Keysight Technologies
MIPI® DigRF\textsuperscript{SM} v4 (M-PHY\textsuperscript{®})
Protocol Triggering and Decode
For Infiniium Series Oscilloscope

Technical overview
MIPI® DigRF®SM v4 (M-PHY®)

MIPI serial buses are the backbone for communication in mobile products. The serial bus interface provides content-rich points for debug and test. However, since these protocols transfer bits serially, using a traditional oscilloscope has limitations. Manually converting captured 1's and 0's to protocol requires significant effort, can’t be done in real-time, and includes potential for human error. As well, traditional scope triggers are not sufficient for specifying protocol-level conditions.

Extend your scope capability with the Keysight Technologies, Inc. MIPI DigRF v4 (M-PHY) triggering and decode application. This application makes it easy to debug and test designs that include MIPI DigRF v4 buses using your Infiniium Series oscilloscope.

- Set up your scope to show MIPI DigRFv4 protocol decode in less than 1 minute.
- Get access to a rich set of integrated protocol-level triggers.
- Save time and eliminate errors by viewing packets at the protocol level.
- Use time-correlated views to quickly troubleshoot serial protocol problems back to their timing or signal integrity root cause.

1 Minute DigRF v4 decode setup

Configure your oscilloscope to display decode in under 1 minute. Use “Auto Setup” to automatically configure sample rate, memory depth, threshold and trigger levels.

Support for live and saved waveforms

Perform and view decode information on both live and saved waveforms. Decode up to any combination of four live or saved waveforms.
MIPI DigRF v4 (M-PHY) Setup, Protocol Triggering and Search Capabilities

Get access to a rich set of integrated protocol-level triggers. The application includes a suite of configurable protocol-level trigger conditions specific to MIPI DigRF v4. When serial triggering is selected, the application uses software-based triggering.

With software-based protocol triggering, the oscilloscope takes signals acquired using scope channels and reconstructs protocol frames after each acquisition. It then inspects these protocol frames against specified protocol-level trigger conditions and triggers when the condition is met.

MIPI DigRF v4 trigger and search setup

Quickly access the software-based trigger via the trigger or search menus. Software-based triggering enables quick setup of data, remote, or error frames.
MIPI DigRF v4 (M-PHY) Protocol Decode

Keysight MIPI DigRF v4 (M-PHY) protocol decoder software supports both high speed (HS-BURST) and low speed (SYS-BURST) modes on Tx and Rx packets. Also, decodes with or without cyclical redundancy check (CRC) support.

Time correlation between signal and decoded data

Quickly move between physical and MIPI DigRF v4 protocol layer information using the time-correlated tracing marker. Display protocol content using embedded decode in the waveform area, Or, see protocol events in a compact listing format. Minor tick marks indicate clock transitions. Major tick marks indicate segments of the serial packet MIPI DigRF v4 measurements are automatically time-correlated with measurement on other scope channels.

Compact protocol using the full screen listing

The protocol viewer window shows the index number, time stamp value identifier, packet type, and data values for each MIPI DigRF v4 packet. Data in the listing window can be saved to a .csv or .txt file for off-line.

SYS-BURST (Low speed) mode

With reference clock probing, Keysight MIPI DigRF v4 (M-PHY) protocol decode software support SYS-BURST mode decode along with HS-BURST (High speed) mode.

Recommended Oscilloscopes

The DigRF v4 protocol decode is compatible with Keysight Infiniium Series oscilloscopes with operating software revision 4.20 or higher. For oscilloscopes with earlier revisions, free upgrade software is available here: [www.keysight.com/find/scope-apps-sw](http://www.keysight.com/find/scope-apps-sw).
