current sequence will stop and the instrument will go to the idle state.

See "Restart" on page 1738 control description for details on the `:INIT:IMM` (Restart) function.

If you are already in Single sweep, the `:INIT:CONT OFF` command has no effect.

If you are already in Single Sweep, then pressing the **Cont/Single** toggle control in the middle of a sweep does not restart the sweep or sequence. Similarly, pressing the **Cont/Single** toggle control does not restart the sweep or sequence if the sweep is not in the idle state (for example, if you are taking a very slow sweep, or the instrument is waiting for a trigger). Even though pressing the **Cont/Single** toggle control in the middle of a sweep does *not* restart the sweep, sending `:INIT:IMM` *does* reset it.

Restart

The **Restart** function restarts the current sweep, or measurement, or set of averaged/held sweeps or measurements. In measurements that support pausing, if you are Paused, pressing **Restart** performs a **Resume**.

The Restart function is accessed in several ways:

- Pressing the **Restart** key
- Sending the remote command `:INIT:IMM`
- Sending the remote command `:INIT:REST`

See "More Information" on page 1033

Remote Command	`:INITiate[:IMMediate]` `:INITiate:RESTart`
Example	`:INIT:IMM` `:INIT:REST`
Notes	`:INIT:REST` and `:INIT:IMM` and the front-panel **Restart** key perform exactly the same function
Couplings	Resets average/hold count k For the first sweep, overwrites all active (update=on) traces with new current data For application modes, resets other parameters as required by the measurement
Status Bits/OPC dependencies	This is an Overlapped command The `:STATus:OPERation` register bits 0 through 8 are cleared The `:STATus:QUEStionable` register bit 9 (INTegrity sum) is cleared The `SWEEPING` bit is set The `MEASURING` bit is set
Backwards Compatibility Notes	For Spectrum Analysis mode in ESA and PSA, the **Restart** hardkey and the `:INIT:REST` command restart trace averages (displayed average count reset to 1) for a trace in **Clear Write**, but did not restart **Max Hold** and **Min Hold** In the X-Series, the **Restart** hardkey and the `:INIT:REST` command restart not only **Trace Average**, but **Max Hold** and **Min Hold** traces as well For wireless comms modes in ESA and PSA, the **Restart** hardkey and the `:INIT:REST` command restarted every measurement, including all traces and numeric results. There is no change to this operation

More Information

The **Restart** function first aborts the current sweep or measurement as quickly as possible. It then resets the sweep and trigger systems, sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is in the process of aligning when a Restart is executed, the alignment finishes before the restart function is performed.

Even when set for Single operation, multiple sweeps may be taken when **Restart** is pressed (for example, when averaging/holding is on). Thus when we say that Restart "restarts a measurement," depending on the current settings, we may mean:

- It restarts the current sweep
- It restarts the current measurement
- It restarts the current set of sweeps if any trace is in Trace Average, Max Hold or Min Hold
- It restarts the current set of measurements if Averaging, or Max Hold, or Min Hold is on for the measurement

With Average/Hold Number (in Meas Setup menu) set to 1, or Averaging off, or no trace in Trace Average or Hold, a single sweep is equivalent to a single measurement. A single sweep is taken after the trigger condition is met; and the instrument stops sweeping once that sweep has completed. However, with Average/Hold Number >1 and at least one trace set to Trace Average, Max Hold, or Min Hold (SA Measurement) or Averaging on (most other measurements), multiple sweeps/data acquisitions are taken for a single measurement. The trigger condition must be met prior to each sweep. The sweep is stopped when the average count k equals the number N set for Average/Hold Number. A measurement average usually applies to all traces, marker results, and numeric results, but sometimes only applies to the numeric results.

Once the full set of sweeps has been taken, the instrument will go to the idle state. To take one more sweep without resetting the average count, increment the average count by 1, by pressing the step up key while Average/Hold Number is the active function, or by sending the remote command `:CALC:AVER:TCON UP`.

Pause/Resume

Pauses a measurement after the current data acquisition is complete.

When a measurement is paused:

- The label on this control changes to **Resume**. Pressing **Resume** un-pauses the measurement.
- Pressing **Restart** also performs a **Resume**.

Remote Command	`:INITiate:PAUSe` `:INITiate:RESume`
Example	`:INIT:PAUS` `:INIT:RES`

Dependencies	Not displayed in Modes that do not support pausing
Couplings	When Averaging is On, if the measurement is paused no more updates will occur until either a Resume or Restart occurs If the measurement is resumed, the averaging continues to use the traces from before the Pause occurred and continues to use the traces from the point where the Resume occurred. This still provides real-time traces, but they will no longer be gap free In a view with a Waterfall window, when the measurement is paused, the Waterfall stops updating. When Resume is selected, the Waterfall will retain the existing traces and continue updating using traces from the point at which Resume was selected. The time stamp of the individual Waterfall traces will show the time from the beginning of the measurement the trace relates to, showing there was a gap in the Waterfall capture In Density view, when the measurement is paused, the Density Display stops updating. When the measurement is resumed, if Persistence is `ON`, the persistence fading will continue from the point when the measurement was paused If a Restart occurs, the average counter is reset and all results are discarded. The measurement begins again, using traces after the Restart occurred

Abort (Remote Command Only)

This command stops the current measurement. It aborts the current measurement as quickly as possible, resets the sweep and trigger systems, and puts the measurement into an "idle" state. If the instrument is in the process of aligning when `:ABORt` is sent, the alignment finishes before the abort function is performed, so `:ABORt` does *not* abort an alignment.

If the instrument is set for Continuous measurement, it sets up the measurement and initiates a new data measurement sequence with a new data acquisition (sweep) taken once the trigger condition is met.

If the instrument is set for Single measurement, it remains in the "idle" state until an `:INIT:IMM` command is received.

Remote Command	`:ABORt`
Example	`:ABOR`
Notes	If `:INIT:CONT` is `ON`, then a new continuous measurement will start immediately, with sweep (data acquisition) occurring once the trigger condition has been met If `:INIT:CONT` is `OFF`, then `:INIT:IMM` is used to start a single measurement, with sweep (data acquisition) occurring once the trigger condition has been met
Dependencies	For continuous measurement, `:ABORt` is equivalent to the **Restart** key Not all measurements support the abort command
Status Bits/OPC dependencies	The `:STATus:OPERation` register bits 0 through 8 are cleared The `:STATus:QUEStionable` register bit 9 (INTegrity sum) is cleared Since all the bits that feed into OPC are cleared by `:ABORt`, the `:ABORt` will cause the *OPC query to return true

3.8.9.2 Sweep Config

This tab accesses controls that enable you to configure the Sweep and Control functions of the instrument, such as Sweep Rules.

Sweep Time Rules

Switches the instrument between normal and accuracy sweep states.

Setting **Auto Sweep Time** to **Accy** results in slower sweep times, usually about three times as long, but yields better amplitude accuracy for CW signals. The instrument amplitude accuracy specifications only apply when **Auto Sweep Time** is set to **Accy**.

Additional amplitude errors which occur when **Auto Sweep Time** is set to **Norm** are usually well under 0.1 dB, though this is not guaranteed. Because of the faster sweep times and still low errors, **Norm** is the preferred setting of **Auto Sweep Time**. **Auto Sweep Time** is set to **Norm** on a **Preset** or **Auto Couple**. This means that in the Preset or Auto Coupled state, instrument amplitude accuracy specifications do not apply.

Remote Command	`[:SENSe]:OBWidth:SWEep:TIME:AUTO:RULes NORMal | ACCuracy` `[:SENSe]:OBWidth:SWEep:TIME:AUTO:RULes?`
Example	`:OBW:SWE:TIME:AUTO:RUL NORM` `:OBW:SWE:TIME:AUTO:RUL?`
Dependencies	This control does not appear in Spectrum Analyzer Mode in VXT models M9420A/21A This control is not available in E7760
Couplings	Set to `NORMal` when **Auto Couple** is pressed or sent remotely
Preset	`NORMal`
State Saved	Saved in instrument state
Range	`NORMal|ACCuracy`

Points

Sets the number of points taken per sweep, and displayed in the traces. The current value of points is displayed parenthetically, next to the sweep time in the lower-right corner of the display. Using more points provides greater resolution. Using fewer points compacts the data and decreases the time required to access a trace over the remote interface.

Increasing the number of points does not increase the sweep time. However, it can slightly impact the trace processing time and therefore the overall measurement speed. Decreasing the number of points does not decrease the sweep time, but it may speed up the measurement, depending on the other sweep settings (for example, in FFT sweeps). Fewer points will always speed up the I/O.

Due to minimum sweep rate limitations of the hardware, the minimum sweep time available to the user will increase above its normal value of 1 ms as the number of sweep points increases above 15001.

Changing the number of sweep points has several effects on the instrument.Since markers are read at the point location, the marker reading may change.The sweep time resolution will change. Trace data for all the traces will be cleared and, if **Sweep** is in **Cont**, a new trace taken. If any trace is in average or hold, the averaging starts over.

Because of sweep time quantization issues, the knob and up/down keys cannot be used to adjust the number of points.

When in a split screen display each window may have its own value for points.

When sweep points is changed, an informational message "Sweep points changed, all traces cleared" is displayed and in the 5G NR mode, Auto Sweep Points is set to `OFF`(0).

Remote Command	`[:SENSe]:OBWidth:SWEep:POINts <integer>` `[:SENSe]:OBWidth:SWEep:POINts?`
Example	`:OBW:SWE:POIN 501` `:OBW:SWE:POIN?`
Dependencies	This function is not available when Signal ID is set to On in External Mixing Neither the knob nor the step keys can be used to change this value. If it is tried, a warning is given Not displayed in modes that do not support Swept
Couplings	Whenever the number of sweep points change: – All trace data is erased – Any traces with Update Off will also go to Display Off (like going from View to Blank in the older instruments) – Sweep time is re-quantized – Any limit lines that are on will be updated – If averaging/hold is on, averaging/hold starts over – Auto Sweep Points is set to OFF (5G NR only) The resolution of setting the sweep time depends on the number of points selected
Preset	1001 unless noted below LTE, LTETDD, MSR, LTEAFDD, LTEATDD: 2001 5GNR: 7001
State Saved	Saved in instrument state
Min	101
Max	100,001
Annotation	On second line of annotations, in lower right corner in parenthesis behind the sweep annotation

3.8.10 Trace

The **Trace** menu lets you control the acquisition, display, storage, detection and manipulation of trace data for the available traces. The Trace Control tab of this menu contains radio-button selections for the trace type (**Clear/Write, Trace Average, Max Hold, Min Hold**) and **View/Blank** setting for the selected trace.

3.8.10.1 Select Trace

Specifies the *selected trace*, which is the trace that will be affected when you change trace settings.

The **Select Trace** control appears above the menu panel, indicating that it applies to *all* controls in the menu panel. **Select Trace** is blanked if you select a tab whose controls do *not* depend on the selected trace (for example, **Trace Function**).

Notes	The selected trace is remembered even when not in the **Trace** menu
Preset	Trace 1
State Saved	Yes

3.8.10.2 Trace Control

The controls on the Trace Control tab allow you to set the type of the Trace and its update mode.

There are four Trace Types: **Clear/Write, Trace Average, Max Hold** and **Min Hold.** Each type handles data in a different way.

Each trace also has two values that determine whether it is being written or not and whether it is being displayed or not. These values, **Update** and **Display,** are described more fully in the "View/Blank" on page 1420 control description; when **Update** is `ON` a trace is updating and when **Update** is `OFF` it is not; and when **Display** is `ON` it is visible and when **Display** is `OFF` it is not. These terms are used throughout the descriptions below.

When Trace Annotation (see **Display** menu) is `ON`, each non-blanked trace is labeled on the trace with the detector used to take it.

For slower sweeps a visual indicator exists on the trace where the new data is being written, a green “caret” or ^ symbol, which moves across the bottom of the graticule showing the current trace point.

Trace Type

Allows you to select the type of trace you want to you use for the current measurement. There are four Trace Types:

Type	Option	Description
Clear Write	`WRITe`	Each trace update replaces the old data in the trace with new data
Trace Average	`AVERage`	The instrument maintains and displays an average trace, which represents the cumulative average on a point-by-point basis of the new trace data and previous averaged trace data
Max Hold	`MAXHold`	The instrument maintains and displays a max hold trace, which represents the maximum data value on a point-by-point basis of the new trace data and previous trace data
Min Hold	`MINHold`	The instrument maintains and displays a min hold trace, which represents the minimum data value on a point-point basis of the new trace data and previous trace data

Besides the **Trace Type**, the state of "View/Blank" on page 1420 must be set to **Active** (**Update**ON, **Display**ON) for a trace to be updating and visible. Selecting any **Trace Type** automatically makes the trace **Active**.

Remote Command	`:TRACe[1]|2|3:OBWidth:TYPE WRITe | AVERage | MAXHold | MINHold` `:TRACe:OBWidth:TYPE?`
Example	`:TRAC:OBW:TYPE MINH` `:TRAC:OBW:TYPE?`
Couplings	When Detector setting is `AUTO` (`[:SENSe]:OBWidth:DETector:AUTO?`), Detector (`[:SENSe]:OBWidth:DETector[:FUNCtion]?`) switches aligning with the switch of this parameter: – `NORMal` with WRITe (Clear Write) – `AVERage` with AVERage – "`POSitive` (peak)" with MAXHold – "`NEGative` (peak)" with MINHold
Preset	`AVERage`
State Saved	Saved in instrument state
Range	ClearWrite|Average|MaxHold|MinHold

Clear and Write | Restart Averaging | Restart Max/Min Hold

This control starts the trace writing as though the trace type had just been selected. Pressing this control has exactly the same effect as selecting the current trace type again – the control is provided because it may not be obvious that re-selecting the *same* selection from a radio button menu will take an action.

This button displays different labels depending on the "Trace Type" on page 1038:

– Clear/Write: Clear and Write

– Trace Average: Restart Averaging

– Max Hold: Restart Max Hold

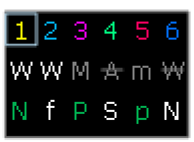
– Min Hold: Restart Min Hold

View/Blank

This control lets you set the state of the two trace variables: Update and Display. The four choices available in this dropdown menu are:

Active	Update and Display both ON
View	Update Off and Display ON
Blank	Update Off and Display OFF
Background	Update ON, Display OFF Allows a trace to be blanked *and* continue to update "in the background", which was not possible in the past

A trace with Display `OFF` is indicated by a strikethrough thru the type letter in the trace annotation panel in the Measurement Bar. A trace with Update `OFF` is indicated by dimming the type letter in the trace annotation panel in the Measurement Bar. In the example below, Traces 3, 4, 5 and 6 have Update `OFF`, and Traces 4 and 6 have Display `OFF`.



See:

– "Trace Update State On/Off" on page 1041

– "Trace Display State On/Off" on page 1041

– "More Information" on page 1041

Notes	See tables below for detail on the SCPI to control the two variables: Update and Display
Dependencies	When Signal ID is on, this key is grayed out
Couplings	Selecting a trace type (Clear/Write, Trace Average, Max Hold, Min Hold) for a trace (pressing the key or sending the equivalent SCPI command) puts the trace in **Active** (Update ON and Display ON), even if that trace type was already selected Selecting a detector for a trace (pressing the key or sending a `[:SENS]:DET:TRAC` command) puts the trace in **Active** (Update ON and Display ON), even if that detector was already selected Selecting a "Math Function" on page 1422 other than `OFF` for a trace (pressing the key or sending the equivalent SCPI command) puts the trace in **Active** (Update ON and Display ON), even if that math mode was already selected Loading a trace from a file puts that trace in View regardless of the state it was in when it was saved; as does being the target of a **Copy** or a participant in an **Exchange**

Trace Update State On/Off

Remote Command	`:TRACe[1]|2|...|6[:<meas>]:UPDate[:STATe] ON | OFF | 0 | 1` `:TRACe[1]|2|...|6[:<meas>]:UPDate[:STATe]?`
Example	`:TRAC2:UPD 0` Makes trace 2 inactive (stops updating)
Couplings	Whenever you set **Update** to ON for any trace, the **Display** is set to ON for that trace
Preset	ON for Trace 1; OFF for 2–6
State Saved	Saved in instrument state
Backwards Compatibility Notes	`:TRACe:MODE VIEW` sets `:TRACe:UPDate OFF`, `:TRACe:DISPlay ON`, for the selected trace. In earlier instruments, View and Blank were trace modes, set by `:TRACe:MODE` command. In the X-Series, View and Blank are two of the states set by the `:TRACe:UPDate` and `:TRACe:DISPlay` commands. The `:TRACe:MODE VIEW` command yields the new equivalent, which is Update=OFF, Display=ON

Trace Display State On/Off

Remote Command	`:TRACe[1]|2|...|6[:<meas>]:DISPlay[:STATe] ON | OFF | 0 | 1` `:TRACe[1]|2|...|6[:<meas>]:DISPlay[:STATe]?`

Example	`:TRAC2:DISP 1`
	Makes trace 1 visible
	`:TRAC3:DISP 3`
	Blanks trace 3

Couplings	Whenever you set Update to On for any trace, the Display is set to On for that trace
Preset	ON for Trace 1; OFF for 2–6
State Saved	Saved in instrument state
Backwards Compatibility Notes	`:TRACe:MODE BLANk` sets `:TRACe:UPDate OFF`, `:TRACe:DISPlay OFF`, for the selected trace. In earlier instruments, View and Blank were trace modes, set by `:TRACe:MODE` command. In the X-Series, View and Blank are two of the states set by the `:TRACe:UPDate` and `:TRACe:DISPlay` commands. The `:TRACe:MODE BLANk` command yields the new equivalent, which is Update=OFF, Display=OFF

More Information

When a trace becomes inactive, any update from the `:SENSe` system (detectors) immediately stops – this does not wait for the end of the sweep. The trace data remains unchanged, but stops updating. If the trace is blanked, this still does not affect the data in the trace. Traces that are blanked (Display=OFF) do not display nor appear on printouts, but their data stays intact, they may be queried, and markers may be placed on them.

In most cases, inactive traces are static and unchanging; however, there are cases when an inactive trace will update, specifically:

- if data is written to that trace from remote
- if trace data is loaded from mass storage
- if the trace is the target of a **Copy** or participant in an **Exchange**
- if the trace is cleared using the Clear Trace function (below)

Inactive traces that are also being displayed (traces in **View**) are displayed at half intensity. Traces in **View** display across the entire X-Axis of the instrument. Their horizontal placement does not change, even if X-Axis settings subsequently are changed, although Y-Axis settings do affect the vertical placement of data.

When a trace becomes active (Update=`ON`), the trace is cleared, the average count is reset, and a new sweep is initiated.

Note that putting a trace into Display=`OFF` and/or Update=`OFF` does *not* restart the sweep and does *not* restart Averaging or Hold functions for any traces.

3.8.10.3 Detector

The Detector tab lets you choose and configure detectors for the selected trace.

Detector

Selects a detector to be used by the instrument for the current measurement. The following choices are available:

Option	Behavior
`AUTO`	The detector selected depends on marker functions, trace functions, average type, and the trace averaging function For details, see "Detector Select Auto/Man" on page 1043
`NORMal`	The detector determines the peak of the CW-like signals, and it yields alternating maximums and minimums of noise-like signals. This is also referred to as Rosenfell detection
`AVERage`	The detector determines the average of the signal within the sweep points, using RMS averaging
`POSitive` Peak	The detector determines the maximum of the signal within the sweep points
`SAMPle`	The detector indicates the instantaneous level of the signal at the center of the sweep points represented by each display point
`NEGative` Peak	The detector determines the minimum of the signal within the sweep points
`RMS`	Equivalent to AVERage

Because they may not find a spectral component's true peak, neither AVERage nor SAMPle detectors measure amplitudes of CW signals as accurately as Peak (POSitive) or NORMal, but they do measure noise without the biases of peak detection.

Remote Command	[:SENSe]:OBWidth:DETector[:FUNCtion] NORMal | AVERage | POSitive | SAMPle | NEGative | RMS [:SENSe]:OBWidth:DETector[:FUNCtion]?
Example	:OBW:DET NORM :OBW:DET? :OBW:DET RMS Sets the detector to Average. Average uses RMS averaging, so this is equivalent to selecting an RMS detector
Notes	The query returns a name that corresponds to the detector type, as shown below The RMS selection sets the detector type to AVERage with RMS averaging. Therefore if RMS has been selected, the query returns AVER

String Returned	Definition
NORM	Normal
AVER	Average (RMS)
POS	Peak
SAMP	Sample
NEG	Negative Peak

Couplings	When Detector setting is AUTO, ([:SENSe]:OBWidth:DETector:AUTO?), Detector ([:SENSe]:OBWidth:DETector[:FUNCtion]?) switches aligning with the switch of this parameter: "NORMal" with Clear Write, "AVERage" with AVERage, "POSitive (peak)" with MAXHold, and "NEGative (peak)" with MINHold
Preset	AVERage
State Saved	Saved in instrument state
Range	NORMal|AVERage|POSitive|SAMPle|NEGative|RMS

Detector Select Auto/Man

This toggle sets the Detector mode to Auto or Manual. In Auto, the proper detector is chosen based on rules that take into account the measurement settings and other instrument settings.

When any detector is selected by the user, this toggles automatically set to Man (manual).

Remote Command	[:SENSe]:OBWidth:DETector:AUTO ON | OFF | 1 | 0 [:SENSe]:OBWidth:DETector:AUTO?

Example	:OBW:DET:AUTO ON :OBW:DET:AUTO?
Couplings	When Detector setting is "Auto" ([:SENSe]:OBWidth:DETector:AUTO?), Detector ([:SENSe]:OBWidth:DETector[:FUNCtion]?) switches aligning with the switch of this parameter: "NORMal" with Clear Write, "AVERage" with AVERage, "POSitive (peak)" with MAXHold, and "NEGative (peak)" with MINHold
Preset	ON
State Saved	Yes

3.8.10.4 Math

The Math tab lets you turn on and configure trace math functions.

Math Function

Trace math functions perform mathematical operations between traces and, in some cases, user-specified offsets. When in a trace math function, the indicated function is performed during the sweep with the math function used in place of a detector.

The trace operands for the math function are set using the **Trace Operands** control.

See also "More Information" on page 1045 and "How trace math is processed" on page 1048.

Remote Command	:CALCulate:OBWidth:MATH TRACe1 | TRACe2 | TRACe3, PDIFference | PSUM | LOFFset | LDIFference | OFF, TRACe1 | TRACe2 | TRACe3,TRACe1 | TRACe2 | TRACe3, <real>,<real> :CALCulate:OBWidth:MATH? TRACe1 | TRACe2 | TRACe3
Example	:CALC:OBW:MATH TRAC1,PDIF,TRAC2,TRAC3,0,0 Sets Trace 1 to Power Diff trace math function, and sets the First Trace operand (for Trace 1) to Trace 2 and the Second Trace operand (for Trace 1) to Trace 3 :CALC:OBW:MATH TRAC1,PSUM,TRAC2,TRAC3,0,0 Sets Trace 1 to Power Sum trace math function and sets the First Trace operand (for Trace 1) to Trace 2 and the Second Trace operand (for Trace 1) to Trace 3 :CALC:OBW:MATH TRAC1,LOFF,TRAC3,TRAC2,-6.00,0 Sets Trace 1 to Log Offset trace math function, sets the First Trace operand (for Trace 1) to Trace 3, leaves the Second Trace operand (for Trace 1) unchanged (it is irrelevant for this function) and sets the Log Offset (for Trace 1) to -6 dB :CALC:OBW:MATH TRAC1,LDIF,TRAC2,TRAC3,0,-6.00 Sets Trace 1 to Log Diff trace math function, sets the First Trace operand (for Trace 1) to Trace 2, sets the Second Trace operand (for Trace 1) to Trace 3, and sets the Log Difference reference for Trace 1 to -6 dBm

	`:CALC:OBW:MATH TRAC1,OFF,TRAC2,TRAC3,0,0` Turns off trace math for trace 1
Notes	**Math Function** has 6 main sets of parameters:

Set 1	Defines the "result trace"	`TRACe1|TRACe2|TRACe3`
Set 2	Defines the "function"	`PDIFference|PSUM|LOFFset|LDIFference|OFF`
Set 3	A "trace operand" (1)	`TRACe1|TRACe2|TRACe3`
Set 4	A "trace operand" (2)	`TRACe1|TRACe2|TRACe3`
Set 5	Defines the "Log Offset" (in dB)	
Set 6	Defines the "Log Difference Reference" (in dBm)	

	Note that the Trace Math mode is an enumeration; that is, when a math function is set for a trace, it turns off any math function that is on for that trace and sets the new math function. The parameters sent in the command are reflected in the values in the control menu. There is no default for any parameter; all 6 parameters must be sent to satisfy the parser. Failure to specify a parameter results in a missing parameter message Remote command examples are included in each section below
Dependencies	None of the trace operands can be the destination trace. If any of the three trace math commands is sent with a destination trace number matching one of the operands, a warning is generated and the function does not turn on
Couplings	Whenever a math function other than `OFF` is selected for a trace, that trace is set to Display=`ON` and Update=`ON`
Preset	`OFF,TRACe2,TRACe3,0,0 | OFF,TRACe3,TRACe1,0,0 | OFF,TRACe1,TRACe2,0,0`
State Saved	The trace math function for each trace is saved in instrument state
Range	Power Difference|Power Sum|Log Offset|Log Difference|Off
Annunciation	The function is annotated on the trace if Trace Annotation is `ON`
Status Bits/OPC dependencies	`*OPC` can be used to detect the completion of a sweep, which will also correspond to the completion of the math operation, since all math takes place during the sweep

More Information

IMPORTANT To generate a trace math result, *you must take a sweep*. The trace math engine, described below, operates in concert with the sweep engine in the instrument.

Until a sweep has been taken, even if the constituent traces are not in Update mode, no result is generated.

Note that certain events can affect the trace in ways that affects all points at once. This can happen in any number of ways, including:

- A trace clear taking place
- A trace being loaded from the file system
- Trace data being sent in from the remote interface
- A copy or exchange of trace data

You should try to avoid these occurrences during a sweep, as they will tend to invalidate the math result being accumulated.

The Trace Math functions are:

Power Diff (Op1 - Op2)

Calculates a power difference between the `First Trace` operand and the `Second Trace` operand and puts the result in the destination trace.

During the sweep, the following formula is executed for each point in the trace operands, and the corresponding point is generated for the destination trace:

```
DestinationTrace = 10 log(10(1/10)(FirstTrace) – 10(1/10)(SecondTrace))
```

The values of the trace points are assumed to be in a decibel scale, as they are internally stored.

If a point in `FirstTrace` is equal to `maxtracevalue`, the resultant point is also `maxtracevalue`.

Otherwise, if the result of the subtraction is less than or equal to 0, the resultant point is `mintracevalue`.

Power Sum (Op1 + Op2)

Calculates a power sum between the `First Trace` operand and the `Second Trace` operand and puts the result in the destination trace.

During the sweep, the following formula is executed for each point in the trace operands, and the corresponding point is generated for the destination trace.

```
DestinationTrace = 10 log(10(1/10)(FirstTrace) + 10(1/10)(SecondTrace))
```

The values of the trace points are assumed to be in a decibel scale, as they are internally stored.

If a point in either trace operand is equal to `maxtracevalue`, the resultant point is also `maxtracevalue`.

Log Offset (Op1 + Offset)

Calculates a log offset from the `First Trace` operand and puts the result in the destination trace. This is like the B-DL function in some older instruments. The offset is entered on the `Offset` control, which only appears when this math function is in force for the selected trace. Each destination trace has its own offset.

During the sweep, the following formula is executed for each point in the trace operand, and the corresponding point is generated for the destination trace.

```
DestinationTrace = FirstTrace + Offset
```

The values of the trace points are assumed to be in dBm (as they are internally stored) and the offset is in dB.

If a point in the trace operand is equal to `maxtracevalue`, the resultant point is also `maxtracevalue`.

If a point in the trace operand is equal to `mintracevalue`, the resultant point is also `mintracevalue`.

Example: If offset is 25 dB, then our destination trace will be higher than the operand trace by 25 dB.

Note that the `Second Trace` operand is not used for this function.

Log Diff (Op1 - Op2 + Ref)

Offsets the difference between the `First Trace` operand and the `Second Trace` operand by a reference and puts the result in the destination trace. This is like the A-B+DL function in some older instruments. The Reference is entered on the **Reference** control, which only appears when this math function is in force for the selected trace. Each destination trace has its own reference.

Offsets the difference between the `First Trace` operand and the `Second Trace` operand by a reference and puts the result in the destination trace. This is like the A-B+DL function in some older instruments. The Reference is entered on the **Reference** control, which only appears when this math function is in force for the selected trace. Each destination trace has its own reference.

During the sweep, the following formula is executed for each point in the trace operands, and the corresponding point is generated for the destination trace.

```
DestinationTrace = (FirstTrace - SecondTrace) + Reference
```

The values of the operand trace points are assumed to be in decibel units (as they are internally stored) and the reference is in dBm so the result is in dBm.

Example: If the first operand trace 1 is at 5 dBm, the second operand trace 2 is at –5 dBm, and the reference is –25 dBm, then the destination trace will be –15 dBm.

Example: If the first operand trace1 is at 60 dBuV, the second operand trace 2 is at 50 dBuV, and the reference is 35 dBuV, then the destination trace will be 45 dBuV.

If a point in `FirstTrace` is equal to `maxtracevalue`, the resultant point is also `maxtracevalue`.

If a point in `FirstTrace` is equal to `mintracevalue`, the resultant point is also `mintracevalue`.

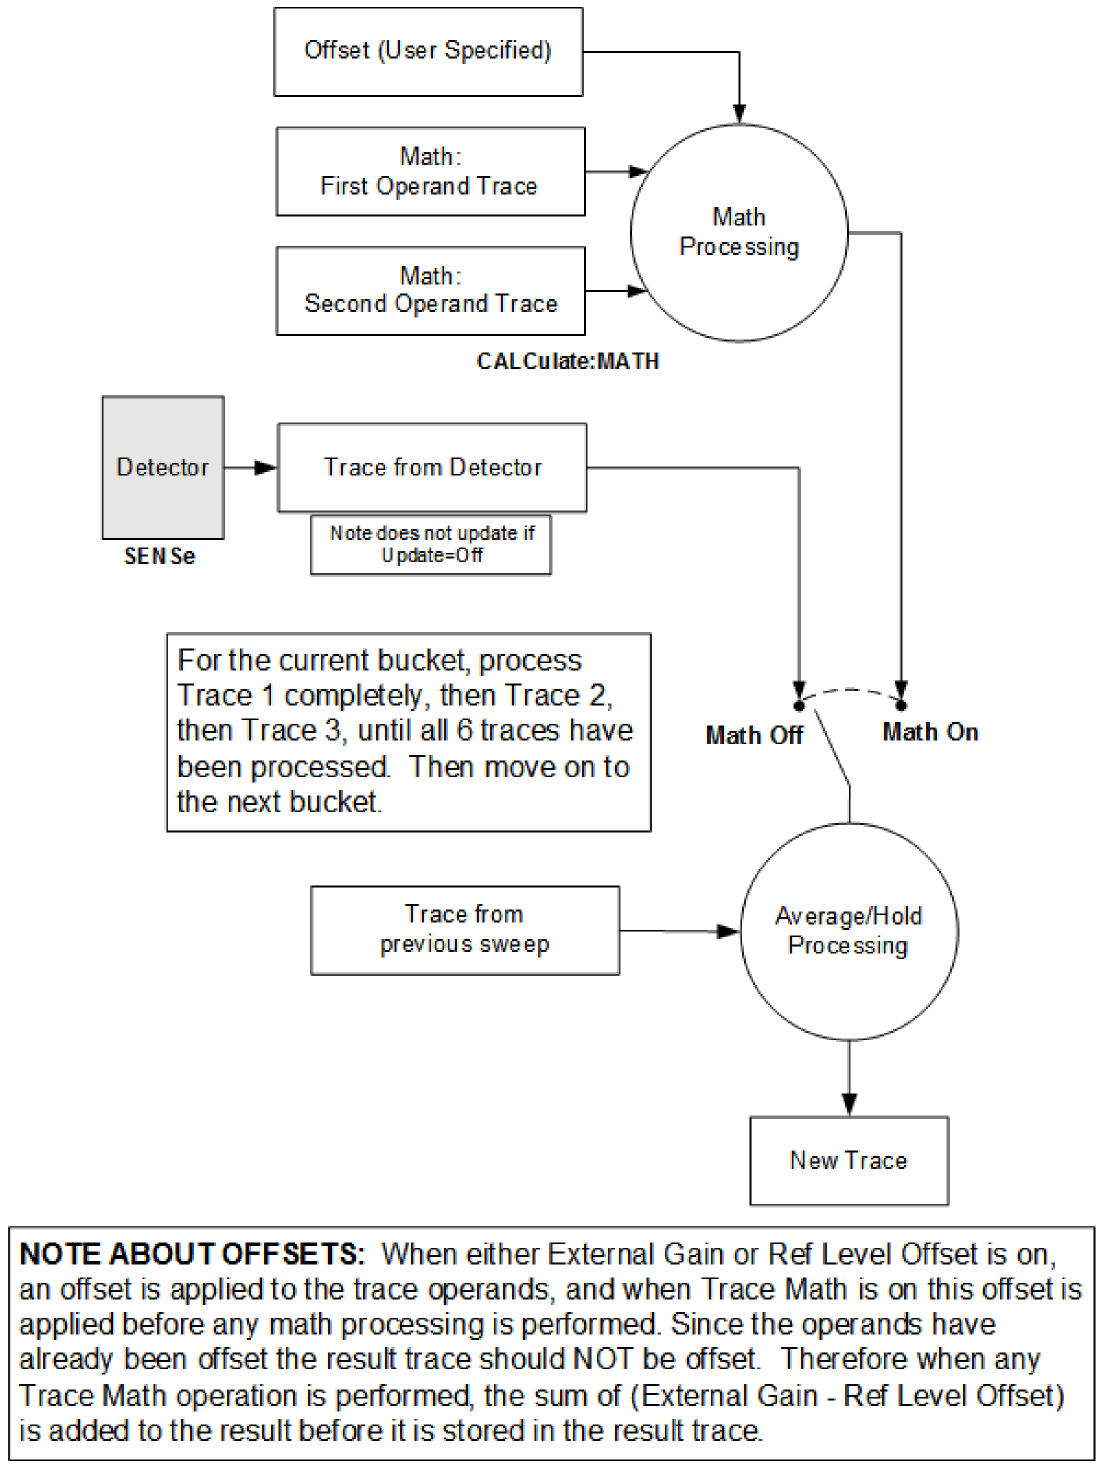
If neither of the above is true for a given point, then:

- If that point in `SecondTrace` is equal to `maxtracevalue`, the resultant point is `mintracevalue`.
- If that point in `SecondTrace` is equal to `mintracevalue`, the resultant point is `maxtracevalue`.

How trace math is processed

Whenever a trace math function is turned on, or the parameters and/or operands of an existing trace math function are changed, the destination trace is cleared. After the trace is cleared, all x-axis values in the trace, and the domain of the trace, are set to match the X-Axis settings of the first trace operand. When this is complete, a new sweep is initiated.

The process of acquiring data, processing it using the math and Average/Hold functions, and presenting it as trace data, consists of several functional blocks, as shown below:



For each active trace, the current trace point is processed for `Trace 1`, then `Trace 2`, then `Trace 3`, etc. Trace data is taken from either the detector for that trace, or from the mathematical result of up to two other traces and an offset, depending on whether trace math is on or not. The resultant data is then fed to the Average/Hold processing block, where (if the trace type is Average, Max Hold, or Min Hold) it is processed with previous trace data. The new trace data resulting from this process is then available for display, storage or remote output.

When the processing is complete for `Trace 1`, `Trace 2` is processed, and so on until all six traces have been processed. This allows a downstream trace to use as one of its math components a fully processed upstream trace. In other words, if math is `ON` for `Trace 4`, and its operand traces are `Trace 2` and `Trace 3`, then all detector, math, average and hold processing for Traces 2 and 3 is completed before the math is performed for `Trace 4`. When the current trace point is completed for all traces, the instrument moves on to the next trace point.

This allows very flexible and powerful math functions to be configured. For example, `Trace 1` can be an average trace, which can be fed with an offset to `Trace 2`, which can also be in **Max Hold**, allowing you to obtain the **Max Hold** of an Average trace.

Note that none of this processing is performed on inactive traces.

Note also that for any active trace with math `ON`, the Operand traces should have *lower* numbers than the trace (for example, using `Trace 4` as an operand for `Trace 1` will cause the data coming from `Trace 4` to be delayed by one sweep).

Operand 1/2

Selects the first and second trace operands, respectively, to be used for the trace math functions for the destination trace.

The operands are common to all math functions for a given trace. The most recently sent `:CALCulate:MATH` command for a given trace sets the operands for that trace, and will be reflected on the trace operand controls for that trace.

Example	The following examples are for the Swept SA measurement.
	1) Set Trace 3 to Power Diff trace math function. Set the First Trace operand (for Trace 3) to Trace 1 and the Second Trace operand (for Trace 3) to Trace 2
	`:CALC:MATH TRACE3,PDIF,TRACE1,TRACE2,0,0`
	
	2) Set Trace 3 to Log Offset trace math function. Set the First Trace operand (for Trace 3) to Trace 1, leave the Second Trace operand (for Trace 3) unchanged (it is irrelevant for this function) and set the Log Offset (for Trace 3) to -6 dB
	`:CALC:MATH TRACE3,LOFF,TRACE1,TRACE2,-6.00,0`

Notes	See the Math Function section for how to specify Operand 1 and Operand 2 using the `:CALCulate:MATH` SCPI command
Dependencies	The destination trace cannot be an operand. The destination trace number is gray on the dropdown
Preset	**Operand 1**: Trace number minus 2 (wraps at 1) For example, for Trace 1, Operand 1 presets to Trace 5; for Trace 6, it presets to Trace 4 **Operand 2**: Trace number minus 1 (wraps at 1) For example, for Trace 1, Operand 2 presets to Trace 6; for Trace 6, it presets to Trace 5
State Saved	Operand 1 and Operand 2 for each trace are stored in instrument state

Offset

The Offset value is used by the Log Offset math function.

Example	The following example is for the Swept SA measurement. `:CALC:MATH TRACE3,LOFF,TRACE1,TRACE2,-6.00,0` Sets Trace 3 to Log Offset trace math function, sets the First Trace operand (for Trace 3) to Trace 1, leaves the Second Trace operand (for Trace 3) unchanged (it is irrelevant for this function) and sets the Log Offset (for Trace 3) to -6 dB
State Saved	The Log Offset value for each trace is saved in Instrument State
Min	–100 dB
Max	100 dB

Reference

The Reference value is used by the Log Diff math function.

Example	The following example is for the Swept SA measurement. `:CALC:MATH TRACE3,LDIF,TRACE1,TRACE2,0,-6.00` Sets Trace 3 to Log Diff trace math function, sets the First Trace operand (for Trace 3) to Trace 1, sets the Second Trace operand (for Trace 3) to Trace 2, and sets the Log Difference reference (for Trace 3) to -6 dBm
State Saved	The Log Difference reference value for each trace is saved in instrument state
Min/Max	Same as reference level

3.8.10.5 Trace Function

The Trace Function includes controls to:

- Copy and Exchange traces
- Preset or Clear all traces

From Trace

Selects the trace to be copied to or exchanged with the **To Trace** when a "Copy" on page 1553 or "Exchange" on page 1553 is performed

Preset	1

To Trace

Selects the trace to be copied from or exchanged with the **From Trace** when a "Copy" on page 1553 or "Exchange" on page 1553 is performed

Preset	2

Copy

This button executes a Trace Copy based on the From Trace and To Trace parameters. The Copy is done from the From Trace to the To Trace. The action is performed once.

The X-Axis settings and domain of a trace go with it when it is copied.

Remote Command	For Swept SA Measurement (in SA Mode):
	`:TRACe:COPY TRACE1 | TRACE2 | TRACE3 | TRACE4 | TRACE5 | TRACE6, TRACE1 | TRACE2 | TRACE3 | TRACE4 | TRACE5 | TRACE6`
	
	For all other measurements:
	`:TRACe:<meas>:COPY TRACe1 | TRACe2 | TRACe3, TRACe1 | TRACe2 | TRACe3`
	where:
	<meas> is the identifier for the current measurement.
	Note that the format of the TRACe<n> parameter differs from that for the Swept SA Measurement.

Example	`:TRAC:COPY TRACE1,TRACE3` Copies Trace 1 to Trace 3 and puts Trace 3 in Update=Off, Display=On
Notes	The `:TRACe:COPY` command is of the form: `:TRACe:COPY <source_trace>,<dest_trace>`
Dependencies	When Signal ID is on, this key is grayed out
Couplings	The destination trace is put in View (Update=Off, Display=On) after the copy

Preset	For Swept SA Measurement (in SA Mode):
	`TRACE1, TRACE2`
	For all other measurements:
	`TRACe1, TRACe2`

Exchange

This button executes a Trace Exchange based on the From Trace and To Trace parameters. The From Trace and To Trace are exchanged with each other. The action is performed once.

The X-Axis settings and domain of a trace go with it when it is exchanged with another trace.

Remote Command	For Swept SA Measurement (in SA Mode):
	`:TRACe:EXCHange TRACE1 | TRACE2 | TRACE3 | TRACE4 | TRACE5 | TRACE6, TRACE1 | TRACE2 | TRACE3 | TRACE4 | TRACE5 | TRACE6`
	
	For all other measurements:
	`:TRACe:<meas>:EXCHange TRACe1 | TRACe2 | TRACe3, TRACe1 | TRACe2 | TRACe3`
	where:
	<meas> is the identifier for the current measurement.
	Note that the format of the TRACe<n> parameter differs from that for the Swept SA Measurement.

Example	`:TRAC:EXCH TRACE1,TRACE2` Exchanges Trace 1 and Trace 2 and puts both traces in Update=Off, Display=On
Notes	The `TRACe[:<meas>]:EXCHange` command is of the form: `:TRACe[:<meas>]:EXCHange <trace_1>,<trace_2>`
Couplings	Both traces are put in View (Update=Off, Display=On) after the exchange
Backwards Compatibility Notes	The copy and exchange operations menu in ESA and PSA is replaced with the more general purpose Trace Function menu. The remote commands are unaffected, as they were already general

Preset All Traces

Turns on Trace 1 and blanks all other traces. Useful when you have many traces on and you want to go back to having only Trace 1 on the display. Does not affect the trace type, detector or any other aspect of the trace system.

Remote Command	`:TRACe[:<meas>]:PRESet:ALL`
Example	`:TRAC:PRES:ALL`
Dependencies	When Signal ID is on, this key is grayed out

Clear All Traces

Clears all traces. Does not affect the state of any function or variable in the instrument. Loads `mintracevalue` into all of the points all traces, except traces in **Min Hold** in which case it loads `maxtracevalue`. Does so even if Update=Off.

Remote Command	`:TRACe[:<meas>]:CLEar:ALL`
Example	`:TRAC:CLE:ALL` Clears all traces
Dependencies	When Signal ID is on, this key is grayed out

3.8.10.6 Advanced

The **Advanced** tab contains controls for setting advanced functions of the instrument.

Measure Trace

Specifies which trace's scalar results are displayed in the Metrics window and retrieved by sending a Read/Fetch command.

- Trace 1
- Trace 2
- Trace 3

Remote Command	`:CALCulate:OBWidth:MTRace TRACe1 | TRACe2 | TRACe3` `:CALCulate:OBWidth:MTRace?`
Example	`:CALC:OBW:MTR TRACe1` `:CALC:OBW:MTR?`
Dependencies	Trace 2 and Trace 3 are grayed out when no trace data is available
Preset	`TRACe1`
State Saved	No
Range	`TRACe1|TRACe2|TRACe3`

3.9 ACP Measurement

ACP is a measurement of the amount of interference, or power, in an adjacent frequency channel. The results are displayed as a bar graph or as spectrum data, with measurement data at specified offsets.

ACP Measurement Commands

The following commands are used to retrieve the measurement results:

`:CONFigure:ACPower`

`:CONFigure:ACPower:NDEFault`

`:INITiate:ACPower`

`:FETCh:ACPower[n]?`

`:READ:ACPower[n]?`

`:MEASure:ACPower[n]?`

Remote Command Results for ACP Measurement

n	Condition	Results Returned
1, or not specified	Mode = SA mode, Radio Std = None, Number of carriers = 1 and only offset A is on	Returns 3 comma-separated values that correspond to: 1. Reference carrier power, 2. lower-adjacent channel power (dBc), and 3. upper-adjacent channel power (dBc) of a trace specified by Measure Trace When in the Spectrum Analyzer (SA) Mode, the values are in the current Y Axis Unit of the instrument
1, or not specified	Meas Type = Total power reference	Returns 28 comma-separated scalar results of a trace specified by Measure Trace in the following order 1. 0.0 2. Total carrier power (dBm) 3. 0.0 4. Reference power (dBm) 5. Lower offset A - relative power (dB) 6. Lower offset A - absolute power (dBm) 7. Upper offset A - relative power (dB) 8. Upper offset A - absolute power (dBm) 9. Lower offset B - relative power (dB) 10. Lower offset B - absolute power (dBm)

n	Condition	Results Returned
		11. Upper offset B - relative power (dB) 12. Upper offset B - absolute power (dBm) ... 25. Lower offset F - relative power (dB) 26. Lower offset F - absolute power (dBm) 27. Upper offset F - relative power (dB) 28. Upper offset F - absolute power (dBm) If the results are not available, -999.0 is returned When in the Spectrum Analyzer (SA) Mode, the values are in the current Y Axis Unit of the instrument When in MSR, LTE Advanced FDD/TDD, and 5G NR, this trace includes only outer offset results and their reference value(s)
	Meas Type = Power spectral density reference	Returns 28 comma-separated scalar results of a trace specified by Measure Trace in the following order: 1. 0.0 2. Total carrier power (dBm/Hz or dBm/MHz) 3. 0.0 4. Reference power (dBm/Hz or dBm/MHz) 5. Lower offset A - relative power (dB) 6. Lower offset A - absolute power (dBm/Hz or dBm/MHz) 7. Upper offset A - relative power (dB) 8. Upper offset A - absolute power (dBm/Hz or dBm/MHz) 9. Lower offset B - relative power (dB) 10. Lower offset B - absolute power (dBm/Hz or dBm/MHz) 11. Upper offset B - relative power (dB) 12. Upper offset B - absolute power (dBm/Hz or dBm/MHz) ... 25. Lower offset F - relative power (dB) 26. Lower offset F - absolute power (dBm/Hz or dBm/MHz) 27. Upper offset F - relative power (dB) 28. Upper offset F - absolute power (dBm/Hz or dBm/MHz) If the results are not available, -999.0 is returned When in the Spectrum Analyzer (SA) Mode, the values are in the current Y Axis Unit of the instrument When in MSR, LTE Advanced FDD/TDD, and 5G NR, this trace includes only outer offset results and their reference value(s)
	Meas Method = FAST	Returns 5 comma-separated results of a trace specified by Measure Trace in the following order: 1. Reference carrier - absolute power (dBm) 2. Lower offset A - absolute power (dBm)

n	Condition	Results Returned
		3. Upper offset A - absolute power (dBm) 4. Lower offset B - absolute power (dBm) 5. 5. Upper offset B - absolute power (dBm)
	Mode = LTEAFDD, LTEATDD, 5G NR, MSR Meas Type = Total power reference and Power Ref = Left & Right Carriers or Left & Right Sub-blocks	Returns 28 comma-separated scalar results of a trace specified by Measure Trace in the following order: 1. 0.0 2. Total carrier power (dBm) 3. Left Reference power (dBm) 4. Right Reference power (dBm) 5. Lower offset A - relative power (dB) 6. Lower offset A - absolute power (dBm) 7. Upper offset A - relative power (dB) 8. Upper offset A - absolute power (dBm) 9. Lower offset B - relative power (dB) 10. Lower offset B - absolute power (dBm) 11. Upper offset B - relative power (dB) 12. Upper offset B - absolute power (dBm) ... 25. Lower offset F - relative power (dB) 26. Lower offset F - absolute power (dBm) 27. Upper offset F - relative power (dB) 28. Upper offset F - absolute power (dBm) If the results are not available, -999.0 is returned When in MSR, LTE Advanced FDD/TDD, and 5G NR, this trace includes only outer offset results and their reference value(s)
	Mode = LTEAFDD, LTEATDD, 5G NR, MSR Meas Type = Power spectral density reference and Power Ref = Left & Right Carriers or Left & Right Sub-blocks	Returns 28 comma-separated scalar results of a trace specified by Measure Trace in the following order: 1. 0.0 2. Total carrier power (dBm/Hz or dBm/MHz) 3. Left reference power (dBm/Hz or dBm/MHz) 4. Right reference power (dBm/Hz or dBm/MHz) 5. Lower offset A - relative power (dB) 6. Lower offset A - absolute power (dBm/Hz or dBm/MHz) 7. Upper offset A - relative power (dB) 8. Upper offset A - absolute power (dBm/Hz or dBm/MHz) 9. Lower offset B - relative power (dB) 10. Lower offset B - absolute power (dBm/Hz or dBm/MHz) 11. Upper offset B - relative power (dB) 12. Upper offset B - absolute power (dBm/Hz or dBm/MHz)

n	Condition	Results Returned
		… 25. Lower offset F - relative power (dB) 26. Lower offset F - absolute power (dBm/Hz or dBm/MHz) 27. Upper offset F - relative power (dB) 28. Upper offset F - absolute power (dBm/Hz or dBm/MHz) If the results are not available, -999.0 is returned When in MSR, LTE Advanced FDD/TDD, and 5G NR, this trace includes only outer offset results and their reference value(s)
2	Meas Type = Total power reference	Returns 48 scalar results of a trace specified by Measure Trace in the following order: 1. Channel (1) - relative power (dB) 2. Channel (1) - absolute power (dBm) 3. Channel (2) - relative power (dB) 4. Channel (2) - absolute power (dBm) … 23. Channel (12) - relative power (dB) 24. Channel (12) - absolute power (dBm) 25. Lower offset A - relative power (dB) 26. Lower offset A - absolute power (dBm) 27. Upper offset A - relative power (dB) 28. Upper offset A - absolute power (dBm) 29. Lower offset B - relative power (dB) 30. Lower offset B - absolute power (dBm) 31. Upper offset B - relative power (dB) 32. Upper offset B - absolute power (dBm) … 45. Lower offset F - relative power (dB) 46. Lower offset F - absolute power (dBm) 47. Upper offset F - relative power (dB) 48. Upper offset F - absolute power (dBm) If the results are not available, -999.0 is returned When in the Spectrum Analyzer (SA) Mode, the values are in the current Y Axis Unit of the instrument When in MSR, LTE Advanced FDD/TDD, and 5G NR, this trace includes only outer offset results and their reference value(s)
	Meas Type = Power spectral density reference	Returns 48 scalar results of a trace specified by Measure Trace in the following order: 1. Channel (1) - relative power (dB) 2. Channel (1) - absolute power (dBm/Hz or dBm/MHz)

n	Condition	Results Returned
		3. Channel (2) - relative power (dB) 4. Channel (2) - absolute power (dBm/Hz or dBm/MHz) ... 23. Channel (12) - relative power (dB) 24. Channel (12) - absolute power (dBm/Hz or dBm/MHz) 25. Lower offset A - relative power (dB) 26. Lower offset A - absolute power (dBm/Hz or dBm/MHz) 27. Upper offset A - relative power (dB) 28. Upper offset A - absolute power (dBm/Hz or dBm/MHz) 29. Lower offset B - relative power (dB) 30. Lower offset B - absolute power (dBm/Hz or dBm/MHz) 31. Upper offset B - relative power (dB) 32. Upper offset B - absolute power (dBm/Hz or dBm/MHz) ... 45. Lower offset F - relative power (dB) 46. Lower offset F - absolute power (dBm/Hz or dBm/MHz) 47. Upper offset F - relative power (dB) 48. Upper offset F - absolute power (dBm/Hz or dBm/MHz) If the results are not available, -999.0 is returned When in the Spectrum Analyzer (SA) Mode, the values are in the current Y Axis Unit of the instrument When in MSR, LTE Advanced FDD/TDD, and 5G NR, this trace includes only outer offset results and their reference value(s)
3	Mode = DTMB (CTTB) or CMMB, Radio BW = 8 MHz and Meas Type = Total power reference	Returns 28 scalar values of the pass/fail (0 = passed, or 1 = failed) determined by testing the relative to the reference carrier and by testing the absolute power limit of the offset frequencies (measured as total power in dB) for a trace specified by Measure Trace 1. Lower offset A - relative limit result 2. Lower offset A - absolute limit result 3. Upper offset A - relative limit result 4. Upper offset A - absolute limit result 5. Lower offset B - relative limit result 6. Lower offset B - absolute limit result 7. Upper offset B - relative limit result 8. Upper offset B - absolute limit result ... 21. Lower offset F - relative limit result 22. Lower offset F - absolute limit result 23. Upper offset F - relative limit result

n	Condition	Results Returned
		24. Upper offset F - absolute limit result 25. Inside Adjacent Channel - relative limit result 26. Inside Adjacent Channel - absolute limit result 27. Outside Adjacent Channel - relative limit result 28. Outside Adjacent Channel - absolute limit result If Radio Device = Exciter, the last four (25, 26, 27 and 28) results returned -999.0
	Mode = DTMB (CTTB) or CMMB, Radio BW = 8 MHz and Meas Type = Power spectral density reference	Returns 28 scalar values of the pass/fail (0 = passed, or 1 = failed) determined by testing the relative to the reference carrier and by testing the absolute power limit of the offset frequencies (measured as power spectral density in dB) for a trace specified by Measure Trace 1. Lower offset A - relative limit result 2. Lower offset A - absolute limit result 3. Upper offset A - relative limit result 4. Upper offset A - absolute limit result 5. Lower offset B - relative limit result 6. Lower offset B - absolute limit result 7. Upper offset B - relative limit result 8. Upper offset B - absolute limit result ... 21. Lower offset F - relative limit result 22. Lower offset F - absolute limit result 23. Upper offset F - relative limit result 24. 	Meas Type = Total power reference	Returns 24 scalar values of the pass/fail (0 = passed, or 1 = failed) determined by testing the relative to the reference carrier and by testing the absolute power limit of the offset frequencies (measured as total power in dB) for a trace specified by Measure Trace 1. Lower offset A - relative limit result 2. Lower offset A - absolute limit result 3. Upper offset A - relative limit result 4. Upper offset A - absolute limit result 5. Lower offset B - relative limit result 6. Lower offset B - absolute limit result

n	Condition	Results Returned
		7. Upper offset B - relative limit result 8. Upper offset B - absolute limit result ... 21 Lower offset F - relative limit result 22 Lower offset F - absolute limit result 23 Upper offset F - relative limit result 24 Upper offset F - absolute limit result If the results are not available, 1 is returned. When in MSR, LTE-Advanced FDD/TDD, and 5G NR, this trace includes only outer offset results
	Meas Type = Power spectral density reference	Returns 24 scalar values of the pass/fail (0 = passed, or 1 = failed) determined by testing the relative to the reference carrier and by testing the absolute power limit of the offset frequencies (measured as power spectral density in dB) for a trace specified by Measure Trace 1. Lower offset A - relative limit result 2. Lower offset A - absolute limit result 3. Upper offset A - relative limit result 4. Upper offset A - absolute limit result 5. Lower offset B - relative limit result 6. Lower offset B - absolute limit result 7. Upper offset B - relative limit result 8. Upper offset B - absolute limit result ... 21 Lower offset F - relative limit result 22 Lower offset F - absolute limit result 23 Upper offset F - relative limit result 24 Upper offset F - absolute limit result If the results are not available, 1 is returned. When in MSR, LTE-Advanced FDD/TDD, and 5G NR, this trace includes only outer offset results
4		Returns <Num Pts> comma-separated scalar values representing the Y values in Trace 1
5		Returns <Num Pts> comma-separated scalar values representing the Y values in Trace 2
6		Returns <Num Pts> comma-separated scalar values representing the Y values in Trace 3
7	Meas Type = Total power reference	Returns (2 * Number of Carriers) scalar results of a trace specified by Measure Trace in the following order: The Number of Carriers is the value filled in Carriers under Carrier Setup menu. If license N9060A-5FP is enabled, max value of Number of Carriers is 18, otherwise, max value of Number of

n	Condition	Results Returned
		Carriers is 12. In MSR, max value of Number of Carriers is 100. In the LTE-Advanced FDD/TDD mode, max value of number of carriers is 5 and in the 5G NR mode, 16 1. Channel (1) - relative power (dB) 2. Channel (1) - absolute power (dBm) 3. Channel (2) - relative power (dB) 4. Channel (2) - absolute power (dBm) ... 2 * Number of Carriers -1. Channel (Number of Carriers) - relative power (dB) 2 * Number of Carriers. Channel (Number of Carriers) - absolute power (dBm) If the results are not available, 9.91E+37 is returned When in the Spectrum Analyzer (SA) Mode, the values are in the current Y Axis Unit of the instrument
	Meas Type = Power spectral density reference	Returns (2 * Number of Carriers) scalar results of a trace specified by Measure Trace in the following order: The Number of Carriers is the value filled in Carriers under Carrier Setup menu If license N9060A-5FP is enabled, max value of Number of Carriers is 18, otherwise, max value of Number of Carriers is 12. In MSR, max value of Number of Carriers is 100. In the LTE-Advanced FDD/TDD mode, max value of number of carriers is 5 and in the 5G NR mode, 16 1. Channel (1) - relative power (dB) 2. Channel (1) - absolute power (dBm/Hz or dBm/MHz) 3. Channel (2) - relative power (dB) 4. Channel (2) - absolute power (dBm/Hz or dBm/MHz) ... 2 * Number of Carriers -1. Channel (Number of Carriers) - relative power (dB) 2 * Number of Carriers. Channel (Number of Carriers) - absolute power (dBm/Hz or dBm/MHz) If the results are not available, 9.91E+37 is returned When in the Spectrum Analyzer (SA) Mode, the values are in the current Y Axis Unit of the instrument
8	Mode = LTEAFDD, LTEATDD, 5G NR, MSR	Returns scalar results of a trace specified by Measure Trace in the following order: 1. 0.0 2. Total carrier power (dBm) 3. Reference Power *1 (See "Reference Power Result Details" on

n	Condition	Results Returned
		page 1065) 4. Reference Power *2 (See "Reference Power Result Details" on page 1065) 5. Inner Lower offset A - relative power (dB) 6. Inner Lower offset A - absolute power (dBm, dBm/Hz or dBm/MHz) 7. Inner Upper offset A - relative power (dB) 8. Inner Upper offset A - absolute power (dBm, dBm/Hz or dBm/MHz) 9. Inner Lower offset B - relative power (dB) 10. Inner Lower offset B - absolute power (dBm, dBm/Hz or dBm/MHz) 11. Inner Upper offset B - relative power (dB) 12. Inner Upper offset B - absolute power (dBm, dBm/Hz or dBm/MHz) ... 25. Inner Lower offset F - relative power (dB) 26. Inner Lower offset F - absolute power (dBm, dBm/Hz or dBm/MHz) 27. Inner Upper offset F - relative power (dB) 28. Inner Upper offset F - absolute power (dBm, dBm/Hz or dBm/MHz) This trace includes only inner offset results Unit of absolute power results – dBm: Meas Type = Total Pwr Ref – dBm/Hz: Meas Type = PSD Ref, PSD Unit = dBm/Hz – dBm/MHz: Meas Type = PSD Ref, PSD Unit = dBm/MHz If the results are not available, 9.91E+37 is returned
9	Mode = LTEAFDD, LTEATDD, 5G NR, MSR	Returns scalar values of the pass/fail (0 = passed, or 1 = failed) determined by testing the relative to the reference carrier and by testing the absolute power limit of the offset frequencies for a trace specified by Measure Trace 1. Inner Lower offset A - relative limit result 2. Inner Lower offset A - absolute limit result 3. Inner Upper offset A - relative limit result 4. Inner Upper offset A - absolute limit result 5. Inner Lower offset B - relative limit result 6. Inner Lower offset B - absolute limit result 7. Inner Upper offset B - relative limit result 8. Inner Upper offset B - absolute limit result

n	Condition	Results Returned
		... 21. Inner Lower offset F - relative limit result 22. Inner Lower offset F - absolute limit result 23. Inner Upper offset F - relative limit result 24. Inner Upper offset F - absolute limit result
10	Mode = LTEAFDD, LTEATDD, 5G NR, MSR	Returns scalar values of offset results of a trace specified by Measure Trace. Numbers returned in this trace is 10 x actually measured offsets. Note that upper and lower sides of an offset are returned separately. For example, when only outer offset A is measured with offset side both, 10 x 2 = 20 values are returned 1. Inner = 1 or Outer = 2 2. Offset A~F. (A=1, B=2, ... F=6) 3. Offset Side. Lower=1 or Upper=2 4. Relative power or relative PSD (dBc or dB) 5. Absolute power (dBm) or absolute PSD (dBm/Hz or dBm/MHz) 6. Reference power (dBm) or reference PSD (dBm/Hz or dBm/MHz) 7. Reference Index 1 8. Reference Index 2 9. 0 (Reserved) 10. 0 (Reserved) ... 10(n-1)+1. Inner = 1 or Outer = 2 10(n-1)+2. Offset A~F. (A=1, B=2, ... F=6) 10(n-1)+3. Offset Side. Lower=1 or Upper=2 10(n-1)+4. Relative power or relative PSD (dBc or dB) 10(n-1)+5. Absolute power (dBm) or absolute PSD (dBm/Hz or dBm/MHz) 10(n-1)+6. Reference power (dBm) or reference PSD (dBm/Hz or dBm/MHz) 10(n-1)+7. Reference Index 1 10(n-1)+8. Reference Index 2 10(n-1)+9. 0 (Reserved) 10(n-1)+10. 0 (Reserved) Where n is number of offsets Meas Type determines which type of power result is returned, i.e., power or PSD. Unit for PSD results is determined by PSD Unit

n	Condition	Results Returned
		If result is not available, 9.91E+37 is returned

Reference Power Result Details

Power Ref	Reference Power *1	Reference Power *2
Left & Right Carriers Max Power Carriers in Sub-block	Left or Max Power Carrier in the lower sub-block (dBm, dBm/Hz or dBm/MHz)	Right or Max Power Carrier in the upper sub-block (dBm, dBm/Hz or dBm/MHz)
Left & Right Sub-blocks	Integrated Power of the lower sub-block (dBm, dBm/Hz or dBm/MHz)	Integrated Power of the upper sub-block (dBm, dBm/Hz or dBm/MHz)
Others	0.0	Reference carrier power (dBm, dBm/Hz or dBm/MHz)

3.9.1 Views

The ACP measurement has two views: "Normal" on page 1115 and "Carrier Info" on page 1115.

These Views are multiple-window Views. When in a multiple window View, you select a window by touching it. The menu controls may sometimes change depending on which window is selected.

Whenever the View changes, the default menu is Frequency, unless otherwise specified in the View description.

NOTE **Y Scale/Div, Y Ref Position, Y Auto Scale, Y Ref Value and Bar Graph affect both views. For example, power bars on the traces in both views appear or disappear when Bar Graph is toggled.**

View Selection by Name

Selects the results view. The following command allows you to select the desired measurement view by enumeration.

Remote Command	`:DISPlay:ACPower:VIEW[:SELect] PRESult | CINFormation` `:DISPlay:ACPower:VIEW[:SELect]?`
Example	`:DISP:ACP:VIEW PRES` `:DISP:ACP:VIEW?`

Preset	PRESult
State Saved	Saved in instrument state
Range	PRESult|CINFormation

View Selection by Number (Remote Command Only)

Selects the results view. The following command allows you to select the desired measurement view by enumeration.

Remote Command	:DISPlay:ACPower:VIEW:NSELect <integer> :DISPlay:ACPower:VIEW:NSELect?
Example	:DISP:ACP:VIEW:NSEL 1 :DISP:ACP:VIEW:NSEL?
Dependencies	This command is available only for LTE-Advanced FDD/TDD and 5G NR
Preset	1
State Saved	Saved in instrument state
Min/Max	1/2

3.9.1.1 Normal

Windows: "Graph" on page 1066, "Metrics" on page 1067,

Dual window view of the graph and the metrics.

Example	:DISP:ACP:VIEW PRES

3.9.1.2 Carrier Info

Windows: "Graph" on page 1066, "Metrics" on page 1067,

Dual window view of the graph and the metrics.

Example	:DISP:ACP:VIEW CINF

3.9.2 Windows

This section describes the Windows that are available in the ACP measurement.

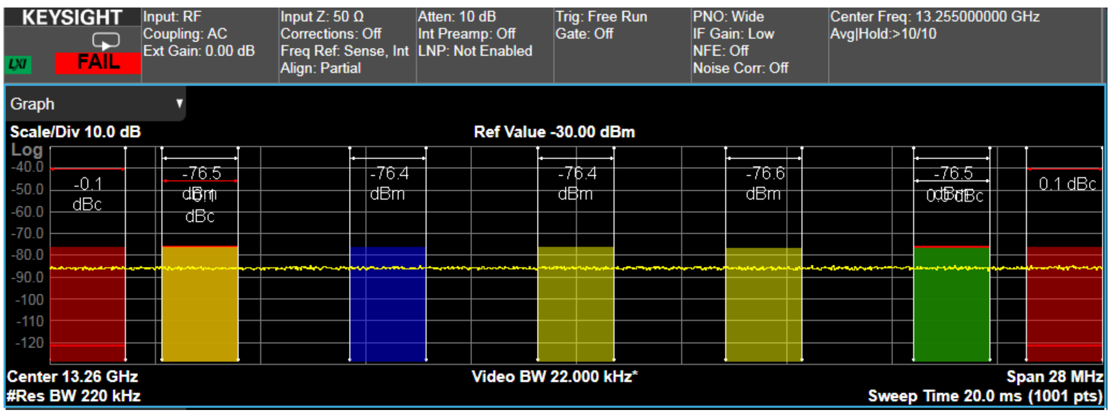
3.9.2.1 Graph

The Graph window is used to display the spectrum being measured by the ACP measurement.

The results of the measurement can be displayed as a single spectrum trace view or displayed with a Bar Graph trace on the spectrum trace.

The Graph window appears in several Views, as follows:

View	Size	Position
Normal	Half, full width	Top
Carrier Info	Half, full width	Top
Gate View	One third, full width	Middle



When the Bar Graph is On and Limit Test is On, the color of each bar graph reflects the limit test result. When the limit test fails, the bar color is red, and when limit test passes, the bar color is blue.

When RBW is selected as the measurement method, the spectrum trace is not displayed, only the bar graph is displayed. In addition, the Bar Graph control (under the Display front-panel key) is set to ON and is grayed out.

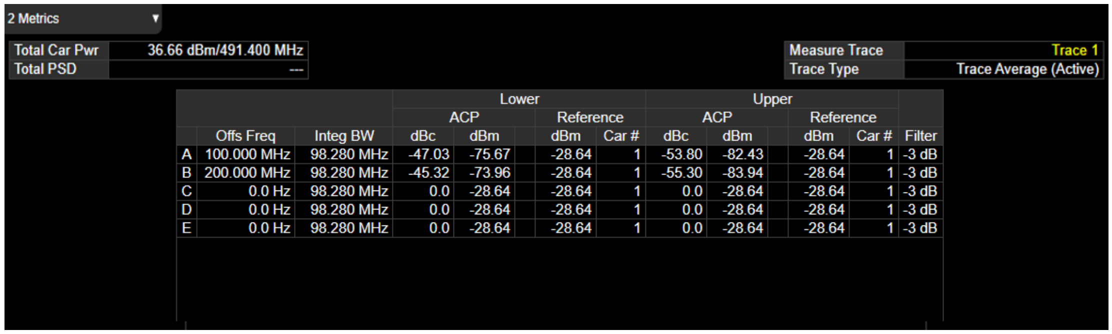
3.9.2.2 Metrics

The Metrics window displays the textual results of the ACP measurement.

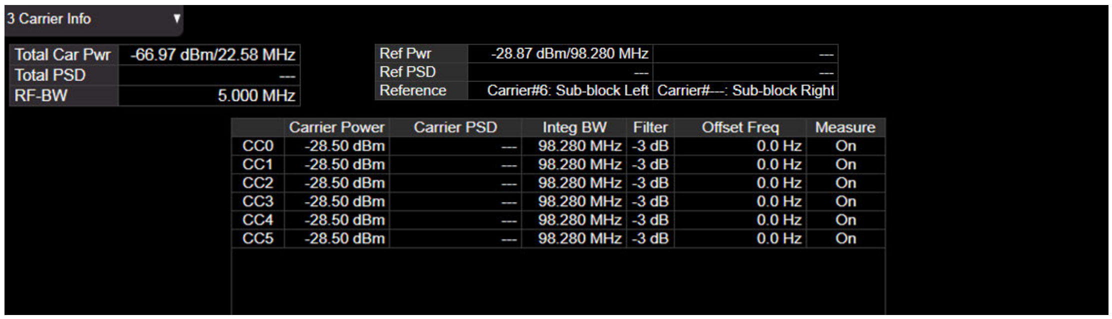
Views in which the Metrics window appears:

View	Size	Position
Normal	Half, full width	Bottom
Carrier Info	Half, full width	Bottom
Gate View	One Third, full width	Bottom

Metrics Window in Normal view



Metrics Window in Carrier Info view



The text window displays the following results:

Total Carrier Power

This is the total power of all the carriers with carrier power present set to yes. The power is calculated by integrating across the bandwidth declared by the Carrier Integ BW parameter for each carrier and then totaling the sums. The total integration bandwidth is shown as part of the result. This will be the total of the Carrier Integ Bw of the carriers used in calculating the total carrier power. If the RRC Filter is on, then the integration bandwidth used is (1 + alpha)/T where T = 1/(Carrier Integ BW) multiplied by the number of carriers with carrier power present set to yes.

Ref Power

This is the power of the reference. The power is calculated by integrating across the bandwidth defined by the Reference Type. The integration bandwidth is shown as a part of the result. For some Power Reference Type, this is the value of the Carrier Integ BW for that carrier unless the RRC Filter is on, then the integration bandwidth used is the displayed value, which is (1 + alpha)/T where T = 1/(Carrier Integ BW).

Reference

In multi-carrier applications, this row displays what is used as a reference power.

Carrier Power

This is the power in all the currently defined carriers. If the carrier has carrier power present, the power will be absolute. If the carrier is defined as not having power present, the power will be relative to the reference carrier. The power is calculated by integrating across the bandwidth declared by the Carrier Integ BW parameter. The integration bandwidth is shown as part of the result. This is the value of the Carrier Integ BW for the carrier unless the RRC Filter is on, then the integration bandwidth used is the displayed value, which is (1 + alpha)/T where T = 1/(Carrier Integ BW).

Offset Relative Power

This is the power in the offsets relative to the reference carrier. The power is calculated by integrating across the bandwidth declared by the Offset Integ BW parameter. The offset integration bandwidth is shown as part of the result. This is the value on the Offset Integ BW menu unless the RRC Filter is on, then the integration bandwidth used is the displayed value, which is (1 + alpha)/T where T = 1/(Offset Integ BW).

Offset Absolute Power

This is the absolute power in the offsets. The power is calculated by integrating across the bandwidth declared by the Offset Integ BW parameter. The offset integration bandwidth is shown as part of the result. This is the value on the Offset Integ BW menu unless the RRC Filter is on, then the integration bandwidth used is the displayed value, which is (1 + alpha)/T where T = 1/(Offset Integ BW).

RF-BW

It displays the total bandwidth from the lowest carrier to the highest carrier whatever their measurement states are on or off.

Integration Bandwidth

It displays the noise bandwidth of each carrier to be measured in the ACP measurement

Measure Trace

See "Measure Trace" on page 1259

Trace Type

This is the trace type (and view/blank parameter) of a trace specified by Measure Trace.

Measure Trace and Trace Type are displayed only when Meas Method is set to “Integration BW”, “Filtered IBW”, or “Fast Power”

Filter

It displays whether RRC filter is used for ACP measurement or not.

Offset Frequency

It shows the offset frequency from the carrier reference frequency in multi-carrier measurements. The carrier frequency display type determines whether the relative frequency or absolute frequency will be displayed.

Sub-block

As for intra-band non-contiguous spectrum operation, the sub-block concept is introduced, which refers to one contiguous allocated block of spectrum for transmission and reception in the intra-band non-contiguous aggregation mode. So far we support the two sub-blocks. It displays which sub-block the carrier belongs to in the intra-band non-contiguous aggregation mode. The column will be displayed when the carrier allocation mode is non-contiguous.

Measure

It shows whether the carrier power presents or not.

3.9.2.3 Gate

Turning on Gate View shows the Gate Window, which allows you to see your Gating signal at the same time as the measured data. See the description under Gate View in the Trigger, Gate Settings section.

View	Size	Position
Gate View	One third, full width	Top

3.9.3 Amplitude

Activates the **Amplitude** menu and selects **Reference Level** or **Reference Value** as the active function, depending on the measurement.

Some features in this menu apply to multiple measurements. Some other features apply only to specific measurements and their controls are blanked or grayed-out in measurements that do not support the feature.

3.9.3.1 Y Scale

Contains controls that pertain to the Y-Axis parameters of the measurement. These parameters control how data on the vertical (Y) axis is displayed and control instrument settings that affect the vertical axis.

Ref Value

Sets the value for the absolute power reference. The reference line is at the top, center, or bottom of the graticule, depending on the value of the **Ref Position** function.

Remote Command	`:DISPlay:ACPower:WINDow[1]:TRACe:Y[:SCALe]:RLEVel <real>` `:DISPlay:ACPower:WINDow[1]:TRACe:Y[:SCALe]:RLEVel?`
Example	`:DISP:ACP:WIND:TRAC:Y:RLEV 100` `:DISP:ACP:WIND:TRAC:Y:RLEV?`
Couplings	When **Auto Scaling** is `ON` (default), this value is automatically determined by the measurement result. When you set a value manually, **Auto Scaling** changes to `OFF`

	Attenuation is not coupled to Ref Value
Preset	10.00 dBm
State Saved	Saved in instrument state
Min/Max	-250.00 dBm / 250.00 dBm
Annotation	Ref <value> top left of graph
Backwards Compatibility SCPI	`:DISPlay:ACPower:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:RLEVel`

Scale/Div

For measurements that support a logarithmic Y-Axis, **Scale/Div** sets the height of one division of the graticule in the current Y-Axis unit.

Scale/Div also determines the displayed amplitude range in the log plot graph. Since there are usually 10 vertical graticule division on the display, the total amplitude range of the graph is typically 10x this amount. For example, if Scale/Div is 10 dB, then the total range of the graph is 100 dB.

Remote Command	`:DISPlay:ACPower:WINDow[1]:TRACe:Y[:SCALe]:PDIVision <rel_ampl>` `:DISPlay:ACPower:WINDow[1]:TRACe:Y[:SCALe]:PDIVision?`
Example	`:DISP:ACP:WIND:TRAC:Y:PDIV 5` `:DISP:ACP:WIND:TRAC:Y:PDIV?`
Couplings	When **Auto Scaling** is `ON` (default), this value is automatically determined by the measurement result. When you set a value manually, **Auto Scaling** changes to `OFF`
Preset	10.00 dB / Div
State Saved	Saved in instrument state
Min	0.10 dB
Max	20 dB
Annotation	<value> dB/ left upper of graph
Backwards Compatibility SCPI	`:DISPlay:ACPower:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:PDIVision`

Ref Position

Positions the reference level at the top, center, or bottom of the Y Scale display. Changing the reference position does not change the reference level value.

Remote Command	`:DISPlay:ACPower:WINDow[1]:TRACe:Y[:SCALe]:RPOSition TOP | CENTer | BOTTom` `:DISPlay:ACPower:WINDow[1]:TRACe:Y[:SCALe]:RPOSition?`

Example	:DISP:ACP:WIND:TRAC:Y:RPOS CENT :DISP:ACP:WIND:TRAC:Y:RPOS?
Preset	TOP
State Saved	Saved in instrument state
Range	TOP|CENTer|BOTTom
Annotation	The greater than (>) and less than (<) symbols are displayed on both sides of the graph to indicate the Reference Position
Backwards Compatibility SCPI	:DISPlay:ACPower:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:RPOSition

Auto Scaling

Toggles the **Auto Scaling** function between On and Off.

Remote Command	:DISPlay:ACPower:WINDow[1]:TRACe:Y[:SCALe]:COUPle 0 | 1 | OFF | ON :DISPlay:ACPower:WINDow[1]:TRACe:Y[:SCALe]:COUPle?
Example	:DISP:ACP:WIND:TRAC:Y:COUP OFF :DISP:ACP:WIND:TRAC:Y:COUP?
Couplings	When **Auto Scaling** is ON, and the **Restart** front-panel key is pressed, this function automatically sets the scale per division to 10 dB and determines the reference values based on the measurement results When you set a value to either **Scale/Div** or **Ref Value** manually, **Auto Scaling** automatically changes to OFF
Preset	1
State Saved	Saved in instrument state
Range	OFF|ON
Backwards Compatibility SCPI	:DISPlay:ACPower:VIEW[1]:WINDow[1]:TRACe:Y[:SCALe]:COUPle

3.9.3.2 Attenuation

Controls the attenuator functions and interactions between the attenuation system components.

There are two attenuator configurations in the X-Series. One is a Dual-Attenuator configuration consisting of a mechanical attenuator and an optional electronic attenuator. The other configuration uses a single attenuator with combined mechanical and electronic sections thatcontrols all the attenuation functions. Different models in the X-Series come with different configurations.

– See "Dual-Attenuator Configurations" on page 1073

– See "Single-Attenuator Configuration" on page 1074

Most attenuation settings are the same for all measurements – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by Meas Preset.

This tab is only available when the hardware set includes an input attenuator, which is typically only the case when using Keysight’s box instruments. For example, this tab does not appear in:

– VXT models M9420A/21A/10A/11A

– E7760

– M9391A

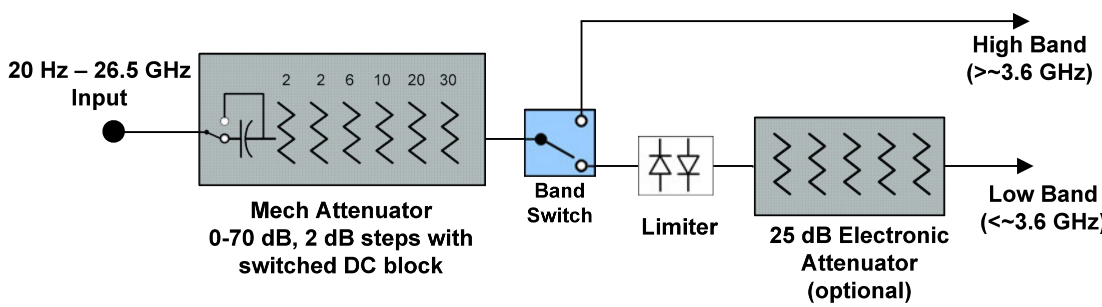
– M9393A

This tab also does not appear in UXM. In UXM all Attenuation and Range settings are disabled, as the expected input power level is handled by the Call Processing App that drives the DUT power control.

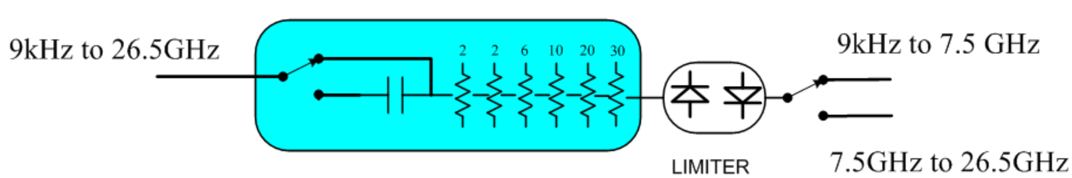
Dependencies	In measurements that support the I/Q inputs, this tab is unavailable when I/Q is the selected input, and is replaced by the Range tab in that case

Dual-Attenuator Configurations

Configuration 1: Mechanical attenuator + optional electronic attenuator

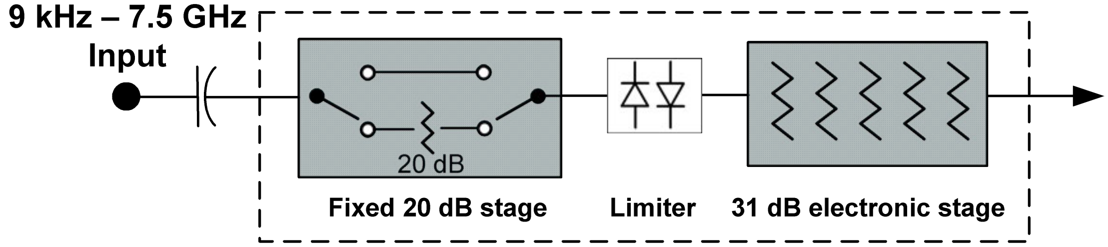


Configuration 2: Mechanical attenuator, no optional electronic attenuator



(note that Configuration 2 is not strictly speaking a dual-section attenuator, since there is no electronic section available. However, it behaves exactly like Configuration 1 without the Electronic Attenuator option EA3, therefore for the sake of this document it is grouped into the “Dual-Attenuator” configuration)

Single-Attenuator Configuration



You can tell which attenuator configuration you have by pressing the Attenuation tab, which (in most Modes) opensthe Attenuation menu. If the first control in the Attenuation menu says **Mech Atten** you have the Dual-Attenuator configuration. If the first control says **Atten** you have the Single-Attenuator configuration.

(Note that depending on the measurement, there may be no Auto/Man functionality on the Mech Atten control).

In the Single-Attenuator configuration, youcontrol the attenuation with a single control, as the fixed stage has only two states. In the Dual-Attenuator configuration, both stages have significant range so you are given separate control of the mechanical and electronic attenuator stages.

When you have the Dual-Attenuator configuration, you may still have only a Single-Attenuator, because unless option EA3 (the Electronic Attenuator option) is available, and you purchase it, you will have only the mechanical attenuator.

Mech Atten

This control is labeled **Mech Atten** in Dual-Attenuator models and **Atten** in Single-Attenuator models. In the Dual-Attenuator configuration, this control only affects the mechanical attenuator.

This control lets you modify the attenuation applied to the RF input signal path. This value is normally auto coupled to the Ref Level, the Internal Preamp Gain, any

External Gain that is entered, and the Max Mixer Level, as described in the table below.

See "Attenuator Configurations and Auto/Man" on page 1076

Remote Command	`[:SENSe]:POWer[:RF]:ATTenuation <rel_ampl>`
	`[:SENSe]:POWer[:RF]:ATTenuation?`
	`[:SENSe]:POWer[:RF]:ATTenuation:AUTO OFF | ON | 0 | 1`
	`[:SENSe]:POWer[:RF]:ATTenuation:AUTO?`

Example	`:POW:ATT 20`
	Dual-Attenuator configuration: sets the mechanical attenuator to 20 dB
	Single-Attenuator mode: sets the main attenuation to 20 dB (see below for definition of "main" attenuation)
	In either case, if the attenuator was in Auto, it is set to Manual
	`:POW:ATT:AUTO ON`
	Turn Auto Mech Atten ON

Dependencies	Some measurements do not support the Auto setting of "Mech Atten" on page 1074. In these measurements, the Auto/Man selection is not available, and the Auto/Man toggle function is not available In Dual-Attenuator configurations, when the electronic attenuator is enabled, the mechanical attenuator has no auto setting and the Auto/Man toggle function is not available. The state of Auto/Man is remembered and restored when the electronic attenuator is once again disabled. This is described in more detail in "Elec Atten" on page 1753 See "Attenuator Configurations and Auto/Man" on page 1076 for more information on the Auto/Man functionality `:POW:ATT:AUTO` is only available in measurements that support Mech Atten Auto, such as Swept SA
Couplings	If the RF Input Port is the RF Input: – If the USB Preamp is connected to USB, use 0 dB for Mech Atten – Otherwise compute the auto-selected value of Mech Atten based on **Reference Level**, Int Preamp, External Gain, Ref Level Offset, Max Mixer Level, µW Path Control and IF Gain settings. Limit this value to be no less than 6 dB (total attenuation below 6 dB can never be chosen by Auto) – In the N9041B, if the RF Input Port is RF Input 2, use the formula above and subtract the Full Range Atten value from the result to determine the Mech Atten. Limit the value so that it is never lower than 0 dB and so that total attenuation, including Full Range Atten, is never less than 6 dB (total attenuation, including Full Range Atten below 6 dB, can never be chosen by Auto) In External Mixingand BBIQ, where the Attenuator is not in the signal path, the Attenuator setting changes as described above when "Mech Atten" on page 1074 is in Auto, but no changes are made to the actual attenuator hardware setting until the input is changed back to the RF Input For CXA-m with option FSA (Fine-Step Attenuator or 2 dB steps), the FSA-like behavior is only available when the frequency setting is <= 7.5GHz. So, when the frequency is changed from below 7.5GHz to above 7.5GHz, the attenuation setting will be changed to a multiple of 10dB which will be no smaller than the previous setting. For example, 4dB attenuation will be changed to 10dB
Preset	The preset for Mech Attenuation is "Auto" The Auto value of attenuation is 10 dB

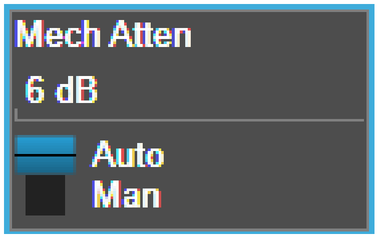
	ON
State Saved	Saved in instrument state
Min	0 dB The attenuation set by this control cannot be decreased below 6 dB with the knob or step keys. Values below 6 dB must be directly entered from the keypad or via SCPI. This protects against setting a dangerously small attenuation value, which can put the instrument at risk of damage to input circuitry. If the current mechanical attenuation is below 6 dB, it can be increased with the knob and step keys, but not decreased
Max	CXA Option 503 or 507: 50 dB EXA: 60 dB All other models: 70 dB Note that in the Single-Attenuator configuration, the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB.
Annotation	The current value for Total Atten is displayed in the Measurement Bar at the top of the display. A value appears for Electronic Attenuation only if the Electronic Attenuator is enabled. The annotation appears as Atten: <total> dB (e<elec>) The e letter is in amber in Single-Attenuator configurations For example: Dual-Attenuator configuration: Atten: 24 dB (e14) Indicating the total attenuation is at 24 dB and the electronic attenuation is at 14 dB Single-Attenuator configuration: A: 24 dB (e14) Indicating the total attenuation is at 24 dB and the “soft” attenuation is at 14 dB (see below for definition of “soft” attenuation) When in Manual, a # sign appears in front of Atten in the annotation

Attenuator Configurations and Auto/Man

As described in "Attenuation" on page 1747 , there are two distinct attenuator configurations available in the X-Series, the single attenuator and Dual-Attenuator configurations. In Dual-Attenuator configurations, we have the mechanical attenuation and the electronic attenuation, and the current total attenuation is the sum of the electronic + mechanical attenuation. In Single-Attenuator configurations, we refer to the attenuation set using "Mech Atten" on page 1074 (or `:POW:ATT`) as the “main” attenuation; and the attenuation that is set by `:POW:EATT` as the “soft” attenuation (`:POW:EATT` is honored even in the Single-Attenuator configuration, for compatibility purposes). Then the current total attenuation is the sum of the main + soft attenuation. See "Elec Atten" on page 1753 for more on “soft” attenuation.

NOTE

In some measurements, the **Mech Atten** control has an Auto/Man function. In these measurements, an Auto/Man switch is shown on the **Mech Atten** control:



Note that in configurations that include an Electronic Attenuator, this switch is only shown when the Electronic Attenuator is disabled.

In other measurements, **Mech Atten** has no Auto/Man function. In these measurements, no switch is shown on the **Mech Atten** control:

Mech Atten also appears with no switch, as above, in configurations that include an Electronic Attenuator but when the Electronic Attenuator is enabled.

Elec Atten

Controls the Electronic Attenuator in Dual-Attenuator configurations. This control does not appear in Single-Attenuator configurations, as the control of both the mechanical and electronic stages of the Single-Attenuator is integrated into the single **Atten** control.

This control includes an Enable/Disable toggle switch; it is only possible to enter a value for the Electronic Attenuator when this switch is in the “Enable” position.

See "More Information" on page 1078

<table>
<tr><td>Remote Command</td><td>[:SENSe]:POWer[:RF]:EATTenuation <rel_ampl>
[:SENSe]:POWer[:RF]:EATTenuation?
[:SENSe]:POWer[:RF]:EATTenuation:STATe OFF | ON | 0 | 1
[:SENSe]:POWer[:RF]:EATTenuation:STATe?</td></tr>
<tr><td>Example</td><td>:POW:EATT 10
:POW:EATT?
:POW:EATT:STAT ON
:POW:EATT:STAT?</td></tr>
<tr><td>Notes</td><td>Electronic Attenuation’s specification is defined only when Mechanical Attenuation is 6 dB</td></tr>
<tr><td>Dependencies</td><td>This control only appears in Dual-Attenuator models with an Electronic Attenuator installed and licensed. It does not appear in models with the Single-Attenuator configuration, as in the Single-Attenuator configuration there is no “electronic attenuator” there is only a single integrated attenuator</td></tr>
</table>

	(which has both a mechanical and electronic stage). However, in the Single-Attenuator configuration, EATT SCPI commands are accepted for compatibility with other X-series instruments and set a “soft” attenuation as described in . The “soft” attenuation is treated as an addition to the “main” attenuation value set by the Atten control or the POW:ATT SCPI command and affects the total attenuation displayed on the Atten control and the Meas Bar The electronic attenuator (and the “soft” attenuation function provided in Single-Attenuator configurations) is unavailable above the low band (0-3.6 GHz, 0-3.4 GHz 0-3GHz, depending on the model). If the low band ranges from 0-3.6GHz, and Stop Frequency of the instrument is > 3.6 GHz, then the **Enabled/Disabled** section of the **Elec Atten** control will be OFF and grayed out If the Internal Preamp is on, meaning it is set to Low Band or Full, the electronic attenuator (and the “soft” attenuation function provided in Single-Attenuator configurations) is unavailable. In this case the **Enabled/Disabled** section of the **Elec Atten** control will be OFF and grayed out If either of the above is true, if the SCPI command is sent, an error indicating that the electronic attenuator is unavailable will be sent If both of the above are true, pressing the control will generate error message -221, in other words, the frequency range lockout takes precedence If the electronic/soft Attenuator is enabled, then the Stop Freq of the instrument is limited to 3.6 GHz and the Internal Preamp is unavailable The SCPI-only “soft” electronic attenuation for the single-attenuator configuration is not available in all measurements; in particular, it is not available in the Swept SA measurement
Couplings	Enabling and disabling the Electronic Attenuator affects the setting of the Mechanical Attenuator (in Dual-Attenuator configurations). This is described in more detail below and in the section "Attenuator Configurations and Auto/Man" on page 1752
Preset	`OFF` (Disabled) for Swept SA measurement `ON` (Enabled) for all other measurements that support the electronic attenuator
State Saved	Saved in instrument state
Min	0 dB
Max	Dual-Attenuator configuration: 24 dB Single-Attenuator configuration: the total of ATT and EATT cannot exceed 50 dB. So, if the EATT is set to 24 dB first, the main attenuation cannot be greater than 26 dB and will be reduced accordingly; if the main attenuator is set to 40 dB first, EATT cannot be greater than 10 dB
Annotation	See Annotation under the **Mech Atten** control description

More Information

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear. These advantages primarily aid in remote operation and are negligible for front panel use. See "Using the Electronic Attenuator: Pros and Cons" on page 1079 for a detailed discussion of the pros and cons of using the electronic attenuator.

For the Single-Attenuator configuration, for SCPI backwards compatibility, the “soft” attenuation feature replaces the Dual-Attenuator configuration’s electronic attenuator. All the same couplings and limitations apply. See "Attenuator Configurations and Auto/Man" on page 1752

Mechanical Attenuator Transition Rules

When the Electronic Attenuator is enabled, the Mechanical Attenuator transitions to a state that has no Auto function. Below are the rules for transitioning the Mechanical Attenuator. Note that the information below ONLY applies to the Dual-Attenuator configurations, and ONLY when the Electronic Attenuator is installed:

When the Electronic Attenuation is enabled from a disabled state:

The Mechanical Attenuator is initialized to 10 dB (this is its optimal performance setting). You can then set it as desired with SCPI, numeric keypad, step keys, or knob, and it behaves as it normally would in manual mode

The Auto/Man state of (Mech) Atten is saved

The Auto/Man toggle on the (Mech) Atten control disappears and the auto rules are disabled

The Electronic Attenuator is set to 10 dB less than the previous value of the Mechanical Attenuator, within the limitation that it must stay within the range of 0 to 24 dB of attenuation

Examples in the Dual-Attenuator configuration:

Mech Atten at 20 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 10 dB. New total attenuation equals the value before Elec Atten enabled

Mech Atten at 0 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 0 dB. New total attenuation does not equal the value before Elec Atten enabled

Mech Atten at 40 dB. Elec Atten enabled, Mech Atten set to 10 dB, and Elec Atten set to 24 dB. New total attenuation does not equal the value before Elec Atten enabled

When the Electronic Attenuation is disabled from an enabled state:

The Elec Atten control is grayed out

- The Auto/Man state of (Mech) Atten is restored

If now in Auto, (Mech) Atten recouples

If now in Man, (Mech) Atten is set to the value of total attenuation that existed before the Elec Atten was disabled. The resulting value is rounded up to the smallest value possible given the (Mech) Atten Step setting - (That is, 57 dB changes to 58 dB when (Mech) Atten Step is 2 dB)

Using the Electronic Attenuator: Pros and Cons

The electronic attenuator offers finer steps than the mechanical attenuator, has no acoustical noise, is faster, and is less subject to wear.

The “finer steps” advantage of the electronic attenuator is beneficial in optimizing the alignment of the instrument dynamic range to the signal power in the front panel as well as remote use. Thus, you can achieve improved relative signal measurement accuracy. Compared to a mechanical attenuator with 2 dB steps, the 1 dB resolution

of the electronic attenuator only gives better resolution when the odd-decibel steps are used. Those odd-decibel steps are less accurately calibrated than the even-decibel steps, so one tradeoff for this superior relative accuracy is reduced absolute amplitude accuracy.

Another disadvantage of the electronic attenuator is that the spectrum analyzer loses its “Auto” setting, making operation less convenient.

Also, the relationship between the dynamic range specifications (TOI, SHI, compression, and noise) and instrument performance are less well-known with the electrical attenuator. With the mechanical attenuator, TOI, SHI, and compression threshold levels increase dB-for-dB with increasing attenuation, and the noise floor does as well. With the electronic attenuator, there is an excess attenuation of about 1 to 3 dB between 0 and 3.6 GHz, making the effective TOI, SHI, and so forth, less well known. Excess attenuation is the actual attenuation relative to stated attenuation. Excess attenuation is accounted for in the instrument calibration

Adjust Atten for Min Clipping

Sets the combination of mechanical and electronic attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an "immediate action" function, that is, it executes once, when the control is pressed.

The algorithms that are used for the adjustment are documented under "Pre-Adjust for Min Clipping" on page 1757.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMediate`
Example	`:POW:RANG:OPT IMM`
Notes	Executing Adjust Atten for Min Clipping initiates the measurement.
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements For the Waveform measurement, this control is available only in 5G NR Mode

Adjust Atten

Allows you to select;

- Electric attenuator only
- Combination of Electric attenuator and Mechanical attenuator

when the command `[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMediate` is executed.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE EONLy | COMBined` `[:SENSe]:POWer[:RF]:RANGe:OPTimize:TYPE?`

Example	`:POW:RANG:OPT:TYPE EONL` `:POW:RANG:OPT:TYPE?`
Dependencies	Does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum measurements For the Waveform measurement, this control is available only in 5G NR Mode
Preset	`COMBined`
State Saved	Saved in instrument state

Pre-Adjust for Min Clipping

If this function is ON, it applies the adjustment described under "Adjust Atten for Min Clipping" on page 1756 each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

In Dual-Attenuator models, you can set **Elec+Mech Atten**, in which case both attenuators participate in the autoranging, or **Elec Atten Only**, in which case the mechanical attenuator does not participate in the autoranging. This latter case results in less wear on the mechanical attenuator and is usually faster.

See "Adjustment Algorithm" on page 1082

Selection	Example	Note
Off	`:POW:RANGe:OPT:ATT OFF`	This is the default setting
Elec Atten Only	`:POW:RANGe:OPT:ATT ELEC`	Selects only the electric attenuator to participate in auto ranging. This offers less wear on the mechanical attenuator and is usually faster
Mech + Elec Atten	`:POW:RANGe:OPT:ATT COMB`	In Dual-Attenuator models, this selects both attenuators to participate in the autoranging

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF | ON | ELECtrical | COMBined` `[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?`
Example	`:POW:RANG:OPT:ATT OFF` `:POW:RANG:OPT:ATT?`
Notes	The parameter option `ELECtrical` sets this function to `ON` in Single-Attenuator models The parameter option `COMBined` is mapped to `ELECtrical` in Single-Attenuator models. If you send `COMBined`, it sets the function to `ON` and returns `ELEC` to a query For SCPI compatibility with models that do not have an input attenuator, the `ON` parameter is honored and mapped to `COMBined`
Dependencies	This control only appears in Dual-Attenuator models with an Electronic Attenuator installed In instruments with Dual-Attenuator model, when **Enable** "Elec Atten" on page 1753 is `OFF` or grayed-out, "Pre-Adjust for Min Clipping" on page 1081 is grayed-out This control does not appear in the Swept SA, RTSA, Monitor Spectrum and Complex Spectrum

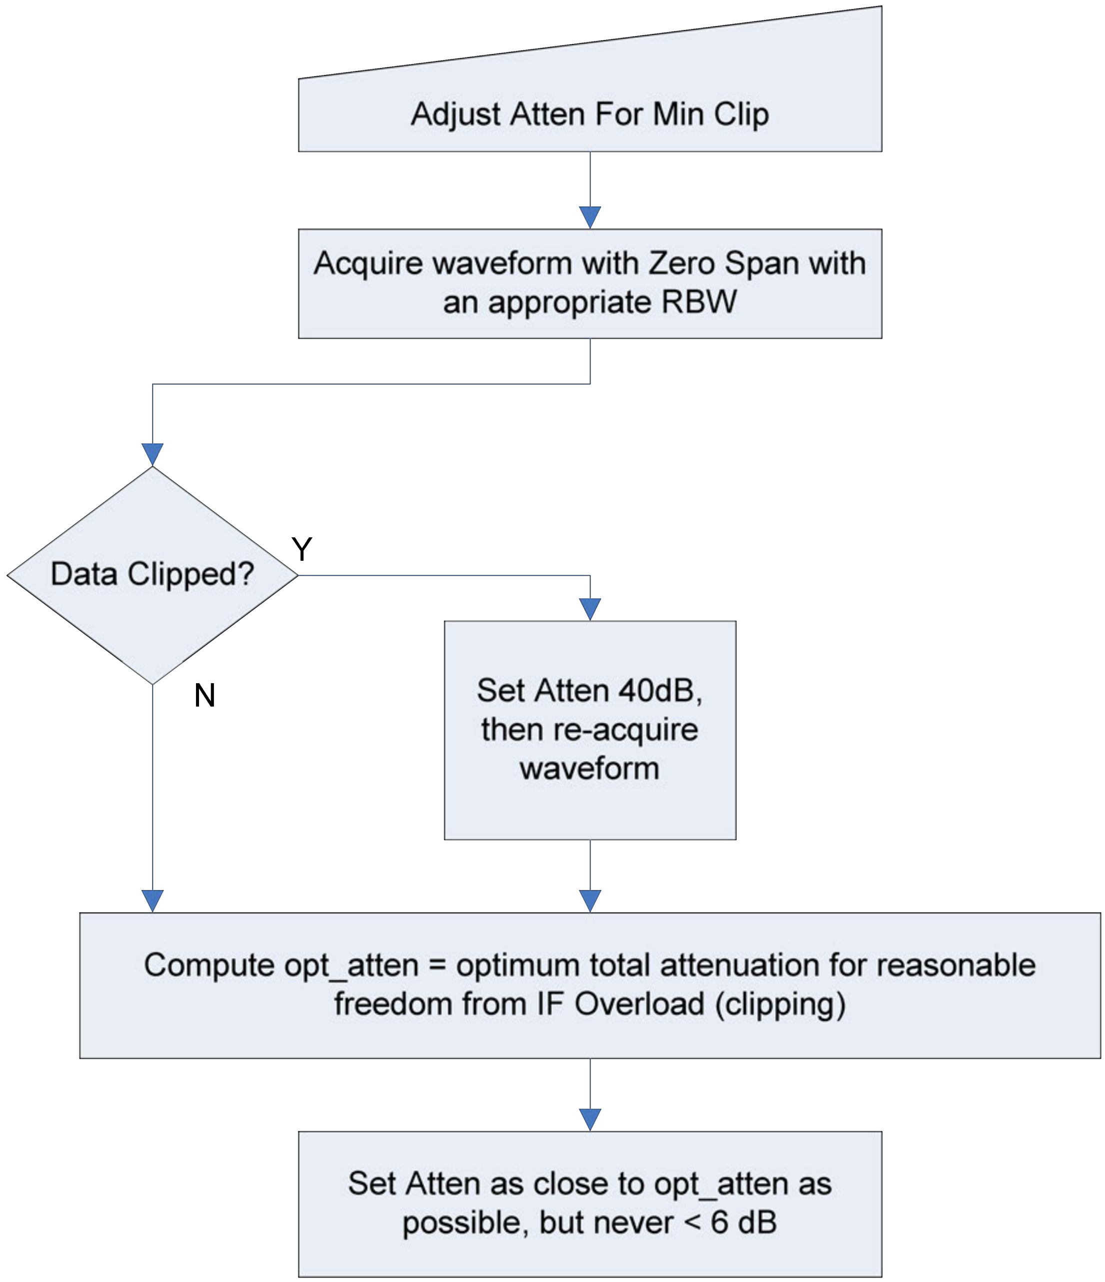
	measurements For the Waveform measurement, this control is available only in 5G NR Mode
Preset	`OFF` when Elec Atten is Disabled at preset, otherwise `ELEC`
State Saved	Saved in instrument state
Range	Dual-Attenuator models: Off | Elec Atten Only | Mech + Elec Atten Single-Attenuator models: Off | On

Notes	`ON` aliases to "Elec Atten Only" (`:POW:RANG:OPT:ATT ELEC`) `OFF` aliases to "Off" (`:POW:RANG:OPT:ATT OFF`) `:POW:RANG:AUTO?` returns true if `:POW:RANG:OPT:ATT` is not `OFF`
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:RANGe:AUTO ON | OFF | 1 | 0` `[:SENSe]:POWer[:RF]:RANGe:AUTO?`

Adjustment Algorithm

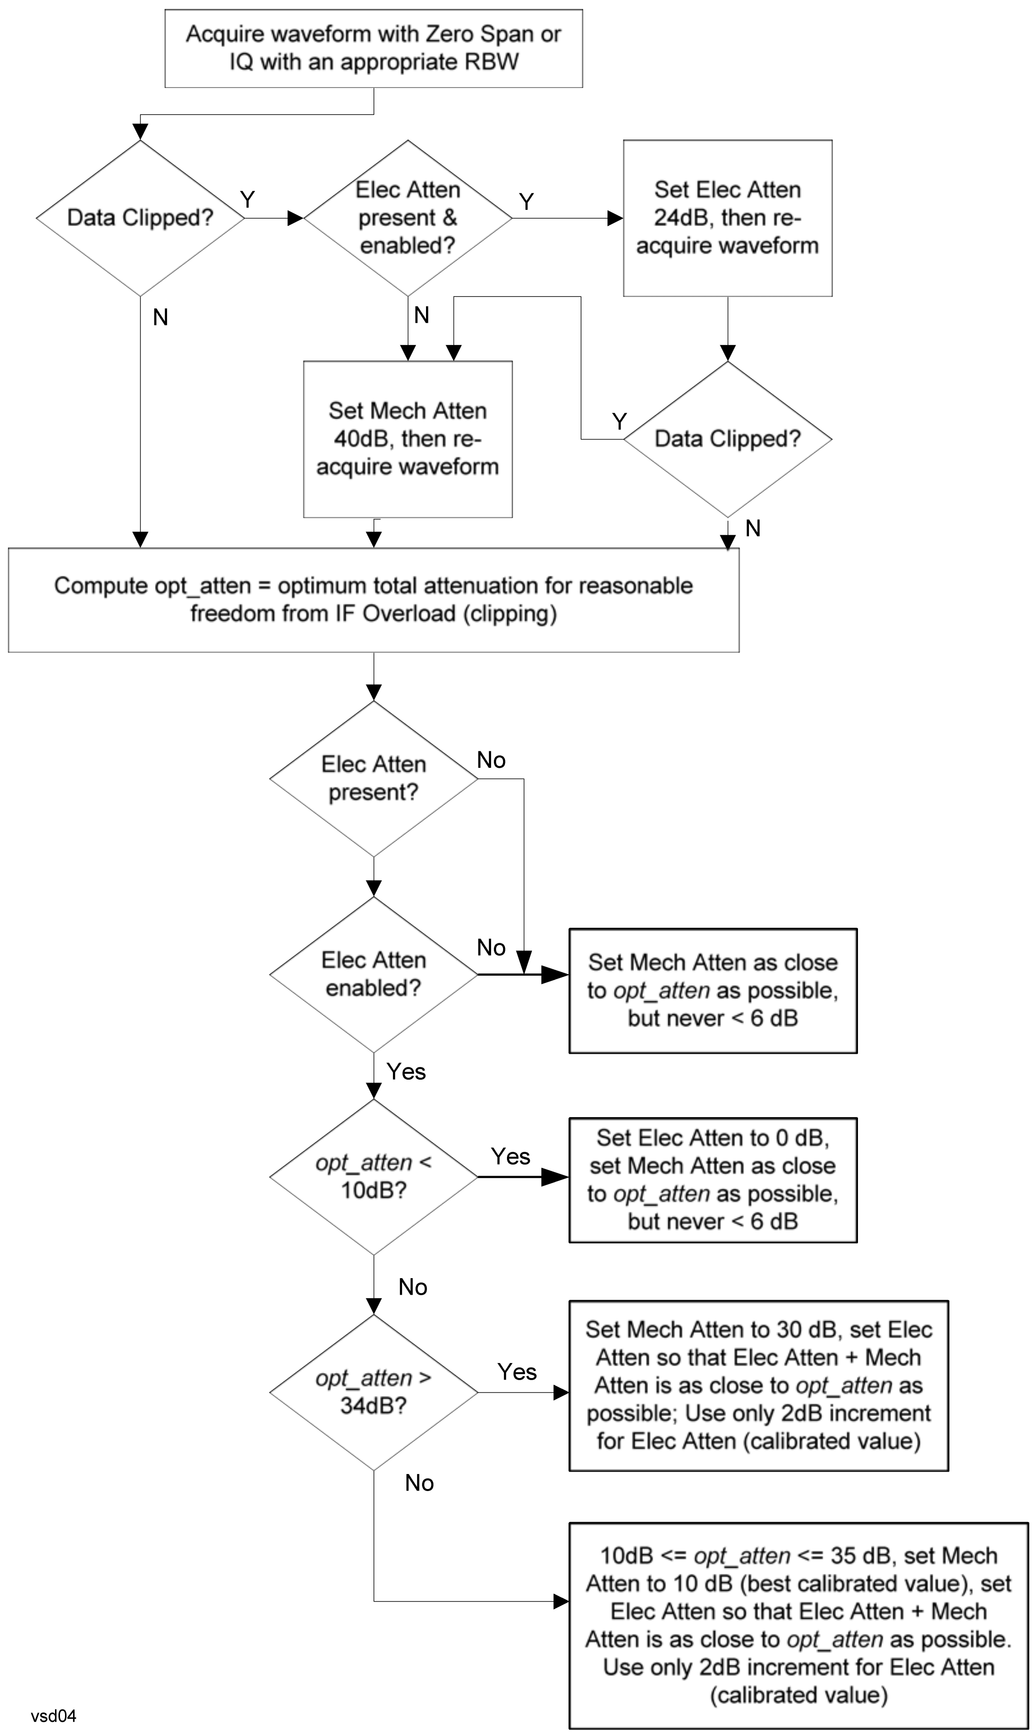
The algorithms for the adjustment are documented below:

Single-Attenuator Models



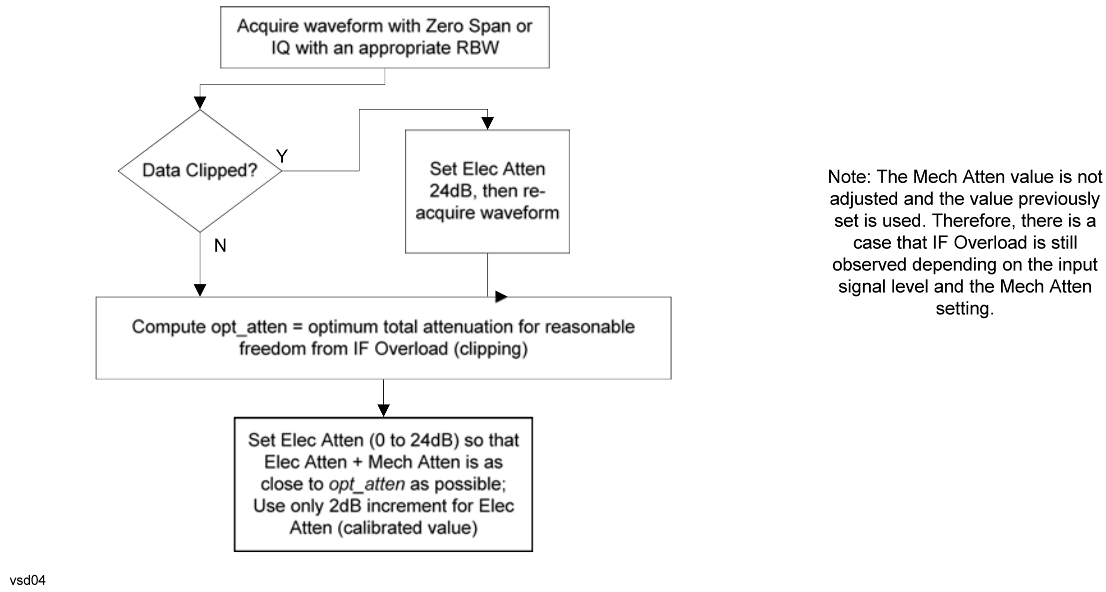
Dual-Attenuator models

"Adjust Atten for Min Clipping" on page 1756 or "Pre-Adjust for Min Clipping" on page 1081 selection is Mech + Elec Atten:



Acquire waveform with Zero Span or IQ with an appropriate RBW
Data Clipped?
Y
N
Elec Atten present & enabled?
Y
N
Set Elec Atten 24dB, then re-acquire waveform
Set Mech Atten 40dB, then re-acquire waveform
Y
Data Clipped?
N
Compute opt_atten = optimum total attenuation for reasonable freedom from IF Overload (clipping)
Elec Atten present?
No
Elec Atten enabled?
No
Set Mech Atten as close to *opt_atten* as possible, but never < 6 dB
Yes
opt_atten < 10dB?
Yes
Set Elec Atten to 0 dB, set Mech Atten as close to *opt_atten* as possible, but never < 6 dB
No
opt_atten > 34dB?
Yes
Set Mech Atten to 30 dB, set Elec Atten so that Elec Atten + Mech Atten is as close to *opt_atten* as possible; Use only 2dB increment for Elec Atten (calibrated value)
No
10dB <= *opt_atten* <= 35 dB, set Mech Atten to 10 dB (best calibrated value), set Elec Atten so that Elec Atten + Mech Atten is as close to *opt_atten* as possible. Use only 2dB increment for Elec Atten (calibrated value)
vsd04

"Pre-Adjust for Min Clipping" on page 1081 selection is Elec Only:



Mech Atten Step

Controls thestep size used when making adjustments to the input attenuation.

This control is labeled **Mech Atten Step** in Dual-Attenuator models and **Atten Step** in Single-Attenuator models. In the Dual-Attenuator configuration, this control only affects the step size of the mechanical attenuator.

Remote Command	`[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement] 10 dB | 2 dB` `[:SENSe]:POWer[:RF]:ATTenuation:STEP[:INCRement]?`
Example	`:POW:ATT:STEP 2` `:POW:ATT:STEP?`
Notes	This feature has a toggle choice from the front panel, but it takes a specific value (in dB) when used remotely. The only valid values are 2 and 10
Dependencies	Blanked in EXA, CXA and CXA-m if option FSA (2 dB steps) is not present. If blanked, attempts to set it via SCPI yield an error
Couplings	When the attenuation step size changes, the current mechanical attenuation value is adjusted (if necessary) to be quantized to the new step size. That is, if step is set to 10 dB, mech atten is increased if necessary so it is a multiple of 10 dB
Preset	EXA, CXA and CXA-m: 10 dB (2 dB with option FSA) All other models: 2 dB
State Saved	Saved in instrument state

3.9.3.3 Range (Non-attenuator models)

This tab is only available for Keysight's modular signal analyzers and certain other Keysight products. Examples include:

- VXT
- E7760
- M9391A
- M9393A

This tab also does not appear in UXM. In UXM, all Attenuation and Range settings are disabled, as the expected input power level is handled by the Call Processing App that drives the DUT power control.

State Saved	No

Range

Represents the amplitude of the largest sinusoidal signal that could be present within the IF without being clipped by the ADC. For signals with high peak-to-average ratios, the range may need to exceed the rms signal power by a significant amount to avoid clipping.

This is a measurement global setting.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe <real>` `[:SENSe]:POWer[:RF]:RANGe?`
Example	`:POW:RANG 10 dBm` `:POW:RANG?`
Notes	The MIN and MAX values are affected by the External Gain parameters, and by the **Center Frequency** The hardware compensates for frequency response and alters the Range setting
Preset	0 dBm
State Saved	Yes
Min	-100
Max	100
Annotation	Meas Bar

Adjust Range for Min Clipping

Sets the combination of attenuation and gain based on the current measured signal level so that clipping will be at a minimum.

This is an "immediate action" function, that is, it executes once, when the key is pressed.

This key does not appear in measurements that do not support this functionality.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize IMMediate`
Notes	Executing Adjust Range for Min Clipping initiates the measurement
Dependencies	This control does not appear in the Swept SA and Monitor Spectrum measurements This control appears in all measurements in E7760

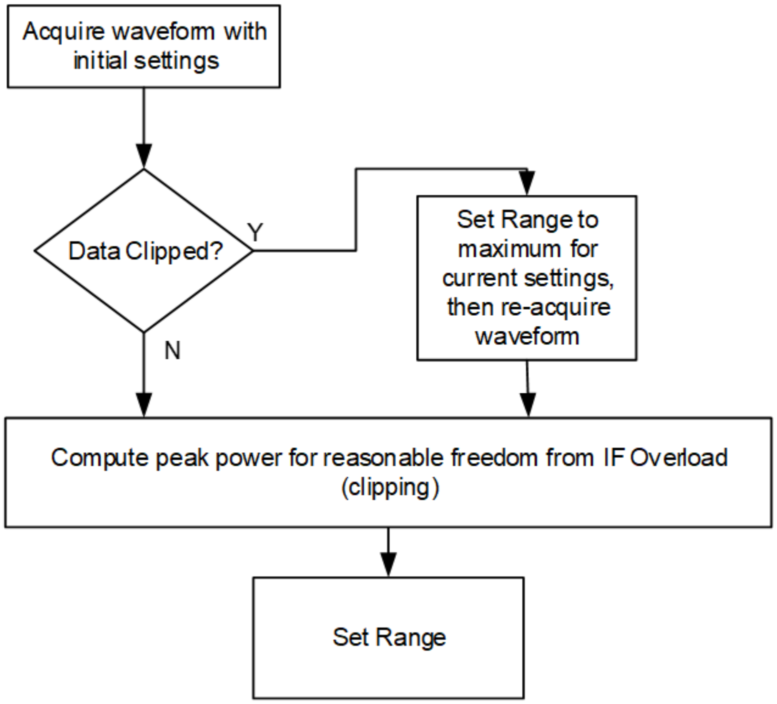
Pre-Adjust for Min Clipping

If this function is `ON`, it applies the adjustment described under Adjust Range For Min Clipping each time a measurement restarts. Therefore, in Continuous measurement mode, it only executes before the first measurement.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation OFF | ON | ELECtrical | COMBined` `[:SENSe]:POWer[:RF]:RANGe:OPTimize:ATTenuation?`
Notes	Because there is no attenuator control available in these models, the control displays only `ON` and `OFF` choices. However, for SCPI compatibility with other platforms, all three parameters (`ELECtrical`, `COMBined`, and `ON`) are honored and all are mapped to `ELECtrical`, so if any of these three parameters is sent, a subsequent query will return `ELEC`
Dependencies	This control does not appear in the Swept SA and Monitor Spectrum measurements This control appears in all measurements in E7760
Preset	`OFF` for Swept SA measurement; `ON` for all other measurements that support **Pre-Adjust for Min Clipping**
State Saved	Saved in instrument state

Adjustment Algorithm

The algorithm for the adjustment is documented below:



Peak-to-Average Ratio

Used with "Range (Non-attenuator models)" on page 1864 to optimize the level control in the instrument. The value is the ratio, in dB, of the peak power to the average power of the signal to be measured. A ratio of 0 should be used for sinusoidal signals; for 802.11g OFDM signals use 9 dB.

All Applications (Modes) show the current value of Peak-to-Average ratio on the control. However, some applications do not permit changing the value. In these situations, the control is grayed-out.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:PARatio <real>` `[:SENSe]:POWer[:RF]:RANGe:PARatio?`
Example	`:POW:RANG:PAR 12 dB`
Notes	In some Applications (Modes) this parameter is read-only; meaning the value will appear on the control and query via SCPI, but is not changeable. In such applications the control is grayed-out. Attempting to change the value via SCPI will be ignored but no error message will be generated
Dependencies	This control does not appear in Spectrum Analyzer Mode
Preset	10 dB VXT Models M9410A/11A: 0 dB
State Saved	Saved in instrument state
Min	0 dB
Max	20 dB

	VXT Models M9410A/11A: 50 dB

Mixer Lvl Offset

This is an advanced setting to adjust target Range at the input mixer, which in turn affects the signal level in the instrument's IF. This setting can be used when additional optimization is needed after setting "Peak-to-Average Ratio" on page 1866. Positive values of offset optimize noise performance over distortion, negative values optimize distortion performance over noise.

Remote Command	`[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet <real>` `[:SENSe]:POWer[:RF]:RANGe:MIXer:OFFSet?`
Example	`:POW:RANG:MIX:OFFS -5 dB`
Preset	0 dB
State Saved	Saved in instrument state
Min	-35 dB VXT Models M9410A/11A: -34 dB
Max	30 dB

3.9.3.4 Signal Path

Contains controls that pertain to the routing of the signal through the frontend of the instrument.

In general, this tab only appears in instruments whose hardware supports this signal routing. For example, this tab does not appear in many of the modular instrument products, including VXT Models M9420/21A. It also does not appear in UXM.

This tab *does* appear in VXT Models M9410A/11A because the Software Preselection control is in this tab, and VXT Models M9410A/11A implement a version of Software Preselection.

Presel Center

Pressing this control adjusts the centering of the preselector filter to optimize the amplitude accuracy at the frequency of the selected marker. If the selected marker is not on when **Presel Center** is pressed, the instrument turns on the selected marker, performs a peak search, and then performs centering on the marker's center frequency. If the selected marker is already on and between the start and stop frequencies of the instrument, the instrument performs the preselector calibration on that marker's frequency. If the selected marker is already on, but outside the frequency range between Start Freq and Stop Freq, the instrument first performs a peak search, and then performs centering on the marker's center frequency.

The value displayed on "Preselector Adjust" on page 1869 will change to reflect the new preselector tuning.

A number of considerations should be observed to ensure proper operation. See "Proper Preselector Operation" on page 1090.

Remote Command	`[:SENSe]:POWer[:RF]:PCENter`
Example	`:POW:PCEN`
Notes	Note that the rules outlined above under the control description apply for the remote command as well as the key. The result of the command is dependent on marker position, etc. Any message shown by the control press is also shown in response to the remote command
Dependencies	Does not appear in CXA-m Does not appear in VXT Models M9410A/11A Grayed-out if the microwave preselector is off – If the selected marker's frequency is below Band 1, an advisory message is generated "Preselector not used in this frequency range" and no action is taken – Grayed-out if entirely in Band 0, that is, if Stop Freq is below about 3.6 GHz – Grayed-out if entirely above 50 GHz, that is, if Start Freq is above 50 GHz – Blank in models that do not include a preselector, such as option 503. If the remote command is sent in these instruments, it is accepted without error, and the query always returns 0 – Grayed-out in the Spectrogram View
Couplings	The active marker position determines where the centering will be attempted If the instrument is in a measurement such as averaging when centering is initiated, the act of centering the preselector restarts averaging, but the first average trace will not be taken until the centering is completed The offset applied to do the centering reads out on the "Preselector Adjust" on page 1869 control
Status Bits/OPC dependencies	When centering the preselector, `*OPC` will not return true until the process is complete and a subsequent measurement has completed, nor will results be returned to `:READ` or `:MEASure` queries The Measuring bit should remain set while this command is operating and should not go false until the subsequent sweep/measurement has completed

Proper Preselector Operation

A number of considerations should be observed to ensure proper operation:

1 If the selected marker is off, the instrument turns on a marker, performs a peak search, and adjusts the preselector using the selected marker's frequency. It uses the "highest peak" peak search method unqualified by threshold or excursion, so that there is no chance of a 'no peak found' error. It continues with that peak, even if it is the peak of just noise. Therefore, for this operation to work properly, there should be a signal on screen in a preselected range for the peak search to find

2 If the selected marker is already on, the instrument attempts the centering at that marker's frequency. There is no preselector for signals below about 3.6 GHz, so if the marker is on a signal below 3.6 GHz, no centering will be attempted and an advisory message generated

3 In some models, the preselector can be bypassed. If it is bypassed, no centering will be attempted in that range and a message will be generated

Preselector Adjust

Allows you to manually adjust the preselector filter frequency to optimize its response to the signal of interest. This function is only available when "Presel Center" on page 1868is available.

For general purpose signal analysis, using **Presel Center** is recommended. Centering the filter minimizes the impact of long-term preselector drift. **Preselector Adjust** can be used instead to manually optimize the preselector. One application of manual optimization would be to peak the preselector response, which both optimizes the signal-to-noise ratio and minimizes amplitude variations due to small (short-term) preselector drifting.

When **Presel Center** is performed, the offset applied to do the centering becomes the new value of **Preselector Adjust**.

Remote Command	`[:SENSe]:POWer[:RF]:PADJust <freq>` `[:SENSe]:POWer[:RF]:PADJust?`
Example	`:POW:PADJ 100KHz` `:POW:PADJ?`
Notes	The value on the control reads out to 0.1 MHz resolution
Dependencies	– Does not appear in CXA-m – Does not appear in VXT Models M9410A/11A – Grayed-out if microwave preselector is off – Grayed-out if entirely in Band 0, that is, if Stop Freq is below about 3.6 GHz – Grayed-out if entirely above 50 GHz, that is, if Start Freq is above 50 GHz – Blank in models that do not include a preselector, such as option 503. If the SCPI is sent in these instruments, it is accepted without error, and the query always returns 0 – Grayed-out in the Spectrogram View
Preset	0 MHz
State Saved	The **Preselector Adjust** value set by "Presel Center" on page 1868, or by manually adjusting **Preselector Adjust** It is not saved in instrument state, and does not survive a Preset or power cycle
Min	-500 MHz
Max	500 MHz
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:MW:PADJust` `[:SENSe]:POWer[:RF]:MMW:PADJust`

Notes	PSA had multiple preselectors, and you could select which preselector to adjust. Since the X-Series has only one mm/uW preselector, the preselector selection control is no longer available. However, to provide backward compatibility, we accept the legacy remote commands The command form has no effect, the query always returns `MWAVe`
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:PADJust:PRESelector MWAVe | MMWave | EXTernal` `[:SENSe]:POWer[:RF]:PADJust:PRESelector?`

Internal Preamp

Accesses a menu of controls for the internal preamps. Turning on the preamp gives a better noise figure, but a poorer inter-modulation distortion (TOI) to noise floor dynamic range. You can optimize this setting for your particular measurement.

The instrument takes the preamp gain into account as it sweeps. If you sweep outside of the range of the preamp, the instrument will also account for that. The displayed result always reflects the correct gain.

For some measurements, when the preamp is on and any part of the displayed frequency range is below the lowest frequency for which the preamp has specifications, a warning condition message appears in the status line. For example, for a preamp with a 9 kHz lowest specified frequency: "Preamp: Accy unspec'd below 9 kHz".

Selection	Example	Note
Off	`:POW:GAIN OFF`	
Low Band	`:POW:GAIN ON` `:POW:GAIN:BAND LOW`	Sets the internal preamp to use only the low band. The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Low Band selection in the dropdown
Full Range	`:POW:GAIN ON` `:POW:GAIN:BAND FULL`	Sets the internal preamp to use its full range. The low band (0-3.6 GHz, 0-3.4 GHz, 0-3GHz, depending on the model) is supplied by the low band preamp and the frequencies above low band are supplied by the high band preamp The frequency range of the installed (optional) low-band preamp is displayed in square brackets on the Full Range selection in the dropdown. If the high band option is not installed the Full Range selection does not appear

Remote Command	`[:SENSe]:POWer[:RF]:GAIN:BAND LOW | FULL` `[:SENSe]:POWer[:RF]:GAIN:BAND?`

	`[:SENSe]:POWer[:RF]:GAIN[:STATe] OFF | ON | 0 | 1` `[:SENSe]:POWer[:RF]:GAIN[:STATe]?`

Example	`:POW:GAIN:BAND LOW`
	`:POW:GAIN:BAND?`
	`:POW:GAIN OFF`
	`:POW:GAIN?`

Dependencies	Preamp is not available on all hardware platforms. If the preamp is not present or is unlicensed, the control is not shown Does not appear in VXT Models M9410A/11A/15A If `:POW:GAIN:BAND FULL` is sent when a low band preamp is available, the preamp band parameter is set to `LOW` instead of `FULL`, and an "Option not installed" message is generated The preamp is not available when the electronic/soft attenuator is enabled
Preset	`LOW` `OFF`
State Saved	Saved in instrument state
Annotation	When the USB Preamp is not connected to USB, the Preamp annotation in the Meas Bar says “Off” if the preamp is off and displays the frequency range of the low band or full range preamp depending on the setting. For example, if the Preamp is set to Low Band and the Low Band is 3.6 GHz the annotation says “3.6 GHz”. If it is a 13.6 GHz preamp and it is set to Full Range the annotation says “13.6 GHz” When the USB Preamp is connected to USB, the Preamp annotation says “Preamp: USB” if the internal preamp is off or “Preamp: USB, Int” if the internal preamp is on (only for measurements that support the USB preamp)

LNA

Lets you turn the Low Noise Amplifier (**LNA**) on or off.

The LNA is an additional preamplifier that provides superior DANL and frequency range compared to the Internal Preamp. The LNA provides lower system noise figure, especially at frequencies above 100 MHz, and can be operated up to the full range of 50 GHz instruments.

For best possible sensitivity, the LNA can be turned on together with the "Internal Preamp" on page 1870, although if you operate both preamps together, note that the TOI (distortion) specifications are impacted. The sensitivity improvement of this combination is substantial when operating in high band (frequencies above 3.6 GHz).

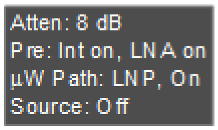
See "More Information" on page 1094

Remote Command	`[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe] OFF | ON | 0 | 1` `[:SENSe]:POWer[:RF]:GAIN:LNA[:STATe]?`
Example	`:POW:GAIN:LNA ON`
Dependencies	Requires option LNA

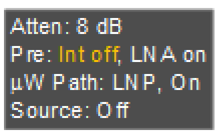
	Option LNA is not required by VXT model M9415A Does not appear in VXT models M9420A/21A/10A/11A May not appear in some measurements
Preset	OFF
State Saved	Saved in State

More Information

When the LNA is installed, the preamp annotation changes to show the state of both the LNA and the Internal Preamp. Below is an example:



Note that when operating entirely in the low band (below about 3.6 GHz), if the LNA is on, the Internal Preamp is switched off (even if you have its switch set to ON). This is because the noise performance is actually degraded in low band if both preamps are on. In this case, the annotation reflects the actual state of the two preamps, but the Internal Preamp annotation displays in amber, to warn you that the actual state of the Internal Preamp does not match the **Internal Preamp** switch control display:



µW Path Control

Options for this control include **µW Preselector Bypass** (Option MPB), **Low Noise Path** (Option LNP) and **Full Bypass Enable** in the High Band path circuits.

When the µW Preselector is bypassed, flatness is improved, but will be subject to spurs from out of band interfering signals. When **Low Noise Path Enable** is selected, the instrument automatically bypasses certain circuitry in the high frequency bands that can contribute to noise, when it is appropriate based on other instrument settings.

For most applications, the preset state is **Standard Path**, which provides the best remote-control throughput, minimizes acoustic noise from switching and minimizes the risk of wear in the hardware switches, particularly in remote test scenarios where both low band and high band setups will follow in rapid succession. In this path, the bypass of the low band/high band switch and microwave preamp is never activated, which can cause some noise degradation but preserves the life of the bypass switch.

For applications that utilize the wideband IF paths, the preset state is **µW Preselector Bypass**, if option MPB is present. This is because, when using a wideband IF such as

the 140 MHz IF, the µW Preselector's bandwidth can be narrower than the available IF bandwidth, causing degraded amplitude flatness and phase linearity, so it is desirable to bypass the preselector in the default case.

You may choose **Low Noise Path Enable** for a lower noise floor, especially in the 21-26.5 GHz region, though without improving many measures of dynamic range, and without giving the best possible noise floor. The preamp, if purchased and used, gives better noise floor than does **Low Noise Path Enable**, but the preamp's compression threshold and third-order intercept are much poorer than that of **Low Noise Path Enable**.

A fourth choice is **Full Bypass Enable**, which combines **µW Preselector Bypass** and **Low Noise Path Enable**. Because this can bypass most of the circuitry between the input and the first mixer, care should be taken when using this setting to avoid damaging the mixer. **Full Bypass Enable** is only available if both options LNP and MPB are present, as well as option FBP.

Path	Example	Note
Standard Path	`:POW:MW:PATH STD`	Normal setting for most measurements. µW Preselector in circuit, Low Noise Path disabled
Low Noise Path Enable	`:POW:MW:PATH LNP`	See "Low Noise Path Enable" on page 1099
µW Preselector Bypass	`:POW:MW:PATH MPB`	See "µW Preselector Bypass" on page 1100
Full Bypass Enable	`:POW:MW:PATH FULL`	See "Full Bypass Enable" on page 1101

Remote Command	`[:SENSe]:POWer[:RF]:MW:PATH STD | LNPath | MPBypass | FULL` `[:SENSe]:POWer[:RF]:MW:PATH?`

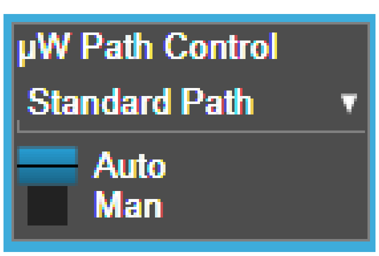
Example	`:POW:MW:PATH LNP`
	Enables the Low Noise path
	`:POW:MW:PATH?`

Notes	If "Presel Center" on page 1868 is performed, the instrument will momentarily switch to the Standard Path, regardless of the setting of **µW Path Control** The DC Block will always be switched in when the low noise path is switched in, to protect succeeding circuitry from DC. Note that this does not mean "when the low noise path is enabled" but when, based on the Low Noise Path rules, the path is actually switched in. This can happen when the selection is **Low Noise Path Enable** or **Full Bypass Enable.** In the case where the DC Block is switched in the instrument is now AC coupled. However, if you selected DC coupling, the UI would still behave as though it were DC coupled, including all annunciation, warnings, status bits, and responses to SCPI queries. This is because, based on other settings, the instrument could switch out the low noise path at any time and hence go back to being DC coupled Alignment switching ignores the settings in this menu, and restores them when finished
Dependencies	Does not appear in CXA-m Does not appear in VXT Models M9410A/11A Does not appear in BBIQ and External Mixing

	The **Low Noise Path Enable** selection does not appear unless Option LNP is present and licensed The **µW Preselector Bypass** selection does not appear unless Option MPB is present and licensed The **Full Bypass Enable** selection does not appear unless options LNP and MPB are both present as well as option FBP In any of these cases, if the required options are not present and the SCPI command is sent, error -241, "Hardware missing; Option not installed" is generated **Low Noise Path Enable** and **Full Bypass Enable** are grayed-out if the current measurement does not support them **Low Noise Path Enable** and **Full Bypass Enable** are not supported in Avionics and MMR Modes. In any of these cases (that is, the feature is not supported in either measurement or mode), if the SCPI command is sent, the following error is generated: -221, “Setting Conflict; Feature not supported for this measurement”
Preset	All except modes specified below: `STD` IQ Analyzer, VXA, Pulse and Avionics mode: – MPB option present and licensed: `MPB` – MPB option not present and licensed: `STD`
State Saved	Save in instrument state
Range	Standard Path|Low Noise Path Enable|µW Presel Bypass|Full Bypass Enable
Annotation	In the Meas Bar, if the Standard path is chosen, it says: µW Path: Standard If Low Noise Path is enabled but the LNP switch is not thrown, it shows: µW Path: LNP,Off If the Low Noise Path is enabled and the LNP switch IS thrown, it shows: µW Path: LNP,On If the preselctor is bypassed, it says: µW Path: Bypass If Full Bypass Enable is selected but the LNP switch is not thrown, it shows: µW Path: FByp,Off If Full Bypass Enable is selected and the LNP switch IS thrown, it shows: µW Path: FByp,On

µW Path Control Auto [Mode: VMA, WLAN, NR5G, CQM]

In VMA, WLAN, 5G NR, CQM modes, an Auto/Man switch is added to **µW Path Control**:



This allows the function to automatically switch based on certain Auto Rules as shown below:

VMA Mode

Measurement	When µW Path Control is in Auto:
Digital Demod	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Monitor Spectrum	Always Presel Bypass
IQ Waveform	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Custom OFDM	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
Channel Power	Always Presel Bypass
Occupied BW	Always Presel Bypass
CCDF	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
ACP	Always Presel Bypass
SEM	Always Presel Bypass
Spurious Emissions	Always Standard Path

WLAN Mode

Measurement	When µW Path Control is in Auto:
Modulation Analysis	Always Presel Bypass
Spectral Flatness	Always Presel Bypasss
Power vs Time	Always Presel Bypass
Monitor Spectrum	Always Presel Bypass
IQ Waveform	Always Presel Bypass
Channel Power	Always Presel Bypass
Occupied BW	Always Presel Bypass
CCDF	Always Presel Bypass
SEM	1. For 11be 320M, when 'Enabled Wideband IF for FFT' is OFF or 'Sweep Type Rule' is Best Dynamic Range, auto µW path is standard. 2. For other cases, auto µW path is presel bypass if presel bypass is enabled, auto µW path is standard if presel bypass is not enabled.
Spurious Emissions	Always Standard Path

5G NR Mode

Measurement	When µW Path Control is in Auto:
Modulation	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in

Measurement	When µW Path Control is in Auto:
Analysis	which case choose Full Bypass if conditions warrant(FBP Option is available and “Allow Full Bypass in Auto” is On), otherwise choose Preselector Bypass
Monitor Spectrum	Always Standard Path
IQ Waveform	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Full Bypass if conditions warrant(FBP Option is available and “Allow Full Bypass in Auto” is On), otherwise choose Preselector Bypass
Channel Power	Always Standard Path
Occupied BW	Always Standard Path
CCDF	Use Standard Path unless tuned frequency > 3.6 GHz and IFBW > 15 MHz, in which case choose Preselector Bypass
ACP	Always Standard Path
SEM	Always Standard Path
Spurious Emissions	Always Standard Path
Transmit On|Off Power	Use Standard Path unless tuned frequency > 3.6 GHz and Info BW > 15 MHz, in which case choose Preselector Bypass

Dependencies	Only appears in VMA, WLAN, 5G NR and CQM modes
Couplings	See the tables above
Preset	ON
Range	ON|OFF

Low Noise Path Enable

You may select Low Noise Path Enable, which gives a lower noise floor under some circumstances, particularly when operating in the 21-26.5 GHz region. With the Low Noise Path enabled, the low band/high band switch and microwave preamp are bypassed whenever all of the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz
- the internal preamp is not installed or (if installed) is set to Off or Low Band

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the Low Noise Path Enable is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the Low Noise Path Enable is selected in the user interface. The only time the Low Noise Path is used is when Low Noise Path Enable is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

For measurements that use IQ acquisition, the low noise path is used when Center Frequency is in High Band (> 3.6 GHz) and no preamp is in use. In other words, the rules above are modified to use only the center frequency to qualify which path to switch in. This is not the case for FFTs in the Swept SA measurement; they use the same rules as swept measurements.

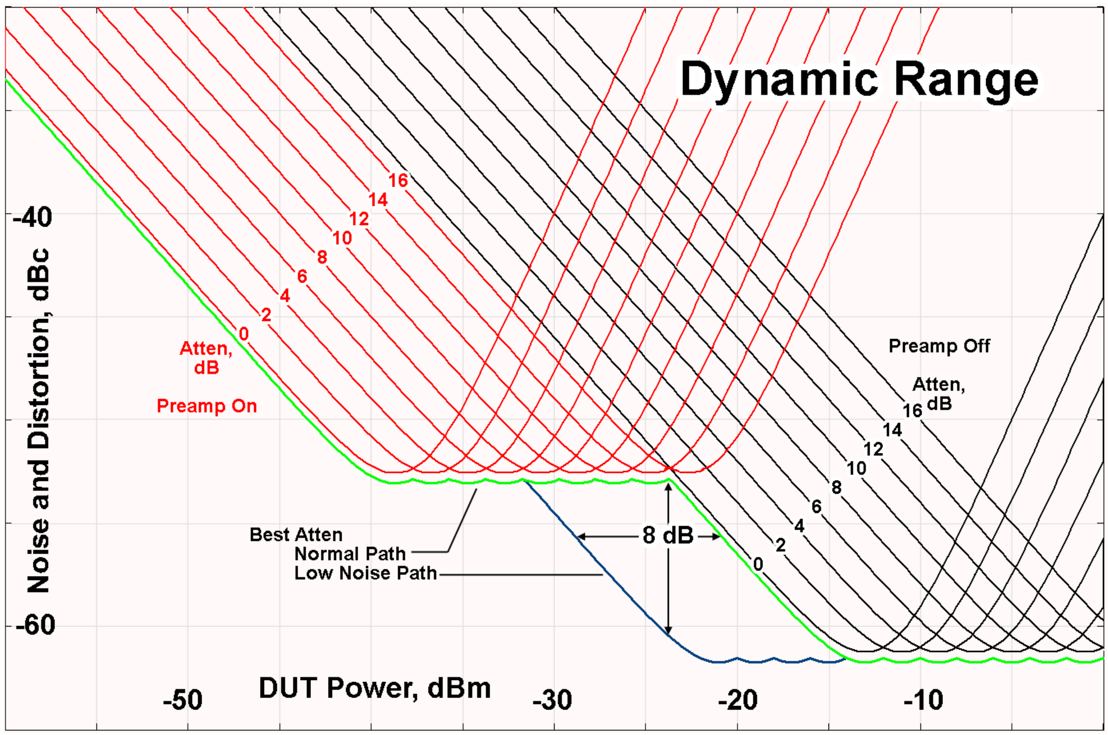
Note that the Low Noise Path, while giving improved DANL, has the disadvantage of decreased TOI performance and decreased gain compression performance relative to the standard path.

Note also that the bypass switch is a mechanical switch and has finite life, so if the Low Noise Path Enable is selected, it is possible to cause frequent cycling of this switch by frequently changing instrument settings such that the above conditions hold true only some of the time. A user making tests of this nature should consider opting for the Standard Path, which will never throw the bypass switch, at the expense of some degraded noise performance.

The low noise path is useful for situations where the signal level is so low that the instrument performance is dominated by noise even with 0 dB attenuation, but still high enough that the preamp option would have excessive third-order intermodulation or compression. The preamp, if purchased and used, gives better noise floor than does the “Low Noise Path.” However, its compression threshold and third-order intercept are much poorer than that of the non-preamp path.

There are some applications, typically for signals around –30 dBm, for which the third-order dynamic range of the standard path is good enough, but the noise floor is not low enough even with 0 dB input attenuation. When the third-order dynamic range of the preamp path is too little and the noise floor of the standard path is too high, the Low Noise Path can provide the best dynamic range

The graph below illustrates the concept. It shows, in red, the performance of an instrument at different attenuation settings, both with the preamp on and off, in a measurement that is affected by both instrument noise and instrument TOI. The green shows the best available dynamic range, offset by 0.5 dB for clarity. The blue shows how the best available dynamic range improves for moderate signal levels with the low noise path switched in. In this illustration, the preamp improves the noise floor by 15 dB while degrading the third-order intercept by 30 dB, and the low noise path reduces loss by 8 dB. The attenuator step size is 2 dB.



There are other times where selecting the low noise path improves performance, too. Compression-limited measurements such as finding the nulls in a pulsed-RF spectrum can profit from the low noise path in a way similar to the TOI-limited measurement illustrated. Accuracy can be improved when the low noise path allows the optimum attenuation to increase from a small amount like 0, 2 or 4 dB to a larger amount, giving better return loss at the instrument input. Harmonic measurements, such as second and third harmonic levels, are much improved using the low noise path because of the superiority of that path for harmonic (though not intermodulation) distortion performance.

µW Preselector Bypass

Toggles the preselector bypass switch for band 1 and higher. When the microwave presel is on, the signal path is preselected. When the microwave preselector is off, the signal path is not preselected. The preselected path is the normal path for the instrument.

The preselector is a tunable bandpass filter which prevents signals away from the frequency of interest from combining in the mixer to generate in-band spurious signals (images). The consequences of using a preselector filter are its limited bandwidth, the amplitude and phase ripple in its passband, and any amplitude and phase instability due to center frequency drift.

Option MPB or pre-selector bypass provides an unpreselected input mixer path for certain X-Series signal analyzers with frequency ranges above 3.6 GHz. This signal path allows a wider bandwidth and less amplitude variability, which is an advantage when doing modulation analysis and broadband signal analysis. The disadvantage is that, without the preselector, image signals will be displayed. Another disadvantage of bypassing the preselector is increased LO emission levels at the front panel input port.

Image responses are separated from the real signal by twice the 1st IF. For IF Paths of 10 MHz and 25 MHz, the 1st IF is 322.5 MHz, so the image response and the real signal will be separated by 645 MHz. The 1st IF will be different for other IF Path settings. When viewing a real signal and its corresponding image response in internal mixing, the image response will be to the left of the real signal.

Also, the image response and the real signal typically have the same amplitude and exhibit the same shape factor.

However, if Option FS1, Fast Sweep Capability, is enabled, the image response in the Swept SA measurement appears lower in amplitude and has a much wider shape factor compared to the real signal.

Full Bypass Enable

With **Full Bypass Enable** selected, the microwave preselector is bypassed. In addition, the low band/high band switch and microwave preamp are bypassed whenever all of the following are true:

- The instrument is not in the Low Band, meaning:
- the start frequency is above 3.5 GHz and
- the stop frequency is above 3.6 GHz.
- the internal preamp is not installed or (if installed) is set to **Off** or **Low Band**

Note that this means that, when any part of a sweep is done in Low Band, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. Also, if the preamp is turned on, the Low Noise Path is not used, whether or not the **Full Bypass Enable** is selected in the user interface. The only time the Low Noise Path is used is when **Full Bypass Enable** is selected, the sweep is completely in High Band (> 3.6 GHz) and no preamp is in use.

CAUTION	When **Full Bypass Enable** is selected, and "Attenuation" on page 1747 is set to 0 dB, there will be a direct AC connection between the input and the first converter

when the Low Noise Path switches in (when Start Freq >3.6 GHz and the Preamp is either not licensed, set to Low Band, or Off). This puts the first converter at high risk to be damaged by high AC power. Consequently, whenever **Full Bypass Enable** is selected, a warning message appears in the status bar:

Full Bypass Enabled, maximum safe input power reduced

Microwave Preselector Bypass Backwards Compatibility

Example	`:POW:MW:PRES OFF` Bypasses the microwave preselector
Notes	Included for Microwave Preselector Bypass backwards compatibility The `ON` parameter sets the `STD` path (`:POW:MW:PATH STD`) The `OFF` parameter sets path `MPB` (`:POW:MW:PATH MPB`)
Preset	`ON`
Backwards Compatibility SCPI	`[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe] ON | OFF | 0 | 1` `[:SENSe]:POWer[:RF]:MW:PRESelector[:STATe]?`

Frequency Extender Preselection Bypass

Frequency Extender Preselection Bypass only applies to the high frequency path of the Frequency Extender and only if the Frequency Extender allows it. For example, the V3050A high frequency path is 50 – 110 GHz and does allow control of the preselector bypass.

When the Frequency Extender's preselection is bypassed, flatness is improved, but will be subject to spurs from out of band interfering signals. For bandwidths greater than 2.5 [GHz], it is recommended that the signal bypass the Frequency Extender Preselector since the max bandwidth of the Preselector can be as narrow as 2.5 [GHz].

For most applications, the preset state is `OFF`, which gives the best remote-control throughput, minimizes acoustic noise from switching, minimizes out of band spurs, and minimizes the risk of wear in the hardware switches.

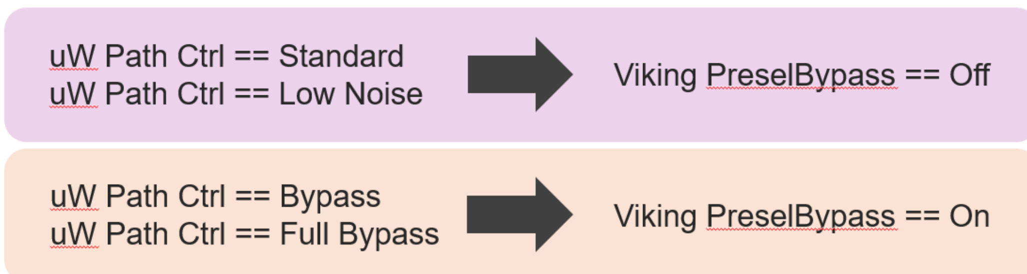
Coupling with Microwave Preselector Control

The control of whether to apply or bypass the Frequency Extender's preselection is dependent on the Microwave Path Control setting.

The coupling between the Microwave Path Control and Frequency Extender Preselector Bypass is described below.

UW PATH CTRL	UW PRESELECTOR	VIKING PRESELECTOR
Standard Path	On	**On**
Low Noise Path Enable	On	**On**
uW Presel Bypass	Off	**Off**
Full Bypass Enable	Off	**Off**

In other words…



For the Frequency Extender Preselector Bypass to take effect, it requires a Frequency Extender device (such as V3050A) be connected and External RF (ERFIN) selected as the input.

The Frequency Extender Preselector is applied or bypassed depending on the Microwave Path Control setting only when the acquisition is above 50 [GHz]. Hence, it will be bypassed only when the acquisition is above 50 [GHz].

Preselector and Bandwidth Conflict

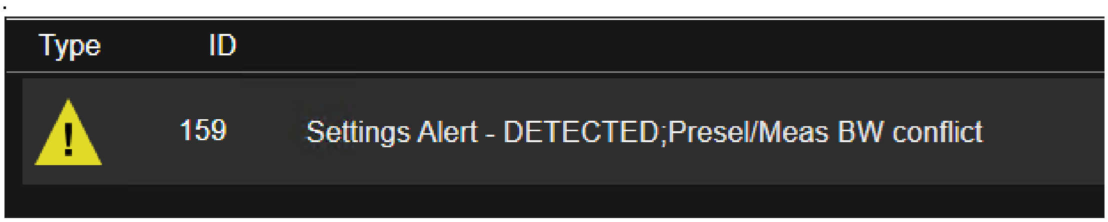
When the Frequency Extender Preselector is applied and the signal bandwidth is greater than 2.5 [GHz], then a settings alert message will show to warn the user that the signal may be distorted due to the limitation of the Frequency Extender Preselector bandwidth.

An example of the settings alert message is shown below.

Settings Alert message in the Status Bar at the bottom of the display.

Settings Alert message in the error queue

.



Software Preselection

Software Preselection is provided in some instruments, either to compensate for issues with provided hardware preselection or to provide the preselection function when there is no hardware preselector.

N9041B

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 50 GHz, software preselection must be used to suppress and separate images above 50 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

In the N9041B, Software Preselection only applies for frequencies above 50 GHz, therefore it is only used for RF Input 2. Even if it is turned on, it will not be used for other inputs and never for frequencies below 50 GHz. This is why the label of this control contains the parenthetical note “(>~50 GHz)”.

Note that in the N9041B, in Swept SA, Software Preselection will work even if the measurement is using an FFT sweep type. In measurements other than Swept SA, Software Preselection will not be used if the measurement is using an FFT sweep type.

N9042B+V3050A

Software Preselection compensates for the frequency range limit of the microwave preselector. Since the microwave preselector only goes up to 88 GHz, software preselection must be used to suppress and separate images above 88 GHz. The specific algorithm used for software preselection is specified by the SW Preselection Type selection – Normal or Advanced.

For N9042B+V3050A, Software Preselection only applies for frequencies above 88 GHz, therefore it is only used for External RF. Even if it is turned on, it will not be used for other inputs and never for frequencies below 88 GHz. This is why the label of this control contains the parenthetical note “(>~88 GHz)”.

Note that for N9042B+V3050A, in Swept SA, Software Preselection will work even if the measurement is using an FFT sweep type. In measurements other than Swept SA, Software Preselection will not be used if the measurement is using an FFT sweep type.

VXT models M9410A/11A

Software Preselection is used to provide the preselection function, as there is no hardware preselector in these models. Two background traces are taken and compared point by point, and the point with the lowest amplitude from the two traces is used. This provides a method to reduce spurs that are internally generated within the VXT, but the user should note the following when using Software

Preselection:

- There is some speed cost due to the need to take multiple captures
- Taking the point with the lowest amplitude in each trace will make the average noise level lower at all points that do not have a spur. This can reduce the accuracy of the measurement of noise and noise-like signals.

Because of the difficulty in identifying spurs manually, you are encouraged to leave Software Preselection ON at all times in VXT models M9410A/11A. If you turn it off in order to speed up your measurement or improve noise accuracy, be aware of unwanted onscreen spurs.

Remote Command	`[:SENSe]:POWer[:RF]:SWPResel:STATe 0 | 1 | ON | OFF` `[:SENSe]:POWer[:RF]:SWPresel:STAT?`
Example	`:POW:SWPR:STAT 1` `:POW:SWPR:STAT?`
Dependencies	Only appears in N9041B, N9042B+V2050A, and VXT models M9410A/11A. Does not appear in all measurements
Couplings	Sweep Time is affected by SW Preselection. Also Auto Tune supports SW Preselection, so set SW Preselection state and then do Auto Tune
Preset	N9041B: OFF N9042B+V3050A: ON M9410A/11A: ON
State Saved	Saved in instrument state

SW Preselection Type

Specifies the algorithm used for software preselection.

Two hidden sweeps are taken in succession. The second sweep is offset in LO frequency by 2*IF/N. For each point in each trace, the smaller amplitude from the two traces is taken and placed in that point in the selected trace. The Peak detector is auto-selected to improve the image suppression effectiveness. Responses of each trace that lie on top of one another will remain and are valid signals. Other signals are images and are suppressed. The action of taking the smaller of the two traces will make the average noise level lower in all points that do not have an image, thus reducing the accuracy of the measurement of noise and noise-like signals.

- `NORMal` - mathematically removes all image and multiple responses of signals present at the input
- `ADVanced` - any trace processing (such as “max hold” or trace averaging) is performed on the points of both candidate traces before the “select minimum” operation occurs. This form of processing works better for non-stationary signals, such as pulsed-RF signals

Remote Command	`[:SENSe]:POWer[:RF]:SWPResel NORMal | ADVanced` `[:SENSe]:POWer[:RF]:SWPResel?`
Example	`:POW:SWPR NORM` `:POW:SWPR?`
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method When "Software Preselection" on page 1883 is Disabled, this control is grayed-out. Its grayout message is "Unavailable unless SW Presel enabled"
Preset	N9041B: `ADVanced` N9042B+V3050A: `NORMal`
State Saved	Saved in instrument state

SW Preselection BW

Specifies the effective bandwidth to be used for Software Preselection.

The choices are:

– `NORMal` – when making Swept measurements, a software preselection algorithm is used which takes up to 4 background acquisitions, then post-processes the result. This algorithm can remove images from signals with an occupied bandwidth up to around 3 GHz. (Default/Preset setting). When making FFT measurements, this algorithm is not used, instead the same algorithm is used as for `NARRow` (below)

– `NARRow`– a software preselection algorithm is used which takes two background acquisitions, then post-processes the result to detect and remove images from wideband signals with occupied bandwidths up to 2 GHz. This increases the risk of images failing to be rejected, but improves the measurement speed

Remote Command	`[:SENSe]:POWer[:RF]:SWPResel:BW NORMal | NARRow` `[:SENSe]:POWer[:RF]:SWPResel:BW?`
Example	`:POW:SWPR:BW NARR`
Dependencies	Only appears in N9041B and N9042B+V3050A. Only appears in measurements that use the Swept method When "Software Preselection" on page 1883 is Disabled, this control is grayed out. Its grayout message is "Unavailable unless SW Presel enabled" For N9042B+V3050A the parameter is SCPI only and always set to `NARRow` when Software Preselection is enabled
Preset	N9041B: `NORMal` N9042B+V3050A: `NARRow`
State Saved	Saved in instrument state

High Freq Prefilter

Lets you set the state of Prefilter for Center Frequencies above 1310 MHz.

In VXT Models M9410A/11A, the Receiver RF path has a bank of filters that come after the RF Attenuator in the signal path. Since this bank of filters precedes the mixer they are known as the “Prefilter” bank. Their purpose is to eliminate unwanted in-band mixing products by filtering out all but the desired frequencies before the signals get to the mixer. There are 13 prefilter bands to cover the frequencies between 9 kHz and 6000 MHz. The Prefilter provides the necessary rejection of the unwanted signal.

Remote Command	`[:SENSe]:<measurement>:PFILter[:STATe] ON | OFF | 1 | 0` `[:SENSe]:<measurement>:PFILter[:STATe]?`

Example	For example, to enable High Freq Prefilter in IQ Analyzer Mode:
	For the Complex Spectrum Measurement:
	`:SPEC:PFIL ON`
	For the IQ Waveform Measurement:
	`:WAV:PFIL ON`
	`:`

Dependencies	This control only appears in VXT models M9410A/11A with center frequency above 1310 MHz
Preset	See “Prefilter Presets” below
State Saved	Saved in instrument state

Prefilter Presets

Meas	Mode	Preset

OFDM	VMA	OFF
SAN	SA	ON
HARM	SA	ON

3.9.4 BW

Opens the **BW** menu, which contains controls for the Resolution Bandwidth and Video Bandwidth functions of the instrument.

The Resolution BW functions control filter bandwidth and filter type. There are two filter types, Gaussian and Flattop. The Gaussian filters have a response curve that is parabolic on a log scale. The Flattop filter shape is a close approximation of a rectangular filter.

3.9.4.1 Settings

Contains the basic Bandwidth functions. In most measurements it is the only tab under Bandwidth.

Res BW

Activates the resolution bandwidth active function, which allows you to manually set the resolution bandwidth (RBW) of the instrument.

Normally, **Res BW** (Auto) selects automatic coupling of the Res BW to Span using the ratio set by the Span:3 dB RBW control (some measurements do not have a Span:3 dB RBW control, in which case the measurement chooses the optimal ratio). To decouple the resolution bandwidth, press the **Auto/Man** toggle on the **Res BW** control, or simply enter a different value for **Res BW**.

When the **Res BW** is manually selected, it may be returned to the coupled state by pressing the **Auto/Man** toggle on the **Res BW** control. This may also be done by pressing **Auto Couple** or by performing a **Preset**.

See:

– "RBW Presets" on page 1110

– "More Information" on page 1110

Remote Command	`[:SENSe]:ACPower:BANDwidth[:RESolution] <bandwidth>`
	`[:SENSe]:ACPower:BANDwidth[:RESolution]?`
	`[:SENSe]:ACPower:BANDwidth[:RESolution]:AUTO ON | OFF | 1 | 0`
	`[:SENSe]:ACPower:BANDwidth[:RESolution]:AUTO?`

Example	`:ACP:BAND 5 MHz`
	`:ACP:BAND?`
	`:ACP:BAND:AUTO ON`
	`:ACP:BAND:AUTO?`

Notes	For numeric entries, all RBW Types choose the nearest (arithmetically, on a linear scale, rounding up) available RBW to the value entered The setting and querying of values depend on the current bandwidth type This control is available only in the IBW mode This parameter is preset by the Meas Method selection. Preset values are as follows: IBW: 100 kHz IBWR: 27 kHz FAST (WCDMA): 390 kHz When Meas Method is “Fast Power” and Fast Power RBW mode is “Speed,” RBW is calculated as follows: RBW = Span × 2.442 × 10^{-3}
Dependencies	When Meas Method is RBW, FAST, or Fast Power and Fast Power RBW mode is Speed, this control is disabled. If pressed, an advisory message is generated. If the equivalent SCPI command is sent, a "Setting conflict" warning is generated
Couplings	Sweep time is coupled to the RBW. As the RBW changes, the sweep time (if set to Auto) is changed to maintain amplitude calibration Video bandwidth (VBW) is coupled to the RBW. As the resolution bandwidth changes, the video bandwidth (if set to Auto) changes to maintain the ratio of VBW/RBW (10:1) When the Res BW is set to Auto, the resolution bandwidth is auto-coupled to the span. The ratio of Span/RBW is approximately 106:1 when auto coupled. When Res BW is set to Man, and the bandwidths are entered manually, these bandwidths are used regardless of other instrument settings
Preset	Auto (unless noted in the table below) See table below
State Saved	Saved in instrument state
Min	1 Hz
Max	8 MHz is the max equivalent –3 dB RBW, which means that the named RBW (the one shown on the control etc.) can actually exceed 8 MHz if using a filter other than –3 dB Gaussian
Annotation	A “#” mark appears before “RBW” in the annotation when it is switched from Auto to Manual coupling
Backwards Compatibility Notes	For backwards compatibility this command obeys both the `BANDwidth` and `BWIDth` forms For ESA, the maximum Res BW was 5 MHz; on X-Series it is 8 MHz The following command is supported `[:SENSe]:ACP:SWEep:BANDwidth|BWIDth[:RESolution]`

RBW Presets

Unless noted in the table below, the Preset value of RBW is **Auto**.

Mode	Preset Value
WCDMA	100 kHz
MSR	100 kHz

More Information

When **Res BW** is set to **Auto**, the bandwidth selected depends on the Filter Type (see "Filter Type" below).

Only certain discrete resolution bandwidths are available. The available bandwidths are dependent on the **Filter Type** or the **EMC Standard**. If an unavailable bandwidth is entered with the numeric keypad, the closest available bandwidth is selected.

In some Power Suite measurements, in the LTE-Advanced applications (both FDD and TDD), when Res BW is in Auto, the resolution bandwidth is predefined based on the corresponding bandwidth of the single LTE carrier, as shown in the table below. In the Multi-carrier case, the narrowest RBW among the active carriers is used.

LTE-A FDD/TDD

	Auto RBW, kHz	
Carrier BW	CHP	ACP
1.4 MHz	20	51
3 MHz	43	51
5 MHz	68	100
10 MHz	150	100
15 MHz	220	100
20 MHz	270	100
200 kHz (NB-IoT in FDD)	10	10

5G NR

100 kHz for all carrier BW

Video BW

Lets you change the instrument post-detection filter (VBW or "video bandwidth") from 1 Hz to 8 MHz in approximately 10% steps. In addition, a wide-open video filter bandwidth may be chosen by selecting 50 MHz. The VBW is annotated at the bottom of the display, in the center.

Normally, **Video BW (Auto)** selects automatic coupling of the Video BW to RBW using the ratio set by the VBW:3 dB RBW control. To decouple the resolution bandwidth, press the **Auto/Man** toggle on the **Video BW** control, or simply enter a different value for **Video BW**.

When the **Video BW** is manually selected, it may be returned to the coupled state by pressing the **Auto/Man** toggle on the **Video BW** control. This may also be done by pressing **Auto Couple** or by performing a **Preset**.

For more information, see "VBW Presets" on page 1112

Remote Command	`[:SENSe]:ACPower:BANDwidth:VIDeo <bandwidth>`
	`[:SENSe]:ACPower:BANDwidth:VIDeo?`
	`[:SENSe]:ACPower:BANDwidth:VIDeo:AUTO ON | OFF | 1 | 0`
	`[:SENSe]:ACPower:BANDwidth:VIDeo:AUTO?`

Example	`:ACP:BAND:VID 2.4 MHz`
	`:ACP:BAND:VID?`
	`:ACP:BAND:VID:AUTO ON`
	`:ACP:BAND:VID:AUTO?`

Notes	For numeric entries, the instrument chooses the nearest (arithmetically, on a linear scale, rounding up) available VBW to the value entered. The 50 MHz VBW is defined to mean “wide open” The values shown in this table reflect the conditions after a Mode Preset
Dependencies	Sometimes the displayed Video BW is not actually used to process the trace data: – When the Average Detector is selected and **Sweep Type** is set to **Swept, t**he video bandwidth filter cannot be used, because it uses the same hardware as the Average Detector – When the Quasi-Peak, EMI Average or RMS Average detector is selected the VBW is implemented by the digital IF as part of the detector When this is the case, the VBW still acts to change the Sweep Time, if **Sweep Time** is in Auto, and still affects the data on other traces for which this is not the case When **Meas Method** is RBW, FAST, or Fast Power, this control is disabled. If pressed, an advisory message is generated. If the equivalent command is sent, a "Setting conflict" warning is generated
Couplings	Video bandwidth (VBW) is normally coupled to RBW. If **VBW** is set to Auto, then the VBW is changed as the RBW changes, to maintain the ratio set by the VBW:3 dB RBW control (usually 10:1 for measurements that do not have a VBW:3 dB RBW control)
Preset	See "VBW Presets" on page 1112 below
State Saved	Saved in instrument state
Min	1 Hz
Max	50 MHz
Annunciation	A “#” mark appears before “VBW” in the annotation when it is not coupled
Annotation	In the bottom center of the screen, “VBW <value> <units>” indicates the current video bandwidth value. Note that for some detectors this is not the value actually used for VBW (see above)
Backwards Compatibility Notes	For backwards compatibility this command obeys both the `BANDwidth` and `BWIDth` forms

VBW Presets

Unless noted in the table below, the Preset value of VBW is **Auto**.

Mode	Preset Value
WCDMA	1 MHz

RBW Filter Type

Selects the type for the resolution bandwidth filters. Historically, the Res BW filters in HP/Agilent/Keysight spectrum analyzers were Gaussian filters, specified using the –3 dB bandwidth of the filter. That is, a 10 MHz Res BW filter was a Gaussian shape with its –3 dB points 10 MHz apart. In the X-Series, the **RBW Filter BW** menu lets you choose between a Gaussian and Flat Top filter shape, for varying measurement conditions.

Filter Type	SCPI Example
Gaussian	`:BAND:SHAP GAUS`
Flattop	`:BAND:SHAP FLAT`

For more information, see the RBW Filter Type control description for the Swept SA measurement.

Remote Command	`[:SENSe]:ACPower:BANDwidth:SHAPe GAUSsian | FLATtop` `[:SENSe]:ACPower:BANDwidth:SHAPe?`
Example	`:ACP:BAND:SHAP GAUS` `:ACP:BAND:SHAP?`
Notes	`GAUSsian`= Gaussian `FLATtop` = Flattop
Dependencies	When **Meas Method** is FAST or Fast Power, this control is disabled. If pressed, an advisory message is generated. If the equivalent command is sent, a "Setting conflict" warning is generated
Preset	**Auto Couple** chooses the preset value
State Saved	Saved in instrument state
Annotation	The annotation under RBW in the bottom left of the screen shows the type of filter or bandwidth that is being used
Backwards Compatibility SCPI	`[:SENSe]:ACPower:BWIDth:SHAPe`

RBW Filter BW

Selects a Gaussian filter based on its –3 dB (Normal) bandwidth or its –6 dB bandwidth.

Remote Command	`[:SENSe]:ACPower:BANDwidth:TYPE DB3 | DB6` `[:SENSe]:ACPower:BANDwidth:TYPE?`
Example	`:ACP:BAND:TYPE DB3` `:ACP:BAND:TYPE?`
Dependencies	When **Filter Type** is `FLATtop` or **Meas Method** is RBW, FAST, or Fast Power, this control is disabled. If pressed, an advisory message is generated. If the equivalent command is sent, a "Setting conflict" warning is generated
Preset	`DB3`
State Saved	Saved in instrument state
Range	–3 dB (Normal)|–6 dB
Backwards Compatibility SCPI	`[:SENSe]:ACPower:BWIDth:TYPE`

3.9.5 Display

Lets you configure display items for the current Mode, Measurement View or Window.

3.9.5.1 Meas Display

Contains controls for setting up the display for the current Measurement, View or Window.

Bar Graph On/Off

Turns the Bar Graph On and Off.

Remote Command	`:DISPlay:ACPower:WINDow[1]:BGRaph OFF | ON | 0 | 1` `:DISPlay:ACPower:WINDow[1]:BGRaph?`
Example	`:DISP:ACP:WIND:BGR OFF` `:DISP:ACP:WIND:BGR?`
Dependencies	When the method is RBW, this control is always set to `ON` and grayed-out
Preset	`ON`
State Saved	Saved in instrument state
Range	`OFF|ON`
Backwards Compatibility SCPI	`:DISPlay:ACPower:VIEW[1]:WINDow[1]:BGRaph`

3.9.5.2 View

Contains controls for selecting the current **View**, and for editing User Views.

Views

The ACP measurement has two views: "Normal" on page 1115 and "Carrier Info" on page 1115.

These Views are multiple-window Views. When in a multiple window View, you select a window by touching it. The menu controls may sometimes change depending on which window is selected.

Whenever the View changes, the default menu is Frequency, unless otherwise specified in the View description.

NOTE: **Y Scale/Div, Y Ref Position, Y Auto Scale, Y Ref Value and Bar Graph affect both views. For example, power bars on the traces in both views appear or disappear when Bar Graph is toggled.**

View Selection by Name

Selects the results view. The following command allows you to select the desired measurement view by enumeration.

Remote Command	`:DISPlay:ACPower:VIEW[:SELect] PRESult | CINFormation` `:DISPlay:ACPower:VIEW[:SELect]?`
Example	`:DISP:ACP:VIEW PRES` `:DISP:ACP:VIEW?`
Preset	`PRESult`
State Saved	Saved in instrument state
Range	`PRESult|CINFormation`

View Selection by Number (Remote Command Only)

Selects the results view. The following command allows you to select the desired measurement view by enumeration.

Remote Command	`:DISPlay:ACPower:VIEW:NSELect <integer>` `:DISPlay:ACPower:VIEW:NSELect?`
Example	`:DISP:ACP:VIEW:NSEL 1` `:DISP:ACP:VIEW:NSEL?`
Dependencies	This command is available only for LTE-Advanced FDD/TDD and 5G NR
Preset	1

State Saved	Saved in instrument state
Min/Max	1/2

Normal

Windows: "Graph" on page 1066, "Metrics" on page 1067,

Dual window view of the graph and the metrics.

Example	`:DISP:ACP:VIEW PRES`

Carrier Info

Windows: "Graph" on page 1066, "Metrics" on page 1067,

Dual window view of the graph and the metrics.

Example	`:DISP:ACP:VIEW CINF`

User View

Lets you choose a View from the saved User Views for the current measurement. This panel only appears if a User View exists for the current measurement.

Remote Command	`:DISPlay:VIEW:ADVanced:SELect <alphanumeric>` `:DISPlay:VIEW:ADVanced:SELect?`
Example	Select Baseband as the current View `:DISP:VIEW:ADV:SEL “Baseband”`

Notes	You must be in the measurement whose View you are trying to set to send the command. You can only set Views for the current measurement using this command
	For predefined views, the parameter is derived from the view name that is shown in the View list in the user interface. For example, if you are trying to select the Trace Zoom view in the Swept SA measurement, you send:
	`:DISP:VIEW:ADV:SEL "Trace Zoom"`
	because “Trace Zoom” is the name of the View as seen in the Mode/Meas dialog or in the Display, View menu
	You *cannot* use the legacy View parameter (which in this case would be `TZOom`) with `:DISP:VIEW:ADV:SEL`
	`<alphanumeric>` is case insensitive; you can specify mixed case, however the name will be evaluated on a single case. Thus, both of the following forms work:
	`:DISP:VIEW:ADV:SEL "Trace Zoom"`
	`:DISP:VIEW:ADV:SEL "TRACE ZOOM"`
	If the specified view is not a valid View, the query returns the error message “-224, Illegal parameter value; View with the name <alphanumeric> does not exist”

	If the display is disabled (via `:DISP:ENAB OFF`) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated
Backwards Compatibility SCPI	The legacy node `:DISPlay:VIEW[:SELect]` is retained for backwards compatibility, but it only supports predefined views

Restore Layout to Default

Restores the Layout to the default for Basic.

Modified Views are very temporary; if you exit the current measurement they are discarded, and they are not saved in State. To retain this View for later use, and to be able to return easily to your original Basic View, you can save your edited View as a "User View".

Save Layout as New View

Saves your new View as a User View. An alpha keyboard appears, which lets you name your new View; the default is the old View name plus a number.

Remote Command	`:DISPlay:VIEW:ADVanced:NAME <alphanumeric>`
Example	`:DISP:VIEW:ADV:NAME "Baseband"` Creates a new View named `Baseband` from the current View, and selects it as the current View
Notes	`<alphanumeric>` is case insensitive; you can specify mixed case, however the name will be evaluated on a single case If `<alphanumeric>` name already exists as a View, the error message "-224, Illegal parameter value; View <alphanumeric> already exists" is generated If the display is disabled (via `:DISP:ENAB OFF`) then the error message "-221, Settings conflict; User View SCPI cannot be used while Display is disabled" is generated

Re-Save User View

You can re-edit a User View; if you make changes, then an asterisk will appear next to the User View's name. You can then tap **Re-Save User View** to save it back to its existing name, or **Save Layout as New View** to add another, new User View.

This is a front panel function only, there is no remote command available to perform this function. To do this remotely, you must first perform **Save Layout as New View**, then delete the old User View and rename the new one with the name of the View you just deleted.

Rename User View

You can rename the current View by giving it a new unique name. Only User Views can be renamed, if the current View is a Predefined View, an error occurs.

Remote Command	`:DISPlay:VIEW:ADVanced:REName <alphanumeric>`
Example	`:DISP:VIEW:ADV:REN "Baseband"`
Notes	`<alphanumeric>` is case insensitive; you can specify mixed case, however the name will be evaluated on a single case If the `<alphanumeric>` specifying the new name is already present in the list of View names, the error message "-224, Illegal parameter value; View <alphanumeric> already exists" is generated If the current View is a Predefined View, the error message "-224, Illegal parameter value; Cannot rename a Predefined View" is generated If the display is disabled (via `:DISP:ENAB OFF`) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated

Delete User View

You can delete the current View if it is a User View. The default view becomes the current view for the Measurement.

Remote Command	`:DISPlay:VIEW:ADVanced:DELete`
Example	`:DISP:VIEW:ADV:DEL`
Notes	`<alphanumeric>` is case insensitive; you can specify mixed case, however the name will be evaluated on a single case If the `<alphanumeric>` is not present in the list of View names, the error message "-224, Illegal parameter value; View <alphanumeric> does not exist" is generated If the current View is a Predefined View, the error message "-224, Illegal parameter value; Cannot delete a Predefined View" is generated If the display is disabled (via `:DISP:ENAB OFF`) then the error message "-221, Settings conflict; View SCPI cannot be used while Display is disabled" is generated

Delete All User Views

Deletes all previously saved User Views. The default view becomes the current view for the Measurement if a User View was the current view when this command was executed.

Remote Command	`:DISPlay:VIEW:ADVanced:DELete:ALL`
Example	`:DISP:VIEW:ADV:DEL:ALL`
Notes	Disabled if there are no User Views

View Editor Remote Commands

The following remote commands help you manage Views and User Views. Note that the SCPI node for User Views handles both Predefined and User Views. The legacy nodes, `:DISPlay:VIEW[:SELect]` and `:DISPlay:VIEW:NSEL`, are retained for backwards compatibility, but they only support predefined views.

View Listing Query

Returns a string containing a comma-separated list of names for *all* the Views, including User Views, available for the current Measurement.

Remote Command	`:DISPlay:VIEW:ADVanced:CATalog?`
Example	`:DISP:VIEW:ADV:CAT?`
Notes	Returns a quoted string of the available Views for the current measurement, separated by commas. The list includes names for *all* the Views, including User Views, available for the current Measurement Example: `"Normal,Trace Zoom,Spectrogram,Baseband,myView1,yourView1"` No distinction is made between Predefined and User Views If you switch measurements with the display disabled (via `:DISP:ENAB OFF`), then query the list of available Views, the result is undefined

User View Listing Query

Returns a string containing a comma-separated list of names for *only* the User Views available for the current Measurement.

Remote Command	`:DISPlay:VIEW:ADVanced:USER:CATalog?`
Example	`:DISP:VIEW:ADV:USER:CAT?`
Notes	Returns a quoted string of the available User Views for the current measurement, separated by commas. Example: `"Baseband,myView1,yourView1"` If you switch measurements with the display disabled (see "Display Enable (Remote Command Only)" on page 1894), then query the list of available Views, the result is undefined

3.9.5.3 Annotation

Contains controls for setting up the annotation for the current Mode or Measurement.

Graticule

Turns the display graticule On or Off for all windows with graticules in all measurements in the current Mode. Also turns the graticule Y-Axis annotation on and off.

Remote Command	`:DISPlay:GRATicule[:STATe] OFF | ON | 0 | 1` `:DISPlay:GRATicule[:STATe]?`
Example	`:DISP:GRAT OFF`
Notes	The graticule is the set of horizontal and vertical lines that make up the grid/divisions for the X-Axis and Y-Axis
Preset	`ON`
State Saved	Saved in instrument state

Backwards Compatibility SCPI	`:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe] OFF | ON | 0 | 1`
	`:DISPlay:WINDow[1]:TRACe:GRATicule:GRID[:STATe]?`
	This command is accepted for backwards compatibility with older instruments, but the `WINDow`, `TRACe` and `GRID` parameters are ignored

Screen Annotation

Controls the display of the annunciation and annotation around the graticule, including any annotation on lines (such as the display line, the threshold line, etc.) and the Y-Axis annotation, for all windows with screen annotation in all measurements in the current Mode.

This does *not* include marker annotation (or the N dB result). When `OFF`, the graticule expands to fill the entire graticule area, leaving only the 1.5% gap above the graticule, as described in the **Trace** section.

Remote Command	`:DISPlay:ANNotation:SCReen[:STATe] OFF | ON | 0 | 1` `:DISPlay:ANNotation:SCReen[:STATe]?`
Example	`:DISP:ANN:SCR OFF`
Dependencies	Grayed-out and forced to `OFF` when **System Display Settings**, **Annotation** is `OFF`
Preset	`ON` This remains `OFF` through a Preset when **System Display Settings**, **Annotation** is set to `OFF`
State Saved	Saved in instrument state

Trace Annotation

Turns on and off the labels on the traces, showing their detector (or their Math Mode) as described in the **Trace** section, for all windows in all measurements in the current Mode for which Trace Annotation on/off is supported.

If Trace Math is being performed on a trace, then the Trace Math annotation replaces the detector annotation.

For measurements that support limit lines, this key also turns on and off the labels on the Limit Lines. The label is the Limit number annotation and Limit Comment displayed on the graph. If the length of the comment is greater than 20 characters, the first 8 characters and the last 8 characters are displayed, joined with ....

Remote Command	`:DISPlay:ANNotation:TRACe[:STATe] ON | OFF | 1 | 0` `:DISPlay:ANNotation:TRACe[:STATe]?`
Example	`:DISP:ANN:TRAC OFF`
Preset	`OFF`
State Saved	Saved in instrument state

Control Annotation

Turns on and off the display of values on the Active Function controls for all measurements in the current Mode. This is a security feature.

Remote Command	`:DISPlay:ACTivefunc[:STATe] ON | OFF | 1 | 0` `:DISPlay:ACTivefunc[:STATe]?`
Example	`:DISP:ACT OFF`
Dependencies	Grayed out and forced to `OFF` when **System Display Settings**, **Annotation** is `OFF`
Preset	`ON` This remains `OFF` through a Preset when **System Display Settings**, **Annotation** is set to `OFF`
State Saved	Saved in instrument state

Meas Bar

Turns the Measurement Bar at the top of the screen on and off for all measurements in the current Mode. When `OFF`, the graticule area expands to fill the area formerly occupied by the Measurement Bar.

Remote Command	`:DISPlay:ANNotation:MBAR[:STATe] OFF | ON | 0 | 1` `:DISPlay:ANNotation:MBAR[:STATe]?`
Example	`:DISP:ANN:MBAR OFF`
Dependencies	Grayed out and forced to `OFF` when **System Display Settings**, **Annotation** is `OFF`
Preset	`ON` This remains `OFF` through a Preset when **System Display Settings**, **Annotation** is set to `OFF`
State Saved	Saved in instrument state

Display Enable (Remote Command Only)

Turns the display on/off, including the display drive circuitry. The backlight stays lit to confirm that the instrument is on. The display enable setting is mode global. Theare three reasons for turning the display off:

1. To increase speed as much as possible by freeing the instrument from having to update the display
2. To reduce emissions from the display, drive circuitry
3. For security purposes

If you have turned off the display:

- and you are in local operation, the display can be turned back on by pressing any key or by sending `:SYSTem:DEFaults MISC` or `:DISPlay:ENABle ON` (neither `*RST` nor :SYSTem:PRESet enable the display)
- and you are in remote operation, the display can be turned back on by pressing the **Local** or **Esc** keys, or by sending `:SYSTem:DEFaults MISC` or `:DISPlay:ENABle ON` (neither `*RST` nor `:SYSTem:PRESet` enable the display)
- and you are using either the `:SYSTem:KLOCk` command or GPIB local lockout, then *no* front-panel key press will turn the display back on. You must turn it back on remotely.

If the display is `OFF`, many SCPI commands related to User Views and Multiscreen functionality do not work, and return the error messages “-221, Settings conflict; Screen SCPI cannot be used when Display is disabled” or “221, Settings conflict; View SCPI cannot be used while Display is disabled”. These commands include:

Name	Command
Select User View	`:DISPlay:VIEW:ADVanced:SELect`
Rename User View	`:DISPlay:VIEW:ADVanced:REName`
Delete User View	`:DISPlay:VIEW:ADVanced:DELete`
Create User View	`:DISPlay:VIEW:ADVanced:NAME`
Select Screen	`:INSTrument:SCReen:SELect`
Delete Screen	`:INSTrument:SCReen:DELete`
Delete All But This Screen	`:INSTrument:SCReen:DELete:ALL`
Add Screen	`:INSTrument:SCReen:CREate`
Rename Screen	`:INSTrument:SCReen:REName`
Sequencer On/Off	`:SYSTem:SEQuencer`

Remote Command	`:DISPlay:ENABle OFF | ON | 0 | 1` `:DISPlay:ENABle?`

Example	`:DISP:ENAB OFF`
Couplings	`:DISP:ENAB OFF` turns Backlight `OFF` and `:DISP:ENAB ON` turns Backlight `ON`, but changing Backlight settings does *not* change the state of `:DISP:ENAB`
Preset	`ON` Set by `:SYST:DEF MISC`, but not affected by `*RST` or `:SYSTem:PRESet`
State Saved	Not saved in instrument state
Backwards Compatibility Notes	`:SYST:PRES` no longer turns on `:DISPlay:ENABle` as it did in legacy analyzers

3.9.6 Freq

Contains controls that allow you to control the Frequency and Channel parameters of the instrument.

Some features in the **Frequency** menu are the same for all measurements in the current Mode – they do not change as you change measurements. Settings like these are called “Meas Global” and are unaffected by Meas Preset. For example, the **Center Freq** setting is the same for all measurements - it does not change as you change measurements.

3.9.6.1 Settings

Contains controls that pertain to the X-Axis parameters of the measurement. These parameters control how data on the vertical (X) axis is displayed and control instrument settings that affect the horizontal axis.

Center Frequency

Sets the frequency that corresponds to the horizontal center of the graticule. While adjusting the Center Frequency the Span is held constant.

The **Center Frequency** setting is the same for all measurements within a mode, that is, it is Meas Global. Some modes are also able to share a Mode Global center frequency value. If this is the case, the Mode will have a **Global** tab in its **Meas Setup** menu.

The **Center Frequency** function sets (and queries) the Center Frequency for the currently selected input. If your instrument has multiple inputs, and you select another input, the Center Freq changes to the value for that input. SCPI commands are available to directly set the Center Freq for a specific input.

Center Freq is remembered as you go from input to input. Thus you can set a Center Freq of 10 GHz with the RF Input selected, change to BBIQ and set a Center Freq of 20 MHz, then switch to External Mixing and set a Center Freq of 60 GHz, and when you go back to the RF Input the Center Freq will return to 10 GHz; back to BBIQ and it is 20 MHz; back to External Mixing and it is 60 GHz.

See:

– "RF Center Freq" on page 1125
– "Ext Mix Center Freq" on page 1126
– "I/Q Center Freq" on page 1127
– "Center Frequency Presets" on page 1124
– "VXT Models with Radio Heads/CIU Frequency Range" on page 1125

Remote Command	`[:SENSe]:FREQuency:CENTer <freq>` `[:SENSe]:FREQuency:CENTer?`

Example	Set Center Frequency to 50 MHz:
	`:FREQ:CENT 50 MHz`
	Increment the Center Frequency by the value of CF Step:
	`:FREQ:CENT UP`
	Return the current value of Center Frequency:
	`:FREQ:CENT?`

Notes	Sets the RF, External Mixing or I/Q Center Frequency depending on the selected input – For RF input it is equivalent to `:FREQ:RF:CENT` – For I/Q input it is equivalent to `:FREQ:IQ:CENT` – For External Mixer it is equivalent to `:FREQ:EMIX:CENT` Preset and Max values are dependent on Hardware Options (5xx) If no terminator (e.g., MHz) is sent the terminator Hz is used. If a terminator with unit other than Frequency is used, an invalid suffix error message is generated
Dependencies	Not available in the MSR, LTE-Advanced FDD/TDD and 5G NR modes
Preset	Depends on instrument maximum frequency, mode, measurement, and selected input See "Center Frequency Presets" on page 1124, "RF Center Freq" on page 1125, "Ext Mix Center Freq" on page 1126, "I/Q Center Freq" on page 1127 and "VXT Models with Radio Heads/CIU Frequency Range" on page 1125
State Saved	Saved in instrument state
Min/Max	Depends on instrument maximum frequency, mode, measurement, and selected input See "Center Frequency Presets" on page 1124, "RF Center Freq" on page 1125, "I/Q Center Freq" on page 1127 and "VXT Models with Radio Heads/CIU Frequency Range" on page 1125
Annotation	Center <value> appears in the lower left corner of the display
Status Bits/OPC dependencies	Non-overlapped

Center Frequency Presets

The following table provides the Center Frequency Presets for the Spectrum Analyzer mode, and the Max Freq, for the various frequency options:

Freq Option	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
503 (all but CXA)	1.805 GHz	3.6 GHz	3.7 GHz
503 (CXA)	1.505 GHz	3.0 GHz	3.08 GHz
507 (all but CXA)	3.505 GHz	7.0 GHz	7.1 GHz
507 (CXA)	3.755 GHz	7.5 GHz	7.58 GHz
508 (all but MXE)	1.805 GHz	3.6 GHz	8.5 GHz
508 (MXE)	4.205 GHz	8.4 GHz	8.5 GHz
513	6.805 GHz	13.6 GHz	13.8 GHz
526 (except CXA and MXE)	13.255 GHz	26.5 GHz	27.0 GHz*
526 (CXA)	13.255 GHz	26.5 GHz	26.55 GHz
526 (MXE)	1.805 GHz	3.6 GHz	27.0 GHz
532	16.005 GHz	32.0 GHz	32.5 GHz
540	20.005 GHz	40.0 GHz	40.5 GHz
543	21.505 GHz	43.0 GHz	43.0 GHz
544	22.005 GHz	44.0 GHz	45.0 GHz
550	25.005 GHz	50.0 GHz	52 GHz
F03 (CXA-m)	1.505 GHz	3.0 GHz	3.08 GHz
F07 (CXA-m)	3.755 GHz	7.5 GHz	7.575 GHz
F13 (CXA-m)	6.805 GHz	13.6 GHz	13.8 GHz
F26 (CXA-m)	13.255 GHz	26.5 GHz	26.55 GHz
504 (M9420A/21A, M8920A)	2.145 GHz	3.88GHz	3.88 GHz
506 (M9420A/21A, M8920A)	3.245 GHz	6.08GHz	6.08 GHz
F06 (M9410A/11A)	1.0 GHz	6.08 GHz	6.08 GHz
F06 (M9415A)	1 GHz	1.08 GHz	6.6 GHz
F08 (M9415A)	1 GHz	1.08 GHz	8.6 GHz
F12 (M9415A)	1 GHz	1.08 GHz	12.9 GHz

*For option 526, the Max CF in RTSA is 26.999999995 GHz.

N9041B Center Freq Presets

Input	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
Input 1, all models	25.005 GHz	50.0 GHz	52 GHz

Input	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
Input 2, opt 585	42.505 GHz	85.0 GHz	86 GHz
Input 2, opt 590	45.005 GHz	90.0 GHz	92 GHz
Input 2, opt 5CX	55.005 GHz	110.0 GHz	110 GHz

Input 2, CXA and MXE

Model	CF after Mode Preset	Stop Freq after Mode Preset	Max Freq (can't tune above)
CXA opt C75	0.7505 GHz	1.5 GHz	1.58 GHz
MXE	505 MHz	1 GHz	1.000025 GHz

Tracking Generator Frequency Limits (CXA only)

Tracking Generator Option	Min Freq (clips to this freq when turn TG on and can't tune below while TG on)	If above this Freq, Stop Freq clipped to this Freq when TG turned on	Max Freq (can't tune above) while TG on
T03	9 kHz	3.0 GHz	3.08 GHz
T06	9 kHz	6.0 GHz	6.05 GHz

Tracking Generator Frequency Limits(CXA-m only)

Tracking Generator Option	Min Freq (clips to this freq when turn TG on and can't tune below while TG on)	If above this Freq, Stop Freq clipped to this Freq when TG turned on	Max Freq (can't tune above) while TG on
T03	2 MHz	3.08 GHz	3.08 GHz
T07	2 MHz	7.575 GHz	7.575 GHz
T13	2 MHz	13.8 GHz	13.8 GHz
T26	2 MHz	26.55 GHz	26.55 GHz

VXT Models with Radio Heads/CIU Frequency Range

The following table shows the Center Frequency Presets and Range for VXT modes with Radio Heads/CIU.

Products with Radio Heads/CIU	Preset	Start frequency	Stop frequency
M9421A + CIU	6 GHz	5.9 GHz	12 GHz
M9410A + CIU	6 GHz	5.9 GHz	12 GHz
M9410A + CIU + RRH	25 GHz	24.25 GHz	43.5 GHz

RF Center Freq

Specifies the RF Center Frequency. This command will set the Center Frequency to be used when the RF input is selected, even if the RF input is not the input that is selected at the time the command is sent. Note that the **Center Freq** function in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command	`[:SENSe]:FREQuency:RF:CENTer <freq>` `[:SENSe]:FREQuency:RF:CENTer?`
Example	`:FREQ:RF:CENT 30 MHz` `:FREQ:RF:CENT?`
Notes	This command is the same in all modes, but the parameter is Measurement Global. So the value is independent in each mode and common across all the measurements in the mode
Dependencies	If the electronic/soft attenuator is enabled, any attempt to set Center Frequency such that the Stop Frequency would be >3.6 GHz fails and results in an advisory message. If the equivalent SCPI command is sent, this same message is generated as part of a "-221, Settings conflict" warning
Preset	See table above
State Saved	Saved in instrument state
Min	-79.999995 MHz
Max	See table above. Basically instrument maximum frequency - 5 Hz If the knob or step keys are being used, also depends on the value of Span

Ext Mix Center Freq

Specifies the External Mixer Center Frequency. This command will set the Center Frequency to be used when the External Mixer is selected, even if the External Mixer input is not the input which is selected at the time the command is sent. Note that the **Center Freq** function in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command	`[:SENSe]:FREQuency:EMIXer:CENTer <freq>` `[:SENSe]:FREQuency:EMIXer:CENTer?`
Example	`:FREQ:EMIX:CENT 60 GHz` `:FREQ:EMIX:CENT?`
Notes	This command is the same in all Modes, but the parameter is Measurement Global, so the value is independent in each mode and common across all the measurements in the mode
Couplings	When returning to External Mixing after having been switched to one of the other inputs (for example, RF), you will return to the settings that you had when you left External Mixing. So you will return to the band you were in with the Center Frequency that you had. However, Span is not an input-dependent parameter, therefore you will bring the span over from the other input. Therefore, the instrument retains the span from the previous input, limited as necessary by the current mixer setup
Preset	When a **Mode Preset** is performed while in External Mixing, the Start frequency of the current Mode is set to the nominal Min Freq of the lowest harmonic range in the Harmonic Table for the current mixer setup. Similarly, the Stop frequency of the current Mode is set to the nominal Max Freq of the highest harmonic range in the Harmonic Table. The Center Freq thus presets to the point arithmetically equidistant from these two frequencies Note that, if the current measurement has a limited Span available to it, and cannot achieve the Span

	shown in the table (Span=Stop Freq – Start Freq), then the instrument uses the maximum Span the measurement allows, and still sets the Center Freq to the midpoint of the Start and Stop Freq values in the Harmonic Table When **Restore Input/Output Defaults** is performed, the mixer presets to the 11970A, whose Start and Stop frequencies are 26.5 and 40 GHz respectively. The center of these two frequencies is 33.25 GHz Therefore, after **Restore Input/Output Defaults**, if you go into External Mixing and do a Mode Preset while in the Spectrum Analyzer Mode, the resulting Center Freq is 33.25 GHz
State Saved	Yes
Min	The minimum frequency in the currently selected mixer band + 5 Hz If the knob or step keys are being used, also depends on Span
Max	The maximum frequency in the currently selected mixer band - 5 Hz If the knob or step keys are being used, also depends on Span

I/Q Center Freq

Specifies the I/Q Center Frequency. This command will set the Center Frequency to be used when the I/Q input is selected, even if the I/Q input is not the input which is selected at the time the command is sent. Note that the **Center Freq** function in the **Frequency** menu on the front panel always applies to the currently selected input.

Remote Command	`[:SENSe]:FREQuency:IQ:CENTer <freq>` `[:SENSe]:FREQuency:IQ:CENTer?`
Example	`:FREQ:IQ:CENT 30 MHz`
Notes	This command is the same in all modes, but the parameter is Measurement Global. So the value is independent in each mode and common across all the measurements in the mode
Preset	0 Hz
State Saved	Saved in instrument state
Min	-40.049995 MHz
Max	40.049995 MHz

Span

Changes the displayed frequency range symmetrically about the center frequency. While adjusting the **Span**, the Center Frequency is held constant, this means that both Start Frequency and Stop Frequency will change.

In measurements that also have Start Freq and Stop Freq controls, pressing **Span** sets the frequency entry mode to Center/Span. In Center/Span mode, the center frequency and span values are displayed below the graticule, and the default active function in the Frequency menu is **Center Freq**. In the Start/Stop annotation mode, Start Freq and Stop Freq are displayed below the graticule instead of Center Freq and Span.

If the Span is set to a value greater than the maximum allowable span of the instrument, an error message is generated indicating the data is out of range and was clipped to upper limit.

The default (and minimum) Span is calculated using the number of carriers and the carrier width where;

Span = (Upper Carrier Freq + (max offset IBW * (1 + alpha)) / 2) - (Lower Carrier Freq - (max offset IBW * (1 + alpha)) / 2)

The span is increased by a factor of 1 + Filter Alpha if the RRC Filter in on.

See "Span Presets" on page 1129

Remote Command	`[:SENSe]:ACPower:FREQuency:SPAN <freq>` `[:SENSe]:ACPower:FREQuency:SPAN?`
Example	`:ACP:FREQ:SPAN 10 MHz` `:ACP:FREQ:SPAN?`
Notes	In Bluetooth Mode, the value of Span has to be an odd MHz
Dependencies	If the electrical attenuator is enabled, any attempt to set **Span** such that the Stop Frequency would be >3.6 GHz results in an error In instruments with an RF Preselector, such as MXE, you cannot sweep across the band break at 3.6 GHz while the RF Preselector is on in Continuous sweep, as there is a mechanical switch which bypasses the RF Preselector above 3.6 GHz. See the Stop Frequency control description for details of this limitation
Couplings	Span affects RBW, sweeptime, FFT & Sweep choice (including FFT Width, Phase Noise Optimization and ADC Dither auto couplings) – Any value of the Center Frequency or Span that is within the frequency range of the instrument is allowed when the value is being set through the front panel numeric key pad or the SCPI command. The other parameter is forced to a different value if needed, to keep the Start and the Stop Frequencies within the instrument's frequency range – When using the knob or the step up/down keys or the UP |DOWN keywords in SCPI, the value that is being changed i.e. the Center Frequency or Span, is limited so that the other parameter is not forced to a new value – In the Bluetooth Mode, if Meas Method is FFT, the max value of Span is coupled to the MAX IFBW of the platform The span value is clipped when the carrier settings and/or the offset settings are changed. The value is changed to satisfy following formula: Span = (Upper Carrier Freq + (max offset IBW * (1 + alpha)) / 2) - (Lower Carrier Freq - (max offset IBW * (1 + alpha)) / 2) This parameter is unavailable when **Meas Method** is Fast Power. In that case, the span is fixed by the formula above
Preset	Depends on instrument maximum frequency, mode, measurement, and selected input See "Span Presets" on page 1129
State Saved	Saved in instrument state

Min/Max	Depends on instrument maximum frequency, mode, measurement, and selected input. See "Span Presets" on page 1129 If the knob or step keys are being used, depends on the value of the other three interdependent parameters Center Frequency, Start Frequency, Stop Frequency
Annotation	Span <value> appears on the first line of the annotation in the lower right corner of display

Span Presets

The following table provides the Max Span, for the various frequency options:

Freq Option	Max Span (can't set higher than this)
503 (all but CXA)	3.7 GHz
503, F03 (CXA, CXA-m)	3.08 GHz
507 (all but CXA)	7.1 GHz
507 (CXA, CXA-m)	7.575 GHz
508 (all but MXE)	8.5 GHz
508 (MXE)	8.5 GHz
513, F13	13.8 GHz
526 (all but CXA and MXE)	27.0 GHz
526 (MXE)	27.0 GHz
526, F26 (CXA, CXA-m)	26.55 GHz
544	44.5 GHz
550	52 GHz
F06 & EP6 (VXT models M9410A/11A)	6.27 GHz
F06 & LFE & EP6 (VXT models M9411A)	6.5999935 GHz
M9415A-F06	6.27 GHz
M9415A-F08	8.27 GHz
M9415A-F12	12.57 GHz

Input 2:

Model	Max Span (can't set higher than this)
CXA opt C75	1.58 GHz
MXE	1.000025 GHz

Note that if you are in External Mixing, the maximum Span will be equal to the Maximum Stop Frequency – Minimum Start Frequency for the currently selected mixer.

Span Presets by Mode

Mode	Preset Value
SA	8 MHz

Mode	Preset Value
WCDMA	24.6848 MHz
LTE, LTETDD, LTEAFDD, LTEATDD, MSR	25 MHz
5G NR	500 MHz
Radio Test	175 kHz

CF Step

Changes the step size for the center frequency and start and stop frequency functions. Once a step size has been selected and the center frequency function is active, the step keys (and the UP|DOWN parameters for Center Frequency from remote commands) change the center frequency by the step-size value. The step size function is useful for finding harmonics and sidebands beyond the current frequency span of the instrument.

Note that the start and stop frequencies also step by the CF Step value.

Remote Command	`[:SENSe]:FREQuency:CENTer:STEP[:INCRement] <freq>`
	`[:SENSe]:FREQuency:CENTer:STEP[:INCRement]?`
	`[:SENSe]:FREQuency:CENTer:STEP:AUTO OFF | ON | 0 | 1`
	`[:SENSe]:FREQuency:CENTer:STEP:AUTO?`

Example	`:FREQ:CENT:STEP 500 MHz`
	`:FREQ:CENT UP`
	increases the current center frequency value by 500 MHz
	`:FREQ:CENT:STEP?`
	`:FREQ:CENT:STEP:AUTO ON`
	`:FREQ:CENT:STEP:AUTO?`

Notes	Preset and Max values are depending on Hardware Options
Dependencies	If the electronic/soft attenuator is enabled, any attempt to change the value of the center frequency >3.6 GHz by pressing the Up-arrow key, fails and results in an advisory message. If the equivalent SCPI command is sent, this same message is generated as part of a “-221, Settings conflict” warning Not available in the MSR, LTE-A FDD/TDD and 5G NR modes
Couplings	When auto-coupled, the center frequency step size is set to 10% of the span
Preset	Auto ON
State Saved	Saved in instrument state
Min	– (the maximum frequency of the instrument). That is, 27 GHz max freq instrument has a CF step range of +/- 27 GHz. Note that this is the maximum frequency given the current settings of the instrument, so in External Mixing, for example, it is the maximum frequency of the current mixer band
Max	The maximum frequency of the instrument. That is, 27 GHz max freq instrument has a CF step range of

	+/- 27 GHz. Note that this is the maximum frequency given the current settings of the instrument, so in External Mixing, for example, it is the maximum frequency of the current mixer band
Status Bits/OPC dependencies	non-overlapped

3.9.7 Marker

Accesses a menu that enables you to select, set up and control the markers for the current measurement. If there are no active markers, **Marker** selects marker 1, sets it to `POSition` (Normal) and places it at the center of the display. If the selected marker is `OFF`, it is set to `POSition` and placed at the center of the screen on the trace determined by the **Marker Trace** rules.

Note that this hard key and all sub keys are unavailable when "Meas Method" on page 1142 is set to RBW.

3.9.7.1 Select Marker

Specifies the selected marker. The term “selected marker” is used throughout this document to specify which marker will be affected when you change marker settings, perform a Peak Search, etc.

The **Select Marker** control appears above the menu panel, indicating that it applies to all controls in the **Marker** menu panels. **Select Marker** is blanked if you select a tab whose controls do *not* depend on the selected marker (for example, **Counter**).

On any menu tab for which **Select Marker** displays, the first control is always **Marker Frequency|Time**.

Notes	The selected marker is remembered even when not in the Marker menu and is used if a Search is done or a Band Function is turned on or for Signal Track or Continuous Peak
Preset	Marker 1
State Saved	The number of the selected marker is saved in instrument state
Annunciation	Appears in the marker results block label for **Normal, Delta** and **Fixed** markers

3.9.7.2 Settings

The controls on this tab include the Marker active function and a radio button selection of the marker control mode (`POSition`, `DELTa`, or `OFF`) for the selected marker, as well as additional functions that help you use markers.

Marker Frequency

Sets the marker X-Axis value in the current marker X-Axis Scale unit. It has no effect if the control mode is `OFF`, but is the SCPI equivalent of entering an X value if the control mode is `POSition` or `DELTa`.

Remote Command	`:CALCulate:ACPower:MARKer[1]|2|...|12:X <freq>` `:CALCulate:ACPower:MARKer[1]|2|...|12:X?`
Example	`:CALC:ACP:MARK3:X 0` `:CALC:ACP:MARK3:X?`
Notes	If no suffix is sent, uses the fundamental units for the current marker X-Axis Scale. If a suffix is sent that does not match the current marker X-Axis Scale unit, an error "Invalid suffix" is generated The query returns the marker's absolute X Axis value if the control mode is `POSition`, or the offset from the marker's reference marker if the control mode is `DELTa`. The query is returned in the fundamental units for the current marker X-Axis scale: Hz for **Frequency and Inverse Time**, seconds for **Period and Time**
Dependencies	This control is unavailable when Meas Method is set to RBW
Preset	After a preset, all markers are turned `OFF`, so Marker X-Axis Value query returns a not a number (`NAN`)
State Saved	Saved in instrument state
Min	-9.9E+37
Max	9.9E+37
Annotation	Mkr # <X value> and <Marker value> upper right on graph

Marker X Axis Position (Remote Command Only)

Sets the marker X-Axis Scale position in trace points. This setting has no effect if the control mode is `OFF`, but is the SCPI equivalent of entering a value if the control mode is `POSition` or `DELTa` - except in trace points rather than X-Axis Scale units. The entered value is immediately translated into the current X-Axis Scale units for setting the value of the marker.

Remote Command	`:CALCulate:ACPower:MARKer[1]|2|...|12:X:POSition <real>` `:CALCulate:ACPower:MARKer[1]|2|...|12:X:POSition?`
Example	`:CALC:ACP:MARK10:X:POS 0` `:CALC:ACP:MARK10:X:POS?`
Notes	The query returns the marker's absolute X-Axis value in trace points if the control mode is `POSition`, or the offset from the marker's reference marker in trace points if the control mode is `DELTa`. The value is returned as a real number, not an integer, corresponding to the translation from X-Axis Scale units to trace points . When a Marker is turned on, it is placed center of the screen on the trace. Therefore the default value depends on instrument condition. If the marker is `OFF`, the response is Not A Number
Dependencies	This command is unavailable when **Meas Method** is set to RBW
Preset	After a preset, all markers are turned `OFF`, so Marker X-Axis Value query returns a Not A Number (`NAN`)
State Saved	Saved in instrument state
Min	-9.9E+37
Max	9.9E+37

Marker Y Axis Value (Remote Command only)

Returns the marker Y-Axis value in the current marker Y-Axis unit.

Remote Command	`:CALCulate:ACPower:MARKer[1]|2|...|12:Y?`
Example	`:CALC:ACP:MARK11:Y?`
Notes	The query returns the marker Y-axis result, if the control mode is `POSition` or `DELTa`. If the marker is `OFF`, the response is Not A Number
Dependencies	This command is unavailable when Meas Method is set to RBW
Preset	Result dependent on Markers setup and signal source
State Saved	No
Backwards Compatibility SCPI	`:CALCulate:ACPower:MARKer[1]|2|...|12:FUNCtion:RESult?`

Marker Mode

Sets the marker control mode to `POSition` (Normal), `DELTa`, or `OFF`. All interactions and dependencies detailed under the control description are enforced when the remote command is sent. If the selected marker is `OFF`, pressing **Marker** sets it to `POSition`, and places it at the center of the screen on the trace determined by the **Marker Trace** rules. At the same time, **Marker X Axis Value** appears on the Active Function area.

The default active function is the active function for the currently selected marker control mode. If the current control mode is `OFF`, there is no active function and the active function is turned off.

Remote Command	`:CALCulate:ACPower:MARKer[1]|2|...|12:MODE POSition | DELTa | OFF` `:CALCulate:ACPower:MARKer[1]|2|...|12:MODE?`
Example	`:CALC:ACP:MARK3:MODE POS` `:CALC:ACP:MARK3:MODE?`
Dependencies	This control is unavailable when **Meas Method** is set to RBW
Preset	`OFF`
State Saved	Saved in instrument state
Range	`POSition|DELTa|OFF`
Annotation	Mkr # <X value> and <Marker value> upper right on graph

Backward Compatibility SCPI Commands

Sets or queries the state of a marker. Setting a marker that is `OFF` to `ON` (1) puts it in `POSition` mode and places it at the center of the screen.

Remote Command	`:CALCulate:ACPower:MARKer[1]|2|...|12:STATe OFF | ON | 0 | 1`

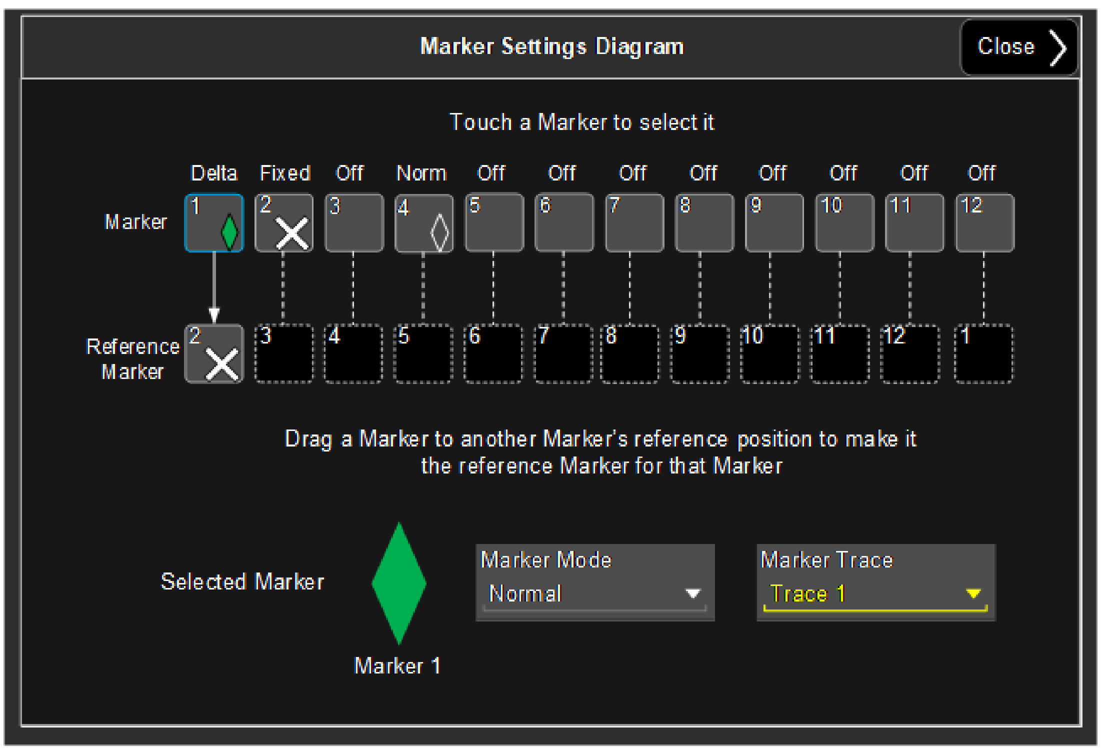
	`:CALCulate:ACPower:MARKer[1]|2|...|12:STATe?`
Example	`:CALC:ACP:MARK2:STAT ON` `:CALC:ACP:MARK2:STAT?`
Preset	`OFF`
State Saved	Saved in instrument state
Range	`OFF|ON`

Delta Marker (Reset Delta)

Pressing this button has exactly the same effect as pressing the `DELTa` selection on the **Marker Mode** radio button. The selected marker becomes a Delta Marker. If the selected marker is already a Delta marker, the reference marker is moved to the current position of the selected marker, thus resetting the Delta to zero.

Marker Settings Diagram

Lets you configure the Marker system using a visual utility.



All Markers Off

Turns off all markers.

Remote Command	`:CALCulate:ACPower:MARKer:AOFF`
Example	`:CALC:ACP:MARK:AOFF`
Dependencies	This control is unavailable when **Meas Method** is set to RBW

Couple Markers

When this function is `ON`, moving any marker causes an equal X-Axis movement of every other marker that is not `OFF`. By "equal X-Axis movement" we mean that we preserve the difference between each marker's X-Axis value (in the fundamental X-Axis units of the trace that marker is on) and the X-Axis value of the marker being moved (in the same fundamental X-Axis units).

This may result in markers going off screen.

Remote Command	`:CALCulate:ACPower:MARKer:COUPle[:STATe] ON | OFF | 1 | 0` `:CALCulate:ACPower:MARKer:COUPle[:STATe]?`
Example	`:CALC:ACP:MARK:COUP ON` `:CALC:ACP:MARK:COUP?`
Dependencies	This control is unavailable when **Meas Method** is set to RBW
Preset	`OFF` Presets on **Mode Preset** and **All Markers Off**
State Saved	Saved in instrument state

3.9.7.3 Peak Search

The controls on this tab allow you to move the marker to selected peaks of the signal, giving you enormous analysis capabilities, particularly when combined with the Delta Marker function.

NOTE

Pressing the **Peak Search** hardkey automatically moves you to the Peak Search page of the **Marker** menu *and* performs a Peak Search.

Pressing the **Peak Search** tab once you are already *in* the **Marker** menu does *not* perform a Peak Search.

Marker Frequency

This is the fundamental control that you use to move a marker around on the trace. This is the same as the **Marker Frequency** control on the **Settings** tab.

Peak Search

Pressing the **Peak Search** control moves the selected marker to the trace point which has the maximum Y-Axis value for that marker's trace.

NOTE Pressing the **Peak Search** hardkey automatically moves you to the Peak Search page of the **Marker** menu *and* performs a Peak Search.

Remote Command	`:CALCulate:ACPower:MARKer[1]|2|...|12:MAXimum`

Example	`:CALC:ACP:MARK2:MAX`
	`:SYST:ERR?`
	can be used to query the errors to determine if a peak is found. The message "No peak found" will be returned after an unsuccessful search

Notes	Sending this command selects the subopcoded marker

Next Peak

Pressing **Next Peak** moves the selected marker to the peak that is next lower in amplitude than the current marker value.

If the selected marker was `OFF`, then it is turned on as a normal marker and a peak search is performed.

Remote Command	`:CALCulate:ACPower:MARKer[1]|2|...|12:MAXimum:NEXT`
Example	`:CALC:ACP:MARK2:MAX:NEXT`
Notes	Sending this command selects the subopcoded marker
State Saved	Not part of saved state

Next Pk Right

Pressing **Next Pk Right** moves the selected marker to the nearest peak right of the current marker.

If the selected marker was `OFF`, then it is turned on as a normal marker and a peak search is performed.

Remote Command	`:CALCulate:ACPower:MARKer[1]|2|...|12:MAXimum:RIGHt`
Example	`:CALC:ACP:MARK2:MAX:RIGH`
Notes	Sending this command selects the subopcoded marker
State Saved	Not part of saved state

Next Pk Left

Pressing **Next Pk Left** moves the selected marker to the nearest peak left of the current marker.

If the selected marker was `OFF`, then it is turned on as a normal marker and a peak search is performed.

Remote Command	`:CALCulate:ACPower:MARKer[1]|2|...|12:MAXimum:LEFT`
Example	`:CALC:ACP:MARK2:MAX:LEFT`
State Saved	Not part of saved state

Minimum Peak

Moves the selected marker to the minimum Y-Axis value on the current trace.

If the selected marker is `OFF`, it is turned on before the minimum search is performed.

Remote Command	`:CALCulate:ACPower:MARKer[1]|2|...|12:MINimum`
Example	`:CALC:ACP:MARK:MIN`
Notes	Sending this command selects the subopcoded marker
State Saved	Not part of saved state

Pk-Pk Search

Finds and displays the amplitude and frequency (or time, if in zero span) differences between the highest and lowest Y-Axis value. It places the selected marker on the minimum value on its selected trace, and places that marker's reference marker on the peak of its selected trace.

This function turns on the reference marker and sets its mode to `POSition` if it is not already on. (These markers may be on two different traces.)

If the selected marker is `OFF`, a delta type marker is turned on and the peak-to-peak search is done. If the selected marker is on, but it is not a delta marker, then it is changed to delta, which turns on the reference marker if needed, and then it performs the peak-to-peak function.

Remote Command	`:CALCulate:ACPower:MARKer[1]|2|...|12:PTPeak`
Example	`:CALC:ACP:MARK:PTP`
Notes	Turns on the Marker D active function Sending this command selects the subopcoded marker
Dependencies	**Pk-Pk Search** is not available when **Coupled Markers** is on
Couplings	The selected marker becomes a delta marker if not already in delta mode
State Saved	Not part of saved state

Marker Delta

Pressing this button has exactly the same effect as pressing the DELTa selection on the **Marker Mode** radio button on the **Settings** tab. The selected marker becomes a Delta Marker. If the selected marker is already a Delta marker, the reference marker is moved to the current position of the selected marker, thus resetting the Delta to zero.

The control is duplicated here in the **Peak Search** menu to allow you to conveniently perform a peak search and change the marker's control mode to Delta without having to access two separate menus.

3.9.7.4 Properties

The controls on this tab are used to set certain properties of the selected marker.

Marker Frequency

This is the fundamental control that you use to move a marker around on the trace. This is the same as the **Marker Frequency** control on the **Settings** tab.

Relative To

Selects the marker to which the selected marker is relative (its reference marker).

Every marker has another marker to which it is relative. This marker is referred to as the "reference marker" for that marker. This attribute is set by the **Marker, Properties, Relative To** key. The marker must be a **Delta** marker to make this attribute relevant. If it is a **Delta** marker, the reference marker determines how the marker is controlled and how its value is displayed. A marker cannot be relative to itself.

Remote Command	`:CALCulate:ACPower:MARKer[1]|2|...|12:REFerence <integer>` `:CALCulate:ACPower:MARKer[1]|2|...|12:REFerence?`
Example	`:CALC:ACP:MARK2:REF 6` `:CALC:ACP:MARK2:REF?`
Notes	This command causes the marker specified with the subopcode to become selected Range (for SCPI command): 1 to 12. If the range is exceeded the value is clipped A marker cannot be relative to itself so that choice is not available, and if sent from SCPI generates error -221: "Settings conflict; marker cannot be relative to itself" When queried a single value is returned (the specified marker numbers relative marker)
Dependencies	This control is unavailable when **Meas Method** is set to RBW
Couplings	The act of specifying the selected marker's reference marker makes the selected marker a Delta marker

	If the reference marker is `OFF`, it is turned on in `POSition` mode at the delta marker location
Preset	The preset default "Relative To" marker (reference marker) is the next higher numbered marker (current marker +1). For example, if marker 2 is selected, then its default reference marker is marker 3. The exception is marker 12, which has a default reference of marker 1 Set to the defaults by using **Restore Mode Defaults.** This is not reset by **Marker Off**, **All Markers Off**, or **Preset**
State Saved	Saved in instrument state. Not affected by **Marker Off** and hence not affected by Preset or power cycle
Min	1
Max	12
Annunciation	Appears in the marker label of a **Delta** marker

Marker Trace

Selects the trace on which you want your marker placed. A marker is associated with one and only one trace. This trace is used to determine the placement, result, and X-Axis Scale of the marker. All markers have an associated trace; it is from that trace that they determine their attributes and behaviors, and it is to that trace that they go when they become Normal markers.

Specifying a Marker Trace manually or with this command associates the marker with the specified trace. If the marker is not OFF, it moves the marker from the trace it was on to the new trace. If the marker is OFF it stays off but is now associated with the specified trace.

The query returns the number of the trace on which the marker is currently placed.

Remote Command	`:CALCulate:ACPower:MARKer[1]|2|...|12:TRACe 1	2	3` `:CALCulate:ACPower:MARKer[1]|2|...|12:TRACe?`
Example	`:CALC:ACP:MARK2:TRAC 2` `:CALC:ACP:MARK2:TRAC?`
Notes	A marker may be placed on a blanked and/or inactive trace, even though the trace is not visible and/or updating An application may register a trace name to be displayed on the control instead of a trace number
Couplings	The state of **Marker Trace** is not affected by the "Auto Couple" on page 1718 key Sending the remote command causes the addressed marker to become selected.
Preset	1
State Saved	Saved in instrument state
Min	1
Max	3

Marker Settings Diagram

Lets you configure the Marker system using a visual utility. This is the same as the "Marker Settings Diagram" on page 1134 control on the **Settings** tab.

3.9.8 Meas Setup

Contains functions for setting up the measurement parameters and also contains functions for setting up parameters global to all measurements in the mode.

3.9.8.1 Settings

Contains frequently used Meas Setup functions to which you will want the fastest access.

Avg|Hold Number

Specifies the number of measurement averages used to calculate the measurement result. The average will be displayed at the end of each sweep. After the specified number of average counts, the average mode (termination control) setting determines the average action.

Remote Command	`[:SENSe]:ACPower:AVERage:COUNt <integer>` `[:SENSe]:ACPower:AVERage:COUNt?`
Example	`:ACP:AVER:COUN 250` `:ACP:AVER:COUN?`
Notes	The BAF backwards Compatibility SCPI command, `[:SENSe]:ACPR:AVERage[:STATe]`, is provided to support same functionality as `[:SENSe]:ACPr:AVERage[:STATe]` (PSA W-CDMA, PSA cdma2000 and PSA 1xEVDO) due to ACPr node conflicts with ACPower node
Preset	10
State Saved	Saved in instrument state
Min/Max	1/1000
Annotation	Avg Number is displayed in the Measurement Bar

Backwards Compatibility SCPI	`[:SENSe]:ACPR:AVERage:COUNt`
	`[:SENSe]:MCPower:AVERage:COUNt`
	Power Suite, W-CDMA

Averaging On/Off

Turns averaging on or off.

NOTE In this measurement, the **Average Type** is preset to the `Log-Pwr Avg (Video)` method. Other averaging methods are not available.

Remote Command	`[:SENSe]:ACPower:AVERage[:STATe] OFF | ON | 0 | 1` `[:SENSe]:ACPower:AVERage[:STATe]?`
Example	`:ACP:AVER OFF` `:ACP:AVER?`
Preset	`ON`
State Saved	Yes
Range	`OFF|ON`

Backwards Compatibility SCPI	`[:SENSe]:ACPR:AVERage[:STATe]`
	`[:SENSe]:MCPower:AVERage[:STATe]`
	Power Suite, W-CDMA

Avg Mode

Enables you to set the Averaging Mode. This determines the averaging action after the specified number of data acquisitions (average count) is reached.

- When set to `EXPonential`, the measurement averaging continues using the specified number of averages to compute each averaged value. The average will be displayed at the end of each sweep.
- When set to `REPeat`, the measurement resets the average counter each time the specified number of averages is reached.

Remote Command	`[:SENSe]:ACPower:AVERage:TCONtrol EXPonential | REPeat` `[:SENSe]:ACPower:AVERage:TCONtrol?`
Example	`:ACP:AVER:TCON EXP` `:ACP:AVER:TCON?`
Notes	The backwards Compatibility SCPI command, `[:SENSe]:ACPR:AVERage:TCONtrol`, is provided to support same functionality as `[:SENSe]:ACPr:AVERage:TCONtrol` (PSA W-CDMA, PSA cdma2000 and PSA 1xEVDO) due to ACPr node conflicts with ACPower node
Preset	`EXPonential`
State Saved	Saved in instrument state
Range	`EXPonential|REPeat`

Backwards Compatibility SCPI	`[:SENSe]:ACPR:AVERage:TCONtrol`
	Power Suite, W-CDMA:
	`[:SENSe]:MCPower:AVERage:TCONtrol`

Meas Method

Sets the desired method to measure ACP. The options are:

Integration BW `IBW`	One sweep of the trace is taken, and the band power for each offset is computed. Depending on the status of the Meas Type parameter (Total Power Reference or PSD Reference), results are displayed relative to the total power or the power spectral density. The display reflects either the current trace or a bar graph view
Filtered IBW `IBWRange` (max dynamic range)	The ACP Path is used to compute ACP when an ACP path is available. This method increases dynamic range, but increases measurement time as it limits the resolution bandwidth. This method is useful for improving dynamic range on a W-CDMA signal because a sharp cutoff bandpass filter is used. The accuracy of the adjacent channel power ratio is not degraded by this method, but the absolute accuracy of both adjacent channel power and carrier power are degraded by up to about 0.5 dB
RBW `RBW`	The algorithm uses zero-span and an appropriate RBW setting to capture all of the power in the carrier channel and the offsets. The zero-span algorithm (RBW method) is slower than the IBW method, but greatly improves repeatability
Fast `FAST`	WCDMA Mode or SA Mode with 3GPP WCDMA radio standard selected: Provides the same method as the Integration BW method, but is optimized for speed to measure a W-CDMA signal SA Mode with CDMA2K radio standard selected: Provides faster measurement using the FFT method with a limited parameter flexibility. When this is selected, CDMA2K preset offsets are given and control of the following are unavailable: – BW menu – Sweep/Control menu except Pause/Resume – Trace/Detector menu – Carrier Setup, Offset Limit, RRC Weighting, Filter Alpha, and Noise Correction in Meas Setup menu
Fast Power `FPOWer` (option FP2 required)	This provides faster measurement using the Hardware accelerated FFT method with a limited parameter flexibility. When this is selected, the following parameters are not available: *Points and Auto Sweep Points under Sweep When changing Meas Method to Fast Power, Auto Sweep Points is turned on and grayed out (Sweep Points will change according to the Fast Power setting). When returning Meas Method to the one other than Fast Power, Auto Sweep Points keeps on and becomes available (Sweep Points will change according to the auto sweep points calculation algorithm) *Trace Type, Restart Averaging and View/Blank under Trace when Select Trace is Trace 2 or Trace3 *Span under Frequency *Res BW, Video BW, Filter Type and Filter BW of Offset > Advanced dialog of

Carr/Offset/Limits Config control under Meas Setup

For Trigger, only Free Run, External 1 and External 2 are supported

When in microwave frequency and measurement span is > 40MHz, RF preselector must be turned off

Remote Command	`[:SENSe]:ACPower:METHod IBW | IBWRange | FAST | RBW | FPOWer` `[:SENSe]:ACPower:METHod?`
Example	`:ACP:METH IBW` `:ACP:METH?`
Notes	FAST mode is only supported for WCDMA and C2K signal. You must be in the WCDMA or SA mode with 3GPP WCDMA or CDMA2K radio standard. Otherwise a setting conflict error message will be reported MSR, LTE, LTETDD, LTE-Advanced FDD/TDD and 5G NR modes support only Integration BW, Filtered IBW and Fast Power methods
Dependencies	When `RBW`, `FAST` or `FPOWer` is selected, Gate function is not available. If you try to turn Gate `ON` while Meas Method is `RBW`, `FAST` or `FPOWer`, an error is generated When Gate function is `ON`, `RBW`, `FAST` and `FPOWer` are not available. If you try to change Meas Method to `RBW`, `FAST` or `FPOWer`, an error is generated VXT Models M9420A/21A/10A/11A support only the Integration BW method
Couplings	IBW (Range) restricts the Res BW available for making this measurement to 30 kHz. When selected, the Res BW is clipped to this value if required and an error number displayed
Preset	`IBW`
State Saved	Saved in instrument state
Range	Integration BW|Filtered IBW (max dynamic range)|RBW|Fast|Fast Power

Backwards Compatibility SCPI	`[:SENSe]:ACPR:SWEep:TYPE`
	(Power Suite, WCDMA)
	`[:SENSe]:MCPower:METHod`

Carrier/Offset/Limits Config

Opens a dialog that lets you set Carriers, Offset, and Limits parameters.

Carrier

Lets you configure your carriers, carrier spacing, noise bandwidth and measurement method.

Dependencies	This index tab appears in all Modes but the MSR, LTE-A FDD/TDD and 5G NR modes

Number of Carriers

This is the same as the **Number of Carriers** control found on the **Reference** menu panel tab under **Meas Setup**.

See "Number of Carriers" on page 1181

Couple to #1

Couples carrier settings to carrier #1. The coupled parameters are Carrier Power Present, Carrier Spacing, Measurement Noise Bandwidth, Method, and Filter Alpha.

Remote Command	`[:SENSe]:ACPower:CARRier[1]|2:LIST:COUPle OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1` `[:SENSe]:ACPower:CARRier[1]|2:LIST:COUPle?`
Example	`:ACP:CARR:LIST:COUP OFF` `:ACP:CARR:LIST:COUP?`
Notes	Carrier subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Some modes do not support Carrier subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored For LTE-Advanced FDD/TDD mode, this control is not shown. In order to maintain backwards compatibility with the legacy LTE FDD/TDD, the SCPI command is supported in LTE & LTE-A converged application
Couplings	When set to On, the carrier settings are coupled to carrier #1. Coupled parameters are Carrier Power Present, Carrier Spacing, Measurement Noise Bandwidth, Method and Filter Alpha When a setting is changed, the couple is set to Off automatically Carrier #1 is always set to On and cannot be changed
Preset	ON
State Saved	Saved in instrument state

Carrier Pwr Present

Configures the carriers for this measurement. It allows spaces to be inserted between carriers. Carriers with the power present parameter set to YES are carriers, and those with the power present parameter set to NO are spaces. Each carrier power present is set to YES or NO. The individual carrier can be set by selecting the desired carrier.

The query for this parameter returns the current values for all of the carriers. If a carrier is defined as having no power present, the power displayed will be relative to the reference carrier, otherwise the absolute power will be displayed.

If you change the carrier power present to no and that carrier is currently configured as the reference carrier, the next carrier to the left (or the right if there are no carriers to the left) will be assigned as the reference carrier. This also applies to the scenario where there are only two carriers configured as having power present and you configure only one carrier to have no power present.

Remote Command	`[:SENSe]:ACPower:CARRier[1]|2:LIST:PPResent YES | NO, YES | NO, YES | NO, YES | NO, YES | NO, YES | NO`
	
	`[:SENSe]:ACPower:CARRier[1]|2:LIST:PPResent?`

Example	`:ACP:CARR2:LIST:PPR YES`
	
	`:ACP:CARR2:LIST:PPR?`

Notes	Carrier subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Some modes do not support Carrier subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored When setting these values remotely, the position in the list sent corresponds to the carrier. Missing values are not permitted, therefore if you want to change values 2 and 6 you must send all values up to 6. Subsequent values will remain unchanged, unless the number of values sent is greater than the number of carriers, then subsequent values will be ignored For LTE-Advanced FDD/TDD modes, this control is not shown. In order to maintain backwards compatibility with the legacy LTE FDD/TDD modes, the SCPI command is supported in the LTE & LTE-A converged application
Couplings	Coupled to the number of carriers. When the SCPI command is sent, the number of carriers will be set to the number of entries in the parameter list
Preset	`YES`
State Saved	Saved in instrument state

Backwards Compatibility SCPI	`[:SENSe]:MCPower:CARRier[1]|2:LIST:PPResent`
	
	`:(Power Suite)`

Carrier Spacing

Sets the width of the carrier spacing. This will be the value applied to all the current slots, whether they are carriers or spaces.

Enter each carrier spacing value individually by selecting the desired carrier, and then enter the carrier width.

Remote Command	`[:SENSe]:ACPower:CARRier[1]|2:LIST:WIDTh <freq>, <freq>, <freq>, <freq>, <freq>, <freq>`
	
	`[:SENSe]:ACPower:CARRier[1]|2:LIST:WIDTh?`

Example	`:ACP:CARR2:LIST:WIDT 25kHz`
	
	`:ACP:CARR2:LIST:WIDT?`

Notes	Carrier subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Some modes do not support Carrier subopcode 2. In those cases, commands with subopcode 2 are

	accepted without error but ignored When setting these values remotely, the position in the list sent corresponds to the carrier. Missing values are not permitted, therefore if you want to change values 2 and 6 you must send all values up to 6. Subsequent values will remain unchanged, unless the number of values sent is greater than the number of carriers, then subsequent values will be ignored For LTE-Advanced FDD/TDD modes, this control is not shown. In order to maintain backwards compatibility with the legacy LTE FDD/TDD modes, the SCPI command is supported in the LTE & LTE-A converged application
Couplings	Coupled to the number of carriers. When the SCPI command is sent, the number of carriers will be set to the number of entries in the parameter list Changing Carrier Spacing might affect the Span See the Span section for details
Preset	SA, WCDMA, LTE, LTETDD: 5 MHz Radio Test: 25 kHz
State Saved	Saved in instrument state
Min/Max	0 Hz/Depends on instrument maximum frequency. Same as the Max Span of Swept SA Measurement
Backwards Compatibility SCPI	`[:SENSe]:MCPower:CARRier[1]|2:LIST:WIDTh` (Power Suite, WCDMA)

Measurement Noise Bandwidth

Specifies the **Measurement Noise Bandwidth** used to calculate the power in the carriers.

Each Measurement Noise Bandwidth value is entered individually by selecting the desired carrier. Enter the measurement noise bandwidth on the Carrier page of the Carr/Offset/Limits Config dialog.

Remote Command	`[:SENSe]:ACPower:CARRier[1]|2:LIST:BANDwidth[:INTegration] <freq>, <freq>, <freq>, <freq>, <freq>, <freq>` `[:SENSe]:ACPower:CARRier[1]|2:LIST:BANDwidth[:INTegration]?`
Example	`:ACP:CARR2:LIST:BAND 25kHz` `:ACP:CARR2:LIST:BAND?`
Notes	In the WCDMA mode, the preset/default value is defined as 3.84 MHz. But internally, 4.6848 MHz is used as the default value Carrier subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Some modes do not support Carrier subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored When setting these values remotely, the position in the list sent corresponds to the carrier. Missing values are not permitted, therefore if you want to change values 2 and 6 you must send all values up to 6. Subsequent values will remain unchanged, unless the number of values sent is greater than the number of carriers, then subsequent values will be ignored

	For LTE-Advanced FDD/TDD modes, this control is not shown. In order to maintain backwards compatibility with the legacy LTE FDD/TDD modes, the SCPI command is supported in the LTE & LTE-A converged application
Couplings	Coupled to the number of carriers. When the SCPI command is sent, the number of carriers is set to the number of entries in the parameter list
Preset	SA: 2 MHz WCDMA: 3.84 MHz LTE, LTETDD: 4.515 MHz|4.5 MHz Radio Test: 25 kHz
State Saved	Saved in instrument state
Min/Max	10 Hz/Depends on instrument maximum frequency. Same as the Max Span of Swept SA Measurement

Backwards Compatibility SCPI	`[:SENSe]:ACPower:BANDwidth:INTegration`
	`[:SENSe]:ACPower:BWIDth:INTegration`
	`[:SENSe]:ACPower:CARRier[1]|2:LIST:BWIDth[:INTegration]`
	Power Suite, WCDMA
	`[:SENSe]:MCPower:CARRier[1]|2:LIST:BANDwidth[:INTegration]`
	`[:SENSe]:MCPower:CARRier[1]|2:LIST:BWIDth[:INTegration]`

Method for Carrier

Accesses the carrier configuration method settings.

Remote Command	`[:SENSe]:ACPower:CARRier[1]|2:LIST:FILTer[:RRC][:STATe] ON | OFF | 1 | 0, ON | OFF | 1 | 0, ON | OFF | 1 | 0, ON | OFF | 1 | 0, ON | OFF | 1 | 0, ON | OFF | 1 | 0` `[:SENSe]:ACPower:CARRier[1]|2:LIST:FILTer[:RRC][:STATe]?`
Example	`:ACP:CARR:LIST:FILT 0,0,0,0` `:ACP:CARR:LIST:FILT?`
Notes	The binary values translate as follows: 1|ON = RRC Weighted 0|OFF = Integ BW Maximum of Array length depends on the number of carriers Some modes do not support Carrier subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored For LTE-Advanced FDD/TDD modes, this control is not shown. In order to maintain backwards compatibility with the legacy LTE FDD/TDD modes, the SCPI command is supported in the LTE & LTE-A converged application
Preset	SA, LTE, LTETDD: OFF WCDMA: ON Radio Test: OFF

State Saved	Saved in instrument state
Range	Integration BW|RRC Weighted

Filter Alpha for Carrier

Inputs the alpha value for the filter used in the current carrier configuration.

Remote Command	`[:SENSe]:ACPower:CARRier[1]|2:LIST:FILTer:ALPHa <real>, <real>, <real>, <real>, <real>, <real>` `[:SENSe]:ACPower:CARRier[1]|2:LIST:FILTer:ALPHa?`
Example	`:ACP:CARR2:LIST:FILT:ALPH 0.5` `:ACP:CARR2:LIST:FILT:ALPH?`
Notes	Some modes do not support Carrier subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored For LTE-Advanced FDD/TDD modes, this control is not shown. In order to maintain backwards compatibility with the legacy LTE FDD/TDD modes, the SCPI command is supported in the LTE & LTE-A converged application
Preset	0.22
State Saved	Saved in instrument state
Min/Max	0.01/1.0

Offset

Lets you configure the spacing of the offset regions.

Offset Frequency Define

Enables you to select offset frequency definition. Each standard defines each offset frequency from Carrier.

For example, 3GPP2 requires the “From Carrier Center to Integ BW Closer Edge” definition. LTE conformance test requires “From Carrier Edge to Integ BW Center” and/or “From Carrier Edge to Integ BW Closer Edge” definition.

`CTOCenter`	From the lowermost carrier center frequency (for lower offset), the uppermost carrier center frequency (for upper offset) to the center frequency of each Offset Integ BW
`CTOEdge`	From the lowermost carrier center frequency (for lower offset), the uppermost carrier center frequency (for upper offset) to the closest edge frequency of each Offset Integ BW
`ETOCenter`	From the lowermost carrier center frequency - spacing of this carrier /2 (for lower

	offset), the uppermost carrier center frequency + spacing of this carrier /2 (for upper offset) to the center frequency of each Offset Integ BW
ETOEdge	From the lowermost carrier center frequency - spacing of this carrier /2 (for lower offset), the uppermost carrier center frequency + spacing of this carrier /2 (for upper offset) to the closest edge of each Offset Integ BW
RTOCenter 5G NR, LTEA, MSR	From either the lower or upper RF BW** edge frequency to the center frequency of each Offset Integ BW
RTOEdge 5G NR, LTEA, MSR	From either the lower or upper RF BW** edge frequency to the closest edge frequency of each Offset Integ BW
RCTOCenter 5G NR only	From the center frequency of RF BW to the center frequency of each Offset Integ BW

** RF BW = $BW_{channel,CA}$ which is defined in each 3GPP standard, regardless of "Measure Carrier" for the uppermost and the lowermost carriers being Enabled or Disabled. When the Number of Component Carrier = 1, RF BW = $BW_{channel}$ = 2 x $F_{offset,RAT}$

See "Diagrams for Offset Freq Define" on page 1150.

Modes other than MSR, LTE-A, 5G NR

Remote Command	[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:TYPE CTOCenter | CTOEdge | ETOCenter | ETOEdge [:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:TYPE?
Example	:ACP:OFFS:TYPE ETOC :ACP:OFFS:TYPE?

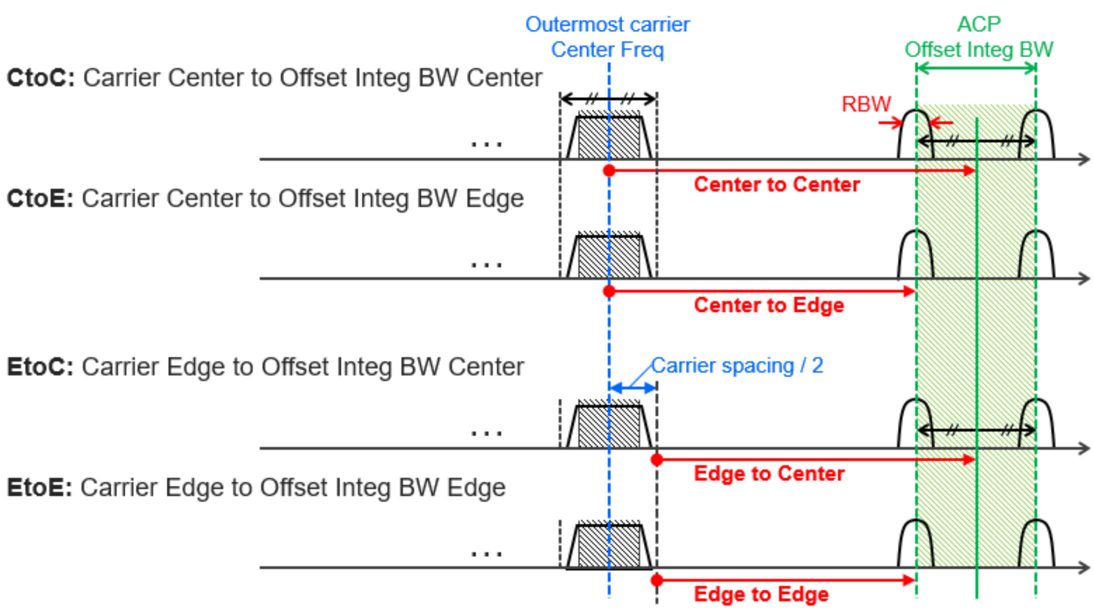
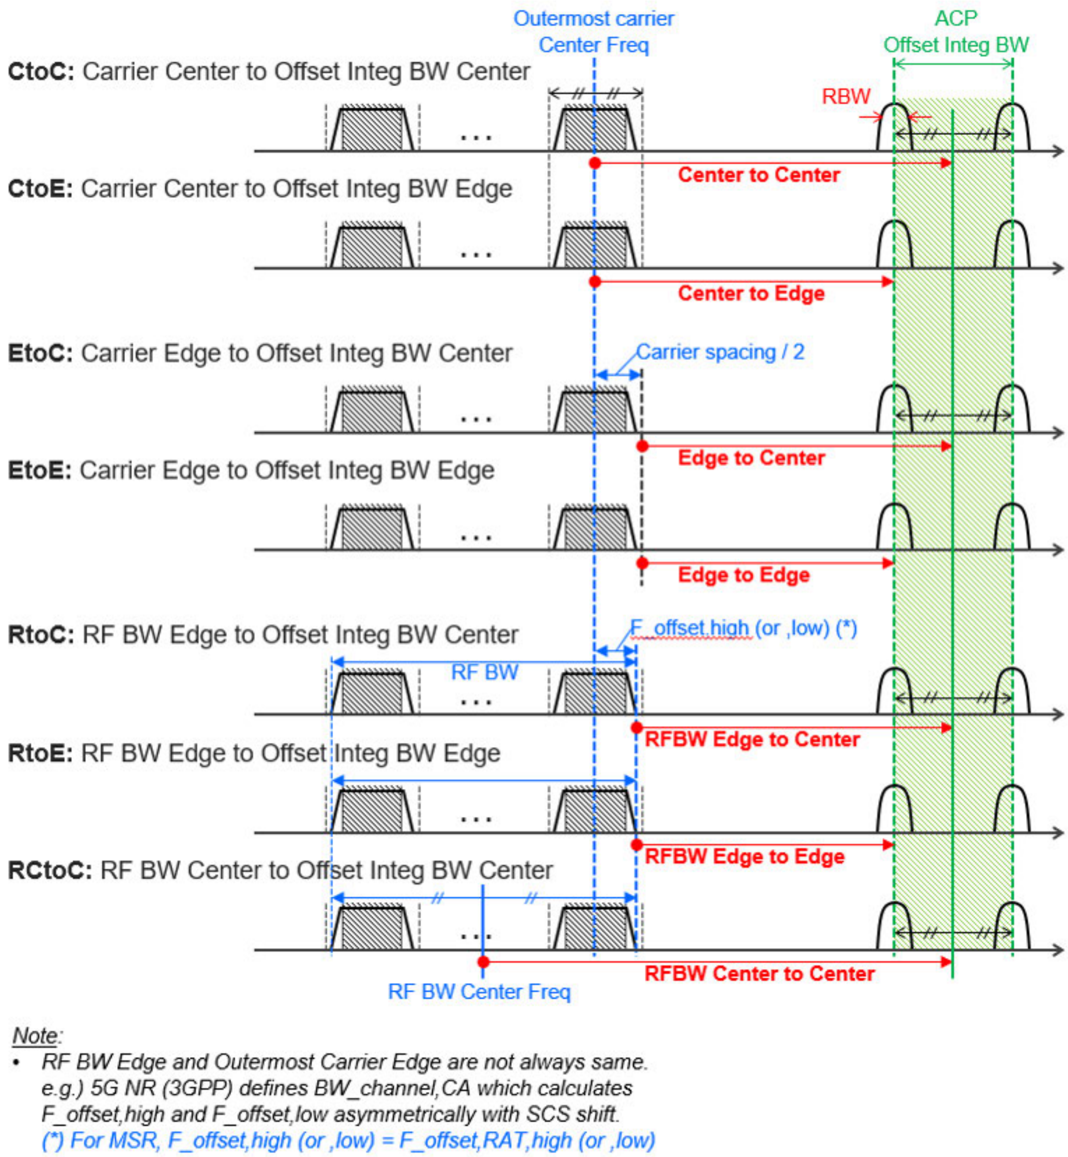
Diagrams for Offset Freq Define

Details depend on the selected mode.

Diagrams for Modes other than MSR, LTE-A, 5G NR



Diagrams for MSR, LTE-A, 5G NR



Offset Freq

This parameter determines the frequency difference between the center of the main channel and the center of the carrier.

Each **Offset Freq** state value is entered individually by selecting the desired carrier.

The list contains up to six (6) entries, depending on the mode selected, for offset frequencies. Each offset frequency in the list corresponds to a reference bandwidth in the bandwidth list.

An offset frequency of zero turns the display of the measurement for that offset off, but the measurement is still made and reported. You can turn off (not use) specific offsets with the [:SENSe]:ACP:OFFSet:LIST:STATe command.

Turning the offset off has the same effect as setting the frequency of the offset to 0 Hz and will cause it to be removed from the results screen.

Remote Command	[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:STATe OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1 [:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:STATe?
Example	:ACP:OFFS1:LIST 0,0,0,0,0,0 :ACP:OFFS1:LIST? :ACP:OFFS2:LIST:STAT 1,1,0,0,0,0 :ACP:OFFS2:LIST:STAT?
Notes	Offset subopcode. 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Some modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored When setting these values remotely, the position in the list sent corresponds to the offset. Missing values are not permitted, unless the number of values sent is greater than the number of carriers, then subsequent values will be ignored
Couplings	Changing Offset Frequency might affect the Span. See the Span control section for details
Preset	SA: 3 MHz, 0 Hz, 0 Hz, 0 Hz, 0 Hz, 0 Hz|3 MHz, 0 Hz, 0 Hz, 0 Hz, 0 Hz, 0 Hz WCDMA: 5.0 MHz, 10.0 MHz, 0 Hz, 0 Hz, 0 Hz, 0 Hz|5.0 MHz, 10.0 MHz, 0 Hz, 0 Hz, 0 Hz, 0 Hz LTE, LTETDD, LTEAFDD, LTEATDD, MSR: 5.0 MHz, 10.0 MHz, 0 Hz, 0 Hz, 0 Hz, 0 Hz|5.0 MHz, 10.0 MHz, 0 Hz, 0 Hz, 0 Hz, 0 Hz 5G NR: 100 MHz, 200 MHz, 0 Hz, 0 Hz, 0 Hz, 0 Hz|100 MHz, 200 MHz, 0 Hz, 0 Hz, 0 Hz, 0 Hz Radio Test: 25 kHz, 50 kHz, 75 kHz, 0 Hz, 0 Hz, 0 Hz SA: ON, OFF, OFF, OFF, OFF, OFF|ON, OFF, OFF, OFF, OFF, OFF WCDMA: ON, ON, OFF, OFF, OFF, OFF|ON, ON, OFF, OFF, OFF, OFF LTE, LTETDD, LTEAFDD, LTEATDD, MSR: ON, ON, OFF, OFF, OFF, OFF|ON, OFF, OFF, OFF, OFF, OFF 5G NR: ON, ON, OFF, OFF, OFF, OFF|ON, OFF, OFF, OFF, OFF, OFF Radio Test: ON, ON, ON, OFF, OFF, OFF
State Saved	Saved in instrument state Yes
Range	OFF|ON
Min/Max	0 Hz/Depends on instrument maximum frequency. Same as the Max Span of Swept SA Measurement
Backwards Compatibility SCPI	[:SENSe]:MCPower:OFFSet[1]|2:LIST[:FREQuency]

Integ BW

Sets the Integration Bandwidth for the offsets. Each resolution bandwidth in the list corresponds to an offset frequency in the list defined by [:SENSe]:ACP:OFFSet[n][:OUTer]:LIST[:FREQuency].

Enter each value individually by selecting the desired offset, then enter the Offset Integration Bandwidth.

You can turn off (not use) specific offsets with the [:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:STATe command.

Remote Command	[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth[:INTegration] <freq>, <freq>, <freq>, <freq>, <freq>, <freq> [:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth[:INTegration]?
Example	:ACP:OFFS2:LIST:BAND 2MHz,2MHz,2MHz,2MHz,2MHz,2MHz :ACP:OFFS2:LIST:BAND?
Notes	Offset subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Some modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored When setting these values remotely, the position in the list sent corresponds to the offset. Missing values are not permitted i.e. if you want to change the second value, you must send all values up to it. Subsequent values will remain unchanged, unless the number of values sent is greater than the number of carriers, then subsequent values will be ignored
Couplings	Changing Integ BW might affect the Span. See Span section for details
Preset	SA: 2 MHz, 2 MHz, 2 MHz, 2 MHz, 2 MHz, 2 MHz|2 MHz, 2 MHz, 2 MHz, 2 MHz, 2 MHz, 2 MHz WCDMA: 3.84 MHz, 3.84 MHz, 3.84 MHz, 3.84 MHz, 3.84 MHz, 3.84 MHz|3.84 MHz, 3.84 MHz, 3.84 MHz, 3.84 MHz, 3.84 MHz, 3.84 MHz LTE, LTETDD, LTEAFDD,LTEATDD, MSR: 4.515 MHz, 4.515 MHz, 4.515 MHz, 4.515 MHz, 4.515 MHz, 4.515 MHz|4.5 MHz, 4.5 MHz, 4.5 MHz, 4.5 MHz, 4.5 MHz, 4.5 MHz 5G NR: 98.28 MHz, 98.28 MHz, 98.28 MHz, 98.28 MHz, 98.28 MHz, 98.28 MHz|98.31 MHz, 98.31 MHz, 98.31 MHz, 98.31 MHz, 98.31 MHz, 98.31 MHz Radio Test: 25 kHz, 25 kHz, 25 kHz, 25 kHz, 25 kHz, 25 kHz
State Saved	Saved in instrument state
Min/Max	10 Hz/Depends on instrument maximum frequency. Same as the Max Span on Swept SA Measurement
Backwards Compatibility SCPI	[:SENSe]:ACPower:OFFSet[1]|2:LIST:BWIDth[:INTegration] [:SENSe]:ACPR:OFFSet[1]|2:LIST:BANDwidth [:SENSe]:ACPR:OFFSet[1]|2:LIST:BWIDth (Power Suite, WCDMA) [:SENSe]:MCPower:OFFSet[1]|2:LIST:BANDwidth[:INTegration] [:SENSe]:MCPower:OFFSet[1]|2:LIST:BWIDth[:INTegration]

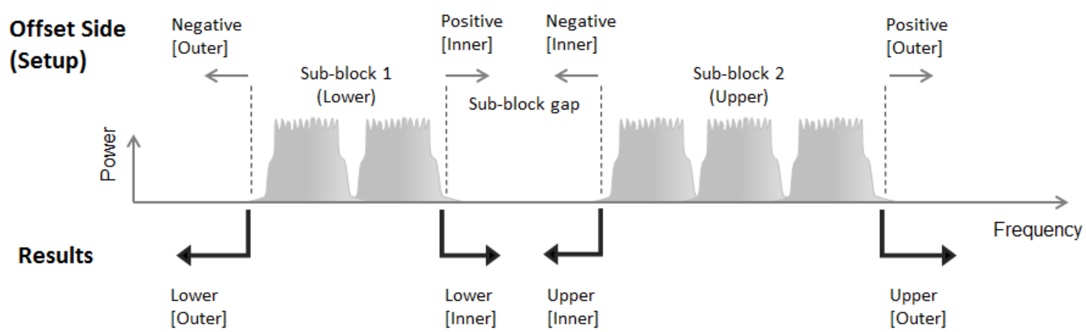
Offset Side

Specifies which offset side to measure.

Enables you to turn off (not use) specific offsetswith [:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:SIDE.

NEGative	Negative (lower) sideband only
BOTH	Both of the negative (lower) and positive (upper) sidebands
POSitive	Positive (upper) sideband only

The figure below shows the relation between the negative/positive offset side setups and the upper/lower results in the MSR and LTE-Advanced FDD/TDD Mode.



Remote Command	[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:SIDE NEGative | BOTH | POSitive,NEGative | BOTH | POSitive,NEGative | BOTH | POSitive,NEGative | BOTH | POSitive,NEGative | BOTH | POSitive,NEGative | BOTH | POSitive [:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:SIDE?
Example	:ACP:OFFS:LIST:SIDE BOTH :ACP:OFFS:LIST:SIDE?
Notes	OFFSet1 is for BTS, 2 for MS. Default is BTS Some modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored If you set POS or NEG in an offset, result of the inactive side returns -999
Preset	BOTH, BOTH, BOTH, BOTH, BOTH, BOTH | BOTH, BOTH, BOTH, BOTH, BOTH, BOTH
State Saved	Saved in instrument state
Range	NEGative|BOTH|POSitive

Method

Allows you to turn RRC filtering of each offset on or off. The value (roll off) for the filter will be set to the value of the **Filter Alpha** parameter.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:FILTer[:RRC][:STATe] ON | OFF | 1 | 0, ON | OFF | 1 | 0, ON | OFF | 1 | 0, ON | OFF | 1 | 0, ON | OFF | 1 | 0, ON | OFF | 1 | 0` `[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:FILTer[:RRC][:STATe]?`
Example	`:ACP:OFFS:LIST:FILT 1,0,0` `:ACP:OFFS:LIST:FILT?`
Notes	`1|ON` = RRC Weighted, `0|OFF` = Integ BW Some modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored
Preset	see table below
State Saved	Saved in instrument state
Range	Integ BW|RRC Weighted

Mode	Values
SA	0, 0, 0, 0, 0, 0|0, 0, 0, 0, 0,0
WCDMA	1, 1, 1, 1, 1, 1|1, 1, 1, 1, 1, 1
LTE, LTETDD, LTEAFDD, LTEATDD, 5G NR, MSR	0, 0, 0, 0, 0, 0|0, 0, 0, 0, 0,0
Radio Test	0, 0, 0, 0, 0, 0

Filter Alpha

Sets the alpha value for the RRC Filter for each offset.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:FILTer:ALPHa <real>, <real>, <real>, <real>, <real>, <real>` `[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:FILTer:ALPHa?`
Example	`:ACP:OFFS:LIST:FILT:ALPH 0.5,0.5,0.5,0.5,0.5,0.5` `:ACP:OFFS:LIST:FILT:ALPH?`
Notes	Some modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored
Preset	see table below
State Saved	Saved in instrument state

WCDMA	0.22,0.22,0.22,0.22,0.22,0.22|0.22,0.22,0.22,0.22,0.22,0.22
LTE, LTETDD, LTEAFDD, LTEATDD, 5G NR, MSR	0.22,0.22,0.22,0.22,0.22,0.22|0.22,0.22,0.22,0.22,0.22,0.22

Advanced (Offset)

This control on the **Offset** dialog page opens up another menu page which lets you set advanced properties of the Inner Offset, such as Res BW, Video BW, and Filter parameters.

Offset Freq

This column is the same as on the main **Offset** menu page. See "Offset Freq" on page 1189

Res BW

Sets the resolution bandwidth. If an unavailable bandwidth is entered with the numeric keypad, the closest available bandwidth is selected.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:RESolution:AUTO ON	OFF	1	0, ON	OFF	1	0, ON	OFF	1	0, ON	OFF	1	0, ON	OFF	1	0, ON	OFF	1	0` `[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:RESolution:AUTO?`

Example	`:ACP:OFFS2:LIST:BAND:RES 220kHz,220kHz,220kHz,220kHz,220kHz,220kHz`
	`:ACP:OFFS2:LIST:BAND:RES?`
	`:ACP:OFFS2:LIST:BAND:RES:AUTO 1,1,1,1,1,1`
	`:ACP:OFFS2:LIST:BAND:RES:AUTO?`

Notes	Offset subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Some modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored
Dependencies	When **Meas Method** is RBW, FAST or Fast Power, this cell is grayed out and disabled. If the cell is pressed, an advisory message is generated. If the equivalent SCPI remote command is sent, a "Setting conflict" warning is generated
Couplings	When Res BW Mode is AUTO, this value is exactly same as Res BW under BW key. When you change this value, Res BW Mode is also changed to Man
Preset	SA: 220 kHz, 220 kHz, 220 kHz, 220 kHz, 220 kHz, 220 kHz WCDMA: 100 kHz, 100 kHz, 100 kHz, 100 kHz, 100 kHz, 100 kHz LTE, LTETDD, LTEAFDD, LTEATDD, 5G NR, MSR: 100 kHz, 100 kHz, 100 kHz, 100 kHz, 100 kHz, 100 kHz|100 kHz, 100 kHz, 100 kHz, 100 kHz, 100 kHz, 100 kHz 1, 1, 1, 1, 1, 1
State Saved	Saved in instrument state

	Yes
Min/Max	1 Hz/8 MHz
Backwards Compatibility SCPI	[:SENSe]:ACPower:OFFSet[1]|2:LIST:BWIDth:RESolution [:SENSe]:ACPower:OFFSet[1]|2:LIST:BWIDth:RESolution:AUTO

Video BW

Enables you to change the instrument post-detection filter (VBW).

Remote Command	[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:VIDeo:AUTO OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1 [:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:VIDeo:AUTO?
Example	:ACP:OFFS2:LIST:BAND:VID 5MHz,5MHz,5MHz,5MHz,5MHz,5MHz :ACP:OFFS2:LIST:BAND:VID? :ACP:OFFS2:LIST:BAND:VID:AUTO 0,0,0,0,1,1 :ACP:OFFS2:LIST:BAND:VID:AUTO?
Notes	The values shown in this table reflect the conditions after a Mode Preset Offset subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Some modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored
Dependencies	When Meas Method is RBW, FAST or Fast Power, this cell is grayed out and disabled. If the cell is pressed, an advisory message is generated. If the equivalent remote command is sent, a "Setting conflict" warning is generated
Preset	SA: 22 kHz, 22 kHz, 22 kHz, 22 kHz, 22 kHz, 22 kHz WCDMA: 1 MHz, 1 MHz, 1 MHz, 1 MHz, 1 MHz, 1 MHz LTE, LTETDD, LTEAFDD, LTEATDD, 5G NR, MSR: 1 MHz, 1 MHz, 1 MHz, 1 MHz, 1 MHz, 1 MHz ON, ON, ON, ON, ON, ON
State Saved	Saved in instrument state Yes
Min/Max	1 Hz/50 MHz
Backwards Compatibility SCPI	[:SENSe]:ACPower:OFFSet[1]|2:LIST:BWIDth:VIDeo [:SENSe]:ACPower:OFFSet[1]|2:LIST:BWIDth:VIDeo:AUTO

Filter Type

Selects the type of bandwidth filter that is used.

Remote Command	[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:SHAPe GAUSsian | FLATtop, GAUSsian | FLATtop, GAUSsian | FLATtop, GAUSsian | FLATtop,

	`GAUSsian | FLATtop, GAUSsian | FLATtop` `[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:SHAPe?`
Example	`:ACP:OFFS2:LIST:BAND:SHAP FLAT,GAUS,GAUS,GAUS,GAUS,GAUS` `:ACP:OFFS2:LIST:BAND:SHAP?`
Notes	Offset subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Some modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored
Dependencies	When Res BW Mode for the offset is Auto, this cell is grayed out and disabled. Since Res BW Mode for the offset is preset to Auto on changing Meas Method to RBW, FAST or Fast Power, this cell is grayed out and disabled too. If the cell is pressed, an advisory message is generated. If the equivalent remote command is sent, a "Setting conflict" warning is generated
Preset	`GAUSsian, GAUSsian, GAUSsian, GAUSsian, GAUSsian, GAUSsian`
State Saved	Saved in instrument state
Range	`GAUSsian|FLATtop`
Backwards Compatibility SCPI	`[:SENSe]:ACPower:OFFSet[1]|2:LIST:BWIDth:SHAPe`

Filter BW

Selects a Gaussian filter based on its –3 dB (Normal) bandwidth or its –6 dB bandwidth.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:TYPE DB3 | DB6, DB3 | DB6, DB3 | DB6, DB3 | DB6, DB3 | DB6, DB3 | DB6` `[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:TYPE?`
Example	`:ACP:OFFS2:LIST:BAND:TYPE DB3,DB3,DB3,DB3,DB3,DB3` `:ACP:OFFS2:LIST:BAND:TYPE?`
Notes	Offset subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Some modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored
Dependencies	When Filter Type if Flattop or Res BW Mode for the offset is Auto, this cell is grayed out and disabled. Since Res BW Mode for the offset is preset to Auto on changing Meas Method to RBW, FAST or Fast Power, this cell is grayed out and disabled too. If the cell is pressed, an advisory message is generated. If the equivalent remote command is sent, a "Setting conflict" warning is generated
Preset	`DB3, DB3, DB3, DB3, DB3, DB3`

Range	–3 dB (Normal)| –6 dB
Backwards Compatibility SCPI	`[:SENSe]:ACPower:OFFSet[1]|2:LIST:BWIDth:TYPE`

Limits

Lets you configure the limits that are used to determine whether the offset regions PASS or FAIL the limit test.

Limit Test

This checkbox is the same as the Limit test control on the **Meas Setup, Settings** tab. See "Limit Test" on page 1159.

Offset Freq

This column is the same as the **Offset Freq** column on the **Offset** index tab, see "Offset Freq" on page 1189.

Abs Limit

Enters an absolute limit value, which sets the absolute amplitude levels to test against for each of the custom offsets. The list must contain six (6) entries. If there is more than one offset, the offset closest to the carrier channel is the first one in the list. `[:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:TEST` selects the type of testing to be done at each offset.

You can turn off (not use) specific offsets with the `[:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:STATe` command.

The query returns the six (6) sets of real numbers that are the current absolute amplitude test limits.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:ABSolute <real>, <real>, <real>, <real>, <real>, <real>` `[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:ABSolute?`
Example	`:ACP:OFFS2:LIST:ABS -10,-10,-10,-10,-10,-10` `:ACP:OFFS2:LIST:ABS?`
Notes	Offset subopcode. 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Some modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored
Preset	SA: 0dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm|0dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm WCDMA: 50 dBm, 50 dBm, 50 dBm, 50 dBm, 50 dBm, 50 dBm|50 dBm, 50 dBm, 50 dBm, 50 dBm, 50 dBm, 50 dBm LTE, LTETDD, LTEAFDD,LTEATDD, MSR: -8.45, -8.45, -8.45, -8.45, -8.45, -8.45|-50.0, -50.0, -50.0, -50.0, -50.0, -50.0 5G NR: 4.92, 4.92, 4.92, 4.92, 4.92, 4.92|-50.0, -50.0, -50.0, -50.0, -50.0, -50.0

Rel Limit (Car)

Enters a relative limit value for the carrier level. This sets the amplitude levels to test against for the specified offsets.

The amplitude level is relative to the carrier amplitude. If multiple offsets are available, the list contains six (6) entries. The offset closest to the carrier channel is the first one in the list.

[:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:TEST selects the type of testing to be done at each offset.

You can turn off (not use) specific offsets with the [:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:STATe command.

The query returns the six (6) sets of real numbers that are the current amplitude test limits, relative to the carrier, for each offset.

Offset[n] n = 1 is base station and n = 2 is mobiles. The default is base station (1).

Remote Command	[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:RCARrier <real>, <real>, <real>, <real>, <real>, <real> [:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:RCARrier?
Example	:ACP:OFFS2:LIST:RCAR 0,0,0,0,0,0 :ACP:OFFS2:LIST:RCAR?
Notes	Offset subopcode. 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Some modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored
Preset	SA: -45, -60, 0, 0, 0, 0|-45, -60, 0, 0, 0, 0 WCDMA: -44.2, -49.2, -49.2, -49.2, -49.2, -49.2|-32.2, -42.2, -42.2, -42.2, -42.2, -42.2 LTE, LTETDD, LTEAFDD,LTEATDD, MSR: -44.2, -44.2, -44.2, -44.2, -44.2, -44.2|-29.2, -29.2, -29.2, -29.2, -29.2, -29.2 5G NR: -43.8, -43.8, -43.8, -43.8, -43.8, -43.8|-29.2, -29.2, -29.2, -29.2, -29.2, -29.2 Radio Test: -60, -60, -60, 0, 0, 0

Min/Max	-150.0/50.0
Backwards Compatibility SCPI	:CALCulate:MCPower:OFFSet:LIST:LIMit:POSitive[:UPPer]:DATA (Power Suite)

Negative Offset Limit(SCPI only)

Enables you to set the upper limit for the lower segment of the specified offset pair.

Remote Command	:CALCulate:ACPower:OFFSet[1]|2[:OUTer]:LIST:LIMit:NEGative[:UPPer-]:DATA <real>, <real>, <real>, <real>, <real>, <real> :CALCulate:ACPower:OFFSet[1]|2[:OUTer]:LIST:LIMit:NEGative[:UPPer-]:DATA?
Example	:CALC:ACP:OFFS:LIST:LIM:NEG:DATA 0,0,0,0,0,0 :CALC:ACP:OFFS:LIST:LIM:NEG:DATA?
Notes	Some modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored

Preset	SA: -45, -60, 0, 0, 0, 0|-45, -60, 0, 0, 0, 0 WCDMA: -44.2, -49.2, -49.2, -49.2, -49.2, -49.2|-32.2, -42.2, -42.2, -42.2, -42.2, -42.2 LTE, LTETDD, LTEAFDD,LTEATDD, MSR: -44.2, -44.2, -44.2, -44.2, -44.2, -44.2|-29.2, -29.2, -29.2, -29.2, -29.2, -29.2 5G NR: -43.8, -43.8, -43.8, -43.8, -43.8, -43.8|-29.2, -29.2, -29.2, -29.2, -29.2, -29.2 Radio Test: -60, -60, -60, 0, 0, 0
State Saved	Saved in instrument state
Min/Max	-150.0/50.0
Backwards Compatibility SCPI	`:CALCulate:MCPower:OFFSet:LIST:LIMit:NEGative[:UPPer]:DATA` (Power Suite, WCDMA)

Rel Limit (PSD)

Enters a relative limit value for the level of the power spectral density. This sets the amplitude levels to test against for any custom offsets. The amplitude level is relative to the power spectral density. If multiple offsets are available, the list contains six (6) entries. The offset closest to the carrier channel is the first one in the list.

`[:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:TEST` selects the type of testing to be done at each offset.

You can turn off (not use) specific offsets with the `[:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:STATe` command.

The query returns the six (6) sets of real numbers that are the current amplitude test limits, relative to the power spectral density, for each offset.

Offset[n] n = 1 is base station and n = 2 is mobiles. The default is base station (1).

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:RPSDensity <rel_ampl>, <rel_ampl>, <rel_ampl>, <rel_ampl>, <rel_ampl>, <rel_ampl>` `[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:RPSDensity?`
Example	`:ACP:OFFS2:LIST:RPSD 10,10,10,10,10,10` `:ACP:OFFS2:LIST:RPSD?`
Notes	Offset subopcode. 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Some modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored
Preset	SA: -28.87 dB, -43.87 dB, 0 dB, 0 dB, 0 dB, 0 dB|-28.87 dB, -43.87 dB, 0 dB, 0 dB, 0 dB, 0 dB WCDMA: -44.2 dB, -49.2 dB, -49.2 dB, -49.2 dB, -49.2 dB, -49.2 dB|-32.2 dB, -42.2 dB, -42.2 dB, -42.2 dB, -42.2 dB, -42.2 dB LTE, LTETDD, LTEAFDD,LTEATDD, 5G NR, MSR: 0, 0, 0, 0, 0, 0|0, 0, 0, 0, 0, 0 Radio Test: -60, -60, -60, 0, 0, 0

State Saved	Saved in instrument state
Min/Max	-150.0 dB/50.0 dB

Fail Mask

Accesses a menu that enables you to select one of the logics for the fail conditions between the measurement results and the test limits. The setting defines the type of testing to be done at any custom offset frequencies. The measured powers are tested against the absolute values defined with `[:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:ABSolute`, or the relative values defined with [:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:RPSDensity and `[:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:RCARrier`.

You can turn off (not use) specific offsets with the `[:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:STATe` command.

Absolute	`ABSolute`	Fail is shown if one of the absolute ACP measurement results is larger than the limit for **Abs Limit**
Relative	`RELative`	Fail is shown if one of the relative ACP measurement results is larger than the limit for **Rel Lim (Car)** or **Rel Lim (PSD)**
Abs AND Rel	`AND`	Fail is shown if one of the absolute ACP measurement results is larger than the limit for **Abs Limit***and* one of the relative ACP measurement results is larger than the limit for **Rel Lim (Car)** or **Rel Lim (PSD)**
Abs OR Rel	`OR`	Fail is shown if one of the absolute ACP measurement results is larger than the limit for **Abs Limit***or* one of the relative ACP measurement results is larger than the limit for **Rel Lim (Car)** or **Rel Lim (PSD)**

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:TEST ABSolute | AND | OR | RELative, ABSolute | AND | OR | RELative, ABSolute | AND | OR | RELative, ABSolute | AND | OR | RELative, ABSolute | AND | OR | RELative, ABSolute | AND | OR | RELative` `[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:TEST?`
Example	`:ACP:OFFS2:LIST:TEST ABS,ABS,ABS,ABS,ABS,ABS` `:ACP:OFFS2:LIST:TEST?`
Notes	Offset subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Some modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored
Preset	SA, WCDMA: REL, REL, REL, REL, REL, REL|REL, REL, REL, REL, REL, REL LTE, LTETDD, LTEAFDD,LTEATDD, 5G NR, MSR: AND, AND, AND, AND, AND, AND|AND, AND, AND, AND, AND, AND Radio Test: REL, REL, REL, REL, REL, REL

State Saved	Saved in instrument state
Range	Absolute|Relative|Abs AND Rel (fail if both fail)|Abs OR Rel (fail if either fails)
Backwards Compatibility SCPI	`[:SENSe]:MCPower:OFFSet[1]|2:LIST:TEST`

Offset Frequency Define

This control allows you to select “Offset” definition:

`CTOCenter`	From the lowermost carrier center frequency (for lower offset), the uppermost carrier center frequency (for upper offset) to the center frequency of each Offset Integ BW
`CTOEdge`	From the lowermost carrier center frequency (for lower offset), the uppermost carrier center frequency (for upper offset) to the closest edge frequency of each Offset Integ BW
`ETOCenter`	From the lowermost carrier center frequency - spacing of this carrier /2 (for lower offset), the uppermost carrier center frequency + spacing of this carrier /2 (for upper offset) to the center frequency of each Offset Integ BW
`ETOEdge`	From the lowermost carrier center frequency - spacing of this carrier /2 (for lower offset), the uppermost carrier center frequency + spacing of this carrier /2 (for upper offset) to the closest edge frequency of each Offset Integ BW
`STOCenter`	From either the lower or upper sub-block edge frequency to the center frequency of each Offset Integ BW
`STOEdge`	From either the lower or upper sub-block edge frequency to the closest edge frequency of each Offset Integ BW
`SCTOCenter` 5G NR only	From the center frequency of sub-block** to the center frequency of each Offset Integ BW

** sub-block (bandwidth) = $BW_{channel,block}$ which is defined in each 3GPP standard, regardless of “Measure Carrier” for the uppermost and the lowermost carriers being Enabled or Disabled. When the Number of Component Carrier within each sub-block = 1, sub-block (bandwidth) = $BW_{channel}$ = 2 x $F_{offset,RAT}$.

See "Diagrams for Offset Freq Define" on page 1166"Diagrams for Offset Freq Define" on page 1188

Mode: MSR, LTEAFDD, LTEATDD

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:TYPE CTOCenter | CTOEdge | ETOCenter | ETOEdge | STOCenter | STOEdge` `[:SENSe]:ACPower:OFFSet[1]|2:INNer:TYPE?`

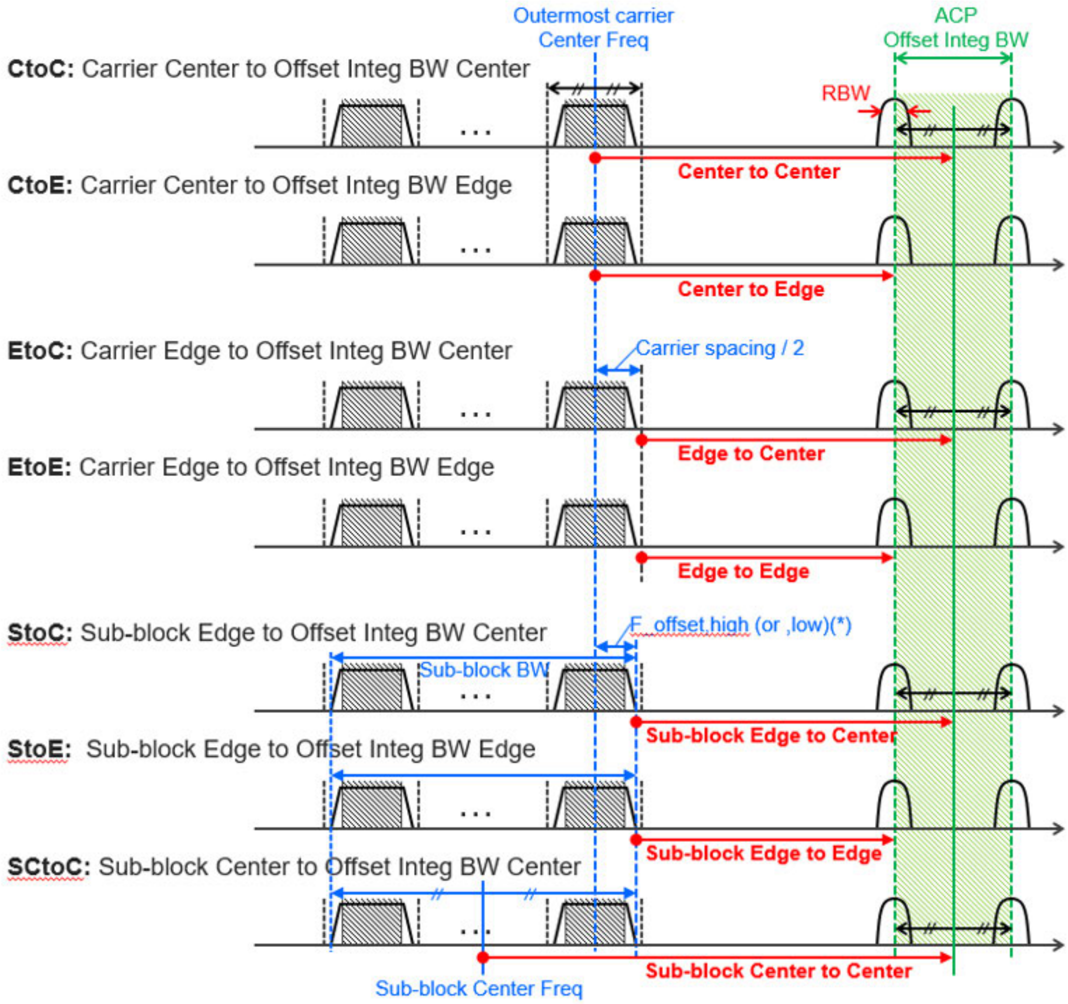
Diagrams for Offset Freq Define



Note:

- *Sub-block Edge and Outermost Carrier Edge in the Sub-block are not always same. e.g.) 5G NR (3GPP) defines BW_channel,block which calculates F_offset,high and F_offset,low asymmetrically with SCS shift.*
  (*) For MSR, F_offset,high (or ,low) = F_offset,RAT,high (or ,low)

Offset Freq

This parameter determines the frequency difference between the center of the main channel and the center of the carrier. When set to Offset to Edge, this parameter determines the frequency difference between the center of the main channel and the near edge of the offset.

Each **Offset Freq** state value is entered individually by selecting the desired carrier. Use the Enabled checkbox to turn the Offset Freq State on and off.

The list contains up to six (6) entries, depending on the mode selected, for offset frequencies. Each offset frequency in the list corresponds to a reference bandwidth in the bandwidth list.

An offset frequency of zero turns the display of the measurement for that offset off, but the measurement is still made and reported. You can turn off (not use) specific offsets with the [:SENSe]:ACP:OFFSet[n]:INNer:LIST:STATe command.

Turning the offset off has the same effect as setting the frequency of the offset to 0 Hz and will cause it to be removed from the results screen.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:STATe OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1` `[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:STATe?`

Example	`:ACP:OFFS1:INN:LIST 0,0,0,0,0,0`
	`:ACP:OFFS1:INN:LIST?`
	`:ACP:OFFS2:INN:LIST:STAT 1,1,0,0,0,0`
	`:ACP:OFFS2:INN:LIST:STAT?`

Notes	When setting these values remotely, the position in the list sent corresponds to the offset. Missing values are not permitted, unless the number of values sent is greater than the number of carriers, then subsequent values will be ignored Offset subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS
Couplings	Changing Offset Frequency might affect the Span. See the Span control section for details
Preset	2.5MHz,7.5MHz,0,0,0,0|2.5MHz,7.5MHz,0,0,0,0 5G NR: 10 MHz, 30 MHz, 0 Hz, 0 Hz, 0 Hz, 0 Hz|100 MHz, 200 MHz, 0 Hz, 0 Hz, 0 Hz, 0 Hz `ON, ON, OFF, OFF, OFF, OFF | ON, OFF, OFF, OFF, OFF, OFF`
State Saved	Saved in instrument state Yes
Min/Max	0 Hz/Depends on instrument maximum frequency. Same as the Max Span of Swept SA Measurement

Integ BW

Sets the Integration Bandwidth for the offsets. Each resolution bandwidth in the list corresponds to an offset frequency in the list defined by `[:SENSe]:ACP:OFFSet[n]:INNer:LIST[:FREQuency]`.

Enter each value individually by selecting the desired offset on the **Offset** menu key using the up down arrows, the knob, or the numeric keypad, then enter the Offset Integration Bandwidth using the **Offset Integration Bandwidth** menu key.

You can turn off (not use) specific offsets with the `[:SENSe]:ACP:OFFSet[n]:INNer:LIST:STATe` command.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth[:INTegration] <freq>, <freq>, <freq>, <freq>, <freq>, <freq>`

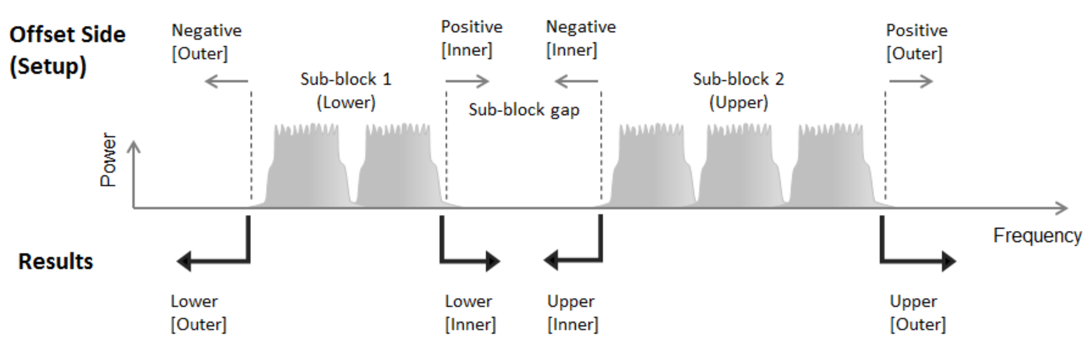
	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth[:INTegration]?`
Example	`:ACP:OFFS2:INN:LIST:BAND 2MHz,2MHz,2MHz,2MHz,2MHz,2MHz` `:ACP:OFFS2:INN:LIST:BAND?`
Notes	When setting these values remotely, the position in the list sent corresponds to the offset. Missing values are not permitted i.e. if you want to change the second value you must send all values up to it. Subsequent values will remain unchanged Offset subopcode. 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS
Couplings	Changing Integ BW might affect the Span. See Span section for details
Preset	LTEAFDD:3.84MHz, 3.84MHz, 3.84MHz, 3.84MHz, 3.84MHz, 3.84MHz|3.84MHz, 3.84MHz, 3.84MHz, 3.84MHz, 3.84MHz, 3.84MHz MSR, LTEATDD: 4.515MHz, 4.515MHz, 4.515MHz, 4.515MHz, 4.515MHz, 4.515MHz|4.5MHz, 4.5MHz, 4.5MHz, 4.5MHz, 4.5MHz, 4.5MHz 5G NR: 19.08 MHz, 19.08 MHz, 19.08 MHz, 19.08 MHz, 19.08 MHz, 19.08 MHz|98.31 MHz, 98.31 MHz, 98.31 MHz, 98.31 MHz, 98.31 MHz, 98.31 MHz
State Saved	Saved in instrument state
Min/Max	10 Hz/Depends on instrument maximum frequency. Same as the Max Span on Swept SA Measurement

Offset Side

Enables you to turn off (not use) specific offsets with `[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:SIDE`.

- `NEGative` - The upper side in the sub-block gap only (i.e. negative sideband of the upper sub-block) is enabled
- `BOTH` - Both sides in the sub-block gap are enabled
- `POSitive` - The lower side in the sub-block gap only (i.e. positive sideband of the lower sub-block) is enabled

The figure below shows the relation between the negative/positive offset side setups and the upper/lower results in the MSR and LTE-Advanced FDD/TDD Mode.



Remote	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:SIDE NEGative	BOTH |`

Command	POSitive,NEGative | BOTH | POSitive,NEGative | BOTH | POSitive,NEGative | BOTH | POSitive,NEGative | BOTH | POSitive,NEGative | BOTH | POSitive [:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:SIDE?
Example	:ACP:OFFS:INN:LIST:SIDE BOTH :ACP:OFFS:INN:LIST:SIDE?
Notes	OFFSet1 is for BTS, 2 for MS. Default is BTS If you set POS or NEG in an offset, result of the inactive side returns -999
Preset	BOTH, BOTH, BOTH, BOTH, BOTH, BOTH | BOTH, BOTH, BOTH, BOTH, BOTH, BOTH
State Saved	Saved in instrument state
Range	NEGative|BOTH|POSitive

Method

Enables you to turn RRC filtering of each offset on or off. The value (roll off) for the filter will be set to the value of the Filter Alpha parameter.

Remote Command	[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:FILTer[:RRC][:STATe] ON | OFF | 1 | 0, ON | OFF | 1 | 0, ON | OFF | 1 | 0, ON | OFF | 1 | 0, ON | OFF | 1 | 0, ON | OFF | 1 | 0 [:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:FILTer[:RRC][:STATe]?
Example	:ACP:OFFS:INN:LIST:FILT 1,0,0 :ACP:OFFS:INN:LIST:FILT?
Notes	1|ON = RRC Weighted, 0|OFF = Integ BW
Preset	LTEAFDD: 1,1,1,1,1,1|1,1,1,1,1,1 MSR, LTEATDD, 5G NR: 0,0,0,0,0,0|0,0,0,0,0,0
State Saved	Saved in instrument state
Range	Integ BW|RRC Weighted

Filter Alpha

Sets the alpha value for the RRC Filter for each offset.

Remote Command	[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:FILTer:ALPHa <real>, <real>, <real>, <real>, <real>, <real> [:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:FILTer:ALPHa?
Example	:ACP:OFFS:INN:LIST:FILT:ALPH 0.5,0.5,0.5,0.5,0.5,0.5 :ACP:OFFS:INN:LIST:FILT:ALPH?
Preset	0.22,0.22,0.22,0.22,0.22,0.22|0.22,0.22,0.22,0.22,0.22,0.22

State Saved	Saved in instrument state
Min/Max	0.01/1.00

Offset Freq

This column is the same as on the main **Inner Offset** menu tab. See"Offset Freq" on page 1204

Res BW

Sets the resolution bandwidth. If an unavailable bandwidth is entered with the numeric keypad, the closest available bandwidth is selected.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:RESolution:AUTO ON | OFF | 1 | 0, ON | OFF | 1 | 0, ON | OFF | 1 | 0, ON | OFF | 1 | 0, ON | OFF | 1 | 0, ON | OFF | 1 | 0` `[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:RESolution:AUTO?`

Example	`:ACP:OFFS2:INN:LIST:BAND:RES 220kHz,220kHz,220kHz,220kHz,220kHz,220kHz`
	`:ACP:OFFS2:INN:LIST:BAND:RES?`
	`:ACP:OFFS2:INN:LIST:BAND:RES:AUTO 1,1,1,1,1,1`
	`:ACP:OFFS2:INN:LIST:BAND:RES:AUTO?`

Notes	Offset subopcode. 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS
Dependencies	When **Meas Method** is RBW, FAST or Fast Power, this control is grayed out and disabled. If the cell is pressed, an advisory message is generated. If the equivalent SCPI remote command is sent, a "Setting conflict" warning is generated
Couplings	When Res BW Mode is AUTO, this value is exactly the same as Res BW under the **BW** key. When you change this value, Res BW Mode is also changed to Man
Preset	100 kHz,100 kHz,100 kHz,100k Hz,100 kHz|100 kHz,100 kHz,100 kHz,100 kHz,100 kHz,100 kHz 1, 1, 1, 1, 1, 1
State Saved	Saved in instrument state Yes
Min/Max	1 Hz/8 MHz

Video BW

Enables you to change the instrument post-detection filter (VBW).

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:VIDeo:AUTO OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF |`

	ON | 0 | 1, OFF | ON | 0 | 1 [:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:VIDeo:AUTO?
Example	:ACP:OFFS2:INN:LIST:BAND:VID 5MHz,5MHz,5MHz,5MHz,5MHz,5MHz :ACP:OFFS2:INN:LIST:BAND:VID? :ACP:OFFS2:INN:LIST:BAND:VID:AUTO 0,0,0,0,1,1 :ACP:OFFS2:INN:LIST:BAND:VID:AUTO?
Notes	The values shown in this table reflect the conditions after a Mode Preset Offset subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS
Dependencies	When **Meas Method** is RBW, FAST or Fast Power, this cell is grayed-out and disabled. If the cell is pressed, an advisory message is generated. If the equivalent remote command is sent, a "Setting conflict" warning is generated
Preset	1 MHz,1 MHz,1 MHz,1 MHz,1 MHz,1 MHz ON, ON, ON, ON, ON, ON
State Saved	Yes Yes
Min/Max	1 Hz/50 MHz

Filter Type

Selects the type of bandwidth filter that is used.

Remote Command	[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:SHAPe GAUSsian | FLATtop, GAUSsian | FLATtop, GAUSsian | FLATtop, GAUSsian | FLATtop, GAUSsian | FLATtop, GAUSsian | FLATtop [:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:SHAPe?
Example	:ACP:OFFS2:INN:LIST:BAND:SHAP FLAT,GAUS,GAUS,GAUS,GAUS,GAUS :ACP:OFFS2:INN:LIST:BAND:SHAP?
Notes	Offset subopcode: 1 for BTS (Downlink), 2 for MS (Uplink)
Dependencies	When Res BW Mode for the offset is Auto, this cell is grayed-out and disabled. Since Res BW Mode for the offset is preset to Auto on changing **Meas Method** to RBW, FAST or Fast Power, this cell is grayed-out and disabled. If the cell is pressed, an advisory message is generated. If the equivalent remote command is sent, a "Setting conflict" warning is generated
Preset	GAUSsian, GAUSsian, GAUSsian, GAUSsian, GAUSsian, GAUSsian
State Saved	Saved in instrument state
Range	GAUSsian|FLATtop

Filter BW

Selects a Gaussian filter based on its –3 dB (Normal) bandwidth or its –6 dB bandwidth.

Remote Command	[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:TYPE DB3 | DB6, DB3 | DB6, DB3 | DB6, DB3 | DB6, DB3 | DB6, DB3 | DB6 [:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:TYPE?
Example	:ACP:OFFS2:INN:LIST:BAND:TYPE DB3,DB3,DB3,DB3,DB3,DB3 :ACP:OFFS2:INN:LIST:BAND:TYPE?
Notes	Offset subopcode: 1 for BTS (Downlink), 2 for MS (Uplink)
Dependencies	When Filter Type if FLATtop or Res BW Mode for the offset is Auto, this cell is grayed-out and disabled. Since Res BW Mode for the offset is preset to Auto on changing **Meas Method** to RBW, FAST or Fast Power, this cell is grayed-out and disabled too. If the cell is pressed, an advisory message is generated. If the equivalent remote command is sent, a "Setting conflict" warning is generated
Preset	DB3, DB3, DB3, DB3, DB3, DB3
State Saved	Saved in instrument state
Range	–3 dB (Normal)| –6 dB

Power Ref Type

Enables you to set reference types of inner offsets.

CUMulative	Cumulated power of the upper and lower sub-block carriers is the reference level. This selection is effective only when one of the following "Power Ref" on page 1217 values is selected: Left & Right Carriers — LRCarriers Max Power Carrier in Sub-block — MPCSubblock Min Power Carrier in Sub-block — MINSubbloc Left & Right Sub-blocks — LRSubblocks Manual — MANual When one of the other **Power Ref** values is selected, carrier powers are not cumulated and the reference level is equivalent to Normal
NORMal	Power of specified carrier or the manual reference level is the reference level

Remote Command	[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:PREFerence CUMulative | NORMal, CUMulative | NORMal, CUMulative | NORMal, CUMulative | NORMal, CUMulative | NORMal, CUMulative | NORMal [:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:PREFerence?
Example	:ACP:OFFS:INN:LIST:PREF CUM,CUM,NORM,NORM,NORM,NORM :ACP:OFFS:INN:LIST:PREF?
Preset	NORMal, NORMal, NORMal, NORMal, NORMal, NORMal
State Saved	Saved in instrument state
Range	CUMulative|NORMal

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:PREFerence:AUTO OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1` `[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:PREFerence:AUTO?`
Example	`:ACP:OFFS:INN:LIST:PREF:AUTO OFF,OFF,OFF,OFF,OFF,OFF` `:ACP:OFFS:INN:LIST:PREF:AUTO?`
Dependencies	This is available only in LTE/LTE-Advanced FDD/TDD and 5G NR ACP measurement

Couplings

When in the LTE-Advanced FDD/TDD mode, the inner power ref type is set automatically when the power ref type state is auto according to the scopes of the sub-block gap in the following table

Sub-block Gap	Inner ACP offset	Power Ref Type
Wgap <5MHz	1st (2.5MHz)	Normal
	2nd (7.5MHz)	Normal
5MHz≤ Wgap <10MHz	1st (2.5MHz)	Cumulative
	2nd (7.5MHz)	Normal
10MHz≤ Wgap <15MHz	1st (2.5MHz)	Cumulative
	2nd (7.5MHz)	Cumulative
15MHz≤ Wgap <20MHz	1st (2.5MHz)	Normal
	2nd (7.5MHz)	Cumulative
20MHz≤ Wgap	1st (2.5MHz)	Normal
	2nd (7.5MHz)	Normal

When in the 5G NR mode, Power Ref Type “Auto” sets the power reference type of inner-ACLR offset automatically.

Downlink: “Cumulative” or “Normal” is selected accordingly when the inner-offsets are configured to meet the test requirements as follows:

FR1, 3GPP TS 38.141-1 v16.5.0 (2020-09) Section 6.6.3.5.3 BS type 1-C:

- Table 6.6.3.5.2-3: Base Station ACLR limit in non-contiguous spectrum or multiple bands
- Table 6.6.3.5.2-4: Base station CACLR limit

FR2, 3GPP TS 38.141-2 v16.5.0 (2020-09) Section 6.7.3.5.3 BS type 2-O:

- Table 6.7.3.5.2-3: BS type 2-O ACLR limit in non-contiguous spectrum
- Table 6.7.3.5.2-4: BS type 2-O CACLR limit in non-contiguous spectrum

Uplink: “Normal” is always selected.

Preset	`ON, ON, ON, ON, ON, ON | OFF, OFF, OFF, OFF, OFF, OFF`
State Saved	Saved in instrument state
Range	Auto|Man

Limit Test

This checkbox is the same as the **Limit Test** control on the **Meas Setup**, **Settings** tab. See "Limit Test" on page 1197.

Offset Freq

This column is the same as the **Offset Freq** column on the **Offset** index tab, see "Offset Freq" on page 1189.

Abs Limit

Enters an absolute limit value, which sets the absolute amplitude levels to test against for each of the custom offsets. The list must contain six (6) entries. If there is more than one offset, the offset closest to the carrier channel is the first one in the list. `[:SENSe]:ACP:OFFSet[n]:INNer:LIST:TEST` selects the type of testing to be done at each offset.

You can turn off (not use) specific offsets with the `[:SENSe]:ACP:OFFSet[n]:INNer:LIST:STATe` command.

The query returns the six (6) sets of real numbers that are the current absolute amplitude test limits.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:ABSolute <real>, <real>, <real>, <real>, <real>, <real>` `[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:ABSolute?`
Example	`:ACP:OFFS2:INN:LIST:ABS -10,-10,-10,-10,-10,-10` `:ACP:OFFS2:INN:LIST:ABS?`
Notes	Offset subopcode. 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS
Preset	-8.45, -8.45, -8.45, -8.45, -8.45, -8.45 | -50.0, -50.0, -50.0, -50.0, -50.0, -50.0 5G NR: -2.2, -2.2, -2.2, -2.2, -2.2, -2.2|-50.0,-50.0,-50.0,-50.0,-50.0,-50.0
State Saved	Saved in instrument state
Min/Max	-200.0 dBm/50.0 dBm

Rel Limit (Car)

Enters a relative limit value for the carrier level. This sets the amplitude levels to test against for the specified offsets.

The amplitude level is relative to the carrier amplitude. If multiple offsets are available, the list contains six (6) entries. The offset closest to the carrier channel is the first one in the list. `[:SENSe]:ACP:OFFSet[n]:INNer:LIST:TEST` selects the type of testing to be done at each offset.

You can turn off (not use) specific offsets with the [:SENSe]:ACP:OFFSet[n]:INNer:LIST:STATe command.

The query returns the six (6) sets of real numbers that are the current amplitude test limits, relative to the carrier, for each offset.

Offset[n] n = 1 is base station and n = 2 is mobiles. The default is base station (1).

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:RCARrier <real>, <real>, <real>, <real>, <real>, <real>` `[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:RCARrier?`
Example	`:ACP:OFFS2:INN:LIST:RCAR 0,0,0,0,0,0` `:ACP:OFFS2:INN:LIST:RCAR?`
Notes	Offset subopcode. 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS
Preset	-44.2, -44.2,-44.2,-44.2,-44.2,-44.2|-29.2, -29.2, -29.2, -29.2, -29.2, -29.2 5G NR: -43.8, -43.8, 43.8, -43.8, -43.8, -43.8|-29.2, -29.2, -29.2, -29.2, -29.2, -29.2
State Saved	Saved in instrument state
Min/Max	-150/50.0

Rel Limit (PSD)

Enters a relative limit value for the level of the power spectral density. This sets the amplitude levels to test against for any custom offsets. The amplitude level is relative to the power spectral density. If multiple offsets are available, the list contains six (6) entries. The offset closest to the carrier channel is the first one in the list.

[:SENSe]:ACP:OFFSet[n]:INNer:LIST:TEST selects the type of testing to be done at each offset.

You can turn off (not use) specific offsets with the [:SENSe]:ACP:OFFSet[n]:INNer:LIST:STATe command.

The query returns the six (6) sets of real numbers that are the current amplitude test limits, relative to the power spectral density, for each offset.

Offset[n] n = 1 is base station and n = 2 is mobiles. The default is base station (1).

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:RPSDensity <rel_ampl>, <rel_ampl>, <rel_ampl>, <rel_ampl>, <rel_ampl>, <rel_ampl>` `[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:RPSDensity?`
Example	`:ACP:OFFS2:INN:LIST:RPSD 10,10,10,10,10,10` `:ACP:OFFS2:INN:LIST:RPSD?`
Notes	Offset subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS
Preset	0, 0, 0, 0, 0, 0|0, 0, 0, 0, 0, 0
State Saved	Saved in instrument state
Min/Max	-150.0 dB/50.0 dB

Fail Mask

Accesses a menu that enables you to select one of the logics for the fail conditions between the measurement results and the test limits. The setting defines the type of testing to be done at any custom offset frequencies. The measured powers are tested against the absolute values defined with `[:SENSe]:ACP:OFFSet[n]:INNer:LIST:ABSolute`, or the relative values defined with `[:SENSe]:ACP:OFFSet[n]:INNer:LIST:RPSDensity` and `[:SENSe]:ACP:OFFSet[n]:INNer:LIST:RCARrier`.

You can turn off (not use) specific offsets with the `[:SENSe]:ACP:OFFSet[n]:INNer:LIST:STATe` command.

- Absolute – Fail is shown if one of the absolute ACP measurement results is larger than the limit for Abs Limit
- Relative – Fail is shown if one of the relative ACP measurement results is larger than the limit for Rel Lim (Car) or Rel Lim (PSD)
- Abs AND Rel – Fail is shown if one of the absolute ACP measurement results is larger than the limit for Abs Limit *and* one of the relative ACP measurement results is larger than the limit for Rel Lim (Car) or Rel Lim (PSD)
- Abs OR Rel– Fail is shown if one of the absolute ACP measurement results is larger than the limit for Abs Limit *or* one of the relative ACP measurement results is larger than the limit for Rel Lim (Car) or Rel Lim (PSD)

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:TEST ABSolute	AND	OR	RELative, ABSolute	AND	OR	RELative, ABSolute	AND	OR	RELative, ABSolute	AND	OR	RELative, ABSolute	AND	OR	RELative, ABSolute	AND	OR	RELative` `[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:TEST?`
Example	`:ACP:OFFS2:INN:LIST:TEST ABS,ABS,ABS,ABS,ABS,ABS` `:ACP:OFFS2:INN:LIST:TEST?`
Notes	Offset subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS
Preset	`AND, AND, AND, AND, AND, AND	AND, AND, AND, AND, AND, AND`
State Saved	Saved in instrument state
Range	Absolute|Relative|Abs AND Rel (fail if both fail)|Abs OR Rel (fail if either fails)

Limit Test

Turns limit checking for each offset On or Off. The limits may be specified within the Offset menu, for each offset, both sides of the carrier. For results that fail the limit, a red F is appended. In the Combined view, the bar turns red.

Remote	`:CALCulate:ACPower:LIMit:STATe OFF	ON	0	1`

Command	:CALCulate:ACPower:LIMit:STATe?
Example	:CALC:ACP:LIM:STAT OFF :CALC:ACP:LIM:STAT?
Preset	SA: OFF WCDMA, LTE, LTETDD, LTEAFDD, LTEATDD, 5G NR, MSR: ON
State Saved	Saved in instrument state
Range	ON|OFF
Backwards Compatibility SCPI	[:SENSe]:MCPower:LIMit[:STATe] [:SENSe]:ACPower:LIMit[:STATe]

Spur Avoidance

Because the VXT models M9410A/11A/15A are direct-conversion (zero-IF) receivers, feedthrough leakage from the local oscillator appears as a spurious signal (spur) at the center frequency. The **Spur Avoidance** function is provided to eliminate this spur, at the expense of some measurement speed.

When **Spur Avoidance** is enabled (the default), the instrument uses a software algorithm to remove this spur from the displayed measurement data, but the algorithm only operates under certain conditions. Specifically, it only operates in multiple capture case.

You can disable this function to speed up your measurement by setting Spur Avoidance to “Disabled.”

Note that when Spur Avoidance is not in effect, either because you have disabled it or because you are not in multiple capture, the following warning message appears in the status bar:

`Settings Alert;Spur Avoidance Off`

This is to alert you that measurement accuracy might be impacted by the fact that Spur Avoidance is not in effect.

Remote Command	[:SENSe]:ACPower:SAVoid[:STATe] ON | OFF | 0 | 1 [:SENSe]:ACPower:SAVoid[:STATe]?
Example	:ACP:SAVoid ON :ACP:SAVoid?
Dependencies	This control only appears in VXT models M9410A/11A/15A
Preset	OFF
State Saved	Saved in instrument state
Range	ON|OFF

Meas Setup Summary Table

Lets you view and access many of the parameters in the Meas Setup menus on one screen.

Auto Couple

Immediately puts all Auto/Man functions into Auto. The **Auto Couple** action is confined to the current measurement only. It does not affect other measurements in the mode.

In the Auto state, Auto/Man functions are said to be "coupled", meaning their values change as you make changes to other values in the measurement. This helps ensure accurate measurements and optimum dynamic range. Auto Couple is an immediate action function, and when it is executed, all the Auto/Man controls for the current measurement are set to Auto, and all measurement settings coupled to the Auto/Man parameters are automatically set to their optimal value.

For further details of measurement-specific settings (if any), see "Measurement-Specific Details" on page 1179 below.

Remote Command	`:COUPle ALL`
Example	`:COUP ALL`
Backwards Compatibility SCPI	`:COUPLE ALL | NONE`
Backwards Compatibility Notes	`:COUP:NONE` puts all Auto/Man parameters in manual mode, decoupling all the coupled instrument parameters. It is retained for backwards compatibility and is *not* recommended for making measurements or new designs

All Auto/Man parameter couplings in the measurement are set to Auto. This includes couplings that may be unavailable or grayed-out due to the current state. For example, in the Swept SA measurement, there is no Auto/Man coupling for RBW while in Zero Span. Nonetheless, if **Auto Couple** were executed while in Zero Span it would set RBW to Auto "behind the scenes" so that, on exit from Zero Span, it would be in Auto.

Any Auto/Man selection specific (local) to the other measurements in the current Mode will not be affected by **Auto Couple**. Any functions that are *not* coupled with other instrument parameters, such as ranging or leveling variables, such as "AutoRange" or "AutoScale", will not be affected.

Executing the **Auto Couple** command generates the informational message, "All Auto/Man functions have been set to Auto".

Each parameter, upon being set to Auto, selects and sets the appropriate auto-coupled value based on that parameter's coupling rules. The Dependency Resolver orchestrates the couplings for parameters that are dependent on one or more other parameters. The coupling and dependency rules for each parameter are defined in the chapter describing that parameter.

Executing the **Auto Couple** command *does not* affect markers, marker functions, trace or display attributes, or any other instrument setting other than those specifically mentioned above.

Measurement-Specific Details

TOI

Parameters affected by Auto Couple are:

- Center Frequency Step
- Resolution Bandwidth
- Span/RBW Ratio
- Sweep Time
- Video BandwidthVBW/RBW ratio
- Upper and Lower Tone (set to Sense
-)Zero span measurement Resolution Bandwidth
- Zero span measurement Dwell Time

Harmonics

For Harmonics, these parameters are:

- Resolution Bandwidth
- Fundamental Frequency
- Dwell Time
- Range Table Resolution Bandwidths
- Range Table Dwell Times

Meas Preset

Restores all measurement parameters to their default values.

Remote Command	`:CONFigure:ACPower`

Example	:CONF:ACP
Couplings	Selecting **Meas Preset** restores all measurement parameters to their default values

3.9.8.2 Reference

All ACP measurements are taken relative to a specific carrier frequency, relative to whose power the offset channel power is measured.

The controls on this tab let you specify the reference carrier frequency and other parameters relevant to the reference carrier.

Number of Carriers

Specifies the number of carriers to be measured.

Remote Command	[:SENSe]:ACPower:CARRier[1]|2:COUNt <integer> [:SENSe]:ACPower:CARRier[1]|2:COUNt?
Example	:ACP:CARR:COUN 1 :ACP:CARR:COUN?
Notes	Carrier subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Note that Carrier subopcode 2 is not supported in some Modes. In those cases, Carrier subopcode 1 is used for both BTS and MS and commands with subopcode 2 are accepted without error but ignored
Dependencies	When Number of Carriers is 1, Ref Carrier is grayed out If N9060A-5FP license is enabled, Max of Carrier is 18, otherwise, Max of Carrier is 12 This control does not appear in the MSR, LTE-A FDD/TDD and 5G NR modes. In order to maintain backwards compatibility with the legacy LTE FDD/TDD modes, the SCPI command is supported in the LTE-A converged application
Couplings	Changing this parameter might affect the Span
Preset	1
State Saved	Saved in instrument state
Min/Max	1/18 when N9060A-5FP license is enabled 1/12 when N9060A-5FP license is disabled
Backwards Compatibility SCPI	[:SENSe]:MCPower:CARRier[1]|2:COUNt (Power Suite)

Carrier/Offset/Limits Config

This is the same dialog that appears on the **Settings** menu panel tab. See "Carrier/Offset/Limits Config" on page 1143

Carrier

Lets you configure your carriers, carrier spacing, noise bandwidth and measurement method.

Dependencies	This index tab appears in all Modes but the MSR, LTE-A FDD/TDD and 5G NR modes

Number of Carriers

Specifies the number of carriers to be measured.

Remote Command	`[:SENSe]:ACPower:CARRier[1]|2:COUNt <integer>` `[:SENSe]:ACPower:CARRier[1]|2:COUNt?`
Example	`:ACP:CARR:COUN 1` `:ACP:CARR:COUN?`
Notes	Carrier subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Note that Carrier subopcode 2 is not supported in some Modes. In those cases, Carrier subopcode 1 is used for both BTS and MS and commands with subopcode 2 are accepted without error but ignored
Dependencies	When Number of Carriers is 1, Ref Carrier is grayed out If N9060A-5FP license is enabled, Max of Carrier is 18, otherwise, Max of Carrier is 12 This control does not appear in the MSR, LTE-A FDD/TDD and 5G NR modes. In order to maintain backwards compatibility with the legacy LTE FDD/TDD modes, the SCPI command is supported in the LTE-A converged application
Couplings	Changing this parameter might affect the Span
Preset	1
State Saved	Saved in instrument state
Min/Max	1/18 when N9060A-5FP license is enabled 1/12 when N9060A-5FP license is disabled
Backwards Compatibility SCPI	`[:SENSe]:MCPower:CARRier[1]|2:COUNt` (Power Suite)

Couple to #1

Couples carrier settings to carrier #1. The coupled parameters are Carrier Power Present, Carrier Spacing, Measurement Noise Bandwidth, Method, and Filter Alpha.

Remote Command	`[:SENSe]:ACPower:CARRier[1]|2:LIST:COUPle OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1`

	[:SENSe]:ACPower:CARRier[1]|2:LIST:COUPle?
Example	:ACP:CARR:LIST:COUP OFF :ACP:CARR:LIST:COUP?
Notes	Carrier subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Some modes do not support Carrier subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored For LTE-Advanced FDD/TDD mode, this control is not shown. In order to maintain backwards compatibility with the legacy LTE FDD/TDD, the SCPI command is supported in LTE & LTE-A converged application
Couplings	When set to On, the carrier settings are coupled to carrier #1. Coupled parameters are Carrier Power Present, Carrier Spacing, Measurement Noise Bandwidth, Method and Filter Alpha When a setting is changed, the couple is set to Off automatically Carrier #1 is always set to On and cannot be changed
Preset	ON
State Saved	Saved in instrument state

Carrier Pwr Present

Configures the carriers for this measurement. It allows spaces to be inserted between carriers. Carriers with the power present parameter set to YES are carriers, and those with the power present parameter set to NO are spaces. Each carrier power present is set to YES or NO. The individual carrier can be set by selecting the desired carrier.

The query for this parameter returns the current values for all of the carriers. If a carrier is defined as having no power present, the power displayed will be relative to the reference carrier, otherwise the absolute power will be displayed.

If you change the carrier power present to no and that carrier is currently configured as the reference carrier, the next carrier to the left (or the right if there are no carriers to the left) will be assigned as the reference carrier. This also applies to the scenario where there are only two carriers configured as having power present and you configure only one carrier to have no power present.

Remote Command	[:SENSe]:ACPower:CARRier[1]|2:LIST:PPResent YES | NO, YES | NO, YES | NO, YES | NO, YES | NO, YES | NO [:SENSe]:ACPower:CARRier[1]|2:LIST:PPResent?
Example	:ACP:CARR2:LIST:PPR YES :ACP:CARR2:LIST:PPR?
Notes	Carrier subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Some modes do not support Carrier subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored When setting these values remotely, the position in the list sent corresponds to the carrier. Missing values are not permitted, therefore if you want to change values 2 and 6 you must send all values up to

	6. Subsequent values will remain unchanged, unless the number of values sent is greater than the number of carriers, then subsequent values will be ignored For LTE-Advanced FDD/TDD modes, this control is not shown. In order to maintain backwards compatibility with the legacy LTE FDD/TDD modes, the SCPI command is supported in the LTE & LTE-A converged application
Couplings	Coupled to the number of carriers. When the SCPI command is sent, the number of carriers will be set to the number of entries in the parameter list
Preset	`YES`
State Saved	Saved in instrument state
Backwards Compatibility SCPI	`[:SENSe]:MCPower:CARRier[1]|2:LIST:PPResent` `:(Power Suite)`

Carrier Spacing

Sets the width of the carrier spacing. This will be the value applied to all the current slots, whether they are carriers or spaces.

Enter each carrier spacing value individually by selecting the desired carrier, and then enter the carrier width.

Remote Command	`[:SENSe]:ACPower:CARRier[1]|2:LIST:WIDTh <freq>, <freq>, <freq>, <freq>, <freq>, <freq>` `[:SENSe]:ACPower:CARRier[1]|2:LIST:WIDTh?`
Example	`:ACP:CARR2:LIST:WIDT 25kHz` `:ACP:CARR2:LIST:WIDT?`
Notes	Carrier subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Some modes do not support Carrier subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored When setting these values remotely, the position in the list sent corresponds to the carrier. Missing values are not permitted, therefore if you want to change values 2 and 6 you must send all values up to 6. Subsequent values will remain unchanged, unless the number of values sent is greater than the number of carriers, then subsequent values will be ignored For LTE-Advanced FDD/TDD modes, this control is not shown. In order to maintain backwards compatibility with the legacy LTE FDD/TDD modes, the SCPI command is supported in the LTE & LTE-A converged application
Couplings	Coupled to the number of carriers. When the SCPI command is sent, the number of carriers will be set to the number of entries in the parameter list Changing Carrier Spacing might affect the Span See the Span section for details
Preset	SA, WCDMA, LTE, LTETDD: 5 MHz Radio Test: 25 kHz

State Saved	Saved in instrument state
Min/Max	0 Hz/Depends on instrument maximum frequency. Same as the Max Span of Swept SA Measurement
Backwards Compatibility SCPI	`[:SENSe]:MCPower:CARRier[1]|2:LIST:WIDTh` (Power Suite, WCDMA)

Measurement Noise Bandwidth

Specifies the **Measurement Noise Bandwidth** used to calculate the power in the carriers.

Each Measurement Noise Bandwidth value is entered individually by selecting the desired carrier. Enter the measurement noise bandwidth on the Carrier page of the Carr/Offset/Limits Config dialog.

Remote Command	`[:SENSe]:ACPower:CARRier[1]|2:LIST:BANDwidth[:INTegration] <freq>, <freq>, <freq>, <freq>, <freq>, <freq>` `[:SENSe]:ACPower:CARRier[1]|2:LIST:BANDwidth[:INTegration]?`
Example	`:ACP:CARR2:LIST:BAND 25kHz` `:ACP:CARR2:LIST:BAND?`
Notes	In the WCDMA mode, the preset/default value is defined as 3.84 MHz. But internally, 4.6848 MHz is used as the default value Carrier subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Some modes do not support Carrier subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored When setting these values remotely, the position in the list sent corresponds to the carrier. Missing values are not permitted, therefore if you want to change values 2 and 6 you must send all values up to 6. Subsequent values will remain unchanged, unless the number of values sent is greater than the number of carriers, then subsequent values will be ignored For LTE-Advanced FDD/TDD modes, this control is not shown. In order to maintain backwards compatibility with the legacy LTE FDD/TDD modes, the SCPI command is supported in the LTE & LTE-A converged application
Couplings	Coupled to the number of carriers. When the SCPI command is sent, the number of carriers is set to the number of entries in the parameter list
Preset	SA: 2 MHz WCDMA: 3.84 MHz LTE, LTETDD: 4.515 MHz|4.5 MHz Radio Test: 25 kHz
State Saved	Saved in instrument state
Min/Max	10 Hz/Depends on instrument maximum frequency. Same as the Max Span of Swept SA Measurement
Backwards Compatibility	`[:SENSe]:ACPower:BANDwidth:INTegration` `[:SENSe]:ACPower:BWIDth:INTegration`

SCPI	[:SENSe]:ACPower:CARRier[1]|2:LIST:BWIDth[:INTegration] Power Suite, WCDMA [:SENSe]:MCPower:CARRier[1]|2:LIST:BANDwidth[:INTegration] [:SENSe]:MCPower:CARRier[1]|2:LIST:BWIDth[:INTegration]

Method for Carrier

Accesses the carrier configuration method settings.

Remote Command	[:SENSe]:ACPower:CARRier[1]|2:LIST:FILTer[:RRC][:STATe] ON | OFF | 1 | 0, ON | OFF | 1 | 0, ON | OFF | 1 | 0, ON | OFF | 1 | 0, ON | OFF | 1 | 0, ON | OFF | 1 | 0 [:SENSe]:ACPower:CARRier[1]|2:LIST:FILTer[:RRC][:STATe]?
Example	:ACP:CARR:LIST:FILT 0,0,0,0 :ACP:CARR:LIST:FILT?
Notes	The binary values translate as follows: 1|ON = RRC Weighted 0|OFF = Integ BW Maximum of Array length depends on the number of carriers Some modes do not support Carrier subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored For LTE-Advanced FDD/TDD modes, this control is not shown. In order to maintain backwards compatibility with the legacy LTE FDD/TDD modes, the SCPI command is supported in the LTE & LTE-A converged application
Preset	SA, LTE, LTETDD: OFF WCDMA: ON Radio Test: OFF
State Saved	Saved in instrument state
Range	Integration BW|RRC Weighted

Filter Alpha for Carrier

Inputs the alpha value for the filter used in the current carrier configuration.

Remote Command	[:SENSe]:ACPower:CARRier[1]|2:LIST:FILTer:ALPHa <real>, <real>, <real>, <real>, <real>, <real> [:SENSe]:ACPower:CARRier[1]|2:LIST:FILTer:ALPHa?
Example	:ACP:CARR2:LIST:FILT:ALPH 0.5 :ACP:CARR2:LIST:FILT:ALPH?
Notes	Some modes do not support Carrier subopcode 2. In those cases, commands with subopcode 2 are

	accepted without error but ignored For LTE-Advanced FDD/TDD modes, this control is not shown. In order to maintain backwards compatibility with the legacy LTE FDD/TDD modes, the SCPI command is supported in the LTE & LTE-A converged application
Preset	0.22
State Saved	Saved in instrument state
Min/Max	0.01/1.0

Offset

Lets you configure the spacing of the offset regions.

Offset Frequency Define

Enables you to select offset frequency definition. Each standard defines each offset frequency from Carrier.

For example, 3GPP2 requires the “From Carrier Center to Integ BW Closer Edge” definition. LTE conformance test requires “From Carrier Edge to Integ BW Center” and/or “From Carrier Edge to Integ BW Closer Edge” definition.

`CTOCenter`	From the lowermost carrier center frequency (for lower offset), the uppermost carrier center frequency (for upper offset) to the center frequency of each Offset Integ BW
`CTOEdge`	From the lowermost carrier center frequency (for lower offset), the uppermost carrier center frequency (for upper offset) to the closest edge frequency of each Offset Integ BW
`ETOCenter`	From the lowermost carrier center frequency - spacing of this carrier /2 (for lower offset), the uppermost carrier center frequency + spacing of this carrier /2 (for upper offset) to the center frequency of each Offset Integ BW
`ETOEdge`	From the lowermost carrier center frequency - spacing of this carrier /2 (for lower offset), the uppermost carrier center frequency + spacing of this carrier /2 (for upper offset) to the closest edge of each Offset Integ BW
`RTOCenter` 5G NR, LTEA, MSR	From either the lower or upper RF BW** edge frequency to the center frequency of each Offset Integ BW
`RTOEdge` 5G NR, LTEA, MSR	From either the lower or upper RF BW** edge frequency to the closest edge frequency of each Offset Integ BW
`RCTOCenter` 5G NR only	From the center frequency of RF BW to the center frequency of each Offset Integ BW

** RF BW = $BW_{channel,CA}$ which is defined in each 3GPP standard, regardless of “Measure Carrier” for the uppermost and the lowermost carriers being Enabled or

Disabled. When the Number of Component Carrier = 1, RF BW = $BW_{channel}$ = 2 x $F_{offset,RAT}$

See "Diagrams for Offset Freq Define" on page 1188.

Modes other than MSR, LTE-A, 5G NR

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:TYPE CTOCenter | CTOEdge | ETOCenter | ETOEdge` `[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:TYPE?`

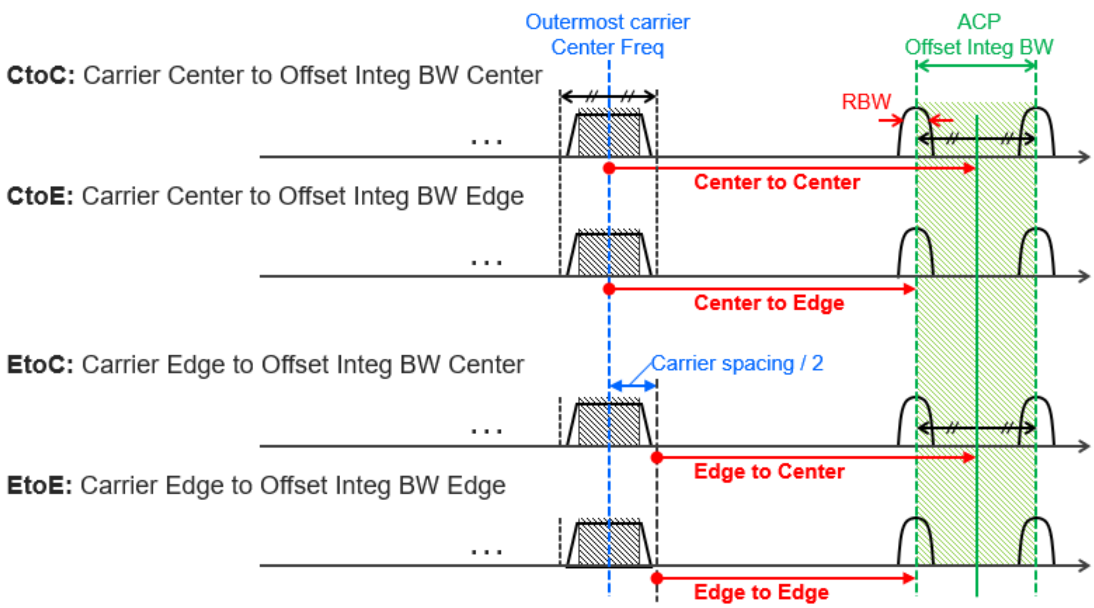
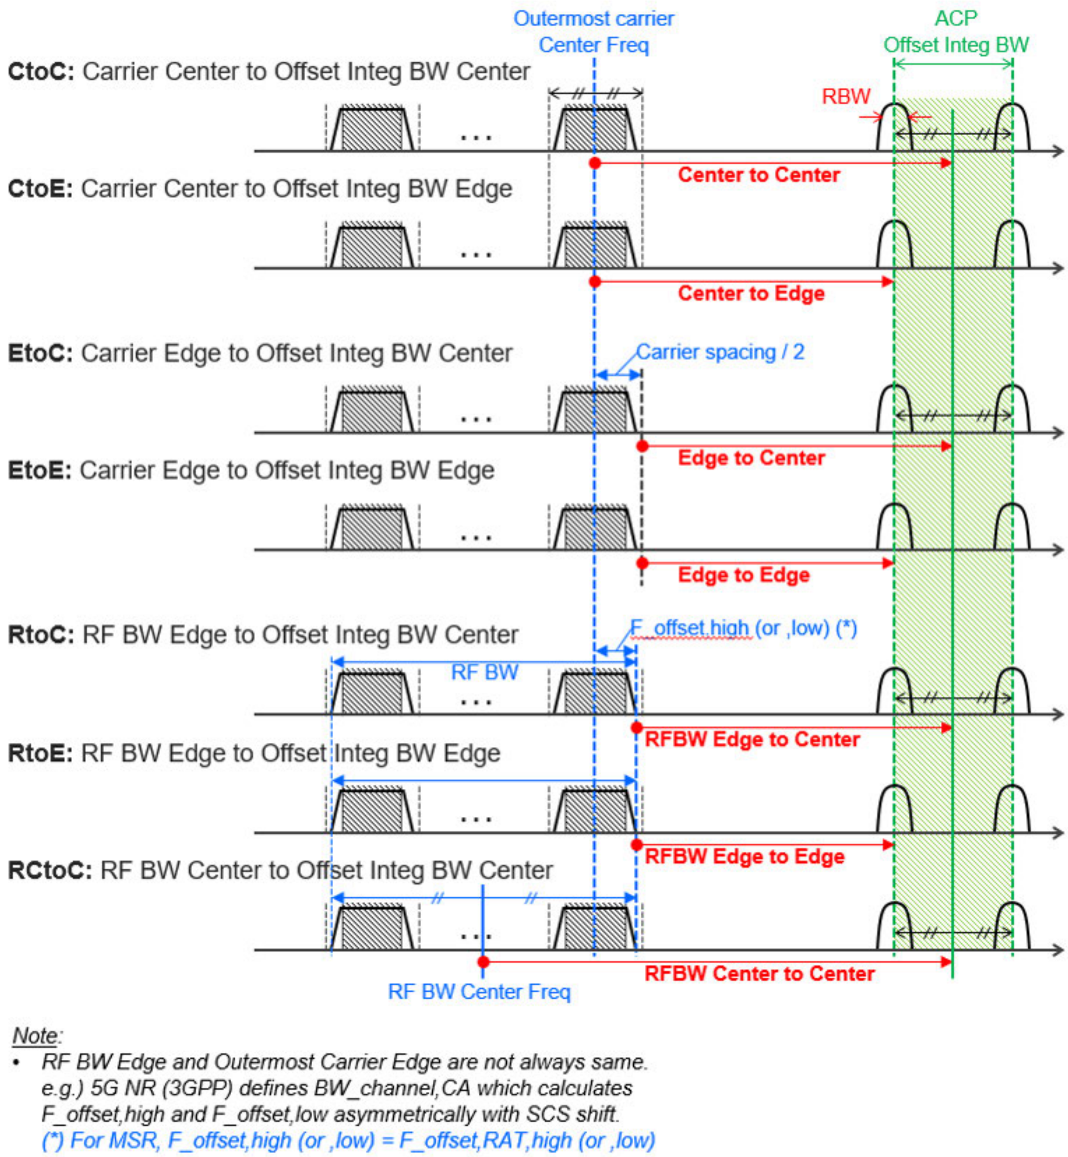
Diagrams for Offset Freq Define

Details depend on the selected mode.

Diagrams for Modes other than MSR, LTE-A, 5G NR



Diagrams for MSR, LTE-A, 5G NR



Offset Freq

This parameter determines the frequency difference between the center of the main channel and the center of the carrier.

Each **Offset Freq** state value is entered individually by selecting the desired carrier.

The list contains up to six (6) entries, depending on the mode selected, for offset frequencies. Each offset frequency in the list corresponds to a reference bandwidth in the bandwidth list.

An offset frequency of zero turns the display of the measurement for that offset off, but the measurement is still made and reported. You can turn off (not use) specific offsets with the `[:SENSe]:ACP:OFFSet:LIST:STATe` command.

Turning the offset off has the same effect as setting the frequency of the offset to 0 Hz and will cause it to be removed from the results screen.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:STATe OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1` `[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:STATe?`

Example	`:ACP:OFFS1:LIST 0,0,0,0,0,0`
	`:ACP:OFFS1:LIST?`
	`:ACP:OFFS2:LIST:STAT 1,1,0,0,0,0`
	`:ACP:OFFS2:LIST:STAT?`

Notes	Offset subopcode. 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Some modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored When setting these values remotely, the position in the list sent corresponds to the offset. Missing values are not permitted, unless the number of values sent is greater than the number of carriers, then subsequent values will be ignored
Couplings	Changing Offset Frequency might affect the Span. See the Span control section for details
Preset	SA: 3 MHz, 0 Hz, 0 Hz, 0 Hz, 0 Hz, 0 Hz|3 MHz, 0 Hz, 0 Hz, 0 Hz, 0 Hz, 0 Hz WCDMA: 5.0 MHz, 10.0 MHz, 0 Hz, 0 Hz, 0 Hz, 0 Hz|5.0 MHz, 10.0 MHz, 0 Hz, 0 Hz, 0 Hz, 0 Hz LTE, LTETDD, LTEAFDD, LTEATDD, MSR: 5.0 MHz, 10.0 MHz, 0 Hz, 0 Hz, 0 Hz, 0 Hz|5.0 MHz, 10.0 MHz, 0 Hz, 0 Hz, 0 Hz, 0 Hz 5G NR: 100 MHz, 200 MHz, 0 Hz, 0 Hz, 0 Hz, 0 Hz|100 MHz, 200 MHz, 0 Hz, 0 Hz, 0 Hz, 0 Hz Radio Test: 25 kHz, 50 kHz, 75 kHz, 0 Hz, 0 Hz, 0 Hz SA: ON, OFF, OFF, OFF, OFF, OFF|ON, OFF, OFF, OFF, OFF, OFF WCDMA: ON, ON, OFF, OFF, OFF, OFF|ON, ON, OFF, OFF, OFF, OFF LTE, LTETDD, LTEAFDD, LTEATDD, MSR: ON, ON, OFF, OFF, OFF, OFF|ON, OFF, OFF, OFF, OFF, OFF 5G NR: ON, ON, OFF, OFF, OFF, OFF|ON, OFF, OFF, OFF, OFF, OFF Radio Test: ON, ON, ON, OFF, OFF, OFF
State Saved	Saved in instrument state Yes
Range	`OFF|ON`
Min/Max	0 Hz/Depends on instrument maximum frequency. Same as the Max Span of Swept SA Measurement
Backwards Compatibility SCPI	`[:SENSe]:MCPower:OFFSet[1]|2:LIST[:FREQuency]`

Integ BW

Sets the Integration Bandwidth for the offsets. Each resolution bandwidth in the list corresponds to an offset frequency in the list defined by [:SENSe]:ACP:OFFSet[n][:OUTer]:LIST[:FREQuency].

Enter each value individually by selecting the desired offset, then enter the Offset Integration Bandwidth.

You can turn off (not use) specific offsets with the [:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:STATe command.

Remote Command	[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth[:INTegration] <freq>, <freq>, <freq>, <freq>, <freq>, <freq> [:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth[:INTegration]?
Example	:ACP:OFFS2:LIST:BAND 2MHz,2MHz,2MHz,2MHz,2MHz,2MHz :ACP:OFFS2:LIST:BAND?
Notes	Offset subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Some modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored When setting these values remotely, the position in the list sent corresponds to the offset. Missing values are not permitted i.e. if you want to change the second value, you must send all values up to it. Subsequent values will remain unchanged, unless the number of values sent is greater than the number of carriers, then subsequent values will be ignored
Couplings	Changing Integ BW might affect the Span. See Span section for details
Preset	SA: 2 MHz, 2 MHz, 2 MHz, 2 MHz, 2 MHz, 2 MHz|2 MHz, 2 MHz, 2 MHz, 2 MHz, 2 MHz, 2 MHz WCDMA: 3.84 MHz, 3.84 MHz, 3.84 MHz, 3.84 MHz, 3.84 MHz, 3.84 MHz|3.84 MHz, 3.84 MHz, 3.84 MHz, 3.84 MHz, 3.84 MHz, 3.84 MHz LTE, LTETDD, LTEAFDD,LTEATDD, MSR: 4.515 MHz, 4.515 MHz, 4.515 MHz, 4.515 MHz, 4.515 MHz, 4.515 MHz|4.5 MHz, 4.5 MHz, 4.5 MHz, 4.5 MHz, 4.5 MHz, 4.5 MHz 5G NR: 98.28 MHz, 98.28 MHz, 98.28 MHz, 98.28 MHz, 98.28 MHz, 98.28 MHz|98.31 MHz, 98.31 MHz, 98.31 MHz, 98.31 MHz, 98.31 MHz, 98.31 MHz Radio Test: 25 kHz, 25 kHz, 25 kHz, 25 kHz, 25 kHz, 25 kHz
State Saved	Saved in instrument state
Min/Max	10 Hz/Depends on instrument maximum frequency. Same as the Max Span on Swept SA Measurement
Backwards Compatibility SCPI	[:SENSe]:ACPower:OFFSet[1]|2:LIST:BWIDth[:INTegration] [:SENSe]:ACPR:OFFSet[1]|2:LIST:BANDwidth [:SENSe]:ACPR:OFFSet[1]|2:LIST:BWIDth (Power Suite, WCDMA) [:SENSe]:MCPower:OFFSet[1]|2:LIST:BANDwidth[:INTegration] [:SENSe]:MCPower:OFFSet[1]|2:LIST:BWIDth[:INTegration]

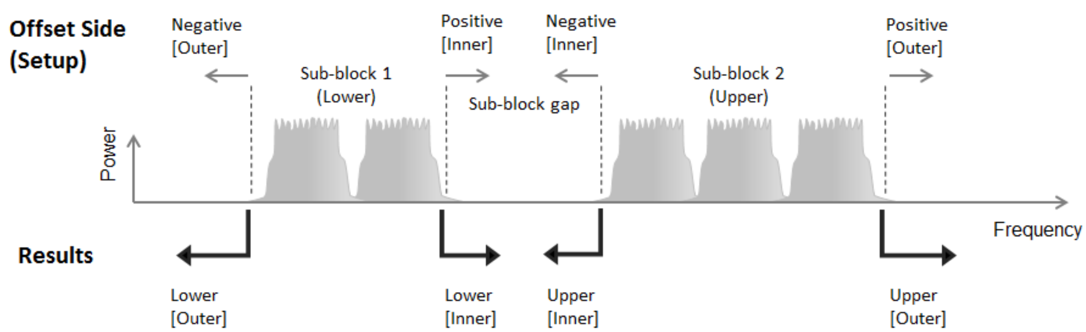
Offset Side

Specifies which offset side to measure.

Enables you to turn off (not use) specific offsetswith [:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:SIDE.

NEGative	Negative (lower) sideband only
BOTH	Both of the negative (lower) and positive (upper) sidebands
POSitive	Positive (upper) sideband only

The figure below shows the relation between the negative/positive offset side setups and the upper/lower results in the MSR and LTE-Advanced FDD/TDD Mode.



Remote Command	[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:SIDE NEGative | BOTH | POSitive,NEGative | BOTH | POSitive,NEGative | BOTH | POSitive,NEGative | BOTH | POSitive,NEGative | BOTH | POSitive,NEGative | BOTH | POSitive [:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:SIDE?
Example	:ACP:OFFS:LIST:SIDE BOTH :ACP:OFFS:LIST:SIDE?
Notes	OFFSet1 is for BTS, 2 for MS. Default is BTS Some modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored If you set POS or NEG in an offset, result of the inactive side returns -999
Preset	BOTH, BOTH, BOTH, BOTH, BOTH, BOTH | BOTH, BOTH, BOTH, BOTH, BOTH, BOTH
State Saved	Saved in instrument state
Range	NEGative|BOTH|POSitive

Method

Allows you to turn RRC filtering of each offset on or off. The value (roll off) for the filter will be set to the value of the **Filter Alpha** parameter.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:FILTer[:RRC][:STATe] ON | OFF | 1 | 0, ON | OFF | 1 | 0, ON | OFF | 1 | 0, ON | OFF | 1 | 0, ON | OFF | 1 | 0, ON | OFF | 1 | 0` `[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:FILTer[:RRC][:STATe]?`
Example	`:ACP:OFFS:LIST:FILT 1,0,0` `:ACP:OFFS:LIST:FILT?`
Notes	`1|ON` = RRC Weighted, `0|OFF` = Integ BW Some modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored
Preset	(see table below)
State Saved	Saved in instrument state
Range	Integ BW|RRC Weighted

Preset:

Mode	Values
SA	0, 0, 0, 0, 0, 0|0, 0, 0, 0, 0,0
WCDMA	1, 1, 1, 1, 1, 1|1, 1, 1, 1, 1, 1
LTE, LTETDD, LTEAFDD, LTEATDD, 5G NR, MSR	0, 0, 0, 0, 0, 0|0, 0, 0, 0, 0,0
Radio Test	0, 0, 0, 0, 0, 0

Filter Alpha

Sets the alpha value for the RRC Filter for each offset.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:FILTer:ALPHa <real>, <real>, <real>, <real>, <real>, <real>` `[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:FILTer:ALPHa?`
Example	`:ACP:OFFS:LIST:FILT:ALPH 0.5,0.5,0.5,0.5,0.5,0.5` `:ACP:OFFS:LIST:FILT:ALPH?`
Notes	Some modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored
Preset	(see table below)
State Saved	Saved in instrument state
Min/Max	0.01/1.00

Preset:

SA	0.22,0.22,0.22,0.22,0.22,0.22|0.22,0.22,0.22,0.22,0.22,0.22
WCDMA	0.22,0.22,0.22,0.22,0.22,0.22|0.22,0.22,0.22,0.22,0.22,0.22
LTE, LTETDD, LTEAFDD, LTEATDD, 5G NR, MSR	0.22,0.22,0.22,0.22,0.22,0.22|0.22,0.22,0.22,0.22,0.22,0.22

Advanced (Offset)

This control on the **Offset** dialog page opens up another menu page which lets you set advanced properties of the Inner Offset, such as Res BW, Video BW, and Filter parameters.

Offset Freq

This column is the same as on the main **Offset** menu page. See "Offset Freq" on page 1189

Res BW

Sets the resolution bandwidth. If an unavailable bandwidth is entered with the numeric keypad, the closest available bandwidth is selected.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:RESolution:AUTO ON	OFF	1	0, ON	OFF	1	0, ON	OFF	1	0, ON	OFF	1	0, ON	OFF	1	0, ON	OFF	1	0` `[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:RESolution:AUTO?`

Example	`:ACP:OFFS2:LIST:BAND:RES 220kHz,220kHz,220kHz,220kHz,220kHz,220kHz`
	`:ACP:OFFS2:LIST:BAND:RES?`
	`:ACP:OFFS2:LIST:BAND:RES:AUTO 1,1,1,1,1,1`
	`:ACP:OFFS2:LIST:BAND:RES:AUTO?`

Notes	Offset subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Some modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored
Dependencies	When **Meas Method** is RBW, FAST or Fast Power, this cell is grayed out and disabled. If the cell is pressed, an advisory message is generated. If the equivalent SCPI remote command is sent, a "Setting conflict" warning is generated
Couplings	When Res BW Mode is AUTO, this value is exactly same as Res BW under BW key. When you change this value, Res BW Mode is also changed to Man
Preset	SA: 220 kHz, 220 kHz, 220 kHz, 220 kHz, 220 kHz, 220 kHz WCDMA: 100 kHz, 100 kHz, 100 kHz, 100 kHz, 100 kHz, 100 kHz LTE, LTETDD, LTEAFDD, LTEATDD, 5G NR, MSR: 100 kHz, 100 kHz, 100 kHz, 100 kHz, 100 kHz, 100 kHz|100 kHz, 100 kHz, 100 kHz, 100 kHz, 100 kHz, 100 kHz 1, 1, 1, 1, 1, 1
State Saved	Saved in instrument state

	Yes
Min/Max	1 Hz/8 MHz
Backwards Compatibility SCPI	`[:SENSe]:ACPower:OFFSet[1]|2:LIST:BWIDth:RESolution` `[:SENSe]:ACPower:OFFSet[1]|2:LIST:BWIDth:RESolution:AUTO`

Video BW

Enables you to change the instrument post-detection filter (VBW).

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:VIDeo:AUTO OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1` `[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:VIDeo:AUTO?`

Example	`:ACP:OFFS2:LIST:BAND:VID 5MHz,5MHz,5MHz,5MHz,5MHz,5MHz`
	`:ACP:OFFS2:LIST:BAND:VID?`
	`:ACP:OFFS2:LIST:BAND:VID:AUTO 0,0,0,0,1,1`
	`:ACP:OFFS2:LIST:BAND:VID:AUTO?`

Notes	The values shown in this table reflect the conditions after a Mode Preset Offset subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Some modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored
Dependencies	When Meas Method is RBW, FAST or Fast Power, this cell is grayed out and disabled. If the cell is pressed, an advisory message is generated. If the equivalent remote command is sent, a "Setting conflict" warning is generated
Preset	SA: 22 kHz, 22 kHz, 22 kHz, 22 kHz, 22 kHz, 22 kHz WCDMA: 1 MHz, 1 MHz, 1 MHz, 1 MHz, 1 MHz, 1 MHz LTE, LTETDD, LTEAFDD, LTEATDD, 5G NR, MSR: 1 MHz, 1 MHz, 1 MHz, 1 MHz, 1 MHz, 1 MHz `ON, ON, ON, ON, ON, ON`
State Saved	Saved in instrument state Yes
Min/Max	1 Hz/50 MHz
Backwards Compatibility SCPI	`[:SENSe]:ACPower:OFFSet[1]|2:LIST:BWIDth:VIDeo` `[:SENSe]:ACPower:OFFSet[1]|2:LIST:BWIDth:VIDeo:AUTO`

Filter Type

Selects the type of bandwidth filter that is used.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:SHAPe GAUSsian | FLATtop, GAUSsian | FLATtop, GAUSsian | FLATtop, GAUSsian | FLATtop,`

	GAUSsian | FLATtop, GAUSsian | FLATtop [:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:SHAPe?
Example	:ACP:OFFS2:LIST:BAND:SHAP FLAT,GAUS,GAUS,GAUS,GAUS,GAUS :ACP:OFFS2:LIST:BAND:SHAP?
Notes	Offset subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Some modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored
Dependencies	When Res BW Mode for the offset is Auto, this cell is grayed out and disabled. Since Res BW Mode for the offset is preset to Auto on changing Meas Method to RBW, FAST or Fast Power, this cell is grayed out and disabled too. If the cell is pressed, an advisory message is generated. If the equivalent remote command is sent, a "Setting conflict" warning is generated
Preset	GAUSsian, GAUSsian, GAUSsian, GAUSsian, GAUSsian, GAUSsian
State Saved	Saved in instrument state
Range	GAUSsian|FLATtop
Backwards Compatibility SCPI	[:SENSe]:ACPower:OFFSet[1]|2:LIST:BWIDth:SHAPe

Filter BW

Selects a Gaussian filter based on its –3 dB (Normal) bandwidth or its –6 dB bandwidth.

Remote Command	[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:TYPE DB3 | DB6, DB3 | DB6, DB3 | DB6, DB3 | DB6, DB3 | DB6, DB3 | DB6 [:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:BANDwidth:TYPE?
Example	:ACP:OFFS2:LIST:BAND:TYPE DB3,DB3,DB3,DB3,DB3,DB3 :ACP:OFFS2:LIST:BAND:TYPE?
Notes	Offset subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Some modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored
Dependencies	When Filter Type if Flattop or Res BW Mode for the offset is Auto, this cell is grayed out and disabled. Since Res BW Mode for the offset is preset to Auto on changing Meas Method to RBW, FAST or Fast Power, this cell is grayed out and disabled too. If the cell is pressed, an advisory message is generated. If the equivalent remote command is sent, a "Setting conflict" warning is generated
Preset	DB3, DB3, DB3, DB3, DB3, DB3
State Saved	Saved in instrument state
Range	–3 dB (Normal)| –6 dB
Backwards Compatibility SCPI	[:SENSe]:ACPower:OFFSet[1]|2:LIST:BWIDth:TYPE

Limits

Lets you configure the limits that are used to determine whether the offset regions PASS or FAIL the limit test.

Limit Test

This checkbox is the same as the Limit test control on the **Meas Setup, Settings** tab. See "Limit Test" on page 1197.

Offset Freq

This column is the same as the **Offset Freq** column on the **Offset** index tab, see "Offset Freq" on page 1189.

Abs Limit

Enters an absolute limit value, which sets the absolute amplitude levels to test against for each of the custom offsets. The list must contain six (6) entries. If there is more than one offset, the offset closest to the carrier channel is the first one in the list. [:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:TEST selects the type of testing to be done at each offset.

You can turn off (not use) specific offsets with the [:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:STATe command.

The query returns the six (6) sets of real numbers that are the current absolute amplitude test limits.

Remote Command	[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:ABSolute <real>, <real>, <real>, <real>, <real>, <real> [:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:ABSolute?
Example	:ACP:OFFS2:LIST:ABS -10,-10,-10,-10,-10,-10 :ACP:OFFS2:LIST:ABS?
Notes	Offset subopcode. 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Some modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored
Preset	SA: 0dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm|0dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm, 0 dBm WCDMA: 50 dBm, 50 dBm, 50 dBm, 50 dBm, 50 dBm, 50 dBm|50 dBm, 50 dBm, 50 dBm, 50 dBm, 50 dBm, 50 dBm LTE, LTETDD, LTEAFDD,LTEATDD, MSR: -8.45, -8.45, -8.45, -8.45, -8.45, -8.45|-50.0, -50.0, -50.0, -50.0, -50.0, -50.0 5G NR: 4.92, 4.92, 4.92, 4.92, 4.92, 4.92|-50.0, -50.0, -50.0, -50.0, -50.0, -50.0

Backwards Compatibility SCPI	`[:SENSe]:ACPR:OFFSet[1]|2:LIST:ABSolute`
	SA, W-CDMA
	`[:SENSe]:MCPower:OFFSet[1]|2:LIST:ABSolute`
	SA, W-CDMA

Rel Limit (Car)

Enters a relative limit value for the carrier level. This sets the amplitude levels to test against for the specified offsets.

The amplitude level is relative to the carrier amplitude. If multiple offsets are available, the list contains six (6) entries. The offset closest to the carrier channel is the first one in the list. `[:SENSe]:ACP:OFFSet[n]:INNer:LIST:TEST` selects the type of testing to be done at each offset.

You can turn off (not use) specific offsets with the `[:SENSe]:ACP:OFFSet[n]:INNer:LIST:STATe` command.

The query returns the six (6) sets of real numbers that are the current amplitude test limits, relative to the carrier, for each offset.

Offset[n] n = 1 is base station and n = 2 is mobiles. The default is base station (1).

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:RCARrier <real>, <real>, <real>, <real>, <real>, <real>` `[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:RCARrier?`
Example	`:ACP:OFFS2:INN:LIST:RCAR 0,0,0,0,0,0` `:ACP:OFFS2:INN:LIST:RCAR?`
Notes	Offset subopcode. 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS
Preset	-44.2, -44.2,-44.2,-44.2,-44.2,-44.2|-29.2, -29.2, -29.2, -29.2, -29.2, -29.2 5G NR: -43.8, -43.8, 43.8, -43.8, -43.8, -43.8|-29.2, -29.2, -29.2, -29.2, -29.2, -29.2
State Saved	Saved in instrument state
Min/Max	-150/50.0

Positive Offset Limit (SCPI only)

Enables you to set the upper limit for the upper segment of the specified offset pair.

Min/Max	-150.0/50.0
Backwards Compatibility SCPI	:CALCulate:MCPower:OFFSet:LIST:LIMit:NEGative[:UPPer]:DATA (Power Suite, WCDMA)

Rel Limit (PSD)

Enters a relative limit value for the level of the power spectral density. This sets the amplitude levels to test against for any custom offsets. The amplitude level is relative to the power spectral density. If multiple offsets are available, the list contains six (6) entries. The offset closest to the carrier channel is the first one in the list.

[:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:TEST selects the type of testing to be done at each offset.

You can turn off (not use) specific offsets with the [:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:STATe command.

The query returns the six (6) sets of real numbers that are the current amplitude test limits, relative to the power spectral density, for each offset.

Offset[n] n = 1 is base station and n = 2 is mobiles. The default is base station (1).

Remote Command	[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:RPSDensity <rel_ampl>, <rel_ampl>, <rel_ampl>, <rel_ampl>, <rel_ampl>, <rel_ampl> [:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:RPSDensity?
Example	:ACP:OFFS2:LIST:RPSD 10,10,10,10,10,10 :ACP:OFFS2:LIST:RPSD?
Notes	Offset subopcode. 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Some modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored
Preset	SA: -28.87 dB, -43.87 dB, 0 dB, 0 dB, 0 dB, 0 dB|-28.87 dB, -43.87 dB, 0 dB, 0 dB, 0 dB, 0 dB WCDMA: -44.2 dB, -49.2 dB, -49.2 dB, -49.2 dB, -49.2 dB, -49.2 dB|-32.2 dB, -42.2 dB, -42.2 dB, -42.2 dB, -42.2 dB, -42.2 dB LTE, LTETDD, LTEAFDD,LTEATDD, 5G NR, MSR: 0, 0, 0, 0, 0, 0|0, 0, 0, 0, 0, 0 Radio Test: -60, -60, -60, 0, 0, 0
State Saved	Saved in instrument state
Min/Max	-150.0 dB/50.0 dB

Fail Mask

Accesses a menu that enables you to select one of the logics for the fail conditions between the measurement results and the test limits. The setting defines the type of testing to be done at any custom offset frequencies. The measured powers are tested against the absolute values defined with [:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:ABSolute, or the relative values defined with [:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:RPSDensity and [:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:RCARrier.

You can turn off (not use) specific offsets with the `[:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:STATe` command.

Absolute	`ABSolute`	Fail is shown if one of the absolute ACP measurement results is larger than the limit for **Abs Limit**
Relative	`RELative`	Fail is shown if one of the relative ACP measurement results is larger than the limit for **Rel Lim (Car)** or **Rel Lim (PSD)**
Abs AND Rel	`AND`	Fail is shown if one of the absolute ACP measurement results is larger than the limit for **Abs Limit***and* one of the relative ACP measurement results is larger than the limit for **Rel Lim (Car)** or **Rel Lim (PSD)**
Abs OR Rel	`OR`	Fail is shown if one of the absolute ACP measurement results is larger than the limit for **Abs Limit***or* one of the relative ACP measurement results is larger than the limit for **Rel Lim (Car)** or **Rel Lim (PSD)**

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:TEST ABSolute | AND | OR | RELative, ABSolute | AND | OR | RELative, ABSolute | AND | OR | RELative, ABSolute | AND | OR | RELative, ABSolute | AND | OR | RELative, ABSolute | AND | OR | RELative` `[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:TEST?`
Example	`:ACP:OFFS2:LIST:TEST ABS,ABS,ABS,ABS,ABS,ABS` `:ACP:OFFS2:LIST:TEST?`
Notes	Offset subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Some modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored
Preset	SA, WCDMA: REL, REL, REL, REL, REL, REL|REL, REL, REL, REL, REL, REL LTE, LTETDD, LTEAFDD,LTEATDD, 5G NR, MSR: AND, AND, AND, AND, AND, AND|AND, AND, AND, AND, AND, AND Radio Test: REL, REL, REL, REL, REL, REL
State Saved	Saved in instrument state
Range	Absolute|Relative|Abs AND Rel (fail if both fail)|Abs OR Rel (fail if either fails)
Backwards Compatibility SCPI	`[:SENSe]:MCPower:OFFSet[1]|2:LIST:TEST`

Offset Frequency Define

This control allows you to select “Offset” definition:

`CTOCenter`	From the lowermost carrier center frequency (for lower offset), the uppermost carrier center frequency (for upper offset) to the center frequency of each Offset Integ BW

CTOEdge	From the lowermost carrier center frequency (for lower offset), the uppermost carrier center frequency (for upper offset) to the closest edge frequency of each Offset Integ BW
ETOCenter	From the lowermost carrier center frequency - spacing of this carrier /2 (for lower offset), the uppermost carrier center frequency + spacing of this carrier /2 (for upper offset) to the center frequency of each Offset Integ BW
ETOEdge	From the lowermost carrier center frequency - spacing of this carrier /2 (for lower offset), the uppermost carrier center frequency + spacing of this carrier /2 (for upper offset) to the closest edge frequency of each Offset Integ BW
STOCenter	From either the lower or upper sub-block edge frequency to the center frequency of each Offset Integ BW
STOEdge	From either the lower or upper sub-block edge frequency to the closest edge frequency of each Offset Integ BW
SCTOCenter 5G NR only	From the center frequency of sub-block** to the center frequency of each Offset Integ BW

** sub-block (bandwidth) = $BW_{channel,block}$ which is defined in each 3GPP standard, regardless of "Measure Carrier" for the uppermost and the lowermost carriers being Enabled or Disabled. When the Number of Component Carrier within each sub-block = 1, sub-block (bandwidth) = $BW_{channel}$ = 2 x $F_{offset,RAT}$.

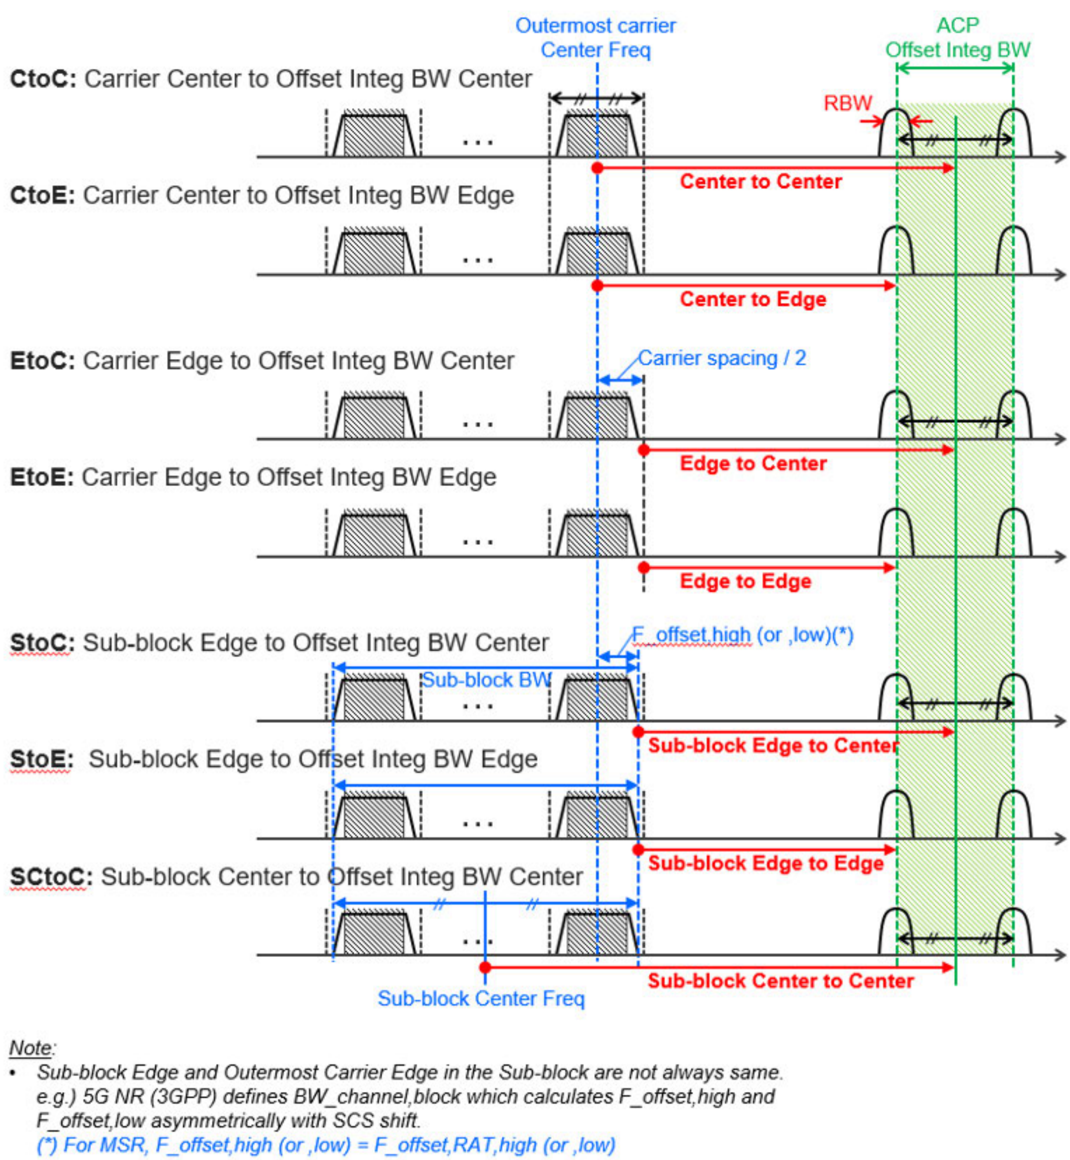
Diagrams for Offset Freq Define



Offset Freq

This parameter determines the frequency difference between the center of the main channel and the center of the carrier. When set to Offset to Edge, this parameter determines the frequency difference between the center of the main channel and the near edge of the offset.

Each **Offset Freq** state value is entered individually by selecting the desired carrier. Use the Enabled checkbox to turn the Offset Freq State on and off.

The list contains up to six (6) entries, depending on the mode selected, for offset frequencies. Each offset frequency in the list corresponds to a reference bandwidth in the bandwidth list.

An offset frequency of zero turns the display of the measurement for that offset off, but the measurement is still made and reported. You can turn off (not use) specific offsets with the [:SENSe]:ACP:OFFSet[n]:INNer:LIST:STATe command.

Turning the offset off has the same effect as setting the frequency of the offset to 0 Hz and will cause it to be removed from the results screen.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:STATe OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1` `[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:STATe?`

Example	`:ACP:OFFS1:INN:LIST 0,0,0,0,0,0`
	`:ACP:OFFS1:INN:LIST?`
	`:ACP:OFFS2:INN:LIST:STAT 1,1,0,0,0,0`
	`:ACP:OFFS2:INN:LIST:STAT?`

Notes	When setting these values remotely, the position in the list sent corresponds to the offset. Missing values are not permitted, unless the number of values sent is greater than the number of carriers, then subsequent values will be ignored Offset subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS
Couplings	Changing Offset Frequency might affect the Span. See the Span control section for details
Preset	2.5MHz,7.5MHz,0,0,0,0|2.5MHz,7.5MHz,0,0,0,0 5G NR: 10 MHz, 30 MHz, 0 Hz, 0 Hz, 0 Hz, 0 Hz|100 MHz, 200 MHz, 0 Hz, 0 Hz, 0 Hz, 0 Hz `ON, ON, OFF, OFF, OFF, OFF | ON, OFF, OFF, OFF, OFF, OFF`
State Saved	Saved in instrument state Yes
Min/Max	0 Hz/Depends on instrument maximum frequency. Same as the Max Span of Swept SA Measurement

Integ BW

Sets the Integration Bandwidth for the offsets. Each resolution bandwidth in the list corresponds to an offset frequency in the list defined by `[:SENSe]:ACP:OFFSet[n]:INNer:LIST[:FREQuency]`.

Enter each value individually by selecting the desired offset on the **Offset** menu key using the up down arrows, the knob, or the numeric keypad, then enter the Offset Integration Bandwidth using the **Offset Integration Bandwidth** menu key.

You can turn off (not use) specific offsets with the `[:SENSe]:ACP:OFFSet[n]:INNer:LIST:STATe` command.

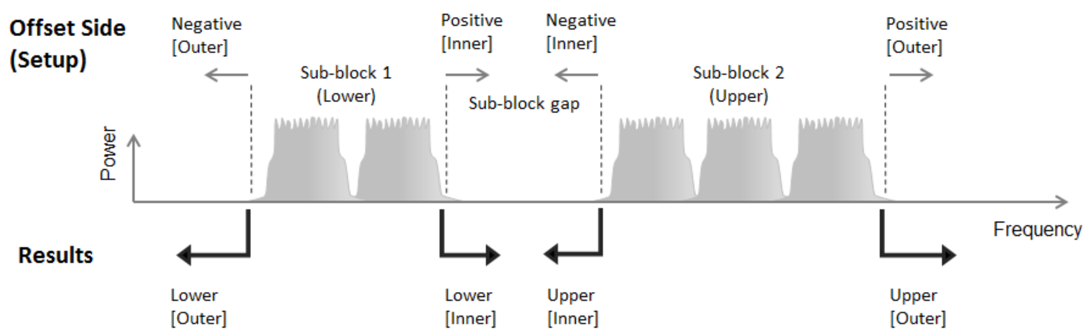
Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth[:INTegration] <freq>, <freq>, <freq>, <freq>, <freq>, <freq>` `[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth[:INTegration]?`
Example	`:ACP:OFFS2:INN:LIST:BAND 2MHz,2MHz,2MHz,2MHz,2MHz,2MHz` `:ACP:OFFS2:INN:LIST:BAND?`
Notes	When setting these values remotely, the position in the list sent corresponds to the offset. Missing values are not permitted i.e. if you want to change the second value you must send all values up to it. Subsequent values will remain unchanged Offset subopcode. 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS
Couplings	Changing Integ BW might affect the Span. See Span section for details
Preset	LTEAFDD:3.84MHz, 3.84MHz, 3.84MHz, 3.84MHz, 3.84MHz, 3.84MHz|3.84MHz, 3.84MHz, 3.84MHz, 3.84MHz, 3.84MHz, 3.84MHz MSR, LTEATDD: 4.515MHz, 4.515MHz, 4.515MHz, 4.515MHz, 4.515MHz, 4.515MHz|4.5MHz, 4.5MHz, 4.5MHz, 4.5MHz, 4.5MHz, 4.5MHz 5G NR: 19.08 MHz, 19.08 MHz, 19.08 MHz, 19.08 MHz, 19.08 MHz, 19.08 MHz|98.31 MHz, 98.31 MHz, 98.31 MHz, 98.31 MHz, 98.31 MHz, 98.31 MHz
State Saved	Saved in instrument state
Min/Max	10 Hz/Depends on instrument maximum frequency. Same as the Max Span on Swept SA Measurement

Offset Side

Enables you to turn off (not use) specific offsets with `[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:SIDE`.

- `NEGative` - The upper side in the sub-block gap only (i.e. negative sideband of the upper sub-block) is enabled
- `BOTH` - Both sides in the sub-block gap are enabled
- `POSitive` - The lower side in the sub-block gap only (i.e. positive sideband of the lower sub-block) is enabled

The figure below shows the relation between the negative/positive offset side setups and the upper/lower results in the MSR and LTE-Advanced FDD/TDD Mode.



Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:SIDE NEGative | BOTH | POSitive,NEGative | BOTH | POSitive,NEGative | BOTH | POSitive,NEGative | BOTH | POSitive,NEGative | BOTH | POSitive,NEGative | BOTH | POSitive` `[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:SIDE?`
Example	`:ACP:OFFS:INN:LIST:SIDE BOTH` `:ACP:OFFS:INN:LIST:SIDE?`
Notes	OFFSet1 is for BTS, 2 for MS. Default is BTS If you set `POS` or `NEG` in an offset, result of the inactive side returns -999
Preset	`BOTH, BOTH, BOTH, BOTH, BOTH, BOTH | BOTH, BOTH, BOTH, BOTH, BOTH, BOTH`
State Saved	Saved in instrument state
Range	`NEGative|BOTH|POSitive`

Method

Enables you to turn RRC filtering of each offset on or off. The value (roll off) for the filter will be set to the value of the Filter Alpha parameter.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:FILTer[:RRC][:STATe] ON | OFF | 1 | 0, ON | OFF | 1 | 0, ON | OFF | 1 | 0, ON | OFF | 1 | 0, ON | OFF | 1 | 0, ON | OFF | 1 | 0` `[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:FILTer[:RRC][:STATe]?`
Example	`:ACP:OFFS:INN:LIST:FILT 1,0,0` `:ACP:OFFS:INN:LIST:FILT?`
Notes	`1|ON` = RRC Weighted, `0|OFF` = Integ BW
Preset	LTEAFDD: 1,1,1,1,1,1|1,1,1,1,1,1 MSR, LTEATDD, 5G NR: 0,0,0,0,0,0|0,0,0,0,0,0

State Saved	Saved in instrument state
Range	Integ BW|RRC Weighted

Filter Alpha

Sets the alpha value for the RRC Filter for each offset.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:FILTer:ALPHa <real>, <real>, <real>, <real>, <real>, <real>` `[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:FILTer:ALPHa?`
Example	`:ACP:OFFS:INN:LIST:FILT:ALPH 0.5,0.5,0.5,0.5,0.5,0.5` `:ACP:OFFS:INN:LIST:FILT:ALPH?`
Preset	0.22,0.22,0.22,0.22,0.22,0.22|0.22,0.22,0.22,0.22,0.22,0.22
State Saved	Saved in instrument state
Min/Max	0.01/1.00

Offset Freq

This column is the same as on the main **Inner Offset** menu tab. See "Offset Freq" on page 1204

Res BW

Sets the resolution bandwidth. If an unavailable bandwidth is entered with the numeric keypad, the closest available bandwidth is selected.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:RESolution:AUTO ON | OFF | 1 | 0, ON | OFF | 1 | 0, ON | OFF | 1 | 0, ON | OFF | 1 | 0, ON | OFF | 1 | 0, ON | OFF | 1 | 0` `[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:RESolution:AUTO?`

Example	`:ACP:OFFS2:INN:LIST:BAND:RES 220kHz,220kHz,220kHz,220kHz,220kHz,220kHz`
	`:ACP:OFFS2:INN:LIST:BAND:RES?`
	`:ACP:OFFS2:INN:LIST:BAND:RES:AUTO 1,1,1,1,1,1`
	`:ACP:OFFS2:INN:LIST:BAND:RES:AUTO?`

Notes	Offset subopcode. 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS
Dependencies	When **Meas Method** is RBW, FAST or Fast Power, this control is grayed out and disabled. If the cell is pressed, an advisory message is generated. If the equivalent SCPI remote command is sent, a "Setting conflict" warning is generated
Couplings	When Res BW Mode is AUTO, this value is exactly the same as Res BW under the **BW** key. When you

	change this value, Res BW Mode is also changed to Man
Preset	100 kHz,100 kHz,100 kHz,100k Hz,100 kHz|100 kHz,100 kHz,100 kHz,100 kHz,100 kHz,100 kHz 1, 1, 1, 1, 1, 1
State Saved	Saved in instrument state Yes
Min/Max	1 Hz/8 MHz

Video BW

Enables you to change the instrument post-detection filter (VBW).

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:VIDeo:AUTO OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1` `[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:VIDeo:AUTO?`

Example	`:ACP:OFFS2:INN:LIST:BAND:VID 5MHz,5MHz,5MHz,5MHz,5MHz,5MHz`
	`:ACP:OFFS2:INN:LIST:BAND:VID?`
	`:ACP:OFFS2:INN:LIST:BAND:VID:AUTO 0,0,0,0,1,1`
	`:ACP:OFFS2:INN:LIST:BAND:VID:AUTO?`

Notes	The values shown in this table reflect the conditions after a Mode Preset Offset subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS
Dependencies	When **Meas Method** is RBW, FAST or Fast Power, this cell is grayed-out and disabled. If the cell is pressed, an advisory message is generated. If the equivalent remote command is sent, a "Setting conflict" warning is generated
Preset	1 MHz,1 MHz,1 MHz,1 MHz,1 MHz,1 MHz `ON, ON, ON, ON, ON, ON`
State Saved	Yes Yes
Min/Max	1 Hz/50 MHz

Filter Type

Selects the type of bandwidth filter that is used.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:SHAPe GAUSsian | FLATtop, GAUSsian | FLATtop, GAUSsian | FLATtop, GAUSsian | FLATtop, GAUSsian | FLATtop, GAUSsian | FLATtop` `[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:SHAPe?`
Example	`:ACP:OFFS2:INN:LIST:BAND:SHAP FLAT,GAUS,GAUS,GAUS,GAUS,GAUS` `:ACP:OFFS2:INN:LIST:BAND:SHAP?`

Notes	Offset subopcode: 1 for BTS (Downlink), 2 for MS (Uplink)
Dependencies	When Res BW Mode for the offset is Auto, this cell is grayed-out and disabled. Since Res BW Mode for the offset is preset to Auto on changing **Meas Method** to RBW, FAST or Fast Power, this cell is grayed-out and disabled. If the cell is pressed, an advisory message is generated. If the equivalent remote command is sent, a "Setting conflict" warning is generated
Preset	`GAUSsian, GAUSsian, GAUSsian, GAUSsian, GAUSsian, GAUSsian`
State Saved	Saved in instrument state
Range	`GAUSsian|FLATtop`

Filter BW

Selects a Gaussian filter based on its –3 dB (Normal) bandwidth or its –6 dB bandwidth.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:TYPE DB3 | DB6, DB3 | DB6, DB3 | DB6, DB3 | DB6, DB3 | DB6, DB3 | DB6` `[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:BANDwidth:TYPE?`
Example	`:ACP:OFFS2:INN:LIST:BAND:TYPE DB3,DB3,DB3,DB3,DB3,DB3` `:ACP:OFFS2:INN:LIST:BAND:TYPE?`
Notes	Offset subopcode: 1 for BTS (Downlink), 2 for MS (Uplink)
Dependencies	When Filter Type if `FLATtop` or Res BW Mode for the offset is Auto, this cell is grayed-out and disabled. Since Res BW Mode for the offset is preset to Auto on changing **Meas Method** to RBW, FAST or Fast Power, this cell is grayed-out and disabled too. If the cell is pressed, an advisory message is generated. If the equivalent remote command is sent, a "Setting conflict" warning is generated
Preset	`DB3, DB3, DB3, DB3, DB3, DB3`
State Saved	Saved in instrument state
Range	–3 dB (Normal)| –6 dB

Power Ref Type

Enables you to set reference types of inner offsets.

`CUMulative` Cumulated power of the upper and lower sub-block carriers is the reference level. This selection is effective only when one of the following "Power Ref" on page 1217 values is selected:

Left & Right Carriers	`LRCarriers`
Max Power Carrier in Sub-block	`MPCSubblock`
Min Power Carrier in Sub-block	`MINSubbloc`
Left & Right Sub-blocks	`LRSubblocks`
Manual	`MANual`

When one of the other **Power Ref** values is selected, carrier powers are not cumulated and the reference level is equivalent to Normal

NORMal	Power of specified carrier or the manual reference level is the reference level

Remote Command	[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:PREFerence CUMulative | NORMal, CUMulative | NORMal, CUMulative | NORMal, CUMulative | NORMal, CUMulative | NORMal, CUMulative | NORMal [:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:PREFerence?
Example	:ACP:OFFS:INN:LIST:PREF CUM,CUM,NORM,NORM,NORM,NORM :ACP:OFFS:INN:LIST:PREF?
Preset	NORMal, NORMal, NORMal, NORMal, NORMal, NORMal
State Saved	Saved in instrument state
Range	CUMulative|NORMal

Remote Command	[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:PREFerence:AUTO OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1, OFF | ON | 0 | 1 [:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:PREFerence:AUTO?
Example	:ACP:OFFS:INN:LIST:PREF:AUTO OFF,OFF,OFF,OFF,OFF,OFF :ACP:OFFS:INN:LIST:PREF:AUTO?
Dependencies	This is available only in LTE/LTE-Advanced FDD/TDD and 5G NR ACP measurement
Couplings	When in the LTE-Advanced FDD/TDD mode, the inner power ref type is set automatically when the power ref type state is auto according to the scopes of the sub-block gap in the following table

Sub-block Gap	Inner ACP offset	Power Ref Type
Wgap <5MHz	1st (2.5MHz)	Normal
	2nd (7.5MHz)	Normal
5MHz≤ Wgap <10MHz	1st (2.5MHz)	Cumulative
	2nd (7.5MHz)	Normal
10MHz≤ Wgap <15MHz	1st (2.5MHz)	Cumulative
	2nd (7.5MHz)	Cumulative
15MHz≤ Wgap <20MHz	1st (2.5MHz)	Normal
	2nd (7.5MHz)	Cumulative
20MHz≤ Wgap	1st (2.5MHz)	Normal
	2nd (7.5MHz)	Normal

When in the 5G NR mode, Power Ref Type “Auto” sets the power reference type of inner-ACLR offset automatically.

Downlink: “Cumulative” or “Normal” is selected accordingly when the inner-offsets are configured to meet the test requirements as follows:

FR1, 3GPP TS 38.141-1 v16.5.0 (2020-09) Section 6.6.3.5.3 BS type 1-C:

	– Table 6.6.3.5.2-3: Base Station ACLR limit in non-contiguous spectrum or multiple bands – Table 6.6.3.5.2-4: Base station CACLR limit FR2, 3GPP TS 38.141-2 v16.5.0 (2020-09) Section 6.7.3.5.3 BS type 2-O: – Table 6.7.3.5.2-3: BS type 2-O ACLR limit in non-contiguous spectrum – Table 6.7.3.5.2-4: BS type 2-O CACLR limit in non-contiguous spectrum Uplink: “Normal” is always selected.

Limit Test

This checkbox is the same as the **Limit Test** control on the **Meas Setup**, **Settings** tab. See "Limit Test" on page 1197.

Offset Freq

This column is the same as the **Offset Freq** column on the **Offset** index tab, see "Offset Freq" on page 1189.

Abs Limit

Enters an absolute limit value, which sets the absolute amplitude levels to test against for each of the custom offsets. The list must contain six (6) entries. If there is more than one offset, the offset closest to the carrier channel is the first one in the list. `[:SENSe]:ACP:OFFSet[n]:INNer:LIST:TEST` selects the type of testing to be done at each offset.

You can turn off (not use) specific offsets with the `[:SENSe]:ACP:OFFSet[n]:INNer:LIST:STATe` command.

The query returns the six (6) sets of real numbers that are the current absolute amplitude test limits.

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:ABSolute <real>, <real>, <real>, <real>, <real>, <real>` `[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:ABSolute?`
Example	`:ACP:OFFS2:INN:LIST:ABS -10,-10,-10,-10,-10,-10` `:ACP:OFFS2:INN:LIST:ABS?`
Notes	Offset subopcode. 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS
Preset	-8.45, -8.45, -8.45, -8.45, -8.45, -8.45 | -50.0, -50.0, -50.0, -50.0, -50.0, -50.0

	5G NR: -2.2, -2.2, -2.2, -2.2, -2.2, -2.2|-50.0,-50.0,-50.0,-50.0,-50.0,-50.0
State Saved	Saved in instrument state
Min/Max	-200.0 dBm/50.0 dBm

Rel Limit (Car)

Enters a relative limit value for the carrier level. This sets the amplitude levels to test against for the specified offsets.

The amplitude level is relative to the carrier amplitude. If multiple offsets are available, the list contains six (6) entries. The offset closest to the carrier channel is the first one in the list.

`[:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:TEST` selects the type of testing to be done at each offset.

You can turn off (not use) specific offsets with the `[:SENSe]:ACP:OFFSet[n][:OUTer]:LIST:STATe` command.

The query returns the six (6) sets of real numbers that are the current amplitude test limits, relative to the carrier, for each offset.

Offset[n] n = 1 is base station and n = 2 is mobiles. The default is base station (1).

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:RCARrier <real>, <real>, <real>, <real>, <real>, <real>` `[:SENSe]:ACPower:OFFSet[1]|2[:OUTer]:LIST:RCARrier?`
Example	`:ACP:OFFS2:LIST:RCAR 0,0,0,0,0,0` `:ACP:OFFS2:LIST:RCAR?`
Notes	Offset subopcode. 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Some modes do not support Offset subopcode 2. In those cases, commands with subopcode 2 are accepted without error but ignored
Preset	SA: -45, -60, 0, 0, 0, 0|-45, -60, 0, 0, 0, 0 WCDMA: -44.2, -49.2, -49.2, -49.2, -49.2, -49.2|-32.2, -42.2, -42.2, -42.2, -42.2, -42.2 LTE, LTETDD, LTEAFDD,LTEATDD, MSR: -44.2, -44.2, -44.2, -44.2, -44.2, -44.2|-29.2, -29.2, -29.2, -29.2, -29.2, -29.2 5G NR: -43.8, -43.8, -43.8, -43.8, -43.8, -43.8|-29.2, -29.2, -29.2, -29.2, -29.2, -29.2 Radio Test: -60, -60, -60, 0, 0, 0
State Saved	Saved in instrument state
Min/Max	-150/50.0
Backwards Compatibility SCPI	`[:SENSe]:MCPower:OFFSet[1]|2:LIST:RCARrier`

Rel Limit (PSD)

Enters a relative limit value for the level of the power spectral density. This sets the amplitude levels to test against for any custom offsets. The amplitude level is relative to the power spectral density. If multiple offsets are available, the list contains six (6) entries. The offset closest to the carrier channel is the first one in the list.

`[:SENSe]:ACP:OFFSet[n]:INNer:LIST:TEST` selects the type of testing to be done at each offset.

You can turn off (not use) specific offsets with the `[:SENSe]:ACP:OFFSet[n]:INNer:LIST:STATe` command.

The query returns the six (6) sets of real numbers that are the current amplitude test limits, relative to the power spectral density, for each offset.

Offset[n] n = 1 is base station and n = 2 is mobiles. The default is base station (1).

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:RPSDensity <rel_ampl>, <rel_ampl>, <rel_ampl>, <rel_ampl>, <rel_ampl>, <rel_ampl>` `[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:RPSDensity?`
Example	`:ACP:OFFS2:INN:LIST:RPSD 10,10,10,10,10,10` `:ACP:OFFS2:INN:LIST:RPSD?`
Notes	Offset subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS
Preset	0, 0, 0, 0, 0, 0|0, 0, 0, 0, 0, 0
State Saved	Saved in instrument state
Min/Max	-150.0 dB/50.0 dB

Fail Mask

Accesses a menu that enables you to select one of the logics for the fail conditions between the measurement results and the test limits. The setting defines the type of testing to be done at any custom offset frequencies. The measured powers are tested against the absolute values defined with `[:SENSe]:ACP:OFFSet[n]:INNer:LIST:ABSolute`, or the relative values defined with `[:SENSe]:ACP:OFFSet[n]:INNer:LIST:RPSDensity` and `[:SENSe]:ACP:OFFSet[n]:INNer:LIST:RCARrier`.

You can turn off (not use) specific offsets with the `[:SENSe]:ACP:OFFSet[n]:INNer:LIST:STATe` command.

- Absolute – Fail is shown if one of the absolute ACP measurement results is larger than the limit for Abs Limit
- Relative – Fail is shown if one of the relative ACP measurement results is larger than the limit for Rel Lim (Car) or Rel Lim (PSD)

- Abs AND Rel – Fail is shown if one of the absolute ACP measurement results is larger than the limit for Abs Limit *and* one of the relative ACP measurement results is larger than the limit for Rel Lim (Car) or Rel Lim (PSD)
- Abs OR Rel– Fail is shown if one of the absolute ACP measurement results is larger than the limit for Abs Limit *or* one of the relative ACP measurement results is larger than the limit for Rel Lim (Car) or Rel Lim (PSD)

Remote Command	`[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:TEST ABSolute | AND | OR | RELative, ABSolute | AND | OR | RELative, ABSolute | AND | OR | RELative, ABSolute | AND | OR | RELative, ABSolute | AND | OR | RELative, ABSolute | AND | OR | RELative` `[:SENSe]:ACPower:OFFSet[1]|2:INNer:LIST:TEST?`
Example	`:ACP:OFFS2:INN:LIST:TEST ABS,ABS,ABS,ABS,ABS,ABS` `:ACP:OFFS2:INN:LIST:TEST?`
Notes	Offset subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS
Preset	`AND, AND, AND, AND, AND, AND | AND, AND, AND, AND, AND, AND`
State Saved	Saved in instrument state
Range	Absolute|Relative|Abs AND Rel (fail if both fail)|Abs OR Rel (fail if either fails)

Reference Carrier (Carrier Index)

Sets the reference carrier. Relative power measurements are made from the reference carrier.

If set to Auto, the measurement selects the carrier with the highest power as the reference carrier and the Ref Carrier parameter is updated. If a value is entered when Ref Carrier Mode is set to Auto, the mode changes to Man.

If set to Man, the value that you enter for the Ref Carrier is used as the reference carrier.

In MSR, LTE-A FDD/TDD and 5G NR modes, this control is called **Carrier Index** and has a different SCPI command. In these modes, it sets the carrier index of the reference power. The power of the carrier selected by this index becomes reference power when Power Ref is Carrier Index. Any value up to the MAX can be set though the measurement only deals with number of carriers specified by Carrier. If the index is larger than Carrier, reference power in this measurement becomes NaN and therefore all relative power results are NaN.

For more information, see "Carrier Index (Modes: MSR, LTEAFDD, LTEATDD, and 5GNR)" on page 1215.

Remote Command	`[:SENSe]:ACPower:CARRier[1]|2:RCARrier <integer>`
	`[:SENSe]:ACPower:CARRier[1]|2:RCARrier?`
	`[:SENSe]:ACPower:CARRier[1]|2:RCARrier:AUTO OFF | ON | 0 | 1`

	[:SENSe]:ACPower:CARRier[1]|2:RCARrier:AUTO?
Example	:ACP:CARR:RCAR 1 :ACP:CARR:RCAR? :ACP:CARR:RCAR:AUTO OFF :ACP:CARR:RCAR:AUTO?
Notes	Carrier subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Note that Carrier subopcode 2 is not supported in some Modes. In those cases, Carrier subopcode 1 is used for both BTS and MS and commands with subopcode 2 are accepted without error but ignored For LTE-Advanced FDD/TDD modes, this control is not shown. In order to maintain backwards compatibility with the legacy LTE FDD/TDD modes, the SCPI command is supported in the LTE & LTE-A converged application
Dependencies	If there is only one carrier, this control is grayed out This control does not appear in the MSR, LTE-A FDD/TDD and 5G NR modes
Couplings	If you enter a carrier value that is currently configured as having no power present, that carrier will be changed to having power present If you enter a ref carrier this parameter will be set to manual
Preset	Auto determined 1
State Saved	Saved in instrument state Yes
Range	Auto|Man
Min/Max	1/Number of available carriers
Backwards Compatibility SCPI	[:SENSe]:MCPower:RCARrier[1]|2 [:SENSe]:MCPower:RCARrier[1]|2:AUTO (Power Suite)

Carrier Index (Modes: MSR, LTEAFDD, LTEATDD, and 5GNR)

Remote Command	[:SENSe]:ACPower:CARRier[1]|2:INDex <integer> [:SENSe]:ACPower:CARRier[1]|2:INDex?
Example	:ACP:CARR:IND 1 :ACP:CARR:IND?
Notes	Carrier subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Note that Carrier subopcode 2 is not supported in some Modes. In those cases, Carrier subopcode 1 is used for both BTS and MS and commands with subopcode 2 are accepted without error but ignored
Dependencies	This control only appears in the MSR, LTE-A FDD/TDD and 5G NR modes

Preset	1
State Saved	Saved in instrument state
Min/Max	LTE-A: 1/Dependent on Num Component Carriers 5G NR: 1/Dependent on Num Component Carriers MSR: 1/100

Ref Carrier Freq

Sets the reference carrier frequency.

Remote Command	`[:SENSe]:ACPower:CARRier[1]|2:RCFRequency <freq>`
	`[:SENSe]:ACPower:CARRier[1]|2:RCFRequency?`
	`[:SENSe]:ACPower:CARRier[1]|2:RCFRequency:AUTO OFF | ON | 0 | 1`
	`[:SENSe]:ACPower:CARRier[1]|2:RCFRequency:AUTO?`

Example	`:ACP:CARR:RCFR 250 MHz`
	`:ACP:CARR:RCFR?`
	`:ACP:CARR:RCFR:AUTO OFF`
	`:ACP:CARR:RCFR:AUTO?`

Notes	Carrier subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Note that Carrier subopcode 2 is not supported in some Modes. In those cases, Carrier subopcode 1 is used for both BTS and MS and commands with subopcode 2 are accepted without error but ignored For LTE-Advanced FDD/TDD modes, this control is not shown. In order to maintain backwards compatibility with the legacy LTE FDD/TDD modes, the SCPI command is supported in the LTE & LTE-A converged application
Dependencies	This control does not appear in the MSR, LTE-A FDD/TDD and 5G NR modes
Couplings	LTE-Advanced FDD/TDD do not support the following couplings Coupled to the Center Frequency If the center frequency changes, the Ref Carrier Frequency is calculated using the following three steps; 1. Ref Freq1 = Ctr Freq - (Total of all Carrier Widths / 2) 2. Ref Freq2 = Ref Freq1 + (Total of all Carrier Widths up to Ref Carrier) 3. Ref Freq = Ref Freq2 + (0.5 * Carrier Width of Ref Carrier) If reference carrier frequency changes the Center Frequency is calculated using the following three steps; 1. Ctr Freq1 = Ref Freq - (0.5 * Carrier Width of Ref Carrier) 2. Ctr Freq2 = Ctr Freq1 - (Total of all Carrier Widths up to Ref Carrier)

	3. Ctr Freq = Ctr Freq2 + (Total of all Carrier Widths / 2) This ensures that the carriers are always centered on the screen If there is only one carrier present, the Reference Carrier Frequency will be the same as the Center Frequency
Preset	Calculated based on the current Center Frequency ON
State Saved	Saved in instrument state Yes
Range	Auto|Man
Min/Max	-79.999995 MHz/Hardware Dependent: – Option 503 = 3.699999995 GHz – Option 508 = 8.499999995 GHz – Option 513 = 13.799999995 GHz – Option 526 = 26.999999995 GHz
Backwards Compatibility SCPI	`[:SENSe]:MCPower:RCFRequency[1]|2 (Power Suite)` `[:SENSe]:MCPower:RCFRequency[1]|2:AUTO`

Measurement Type

Changes the reference used for the measurement. This allows you to make absolute and relative power measurements of either total power or the power normalized to the measurement bandwidth.

- Total Pwr Ref (`TPRef`) sets the reference to the total carrier power
- PSD Ref (`PSDRef`) sets the reference to the power spectral density of the carrier

Remote Command	`[:SENSe]:ACPower:TYPE TPRef | PSDRef` `[:SENSe]:ACPower:TYPE?`
Example	`:ACP:TYPE PSDR` `:ACP:TYPE?`
Preset	`TPRef`
State Saved	Saved in instrument state
Range	Total Power Ref|PSD Ref

Power Ref

Selects the power reference type. This control has two different forms, depending on the currently-selected Mode:

– "Power Ref (Modes: SA, WCDMA, VMA, SRComms)" on page 1218

– "Power Ref (Modes: LTE-A FDD/TDD, 5G NR, MSR)" on page 1218

Power Ref (Modes: SA, WCDMA, VMA, SRComms)

Type	Option	Description
Ref Carrier	`RCARrier`	Power of the specified carrier is the reference of measurement. Use the Reference Carrier control to select Carrier Index
Manual Power	`MANual`	Power or PSD specified by the user is the reference of measurement
Total Multicarriers	`TMCarriers`	Total Power of multi carriers is the power reference of measurement. Each carrier power is calculated with its own carrier configuration settings

Remote Command	`[:SENSe]:ACPower:CARRier[1]|2:PREFerence:TYPE RCARrier	MANual	TMCarriers` `[:SENSe]:ACPower:CARRier[1]|2:PREFerence:TYPE?`
Example	`:ACP:CARR:PREF:TYPE RCARrier` `:ACP:CARR:PREF:TYPE?`
Notes	This command is available only in SA, WCDMA, VMA and Short Range Comms Carrier subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Note that Carrier subopcode 2 is not supported in some Modes. In those cases, Carrier subopcode 1 is used for both BTS and MS and commands with subopcode 2 are accepted without error but ignored
Preset	`RCARrier`
State Saved	Saved in instrument state
Range	Reference Carrier | Manual Power | Total Multicarriers

Power Ref (Modes: LTE-A FDD/TDD, 5G NR, MSR)

Selects the power reference type:

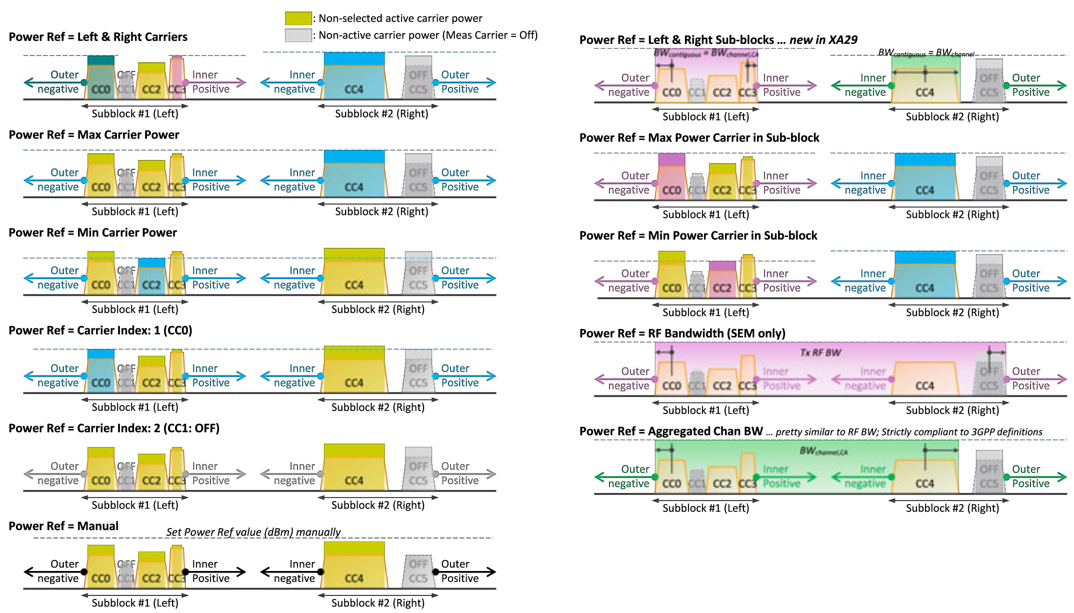
Type	Option	Description
Left & Right Carriers	`LRCarriers`	Powers of leftmost and rightmost carriers with Measure Carrier On in a sub-block are the references of left and right sides respectively. Left and right carriers are determined based on the carrier center frequencies. If Measure Carriers of all the carriers in a sub-block are off, the reference power in a sub-block and all the relative power results are NaN. Relative limits are not evaluated

Type	Option	Description
Max Power Carrier	MPCarrier	Maximum carrier power among the carriers of Measure Carrier On is the reference of measurement. If Measure Carriers of all the carriers are off, the reference power and all the relative power results are NAN. Relative limits are not evaluated
Min Power Carrier 5G NR only	MINPcarrier	Minimum carrier power among the carriers of Measure Carrier On is the reference of measurement. If Measure Carriers of all the carriers are off, the reference power and all the relative power results are NAN. Relative limits are not evaluated
Carrier Index	CINDex	Power of the specified carrier is the reference of measurement. If Measure Carriers of this carrier index is off, the reference power and all the relative power results are NAN. Relative limits are not evaluated
Manual	MANual	Power or PSD specified by the user is the reference of measurement
Aggregated Chan BW LTE-A and 5G NR only	ACBandwidth	The assigned aggregated channel bandwidth power which is measured with a rectangular filter with measurement bandwidth specified as aggregated channel bandwidth based on the definition of each 3GPP standard. Calculated from the carrier configuration including SCS (Power Meas), the smallest SCS among the enabled SCSs of the selected component carrier. If Measure Carriers of all the carriers are off, the reference power and all the relative power results are NAN. Relative limits are not evaluated
Max Power Carrier in Sub-block	MPCSubblock	Maximum carrier power among the sub-block carriers of Measure Carrier On is the reference of measurement. If Measure Carriers of all the carriers in a sub-block are off, the reference power of the sub-block and all the relative power results referring to this sub-block are NAN, and these relative limits are not evaluated
Total Multicarriers MSR only	TMCarriers	Total power of multi carriers is the power reference of measurement. Each carrier power is calculated with its own carrier configuration settings
Min Power Carrier in Sub-block 5G NR only	MINSubbloc	Minimum carrier power among the sub-block carriers of Measure Carrier On is the reference of measurement. If Measure Carriers of all the carriers in a sub-block are off, the reference power of the sub-block and all the relative power results referring to this sub-block are NAN, and these relative limits are not evaluated
Left & Right Sub-blocks 5G NR only	LRSubblocks	The reference depends on the number of Component Carriers (CC) and Carrier Allocation as follows: – Num of CC is 1: the carrier power is the reference – Num of CC is 2 or more & Carrier Allocation is Contiguous: Aggregated Channel power is the reference

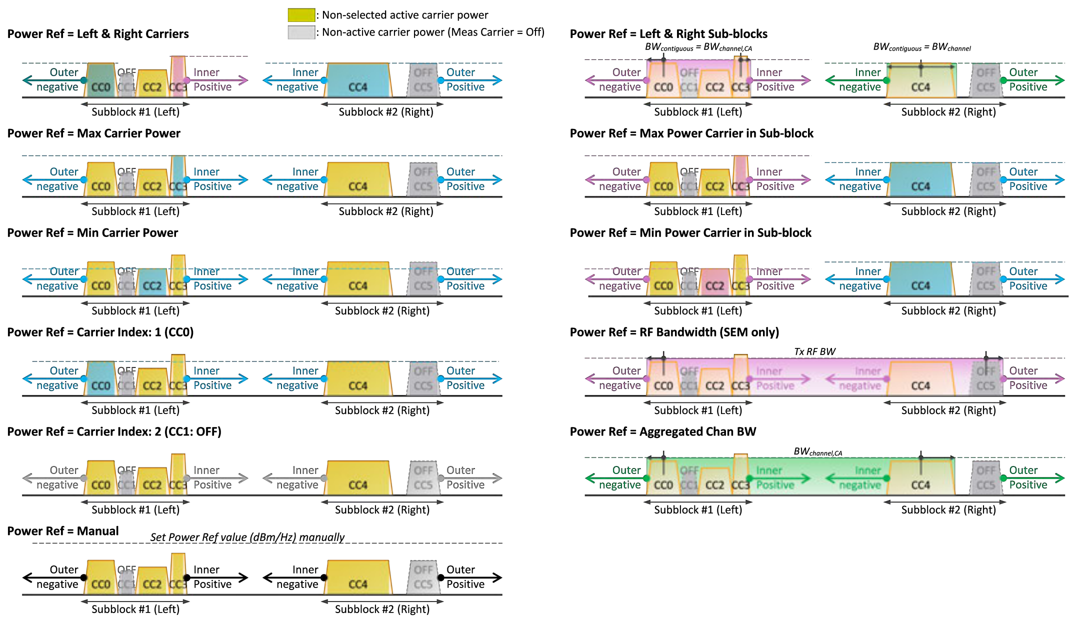
Type	Option	Description
		– Num of CC is 2 or more & Carrier Allocation is Non-Contiguous: Aggregated powers of left and right sub-blocks are the references. Left and right sub-blocks are determined by component carrier configuration

The powers of carriers are not included in the reference power when their Measure Carriers are Off. When Measure Carriers of all the carriers in a sub-block are Off, the reference power and all the relative power results are NaN. Therefore, relative limits are not evaluated.

Meas Type = Total Power Ref



Meas Type = PSD Ref



Remote Command	`[:SENSe]:ACPower:CARRier[1]|2:PREFerence:TYPE LRCarriers | MPCarrier | CINDex | MANual | MPCSubblock | ACBandwidth | TMCarriers | MINPcarrier | MINSubblock | LRSubblocks` `[:SENSe]:ACPower:CARRier[1]|2:PREFerence:TYPE?`
Example	`:ACP:CARR:PREF:TYPE CIND` `:ACP:CARR:PREF:TYPE?`
Notes	This command is available only in the MSR, LTE-A FDD/TDD and 5G NR modes `ACBandwidth` is available only in LTE-A and 5G NR `TMCarriers` is available only in MSR `MINPcarrier,MINSubblock`, and `LRSubblocks` are available only in 5G NR Carrier subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Note that Carrier subopcode 2 is not supported in some Modes. In those cases, Carrier subopcode 1 is used for both BTS and MS and commands with subopcode 2 are accepted without error but ignored
Preset	`MPCarrier`
State Saved	Saved in instrument state

Power Ref State SCPI Only

Remote Command	`[:SENSe]:ACPower:CARRier[1]|2:AUTO[:STATe] OFF | ON | 0 | 1` `[:SENSe]:ACPower:CARRier[1]|2:AUTO[:STATe]?`
Example	`:ACP:CARR:AUTO OFF`

	:ACP:CARR:AUTO?
Preset	ON
State Saved	Saved in instrument state
Range	Auto|Man
Backwards Compatibility SCPI	[:SENSe]:MCPower:CARRier[1]|2:AUTO[:STATe]

Total Power Ref

Sets manual total power reference.

This control has two different forms, depending on the currently-selected Mode:

– "Total Power Ref (Modes: SA, WCDMA, VMA, SRComms)" on page 1222

– "Total Power Ref (Modes: LTE-A FDD/TDD, 5G NR, MSR)" on page 1223

Total Power Ref (Modes: SA, WCDMA, VMA, SRComms)

This is used when Power Ref is Manual and Meas Type is Total Power.

Remote Command	[:SENSe]:ACPower:CARRier[1]|2[:POWer] <real> [:SENSe]:ACPower:CARRier[1]|2[:POWer]?
Example	:ACP:CARR 10 :ACP:CARR?
Notes	Although the default value is defined, the value is recalculated by the measurement result just after measurement Carrier subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Note that Carrier subopcode 2 is not supported in some Modes. In those cases, Carrier subopcode 1 is used for both BTS and MS and commands with subopcode 2 are accepted without error but ignored The Unit Terminators differ depending on whether or not the mode supports Y Axis Unit and also which Y Axis Unit is selected
Dependencies	This control is available only when **Meas Type** is TPRef. If **Meas Type** is not TPRef, this is grayed-out
Preset	0.0
State Saved	Saved in instrument state
Min/Max	-200 dBm/200 dBm
Backwards Compatibility SCPI	[:SENSe]:MCPower:CARRier[1]|2[:POWer]

Total Power Ref (Modes: LTE-A FDD/TDD, 5G NR, MSR)

Sets the multi-carrier power reference. This is used when Power Ref is Manual and Meas Type is Total Power.

When set to Auto, the carrier power result reflects the measured power value in the selected reference carrier.

When set to Man, the result is referenced to the last measured value, or you may specify the reference for the multi-carrier power measurement. Relative values are displayed, referenced to the “Power Reference” value.

Remote Command	`[:SENSe]:ACPower:CARRier[1]|2[:POWer] <real>` `[:SENSe]:ACPower:CARRier[1]|2[:POWer]?`
Example	`:ACP:CARR 10` `:ACP:CARR?`
Notes	Although the default value is defined, the value is recalculated by the measurement result just after measurement Carrier subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Note that Carrier subopcode 2 is not supported in some Modes. In those cases, Carrier subopcode 1 is used for both BTS and MS and commands with subopcode 2 are accepted without error but ignored The Unit Terminators differ depending on whether or not the mode supports Y Axis Unit and also which Y Axis Unit is selected
Dependencies	This control is enabled when Measurement Type is Total Power and Power Ref is Manual
Preset	0.0
State Saved	Saved in instrument state
Min/Max	-200 dBm/200 dBm
Backwards Compatibility SCPI	`[:SENSe]:MCPower:CARRier[1]|2[:POWer]`

PSD Ref

Sets manual PSD reference.

This control has two different forms, depending on the currently-selected Mode:

– "PSD Ref (Modes: SA, WCDMA, VMA, SRComms)" on page 1223

– "PSD Ref (Modes: LTEAFDD, LTEATDD, 5GNR, MSR)" on page 1225

PSD Ref (Modes: SA, WCDMA, VMA, SRComms)

This is used when Power Ref is Manual and Meas Type is PSD.

Sets the power spectral density in the carrier (main channel) that is used to compute the relative power spectral density values for the offsets when Meas Type is set to PSD Ref.

Remote Command	`[:SENSe]:ACPower:CARRier[1]|2:CPSD <real>` `[:SENSe]:ACPower:CARRier[1]|2:CPSD?`
Example	`:ACP:CARR:CPSD 25` `:ACP:CARR:CPSD?`
Notes	Although the default value is defined, the value is recalculated by the measurement result just after measurement Carrier subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Note that Carrier subopcode 2 is not supported in some Modes. In those cases, Carrier subopcode 1 is used for both BTS and MS and commands with subopcode 2 are accepted without error but ignored
Dependencies	This control is available only when Meas Type is `PSDRef`. If **Meas Type** is not `PSDRef`, this is grayed-out
Couplings	The value of PSD Ref is automatically converted when PSD Unit is changed
Preset	0.0
State Saved	Saved in instrument state
Min/Max	-999/999

Power Ref State (Backwards Compatibility SCPI)

Sets the Power Reference State to auto or manual.

Example	`:ACP:CARR:AUTO OFF`
	`:ACP:CARR:AUTO?`
	`:MCP:CARR:AUTO ON`
	`:MCP:CARR:AUTO?`

Notes	For backwards compatibility with legacy SA and WCDMA, this command is supported When the mode is `ON`, it corresponds to the Ref Carrier of the Power Ref selection When the mode is `OFF`, it corresponds to the Manual of the Power Ref selection
Preset	`ON`
State Saved	Saved in instrument state
Range	Auto|Man

Backwards Compatibility SCPI	`[:SENSe]:ACPower:CARRier[1]|2:AUTO[:STATe] OFF | ON | 0 | 1`
	`[:SENSe]:ACPower:CARRier[1]|2:AUTO[:STATe]?`
	`[:SENSe]:MCPower:CARRier[1]|2:AUTO[:STATe] OFF | ON | 0 | 1`
	`[:SENSe]:MCPower:CARRier[1]|2:AUTO[:STATe]?`

PSD Ref (Modes: LTEAFDD, LTEATDD, 5GNR, MSR)

Sets manual PSD reference. This is used when Power Ref is **Manual** and Meas Type is **PSD**.

Sets the power spectral density in the carrier (main channel) that is used to compute the relative power spectral density values for the offsets when Meas Type is set to **PSD Ref**. When the **PSD Ref** state is set to **Auto**, this will be set to the measured carrier power spectral density.

Remote Command	`[:SENSe]:ACPower:CARRier[1]|2:CPSD <real>` `[:SENSe]:ACPower:CARRier[1]|2:CPSD?`
Example	`:ACP:CARR:CPSD 25` `:ACP:CARR:CPSD?`
Notes	Although the default value is defined, the value is recalculated by the measurement result just after measurement Carrier subopcode: 1 for BTS (Downlink), 2 for MS (Uplink). Default is BTS Note that Carrier subopcode 2 is not supported in some Modes. In those cases, Carrier subopcode 1 is used for both BTS and MS and commands with subopcode 2 are accepted without error but ignored
Dependencies	This control is enabled when **Measurement Type** is PSD Reference and **Power Ref** is Manual
Couplings	The value of PSD is automatically converted when PSD Unit is changed
Preset	0.0
State Saved	Saved in instrument state
Min/Max	-999/999

PSD Unit

Sets the unit bandwidth for Power Spectral Density. The available units are dBm/Hz and dBm/MHz.

Remote Command	`:UNIT:ACPower:POWer:PSD DBMHZ | DBMMHZ` `:UNIT:ACPower:POWer:PSD?`
Example	`:UNIT:ACP:POW:PSD DBMMHZ` `:UNIT:ACP:POW:PSD?`
Dependencies	This control is enabled when Measurement Type is PSD Reference
Couplings	When the PSD unit is changed, the PSD reference result of the “MEAS|READ|FETCH:ACP[n]?” is also changed by the PSD unit basis (in either dBm/Hz or dBm/MHz)
Preset	`DBMHZ`
State Saved	Saved in instrument state
Range	dBm/Hz|dBm/MHz

3.9.8.3 Radio

The Radio tab contains controls to select the Radio Device, and enable or disable HSPA/HSPA+ options.

Radio Device

Allows you to specify the device to be used.
