KEYSIGHT
Connect and Secure the World with Dynamic Network Intelligence

The need for always-on networks is pervasive, and expectations are high when it comes to keeping them connected and secure. As technologies advance, edge computing, cloud environments, sophisticated security threats, increasing bandwidth requirements, and demanding compliance regulations make it challenging to extract actionable insight from your network.

Keysight can help. Customers rely on our solutions to deliver rich data about network traffic, applications, and users across any networking environment. This deep insight is what we call dynamic network intelligence. It helps you continuously innovate, meet aggressive service-level agreements, and keep applications running smoothly and securely.

Delivering dynamic network intelligence relies on network visibility, and Keysight provides a complete suite of products. Keysight Vision network packet brokers (NPBs) are at the core. They help you get the most out of your security and network monitoring tools by delivering filtered, streamlined traffic. External bypass switches, such as the Keysight iBypass, enable high availability and inline failover to keep your network online. And taps provide a pure and unedited view into traffic on the network, forming the foundation of dynamic network intelligence. Together, Keysight’s network visibility products enable you, and all your network tools, to be more efficient and effective so you can keep performance high and security tight.

GET A CRASH COURSE IN NETWORKING FUNDAMENTALS.
Network Packet Brokers: The Right Data for the Right Tools

NPBs are central to providing dynamic network intelligence throughout your network. Using application-aware traffic filtering, decryption, and deduplication, NPBs enable your security and monitoring tools to be more efficient and effective by ensuring that each tool gets the right data — nothing more, nothing less. Furthermore, unlike many competitive offerings, Keysight NPBs offer hardware acceleration enabled by field-programmable gate arrays (FPGAs). This functionality is a key consideration for any visibility deployment supporting mission-critical security or network monitoring because it allows the application of features and filters at line rate without lost traffic, blind spots, or dropped packets. Because partial visibility isn’t good enough.

Keysight NPBs offer these key features:

- Zero-loss architecture
- Load balancing for multiple monitoring or security tools
- Centralized decryption, including advanced TLS 1.3
- Dynamic filter compiler reduces operational complexity
- Easy-to-use graphical user interface (GUI)
Visibility for finance

TradeVision is a unique product for financial services organizations. It combines market-feed health monitoring with best-in-class functionality that enables it to monitor 240 million trade/quote messages a second. That’s 12 times more than the entire US equities and options markets combined. With lossless FPGA-based hardware acceleration, precision time-stamping, and tap aggregation capabilities, TradeVision reduces the time required to address potentially costly issues. Additional features include:

- Multicast gap detection
- Advanced latency analytics
- Micro-burst alerting
- High-resolution traffic statistics
- Simplified feed management

Accredited security for US federal agencies

Government agencies, military, and other security-conscious organizations require the highest standards of security integrity. That’s why all of our NPBs are Common Criteria, FIPS 140–2 and DoDIN APL listed. And, the most recent certifications utilize a software module approach, which means they will always benefit from the latest software enhancements.

Want to know more?
Learn more about NPBs — what they do, and why you need one.
Advanced packet processing and intelligent context-aware filtering

Keysight’s robust intelligent visibility feature stacks help you get the most out of Vision Series NPBs and your entire visibility and security platform. These software stacks provide filtering based on L2 through L7. Each feature stack has a purpose-built design to ensure you get the best performance, whether in a physical data center or a private, hybrid, or public cloud.

NPB feature stacks offer dynamic network intelligence that extends and enhances the functionality of an NPB with advanced packet processing. See how we stack up.

**NetStack**
Provides the gold standard baseline for network visibility. It includes robust filtering, load balancing, aggregation, replication, and more with three stages of filtering (ingress, dynamic, and egress) and dynamic filter compiler.

**PacketStack**
Provides intelligent packet filtering, manipulation, and transport with deduplication that removes duplicate packets at full line rate with no loss. Other capabilities include header (protocol) stripping, packet trimming, time stamping, data masking, and burst protection.

With PacketStack, you can do the following:
- Protect and extend the life of monitoring tools, so they operate more effectively
- Boost tool performance by retaining only needed header bytes and trimming payload to a user-configurable length
- Hide personally identifiable information, such as credit card and Social Security numbers, before sending data to analysis tools
- Monitor tools to measure latency, with nanosecond resolution and accuracy, by timestamping all packets for time-sensitive applications
- Terminate L2GRE or ERSPAN tunnels from vTap and deliver plain Ethernet traffic to your tools
- Strip new or proprietary protocols like L3GRE, Jmirror, PBB-TE, LISP, VSL, OTV, and PPPoE using generic header stripping

**SecureStack**
Optimizes handling for secure traffic. Supports inline and out-of-band SSL / TLS decryption and threat intelligence. Data Masking Plus meets Health Insurance Portability and Accountability Act, Payment Card Industry, and other regulatory compliance requirements. Achieve greater visibility by decrypting traffic so you can quickly detect hidden malware and prevent data loss or security tool bottlenecks.

**AppStack**
Provides context-aware, signature-based application-layer filtering with accurate and fast application identification, geolocation and tagging, patented signature detection, and optional RegEx filtering. A simple point-and-click management interface allows you to select application traffic types of interest and filter traffic to tools. AppStack improves monitoring platforms by adding a richer set of geographical, application, and device information.

**MobileStack**
Offers visibility intelligence for the mobile carrier evolved packet core with General Packet Radio Service Tunneling Protocol, or GPRS Tunneling Protocol (GTP). MobileStack provides Session Initiation Protocol correlation and load balancing, subscriber-specific filtering, subscriber allow lists, and subscriber sampling. MobileStack on Vision X can correlate up to 512 million subscriber sessions and 1,600 GB of user plane traffic per chassis and is designed to support 5G performance.

**TradeStack**
Offers the financial capital markets a simplified market feed data management tool that removes the hassle of configuring, analyzing, and managing market feed data. Features include high-resolution traffic stats down to 0.1 millisecond resolution, microburst detection, feed health, and gap detection.

With Keysight’s modular NPB stacks, you can add only the capabilities and features you need, when you need them. Equipping your NPBs with a full stack of software solutions ensures that your network visibility architecture will evolve and scale to support current and future needs.
Stop hackers with secure traffic processing and SSL / TLS decryption

To prevent blind spots, you need to see all network traffic — both decrypted and encrypted. But, the same encryption used to protect your data can be a dual-edged sword. Cybercriminals can attack your network by concealing ransomware and malware within encrypted data, much like a Trojan horse. Beat hackers at their own game by offloading the process-intensive task of SSL/TLS decryption to a Vision Series NPB with SecureStack. Doing so will improve the efficiency of your tools without overloading or impacting their performance.

Active SSL Description and Encryption (TLS 1.3 Support)

Security and Monitoring Tools

Reduce costs and extend the life of tools with load balancing

Vision NPBs with NetStack perform aggregation and load balancing, breaking data down into lower-rate streams to send to the proper tools. Spreading 40 Gbps of traffic across multiple 10 Gbps tools, for example, extends the life of your 10 Gbps tools until you have budget for more expensive tools that support higher data rates.

Deduplication increases the efficiency of monitoring and security tools 35% to 50% by reducing the amount of filtered data sent to tools.
NextGen network packet broker: Vision E400S
Scale your visibility to 400G speed

Keysight’s Vision E400S is the next-generation network visibility solution with comprehensive feature sets to meet the ever-evolving visibility needs of your production network, for up to 400Gbps network speed.

Highly compact and 1RU in size, Vision E400S front panel provides 24 QSFP56 and 16 QSFP-DD ports. Each QSFP-DD can break out to many smaller speed ports (200G, 100G, 40G, 50/25/10G) via fan-out cable. It’s the only NPB that supports all possible permutation of speeds, increasing the chance of interoperating with legacy devices while maximizing design flexibility.

The re-programmable nature of the silicon allows fast implementation of a new parser or header stripping option of any new protocols, well-known or proprietary. New load balance options support load balancing per port group. In addition to traditional session-aware load balance, new options also allow asymmetric LB, weighted LB, random LB, and LB using tunneled IP header.

Highlights

- Compact 1RU NPB that supports 10/25/40/50/100/200/400G port speeds
- P4 and Tofino based programmable silicon
- Full-duplex, non-blocking, and line rate L2 forwarding of 9.2 Tbps
- Front panel includes 24 SFP56 and 16 QSFP-DD ports
- Hot-swappable fans, power supplies
- Industry only 400G NPB that supports all QSFP-DD speed permutations: 1x400G, 2x200G, (1,2,4) x100G, (4,8)x50G, (1,2)x40G, 8x25G, 8x10G

Bypass Switches: Ensure Uptime and Network Availability

External bypass switches are the key to high availability and ease of maintenance for network monitoring and security deployments. While everyone recognizes the need for tools such as intrusion prevention and firewalls, the inline deployment models of these tools can create risk or downtime when it is time for reboots, maintenance, or replacement. External bypass switches, such as Keysight iBypass, provide automated failover, which prevents tool updates or downtime from bringing down the network.

Keysight iBypass offers these key features:

- Supports redundant and serial architectures
- High availability: active-active or active-standby
- Preconfigured heartbeat
- Centralized management
- Easy-to-use GUI

Network Taps: The Foundation of Dynamic Network Intelligent

Network taps, and the pure, unfiltered visibility into network traffic they provide, are the foundation of dynamic network intelligence. Unlike SPAN ports or port mirroring, taps provide a view of all traffic — including malformed traffic and errors that typically would get dropped. This true visibility facilitates troubleshooting, as well as security and forensics.

Keysight offers the broadest selection of taps for any network, including Flex Tap optical taps, Flex Tap Secure+ enhanced security taps, copper taps, aggregation taps, and industrial Tough Taps.

Keysight taps offer these key features:

- plug and play
- no IP address
- secure and unhackable
- copper and fiber
- speeds up to 400 Gbps

Tough taps for industrial environments

Built from the ground up, Keysight Tough Taps are the industry’s first ruggedized network taps designed for harsh environments. They meet extended temperature ranges, withstand shock and vibration, and have optimized copper and fiber 10 / 100, 1G, and 10G ports. Tough Taps are certified for Institute of Electrical and Electronics Engineers (IEEE) standards, including IEEE 1613 for safety and IEC 61850 for communication protocols for intelligent electrical devices.

The Copper Tough Taps offer out-of-band monitoring for security and performance tools and duplicate all packets for full visibility. For extra uptime protection, these taps have redundant terminal block power connectors. If the primary power source fails, the tap automatically switches to the backup power source. If both input power sources fail, the tap will still pass traffic between its network ports (fail-open).

The Flex Tough Taps collect and archive network traffic. They are optimized for “run to fail” fiber networks with both old and new fiber modes found in remote substations. These taps are TAA compliant, and you can deploy them at any inline connection on the network.

| **Unique features** | • Supports Power over Ethernet (PoE)  
  • Auto speed negotiation  
  • Secured by design — with no management interface or IP address, it cannot be hacked  
  • Physical air-gapped monitor ports — data diode between tool ports and monitored ports prevents malicious injections from monitoring network  
  • Silent operation  
  • DIN rail mountable  
  • Fan-less | • No power required  
  • Secured by design — with no management interface or IP address, it cannot be hacked  
  • Passes all traffic (including errors) from all layers  
  • Compact — 4 taps in one module  
  • Completely passive, optical device  
  • OM1, OM5 multi-mode models in 70 / 30 split ratio  
  • Can be deployed at any inline network connection  
  • DIN rail mountable  
  • Same form factor as Copper Tough Tap  
  • Color-coded LC connectors |

Cloud Visibility
CloudLens powers better security, visibility, and performance monitoring for the cloud

Keysight’s platform for public, private, and hybrid cloud visibility, CloudLens, enables packet capture, filtering, and analysis to provide dynamic network intelligence in any cloud environment. With its unique cloud-native architecture, CloudLens is a natural fit for cloud-only and cloud-first strategies, along with organizations that utilize multi-cloud or hybrid environments.

When network security and performance matter most, organizations trust CloudLens to shed light on their most vulnerable blind spots.

CloudLens offers these key features:

• Captures and forwards full packets and/or NetFlow from virtual machines, containers or inter-Pod network traffic to tools
• Operates as a virtualized network packet broker, allowing aggregation, filtering, deduplication of virtual network traffic all within the cloud
• Auto-scales elastically, on-demand with cloud instances
• Multi-platform capable, cloud service provider and platform agnostic

Learn more about CloudLens
Visibility Central Management: Manage Many NPBs Through a Single-Pane-of-Glass

Networks are growing increasingly complex, as is the task of extracting dynamic network intelligence information from them. Having a visibility fabric consisting of NPBs, bypass switches, and taps is a good start. What comes next is managing and coordinating all these systems. That is where Keysight’s Visibility Central Management comes in.

Centralized management enables you to manage hundreds of devices with monitoring, scheduled configuration changes, and bulk software upgrades. You can import or export configurations, run scripts, view bandwidth utilization, and more. Additionally, you can customize dashboards and integrate with other network management systems via northbound interfaces.

Keysight centralized management offers these key features:

- single-pane-of-glass management
- device auto-discovery
- SSO and zero-touch provisioning
- physical or virtual form factors
- high availability with floating primary / backup IP
- RADIUS, TACACS+, and LDAP authentication
