System Description

Inverters are essential components for numerous applications since they convert voltage bi-directionally. Traction inverters convert DC voltage from a battery to AC voltage for an electric machine (such as a motor). This functionality makes inverters an important component in electromobility, as well as numerous other industrial applications.

![Diagram of components](image)

**Figure 1: Emulation of components for the independent test**

To allow flexible and reproducible tests, the electric machine can be replaced by a Scienlab Machine Emulator (ME) from Keysight. Depending on the configuration, the Machine Emulator can emulate one or more of the following machine types:

- Permanent Magnet Synchronous Machine (PMSM)
- Asynchronous Machine (ASM)
- External connection for open (user-defined) machine model

The Machine Emulator will be controlled by corresponding model parameters to emulate different kinds of machines to the inverter. The battery is not a real battery either; it is emulated by a Dynamic DC Emulator on the test bench. Furthermore, there are several opportunities to control the inverter test bench:

- PC-Software Emulator Control for manual testing
- HiL system for automated, model based, real-time testing (dSPACE, Vector, ...)
- Ethernet or EtherCAT interface for open control solutions

The Machine Emulator consists of:

- Control cabinet with Active Front End (AFE)
- Controller and power amplifiers
- Ethernet-Interface (including interface description in English)
Figure 2: Top view of Machine Emulator cabinet (75 kW to 150 kW). Two cabinets required for 300 kW.

- Protection class IP 54
- Environmental temperature: +10 to +40 °C
- Humidity: 30 to 75 % relative humidity
- Sound level according to DIN EN 3744 <70 dB(A), measured at 1 m distance on front
- 2x 230 VAC service outlets per system cabinet, accessible from the outside, door installation
- Right side door hinge
- System cabinet on rollers or base stands

**AFE (Active Front End)**

- Energy recovery
- Power factor compensation (cos φ > 0.98)
- Bi-directional power flow
- HF EMC filter, 2 kHz filter
- Verification of conformity with the limits of power-related disturbances as specified by EN61000-6-4:2007
- Galvanic isolation
- Resonant converter
Mains power supply

- Mains supply
- Functional earth (FE)
- Cable connector on the roof by EMC screw connection

Machine emulation

Real-time computer controls the electrical output variables according to the corresponding machine model

- Reference input: torque or speed
- Basic voltage accuracy: 0.5 % full scale, phase angle accuracy: typical 2°; maximum 5° @ 2.5 kHz
- Basic current accuracy: 1 % full scale
- Additional current measurement for transducers: 0.5 % full scale

Short-circuit management

The current by an inverter short-circuit can be specified by parameter

- Minimum machine inductance: please see Coupling Chokes on page 10
- Terminal voltage phase shift possible during short circuit activation/deactivation
- Settling time until stationary short circuit current typically requires up to 30 ms but depends on the operating point
- The short circuit current is not be actively set for low voltages (typically lower than 10 V). In general, the short circuit current is low in that case due to the resistance of the coupling inductance.

Power electronics cooling

- Water or water heat exchanger with internal water circuit
- Limiting the water flow in the cabinet
- Monitoring water temperature and internal controller
- Water stop valve

Internal cabinet cooling

- Water or air heat exchanger
- Monitoring the interior temperature and the heat exchanger temperature
- No air flow to the laboratory environment
- Roof assembly
Cooling water

- Temperature of coolant-in line: ¾”, +6 °C to +20 °C
- Temperature of coolant-out line: ¾”, Maximum +30 °C
- Maximum input pressure: 6 bar, free of pressure surges, differential pressure: 1.5 to 3 bar
- Water-stop valve

**Interface to the superordinate test bench guard (through terminal blocks)**

- Release of main power contactors
- Release of output contactors
- Status signal output contactors open / closed
- Status signal limit value violated
- Status signal collective-alarm error
- Status signal emergency stop

**Safety**

- Parametrizable limit values (current, voltage, power) for protection of the device under test
- Integration in the emergency stop loop of the laboratory
- Master switch off (integrated in cabinet door)
- Emergency stop button (integrated in cabinet door)
- Key switch for release of output contactors
- Door handles: convenient handles with safety lock
- Signal lamp with 3 lights, installed on a magnetic base on the cabinet roof
  - Red: error; yellow: operation, green: ready for operation

**Intrinsic safety**

- Built-in safeguards against overheating, over-load, short circuit and no-load operation
- Monitoring of all internal voltages, currents and temperatures
- AC output contactors, capable of disconnecting at full load current
- Main-side contactors ensure voltage-free operation
- Discharging of all internal high-voltage sources during emergency stop
Documentation

- Operating instructions in English
- Getting Started Guide in English
- CE certificate of conformity
- Final inspection and calibration protocol

Technical execution as per the common basic safety and health demands of EU directives. Special customer standards have not been considered.

System Options

Extension of Sensor Emulation

The machine emulator can emulate speed/position sensors and temperature sensors by default:

Emulation of speed/position sensors

- Resolver
- Incremental encoder
- Hall sensor
- Max. output frequency up to 100 kHz

Emulation of temperature sensors

- Emulation of two temperature sensors via analog signals
- 2x output voltage 0 V to 5 V, output current up to a maximum of 10 mA
SL1044A-080 Extension of Sensor Emulation to XMR Sensor and Failure Emulation

This option enables the emulation of XMR sensors and sensor defects. Emulated XMR sensors are the Giant Magneto Resistance (GMR) and the Anisotropic Magneto Resistance (AMR) sensors.

**XMR sensors:**

**Inputs**

- $V_{ref}$ Analog Input ($V_{cc}$ / Resolver Exciter): -10 to 10 V

**Outputs**

8x analogue outputs:

- GMR, AMR, Vogt, Resolver: Sin+, Sin-, Cos+, Cos-
- AMR has twice the signal frequency compared to the GMR
- GMR has the mech. frequency of the electric motor
- Output voltage (amplitude): $-V_{ref}$ to $V_{ref}$ (per-phase from $V_{ref}$)
- Output voltage (offset): 0 to $V_{ref}$ (per-generation of $V_{ref}$)
- Frequency AMR: DC to 2.5 kHz (30000 rpm)
- Frequency GMR: DC to 500 Hz (30000 rpm)
- Sensor position: -180 ° to 180 °
- Phase shift between the outputs (Sin / Cos): -180 ° to 180 °
- The outputs are short circuit proof
- Maximum output current: 40 mA
- Internal resistance in the control range: 11 Ω

**Emulation of sensor defects**

- Emulation of defects in the position and speed sensors (phase shift, gain, open terminals)
  [open terminals for open drain sensor emulation not available]
- Emulation of defects in temperature sensors (short circuit, open terminals)
DC Output

SL1044A-040 Optional DC Output 600 A

Operation of the 1044A Scienlab Machine Emulator as a fully functional SL1042A Scienlab Dynamic DC Emulator.

- Software switching between Machine and Dynamic DC Emulator via customer interface

Coupling Chokes

Coupling Chokes are necessary for the emulation of low values of machine inductance (typically values close to the smaller machine inductance work best).

SL1044A-050 Standard Coupling Chokes 150 µH

- Base dimensions (H x W x D): 2005 mm x 800 mm x 880 mm
- Transport dimensions (H x W x D): 2005 mm x 800 mm x 880 mm
- Weight: approximately 400 kg

Output to test item (DUT)

Figure 3: Example of coupling choke system (top view)
Cabinet of coupling chokes with 150 µH, per ME and phase.

For one ME:

- Connection point for two power stages
- 6 one-phase chokes 300 µH / 300 A
- Effective inductance per phase
  - 150 kW system: 150 µH
  - 300 kW system: 75 µH
- 2 Power contactors, switchable via Interface
- N coupling choke cabinets of this kind can be connected in series, to multiply the physically connected inductance
- Cabinet cooling via roof ventilator
- 1 cabinet / 2 power stage

Figure 4: Exemplary block diagram
SL1044A-051 Coupling Chokes 250 µH

- Base dimensions (H x W x D): 2800 mm x 800 mm x 880 mm
- Transport dimensions (H x W x D): 2600 mm x 800 mm x 880 mm
- Weight: approx. 500 kg

Figure 5: Example of coupling choke system (top view)

Cabinet of coupling chokes with maximum 250 µH, per ME and phase.

For one ME:

- 6 one-phase chokes 200µH / 300A
- 6 one-phase chokes 300µH / 300A
- Maximum effective inductance per phase
  - 150 kW system: 250 µH
  - 300 kW system: 125 µH
- 4 Power contactors, switchable via Interface
- N coupling choke cabinets of this kind can be connected in series to multiply the physically connected inductance
- Cabinet cooling: water
- 1 cabinet / 2 power stage
Figure 6: Exemplary block diagram

The table shows the combination of the inductance per ME

<table>
<thead>

SL1044A-052 Coupling Chokes 500 µH

- One cabinet coupling Chokes cabinet has a maximum inductance of 1000 µH. For this variant, one ME requires two cabinets. One cabinet has the following data:
- Base dimensions (H x W x D): 2800 mm x 1600 mm x 880 mm
- Transport dimensions (H x W x D): 2600 mm x 800 mm x 880 mm
- Weight: approx. 1000 kg

Figure 7: Example of coupling choke system (top view)
Cabinet of coupling chokes with maximum 500 μH, per ME and phase.

For one ME:

- 12 one-phase chokes 200 μH / 300 A
- 12 one-phase chokes 300 μH / 300 A
- Maximum effective inductance per phase
  - 150 kW system: 500 μH
  - 300 kW system: 250 μH
- 12 Power contactors, switchable via Interface
- N coupling choke cabinets of this kind can be connected in series, in order to multiply the physically connected inductance
- Cabinet cooling: water
- 2 cabinet / 2 power stage

The table show the combination of the inductance per ME

Emulation of Line-Effects

SL1044A-070 Emulation of Line-Effects

Short circuit and interruption (open circuit) of single lines on the machine terminal during operation up to 600 A / 150 kW.

- Three-phase short circuit
- Two-phase short circuit via all three phases
- One, two and three-phase failure
- Error case selectable via interface
- Error cases realized by power contactors

Cabinet Base Option Class

SL1044A-701 Base stand

Control cabinet is placed on top of a 15 cm high base stand.

SL1044A-702 Rollers

Control cabinet stands on top of 25 cm high rollers and can be moved.

Interface Options Beyond Ethernet

SL1044A-030 Additional EtherCAT Interface

Control cabinet is equipped with an extra EtherCAT interface.

- EtherCAT – interface description in English

Note: This option cannot be combined with the FPGA interface.

Note: When using dSpace HiL this option is not necessary for the communication between the emulator and the HiL.

SL1044A-031 Additional FPGA Interface

Control cabinet is equipped with an extra interface for external dSpace FPGA.

Note: This option is required if external dSpace FPGA in SL1020A is selected.

Note: This option cannot be combined with the EtherCAT interface.

SL1044A-021 NET-Assembly License/DLL SLEP

DLL driver for direct connection of DC Emulator or Machine Emulator in external MS Windows Applications via Ethernet (e.g. LabView).
Machine Modeling

SL1044A-060 PMSM Model Includes Definition of Look-up Tables

Anisotropic machine model of a Permanent Magnet Synchronous Machine (PMSM) for generator and motor operation.

Basic system parameters:

- \( L_d \) - d-Axis inductance [25 \( \mu \)H to 1000 \( \mu \)H]
- \( L_q \) - q-Axis Inductance [25 \( \mu \)H to 1000 \( \mu \)H]
- \( R_s \) - Stator resistance [1 \( \Omega \) to 10 \( \Omega \)]
- \( \Psi_{PM} \) - Excitation flow
- \( J_{\text{mech}} \) - Mechanical moment of inertia
- \( p \) - Number of pole pairs [1 to 20]

The actual range of inductance values may depend on the operating point. The available range of machine operation depends on the machine characteristics and, if required, may be evaluated by Keysight.

Definition of look-up tables

Parameters dependencies can be specified in up to two dimensions \( x = f(y,z) \).

Examples of application:

- Inductance saturation
- Temperature dependency of \( \Psi_{PM} \) (PMSM)
- Characteristic lines of (temperature) sensors
- Mechanical friction losses

SL1044A-061 ASM Model Includes Definition of Look-up Tables

Asynchronous Machine (ASM) with squirrel-cage rotor for generator and motor operation

Basic system settings:

- \( R_s \) - Stator resistance
- \( R_r \) - Rotor resistance
- \( L_{ls} \) - Stator leakage inductance
- \( L_{lr} \) - Rotor leakage inductance
- \( L_m \) - Magnetic coupling inductance
- \( \text{Coupling factor stator / rotor} \)
- \( J_{\text{mech}} \) - Mechanical moment of inertia
- \( p \) - Number of pole pairs

The actual range of inductance may depend on the operating point. The available range of operation of the machine depends on the machine characteristics and, if required, may be evaluated by Keysight.
Definition of look-up tables

Parameters dependencies can be specified in up to two dimensions $x = f(y,z)$.

Examples of application:

- Inductance saturation
- Characteristic lines of (temperature) sensors
- Mechanical friction losses

Service Options

Service features depend on the customer facilities and expertise and overall scope of the project. For that reason, it is not possible to give exact service efforts without knowing the requirements and goals of the customer. Keysight offers the following services to ensure a successful project execution and to reduce the ramp-up time for our customers.

HS0003A-100 Project Management

Project Management is recommended for each test bench project. By ordering the Project Management service, an experienced project manager dedicated to your project acts as a direct communication interface from Keysight to the customers Project Management Team.

The project manager takes over the responsibility:

- To observe internal project progress and insure that project schedule/ project milestones are kept.
- That any unscheduled occasions with relevance for the project are immediately communicated and discussed with the customer.
- To provide complete and accurate project documentation to the customer.

HS0002A-108 Preliminary Acceptance

The Preliminary Acceptance implements the customer’s Device Under Test (DUT) into the test environment before delivery. It is important to get the customer’s DUT for the preliminary acceptance. Without the customer’s DUT, a preliminary acceptance is not possible. The preliminary acceptance is required for new customers.

- This position also includes training for the customer.
- Recommended: Bochum, Germany

Note: The preliminary acceptance is valid for one DUT. It is necessary and important to send the document 'Checklist Inverter Test Bench,' including all mentioned files in the document, to Keysight Bochum eight weeks before the preliminary acceptance. Please contact your sales representative if you did not get the mentioned document.
R9001A-201 Installation Service

The scope of the offered Installation Service depends on the individual customer facility. Please share all relevant information and requirements regarding test bench components that require installation. Such requirements include connection to the local grid and local water supply. This allows your local field engineer to calculate the scope of service personnel and material costs for installation.

**Note:** Installation can also be executed by the customer.

Required output cables for 600 A Systems:

- **Emulator ↔ Chokes:** approx. 6 x 4 meter 4G50 mm²  
  (Recommended: Ölflex Classic 100 CY)
- **Chokes ↔ DUT:** approx. 3 x 6 meter 300 mm²  
  (Recommended: Ölflex FD90CY)
- **Chokes ↔ DUT:** approx. 3 x 6 meter 150 mm²  
  (Recommended: Ölflex FD90CY PE) (if required)

**Note:** The actual length of the cables depends on the lab layout. The sum (Emulator ↔ Chokes ↔ DUT) must not exceed 10 meters.

**Note:** For 1200 A Systems, double the amount of cables is required. The cables need to be connected in parallel at the DUT side.

R9001A-202 Commissioning - Test Solution

The Commissioning Service guides the customer during first usage of the test bench after installation. Commissioning is recommended for each test bench. It includes:

- Local presence of experienced test bench engineer during first usage of the test bench.
- Consulting with customer personnel with regards to intended usage of the test bench (e.g. initial test with customer specimen)
- Review of executed hardware installation of Keysight products.
- Review and consulting per software settings of operation software if ordered
- Travel expenses

**Note:** Commissioning is offered on a daily base. Keysight recommends at least 12 days of Commissioning Service for each test bench.
HS0002A-100 Productivity Assistance

The Productivity Assistance is offered to support, consult, and train the customer’s operation personnel to reduce the ramp-up time for initial usage of a new test bench and for any unexpected system behavior during the test bench life cycle. Productivity Assistance is executed either remotely (phone/Internet) or on site (on request). It includes:

- Direct access to an experienced system specialist via Phone/Internet
- Support for failure analysis and trouble shoot
- Software and programming support & consulting

Note: Keysight recommends at least two days of Productivity Assistance for each test bench project.
