5.2. Setup

5.2.1. Recalling a State File
This section describes how to recall a state file of the E5071C that includes all the measurement settings for USB Type-C connectors and cable assemblies compliance tests. The state file can be downloaded at: http://www.keysight.com/find/ena-tdr_compliance
Copy the state file into the E5071C’s directory via USB mass storage device and recall the state file using the TDR software. Necessary parameters for testing are automatically set up in the E5071C. Refer to Appendix for the details about manual setup. If TDR setup wizard is shown, click Close button in the TDR setup wizard main window.

1. Open Setup tab.
2. Click Advanced Mode to show the dialog box.
3. A dialog box appears requesting for confirmation. Then click Yes. (Uncheck “Use Advanced Calibration Methods”)
4. Click File and select Recall State.
5. Specify a folder and a file name, and click Open.

The E5071C’s channel 1 is used for time-domain measurements by using the TDR software displayed at the bottom of the E5071C’s screen. The channel 2 is used for frequency-domain measurements by using the hard keys on the front panel and the soft keys on the right side of the screen.
5.2.2. Saving a State File
All the measurement settings including calibration information can be saved in a state file (*.tdr). After performing calibration, all necessary calibration coefficients are saved in a state file and can be recalled for the next measurements.

1. Press **Save/Recall > Save Type** and select **State & Cal** as a state file type.
2. Click **File** of the TDR software and select **Save State**.
3. Enter file name and save the state file with calibration information.
5.3. Calibration
The purpose of this step is to calibrate the RF effects such as delay, loss or mismatch of RF cables and test fixture traces before measurements. In order to remove the fixture trace effect, two calibration methods (ECal calibration & de-embedding or TRL calibration) are available with the E5071C firmware for the USB Type-C connectors and cable assemblies compliance tests.

5.3.1. ECal Calibration and De-embedding
Full calibration is performed by using the 4-port ECal Module (i.e. N4433A) at the end of RF cables connected to the E5071C’s test ports. The effect of the fixture is removed by de-embedding the fixture traces with S-parameter Touchstone files. Refer to Appendix for the details about de-embedding file creation.

5.3.1.1. Time-Domain Measurements
ECal calibration and de-embedding for time-domain measurements are performed by the TDR software.

   d) Connect the E5071C ports (port 1 to 4) to the ECal module with RF cables.
   e) Click Calibrate to perform ECal Calibration.
   f) Click Next >.

5.4.1. D+/D- Impedance

Multiple reflections from impedance mismatches cause noise at the receiver. Therefore, the impedance profile provides an indication of multiple reflection induced noise.

1. Connect the E5071C ports (port 1 to 4) to the test fixture ports with RF cables.

7. [Appendix] De-embedding File Creation using PLTS AFR

The procedure to create the de-embedding files using the Keysight Physical Layer Test System (PLTS) Automatic Fixture Removal (AFR) function and 2x Thru standard is introduced in the section.

7.1. 2x Thru Standard Measurement
1. Recall the state file as described in 5.2.1. Recalling a State File.
2. Perform the calibration using ECal as described in 5.3.1.2 Frequency-Domain Measurements > 1. ECal Calibration.
3. Connect the E5071C ports (port 1 to 4) to 2x Thru standard with RF cables as shown below (1, 2, 3, 4 are E5071C port numbers).
